TABLE OF CONTENTS

1 GENERAL DESCRIPTION.....	31
2 FEATURE DESCRIPTION	32
3 PARTS INFORMATION	44
3.1 Summary	44
3.2 Package Type	44
3.3 NuMicro® M481 Base Series	45
3.4 NuMicro® M482 USB FS OTG Series	46
3.5 NuMicro® M483 CAN Series.....	47
3.6 NuMicro® M484 USB HS OTG Series.....	48
3.7 NuMicro® M485 Crypto Series.....	49
3.8 NuMicro® M487 Ethernet Series	50
3.9 NuMicro® M480 Naming Rule	51
4 PIN CONFIGURATION	52
4.1 Pin Configuration	52
4.1.1 NuMicro® M481 Base Series QFN33 Pin Diagram	52
4.1.2 NuMicro® M481 Base Series LQFP48 Pin Diagram	53
4.1.3 NuMicro® M481 Base Series LQFP64 Pin Diagram	54
4.1.4 NuMicro® M482 USB FS OTG Series QFN33 Pin Diagram	55
4.1.5 NuMicro® M482 USB FS OTG Series LQFP48 Pin Diagram	56
4.1.6 NuMicro® M482 USB FS OTG Series LQFP64 Pin Diagram	57
4.1.7 NuMicro® M482 USB FS OTG Series LQFP128 Pin Diagram	58
4.1.8 NuMicro® M483 CAN Series LQFP64 Pin Diagram	59
4.1.9 NuMicro® M483 CAN Series LQFP128 Pin Diagram	60
4.1.10 NuMicro® M484 USB HS OTG Series LQFP64 Pin Diagram	61
4.1.11 NuMicro® M484 USB HS OTG Series with 2 USB LQFP64 Pin Diagram	62
4.1.12 NuMicro® M484 USB HS OTG Series LQFP128 Pin Diagram	63
4.1.13 NuMicro® M485 Crypto Series QFN33 Pin Diagram	64
4.1.14 NuMicro® M485 Crypto Series LQFP48 Pin Diagram	65
4.1.15 NuMicro® M485 Crypto Series LQFP64 Pin Diagram	66
4.1.16 NuMicro® M485 Crypto Series LQFP128 Pin Diagram	67
4.1.17 NuMicro® M487 Ethernet Series LQFP64 Pin Diagram	68
4.1.18 NuMicro® M487 Ethernet Series LQFP128 Pin Diagram	69
4.1.19 NuMicro® M487 Ethernet Series LQFP144 Pin Diagram	70
4.2 Pin Description.....	71
4.2.1 M481 Series Pin Description	71
4.2.2 M482 Series Pin Description	88
4.2.3 M483 Series Pin Description	117

4.2.4	M484 Series Pin Description	145
4.2.5	M485 Series Pin Description	172
4.2.6	M487 Series Pin Description	200
4.2.7	M480 Multi-function Summary Table	231
4.2.8	M480 Multi-function Summary Table Sorted by GPIO	258
5	BLOCK DIAGRAM.....	289
5.1	NuMicro® M480 Block Diagram.....	289
6	FUNCTIONAL DESCRIPTION.....	290
6.1	ARM® Cortex® -M4 Core.....	290
6.2	System Manager.....	293
6.2.1	Overview.....	293
6.2.2	System Reset.....	293
6.2.3	System Power Distribution	299
6.2.4	Power Modes and Wake-up Sources	300
6.2.5	Power Modes and Power Level Transition	304
6.2.6	System Memory Map	304
6.2.7	SRAM Memory Organization	308
6.2.8	Bus Matrix.....	310
6.2.9	HIRC Auto Trim	310
6.2.10	Register Lock Control	311
6.2.11	Register Map	314
6.2.12	Register Description	316
6.2.13	System Timer (SysTick).....	368
6.2.14	System Timer Control Register Map.....	369
6.2.15	Nested Vectored Interrupt Controller (NVIC).....	373
6.2.16	System Control Register	403
6.3	Clock Controller	412
6.3.1	Overview	412
6.3.2	Clock Generator.....	414
6.3.3	System Clock and SysTick Clock.....	415
6.3.4	Peripherals Clock	416
6.3.5	Power-down Mode Clock	417
6.3.6	Clock Output.....	417
6.3.7	USB Clock Source.....	418
6.3.8	HXT clock	419
6.3.9	Register Map	420
6.3.10	Register Description	422
6.4	Flash Memory Controller (FMC).....	468
6.4.1	Overview	468
6.4.2	Features.....	468
6.4.3	Block Diagram.....	468

6.4.4 Functional Description	471
6.4.5 Register Map	511
6.4.6 Register Description	512
6.5 General Purpose I/O (GPIO)	538
6.5.1 Overview	538
6.5.2 Features	538
6.5.3 Block Diagram	539
6.5.4 Basic Configuration	539
6.5.5 Functional Description	540
6.5.6 Register Map	543
6.5.7 Register Description	547
6.6 PDMA Controller (PDMA)	564
6.6.1 Overview	564
6.6.2 Features	564
6.6.3 Block Diagram	564
6.6.4 Basic Configuration	564
6.6.5 Functional Description	565
6.6.6 Register Map	571
6.6.7 Register Description	573
6.7 Timer Controller (TMR)	605
6.7.1 Overview	605
6.7.2 Features	605
6.7.3 Block Diagram	606
6.7.4 Basic Configuration	610
6.7.5 Timer Functional Description	611
6.7.6 PWM Functional Description	616
6.7.7 Register Map	633
6.7.8 Register Description	639
6.8 Watchdog Timer (WDT)	682
6.8.1 Overview	682
6.8.2 Features	682
6.8.3 Block Diagram	682
6.8.4 Basic Configuration	682
6.8.5 Functional Description	683
6.8.6 Register Map	686
6.8.7 Register Description	687
6.9 Window Watchdog Timer (WWDT)	691
6.9.1 Overview	691
6.9.2 Features	691
6.9.3 Block Diagram	691
6.9.4 Basic Configuration	691

6.9.5 Functional Description	692
6.9.6 Register Map	696
6.9.7 Register Description	697
6.10 Real Time Clock (RTC).....	702
6.10.1 Overview	702
6.10.2 Features.....	702
6.10.3 Block Diagram.....	703
6.10.4 Basic Configuration	703
6.10.5 Functional Description	705
6.10.6 Register Map	712
6.10.7 Register Description	714
6.11 EPWM Generator and Capture Timer (EPWM).....	748
6.11.1 Overview	748
6.11.2 Features.....	748
6.11.3 Block Diagram.....	749
6.11.4 Basic Configuration	753
6.11.5 Functional Description	755
6.11.6 Register Map	788
6.11.7 Register Description.....	794
6.12 Basic PWM Generator and Capture Timer (BPWM).....	863
6.12.1 Overview	863
6.12.2 Features.....	863
6.12.3 Block Diagram.....	864
6.12.4 Basic Configuration	867
6.12.5 Functional Description	868
6.12.6 Register Map	883
6.12.7 Register Description.....	886
6.13 Quadrature Encoder Interface (QEI)	919
6.13.1 Overview	919
6.13.2 Features.....	919
6.13.3 Block Diagram.....	919
6.13.4 Basic Configuration	920
6.13.5 Functional Description	921
6.13.6 Register Map	929
6.13.7 Register Description.....	930
6.14 Enhanced Input Capture Timer (ECAP).....	940
6.14.1 Overview	940
6.14.2 Features.....	940
6.14.3 Block Diagram.....	940
6.14.4 Basic Configuration	941
6.14.5 Functional Description	942

6.14.6 Register Map	947
6.14.7 Register Description	948
6.15 UART Interface Controller (UART).....	960
6.15.1 Overview	960
6.15.2 Features.....	960
6.15.3 Block Diagram.....	961
6.15.4 Basic Configuration	964
6.15.5 Functional Description	968
6.15.6 Register Map	993
6.15.7 Register Description	995
6.16 Ethernet MAC Controller (EMAC).....	1029
6.16.1 Overview	1029
6.16.2 Features.....	1029
6.16.3 Block Diagram.....	1030
6.16.4 Basic Configuration	1030
6.16.5 Functional Description	1031
6.16.6 Register Map	1047
6.16.7 Register Description	1050
6.17 Smart Card Host Interface (SC)	1102
6.17.1 Overview	1102
6.17.2 Features.....	1102
6.17.3 Block Diagram.....	1102
6.17.4 Basic Configuration	1104
6.17.5 Functional Description	1107
6.17.6 Register Map	1119
6.17.7 Register Description	1120
6.18 I ² S Controller (I ² S)	1144
6.18.1 Overview	1144
6.18.2 Features.....	1144
6.18.3 Block Diagram.....	1144
6.18.4 Basic Configuration	1144
6.18.5 Functional Description	1145
6.18.6 Register Map	1156
6.18.7 Register Description	1157
6.19 Serial Peripheral Interface (SPI).....	1175
6.19.1 Overview	1175
6.19.2 Features.....	1175
6.19.3 Block Diagram.....	1176
6.19.4 Basic Configuration	1176
6.19.5 Functional Description	1180
6.19.6 Timing Diagram.....	1193

6.19.7 Programming Examples	1194
6.19.8 Register Map	1197
6.19.9 Register Description	1198
6.20 Quad Serial Peripheral Interface (QSPI).....	1218
6.20.1 Overview	1218
6.20.2 Features.....	1218
6.20.3 Block Diagram.....	1218
6.20.4 Basic Configuration	1219
6.20.5 Functional Description	1220
6.20.6 Timing Diagram.....	1236
6.20.7 Programming Examples	1238
6.20.8 Register Map	1241
6.20.9 Register Description.....	1242
6.21 SPI Synchronous Serial Interface Controller (SPI Master mode)	1256
6.21.1 Overview	1256
6.21.2 Features.....	1256
6.21.3 Block Diagram.....	1258
6.21.4 Basic Configuration	1258
6.21.5 Functional Description	1259
6.21.6 Mapping Address for SPI Flash Controller in AMBA System	1269
6.21.7 Register Map	1270
6.21.8 Register Description	1271
6.22 I ² C Serial Interface Controller (I ² C).....	1290
6.22.1 Overview	1290
6.22.2 Features.....	1290
6.22.3 Block Diagram.....	1291
6.22.4 Basic Configuration	1291
6.22.5 Functional Description	1293
6.22.6 Register Map	1316
6.22.7 Register Description	1317
6.23 USCI - Universal Serial Control Interface Controller (USCI).....	1339
6.23.1 Overview	1339
6.23.2 Features.....	1339
6.23.3 Block Diagram.....	1339
6.23.4 Functional Description	1339
6.24 USCI – UART Mode	1350
6.24.1 Overview	1350
6.24.2 Features.....	1350
6.24.3 Block Diagram.....	1350
6.24.4 Basic Configuration	1351
6.24.5 Functional Description	1352

6.24.6 Register Map	1361
6.24.7 Register Description	1362
6.25 USCI - SPI Mode	1384
6.25.1 Overview	1384
6.25.2 Features	1384
6.25.3 Block Diagram	1385
6.25.4 Basic Configuration	1385
6.25.5 Functional Description	1386
6.25.6 Register Map	1400
6.25.7 Register Description	1401
6.26 USCI - I ² C Mode	1424
6.26.1 Overview	1424
6.26.2 Features	1424
6.26.3 Block Diagram	1425
6.26.4 Basic Configuration	1425
6.26.5 Functional Description	1426
6.26.6 Register Map	1445
6.26.7 Register Description	1446
6.27 Controller Area Network (CAN)	1464
6.27.1 Overview	1464
6.27.2 Features	1464
6.27.3 Block Diagram	1464
6.27.4 Basic Configuration	1465
6.27.5 Functional Description	1466
6.27.6 Test Mode	1467
6.27.7 CAN Communications	1470
6.27.8 Register Map	1486
6.27.9 Register Description	1491
6.28 Secure Digital Host Controller (SDH)	1526
6.28.1 Overview	1526
6.28.2 Features	1526
6.28.3 Block Diagram	1527
6.28.4 Basic Configuration	1527
6.28.5 Functional Description	1528
6.28.6 Register Map	1531
6.28.7 Register Description	1532
6.29 External Bus Interface (EBI)	1551
6.29.1 Overview	1551
6.29.2 Features	1551
6.29.3 Block Diagram	1552
6.29.4 Basic Configuration	1552

6.29.5 Functional Description	1554
6.29.6 Register Map	1564
6.29.7 Register Description	1565
6.30 USB 1.1 Device Controller (USBD)	1569
6.30.1 Overview	1569
6.30.2 Features	1569
6.30.3 Block Diagram	1570
6.30.4 Basic Configuration	1570
6.30.5 Functional Description	1571
6.30.6 Register Map	1576
6.30.7 Register Description	1579
6.31 High Speed USB 2.0 Device Controller (HSUSBD)	1603
6.31.1 Overview	1603
6.31.2 Features	1603
6.31.3 Block Diagram	1603
6.31.4 Basic Configuration	1603
6.31.5 Functional Description	1604
6.31.6 Registers Map	1606
6.31.7 Register Description	1611
6.32 USB 2.0 Host Controller (USBH)	1661
6.32.1 Overview	1661
6.32.2 Features	1661
6.32.3 Block Diagram	1662
6.32.4 Basic Configuration	1663
6.32.5 Functional Description	1663
6.32.6 Register Map	1665
6.32.7 Register Description	1667
6.33 USB On-The-Go (OTG)	1718
6.33.1 Overview	1718
6.33.2 Features	1718
6.33.3 Block Diagram	1718
6.33.4 Basic Configuration	1719
6.33.5 Functional Description	1719
6.33.6 Register Map	1722
6.33.7 Register Description	1723
6.34 High Speed USB On-The-Go (HSOTG)	1732
6.34.1 Overview	1732
6.34.2 Features	1732
6.34.3 Block Diagram	1732
6.34.4 Basic Configuration	1733
6.34.5 Functional Description	1733

6.34.6 Register Map	1737
6.34.7 Register Description	1738
6.35 CRC Controller (CRC)	1747
6.35.1 Overview	1747
6.35.2 Features	1747
6.35.3 Block Diagram	1747
6.35.4 Basic Configuration	1748
6.35.5 Functional Description	1748
6.35.6 Register Map	1750
6.35.7 Register Description	1751
6.36 Cryptographic Accelerator (CRYPTO)	1756
6.36.1 Overview	1756
6.36.2 Features	1756
6.36.3 Block Diagram	1757
6.36.4 Basic Configuration	1758
6.36.5 Functional Description	1758
6.36.6 Register Map	1780
6.36.7 Register Description	1791
6.37 Enhanced 12-bit Analog-to-Digital Converter (EADC)	1858
6.37.1 Overview	1858
6.37.2 Features	1858
6.37.3 Block Diagram	1859
6.37.4 Basic Configuration	1859
6.37.5 Functional Description	1860
6.37.6 Register Map	1875
6.37.7 Register Description	1878
6.38 Digital to Analog Converter (DAC)	1908
6.38.1 Overview	1908
6.38.2 Features	1908
6.38.3 Block Diagram	1909
6.38.4 Basic Configuration	1909
6.38.5 Functional Description	1910
6.38.6 Register Map	1915
6.38.7 Register Description	1916
6.39 Analog Comparator Controller (ACMP)	1930
6.39.1 Overview	1930
6.39.2 Features	1930
6.39.3 Block Diagram	1931
6.39.4 Basic Configuration	1931
6.39.5 Functional Description	1932
6.39.6 Register Map	1937

6.39.7 Register Description	1938
6.40 OP Amplifier (OPA)	1945
6.40.1 Overview	1945
6.40.2 Features	1945
6.40.3 Block Diagram	1946
6.40.4 Basic Configuration	1946
6.40.5 Functional Description	1947

1 GENERAL DESCRIPTION

The NuMicro® M480 series 32-bit microcontroller powered by Arm® Cortex®-M4F with DSP extension runs up to 192 MHz with 175 μ A/MHz power consumption. Its 256/512 KB embedded Flash memory in dual-bank architecture supports Over-The-Air firmware upgrade. The 96/160 KB embedded SRAM includes 32 KB cache for speeding up code execution from the external SPI Flash. Built-in 4 KB Secure Protection ROM provides a safe space for saving confidential program or data. System supports a wide voltage range from 1.8V to 3.63V in industrial operating temperature from -40°C to 105°C.

The M480 series is equipped with a large number of high speed digital peripherals, such as a USB 2.0 high speed interface with on-chip transceiver working in device/host/OTG mode, a USB 2.0 full speed interface with on-chip transceiver working in device/host/OTG mode, up to nine UART interfaces including three ISO-7816-3 interfaces, up to four composite SPI/I2S interfaces, a Quad-SPI interface, a SPI Flash interface supporting quad mode, three I²C interfaces, a 192 kHz/32-bit I²S interface, two SDIO interfaces, two CAN 2.0B interfaces, two QEI interfaces, a 10/100 Mbps Ethernet MAC supporting RMII and two Universal Serial Control Interfaces which can be configured as UART, SPI or I²C. The M480 series also supports 16 channels peripheral DMA and up to 32 channels PWM running up to 192 MHz.

The M480 series provides high performance analog peripherals, such as a 12-bit 5MSPS SAR ADC with up to 16 channels, two 12-bit 1MSPS DAC, two analog comparators and three operational amplifiers, as well as a built-in hardware cryptography accelerator that supports ECC, AES, DES, triple DES, SHA, HMAC and a random number generator (RNG).

The NuMicro® M480 series includes the following sub-series:

- NuMicro® M481 Base series: Delivers high performance computing power with low power consumption for running complex algorithm.
- NuMicro® M482 USB FS OTG series: Built-in USB 2.0 full speed interface with on-chip OTG transceiver working in device/host/OTG mode.
- NuMicro® M483 CAN series: Built-in two sets of CAN 2.0B bus interfaces.
- NuMicro® M484 USB HS OTG series: Built-in USB 2.0 high speed interface with on-chip OTG transceiver working in device/host/OTG mode.
- NuMicro® M485 Crypto series: Built-in hardware cryptography engine and random number generator.
- NuMicro® M487 Ethernet series: Built-in 10/100Mbps Ethernet MAC supports industrial RMII, MDC and MDIO for communicating with an external transceiver.

2 FEATURE DESCRIPTION

Core and System

Boot Loader

- Factory pre-loaded 32 KB mask ROM for secure boot procedure
- Uses SHA-256 and AES-256 to validate data in APROM, LDROM and external SPI Flash
- Nuvoton ISP (In-System-Programming) tool for firmware upgrade via UART and high speed USB device
- ISP/IAP libraries

ARM® Cortex®-M4

- ARM® Cortex®-M4 processor, running up to 192 MHz
- Built-in Memory Protection Unit (MPU)
- Built-in Nested Vectored Interrupt Controller (NVIC)
- Hardware IEEE 754 compliant Floating-point Unit (FPU)
- DSP extension with hardware divider and single-cycle 32-bit hardware multiplier
- 24-bit system tick timer
- Programmable and maskable interrupt
- Low Power Sleep mode by WFI and WFE instructions

Brown-out Detector (BOD)

- Eight-level BOD with brown-out interrupt and reset option. (3.0V/2.8V/2.6V/2.4V/2.2V/2.0V/1.8V/1.6V)

Low Voltage Reset (LVR)

- LVR with 1.5V threshold voltage level.

Security

- 96-bit Unique ID (UID).
- 128-bit Unique Customer ID (UCID).
- One built-in temperature sensor with 1°C resolution.

Memories

Flash

- Dual bank 512/256 KB on-chip Application ROM (APROM) for Over-The-Air (OTA) upgrade
- 192 MHz maximum frequency, with performance at zero wait cycle in continuous address read access
- 4 KB on-chip Flash for user-defined loader (LDROM)
- 8 KB non-readable Key Protection ROM (KPROM) for firmware programming protection
- 4 KB non-readable Security Protection ROM (SPROM) for intellectual property protection
- 2 KB One Time Programmable (OTP) ROM for data security
- All on-chip Flash support 4 KB page erase
- Fast Flash programming verification with CRC
- On-chip Flash programming with In-Chip Programming (ICP), In-System Programming (ISP) and In-Application Programming (IAP)

	<p>capabilities</p> <ul style="list-style-type: none">Configurable boot up sources including user-defined loader (LDROM) or Application ROM (APROM)Data Flash with configurable memory size2-wired ICP Flash updating through SWD interface32-bit/64-bit and multi-word Flash programming function
SRAM	<ul style="list-style-type: none">Up to 160 KB on-chip SRAM includes:<ul style="list-style-type: none">32 KB SRAM located in bank 0 that supports hardware parity check and retention mode; Exception (NMI) generated upon a parity check error96/32 KB SRAM located in bank 132 KB SRAM located in bank 2 that can be used as cache for external SPI Flash memoryByte-, half-word- and word-accessPDMA operation
Cyclic Redundancy Calculation (CRC)	<ul style="list-style-type: none">Supports CRC-CCITT, CRC-8, CRC-16 and CRC-32 polynomialsProgrammable initial value and seed valueProgrammable order reverse setting and one's complement setting for input data and CRC checksum8-bit, 16-bit, and 32-bit data width8-bit write mode with 1-AHB clock cycle operation16-bit write mode with 2-AHB clock cycle operation32-bit write mode with 4-AHB clock cycle operationUses DMA to write data with performing CRC operation
Peripheral DMA (PDMA)	<ul style="list-style-type: none">Sixteen independent and configurable channels for automatic data transfer between memories and peripheralsBasic and Scatter-Gather transfer modesEach channel supports circular buffer management using Scatter-Gather Transfer modeStride function for rectangle image data movementFixed-priority and Round-robin priorities modesSingle and burst transfer typesByte-, half-word- and word transfer unit with count up to 65536Incremental or fixed source and destination address
Clocks	
External Clock Source	<ul style="list-style-type: none">4~24 MHz High-speed eXternal crystal oscillator (HXT) for precise timing operation32.768 kHz Low-speed eXternal crystal oscillator (LXT) for RTC function and low-power system operationSupports clock failure detection for external crystal oscillators and

exception generation (NMI)

Internal Clock Source

- 12 MHz High-speed Internal RC oscillator (HIRC) trimmed to 2% accuracy that can optionally be used as a system clock
 - 10 kHz Low-speed Internal RC oscillator (LIRC) for watchdog timer and wakeup operation
 - Up to 480 MHz on-chip PLL, sourced from HIRC or HXT, allows CPU operation up to the maximum CPU frequency without the need for a high-frequency crystal
-

Real-Time Clock (RTC)

- Real-Time Clock with a separate power domain
 - The RTC clock source includes Low-speed external crystal oscillator (LXT)
 - The RTC block includes 80 bytes backup registers, which can be cleared by tamper pins
 - Supports 6 static and dynamic tamper pins
 - Able to wake up CPU from any reduced power mode
 - Supports ±5ppm within 5 seconds software clock accuracy compensation
 - Supports Alarm registers (second, minute, hour, day, month, year)
 - Supports RTC Time Tick and Alarm Match interrupt
 - Automatic leap year recognition
 - Supports 1 Hz clock output for calibration
-

Timers**TIMER**

- Four sets of 32-bit timers with 24-bit up counter and one 8-bit pre-scale counter from independent clock source
- One-shot, Periodic, Toggle and Continuous Counting operation modes
- Supports event counting function to count the event from external pins
- Supports external capture pin for interval measurement and resetting 24-bit up counter
- Supports chip wake-up function, if a timer interrupt signal is generated

PWM

- Eight 16-bit PWM counters with 12-bit clock prescale with up to 192 MHz
- Supports 12-bit deadband (dead time)
- Up, down or up-down PWM counter type
- Supports brake function
- Supports mask function and tri-state output for each PWM channel

Enhanced PWM (EPWM)

- Twelve 16-bit counters with 12-bit clock prescale for twelve 192
-

MHz PWM output channels

- Up to 12 independent input capture channels with 16-bit resolution counter
 - Supports dead time with maximum divided 12-bit prescale
 - Up, down or up-down PWM counter type
 - Supports complementary mode for 3 complementary paired PWM output channels
 - Synchronous function for phase control
 - Counter synchronous start function
 - Brake function with auto recovery mechanism
 - Mask function and tri-state output for each PWM channel
 - Able to trigger EADC or DAC to start conversion
-

- Two 16-bit counters with 12-bit clock prescale for twelve 192 MHz PWM output channels.

Basic PWM (BPWM)

- Up to 6 independent input capture channels with 16-bit resolution counter
 - Up, down or up-down PWM counter type
 - Counter synchronous start function
 - Complementary mode for 3 complementary paired PWM output channels
 - Mask function and tri-state output for each PWM channel
 - Able to trigger EADC to start conversion.
-

Watchdog

- 18-bit free running up counter for WDT time-out interval
 - Supports multiple clock sources from LIRC (default selection), HCLK/2048 and LXT with 8 selectable time-out period
 - Able to wake up system from Power-down or Idle mode
 - Time-out event to trigger interrupt or reset system
 - Supports four WDT reset delay periods, including 1026, 130, 18 or 3 WDT_CLK reset delay period
 - Configured to force WDT enabled on chip power-on or reset.
-

Window Watchdog

- Clock sourced from HCLK/2048 or LIRC; the window set by 6-bit counter with 11-bit prescale
 - Suspended in Idle/Power-down mode
-

Analog Interfaces

Enhanced Analog-to-Digital Converter (EADC)

- One 12-bit, 19-ch 5 MSPS SAR EADC with up to 16 single-ended input channels or 8 differential input pairs; 10-bit accuracy is guaranteed.
 - Three internal channels for V_{DD}, band-gap VBG input and Temperature sensor input
 - Supports external V_{REF} pin or internal reference voltage V_{REF}: 1.6V, 2.0V, 2.5V, and 3.0V.
-

	<ul style="list-style-type: none">• Two power saving modes: Power-down mode and Standby mode• Supports calibration capability.• Analog-to-Digital conversion can be triggered by software enable, external pin, Timer 0~3 overflow pulse trigger or PWM trigger.• Configurable EADC sampling time.• Up to 19 sample modules.• Double data buffers for sample module 0~3.• PDMA operation.
Digital-to-Analog Converter (DAC)	<ul style="list-style-type: none">• Two 12-bit, 1 MSPS voltage type DAC with 8-bit mode and 8μs rail-to-rail settle time.• Maximum output voltage AV_{DD} -0.2V at buffer mode• Digital-to-Analog conversion triggered by Timer0~3, EPWM0, EPWM1, external trigger pin to start DAC conversion or software.• Supports group mode for synchronized data update of two DACs.• PDMA operation
Analog Comparator (ACMP)	<ul style="list-style-type: none">• Two rail-to-rail Analog Comparators.• Supports four multiplexed I/O pins at positive input.• Supports I/O pins, band-gap, DAC, and 16-level Voltage divider from AV_{DD} or V_{REF} at negative input• Supports four programmable propagation speeds for power saving• Supports wake up from Power-down by interrupt• Supports triggers for brake events and cycle-by-cycle control for PWM• Supports window compare mode and window latch mode.• Supports programmable hysteresis window: 0mV, 10mV, 20mV and 30mV
Operational Amplifier (OPA)	<ul style="list-style-type: none">• Three Operational Amplifiers with 0~AV_{DD} input voltage range.• OPA schmitt trigger buffer output used as the interrupt source of comparator.
Communication Interfaces	
Low-power UART	<ul style="list-style-type: none">• Six sets of UARTs with up to 17.45 MHz baud rate.• Auto-Baud Rate measurement and baud rate compensation function.• Supports low power UART (LPUART): baud rate clock from LXT(32.768 KHz) with 9600bps in Power-down mode even system clock is stopped.• 16-byte FIFOs with programmable level trigger• Auto flow control (nCTS and nRTS)• Supports IrDA (SIR) function• Supports LIN function on UART0 and UART1

- Supports RS-485 9-bit mode and direction control
- Supports nCTS, incoming data, Received Data FIFO reached threshold and RS-485 Address Match (AAD mode) wake-up function in idle mode.
- Supports hardware or software enables to program nRTS pin to control RS-485 transmission direction
- Supports wake-up function
- 8-bit receiver FIFO time-out detection function
- Supports break error, frame error, parity error and receive/transmit FIFO overflow detection function
- PDMA operation.

Smart Card Interface

- Three sets of ISO-7816-3 which are compliant with ISO-7816-3 T=0, T=1
- Supports full duplex UART function.
- 4-byte FIFOs with programmable level trigger
- Programmable guard time selection (11 ETU ~ 266 ETU)
- One 24-bit and two 8 bit time-out counters for Answer to Request (ATR) and waiting times processing
- Auto inverse convention function
- Stop clock level and clock stop (clock keep) function
- Transmitter and receiver error retry function
- Supports hardware activation, deactivation and warm reset sequence process
- Supports hardware auto deactivation sequence after card removal.

I²C

- Three sets of I²C devices with Master/Slave mode.
- Supports Standard mode (100 kbps), Fast mode (400 kbps) and Fast mode plus (1 Mbps)
- Supports 10 bits mode
- Programmable clocks allowing for versatile rate control
- Supports multiple address recognition (four slave address with mask option)
- Supports SMBus and PMBus
- Supports multi-address power-down wake-up function
- PDMA operation

SPI Master (SPI Flash)

- Maximum 32 MB external SPI Flash memory with standard (1-bit), dual (2-bit) and quad (4-bit) transfer mode with Up to 96 Mbit/s.
- 32 KB cache memory for enhancing program execution performance.
- 64-bit key length for code protection.
- DMA mode for code transfer between SPI Flash memory and SRAM.
- SPI Master function with 8-, 16-, 24-, and 32-bit length of transaction and burst mode operation, which can transmit/receive

data up to four successive transactions in one transfer.

- One set of SPI Quad controller with Master/Slave mode, up to 96 MHz at 2.7V~3.6V system voltage.
 - Supports Dual and Quad I/O Transfer mode
 - Supports one/two data channel half-duplex transfer
 - Supports receive-only mode
 - Configurable bit length of a transfer word from 8 to 32-bit
 - Provides separate 8-level depth transmit and receive FIFO buffers
 - Supports MSB first or LSB first transfer sequence
 - Supports the byte reorder function
 - Supports Byte or Word Suspend mode
 - Supports 3-wired, no slave select signal, bi-direction interface
 - PDMA operation.
-

- Up to four sets of SPI/I2S controllers with Master/Slave mode.
- SPI/I2S provides separate 4-level of 32-bit (or 8-level of 16-bit) transmit and receive FIFO buffers.

SPI

- SPI can communicate at up to 96 Mbit/s
- Configurable bit length of a transfer word from 8 to 32-bit.
- MSB first or LSB first transfer sequence.
- Byte reorder function.
- Supports Byte or Word Suspend mode.
- Supports one data channel half-duplex transfer.
- Supports receive-only mode.

I²S

- Supports mono and stereo audio data with 8-, 16-, 24- and 32-bit audio data sizes.
 - Supports PCM mode A, PCM mode B, I2S and MSB justified data format.
 - PDMA operation.
-

- One set of I2S interface with Master/Slave mode.
 - I2S audio sampling frequencies up to 192 kHz are supported.
 - Supports mono and stereo audio data with 8-, 16-, 24- and 32-bit word sizes.
 - Two 16-level FIFO data buffers, one for transmitting and the other for receiving.
 - Supports I2S protocols: Philips standard, MSB-justified, and LSB-justified data format.
 - Supports PCM protocols: PCM standard, MSB-justified, and LSB-justified data format.
 - PCM protocol supports TDM multi-channel transmission in one
-

audio sample; the number of data channel can be set as 2, 4, 6 or 8.

- PDMA operation.
- Two sets of USCI, configured as UART, SPI or I2C function.
- Supports single byte TX and RX buffer mode

UART

- Supports one transmit buffer and two receive buffers for data payload.
- Supports hardware auto flow control function and programmable flow control trigger level.
- 9-bit Data Transfer.
- Baud rate detection by built-in capture event of baud rate generator.
- Supports wake-up function.
- PDMA operation.

SPI

- Supports Master or Slave mode operation.
- Supports one transmit buffer and two receive buffer for data payload.
- Supports additional receive/transmit 16 entries FIFO for data payload.
- Configurable bit length of a transfer word from 4 to 16-bit (SPI Quad transmission only supports 8 to 16-bit of word length).
- Supports MSB first or LSB first transfer sequence.
- Supports Word Suspend function.
- Supports 3-wire, no slave select signal, bi-direction interface.
- Supports wake-up function: input slave select transition.
- PDMA operation.

I²C

- Supports master and slave device capability.
- Supports one transmit buffer and two receive buffer for data payload.
- Communication in standard mode (100 kbps), fast mode (up to 400 kbps), and Fast mode plus (1 Mbps).
- Supports 10-bit mode.
- Supports 10-bit bus time out capability.
- Supports bus monitor mode.
- Supports power-down wake-up by data toggle or address match.
- Supports multiple address recognition.
- Supports device address flag.
- Programmable setup/hold time.

Universal Serial Control Interface (USCI)

-
- Two sets of CAN 2.0B controllers.
 - Each supports 32 Message Objects; each Message Object has its

Secure Digital Host Controller (SDHC)

- own identifier mask.
- Programmable FIFO mode (concatenation of Message Object).
- Disabled Automatic Re-transmission mode for Time Triggered CAN applications.
- Supports power-down wake-up function.

External Bus Interface (EBI)

- Two sets of Secure Digital Host Controllers, compliant with SD Memory Card Specification Version 2.0.
- Supports 50 MHz to achieve 200 Mbps at 3.3V operation.
- Supports dedicated DMA master with Scatter-Gather function to accelerate the data transfer between system memory and SD/SDHC/SDIO card.
- Supports up to three memory banks with individual adjustment of timing parameter.
- Each bank supports dedicated external chip select pin with polarity control and up to 1 MB addressing space.
- 8-/16-bit data width.
- Supports byte write in 16-bit data width mode.
- Configurable idle cycle for different access condition: Idle of Write command finish (W2X) and Idle of Read-to-Read (R2R).
- Supports Address/Data multiplexed mode.
- Supports address bus and data bus separate mode.
- Supports LCD interface i80 mode.
- PDMA operation.

GPIO

- Supports four I/O modes: Quasi bi-direction, Push-Pull output, Open-Drain output and Input only with high impedance mode.
- Selectable TTL/Schmitt trigger input.
- Configured as interrupt source with edge/level trigger setting.
- Supports independent pull-up/pull-down control.
- Supports high driver and high sink current I/O.
- Supports software selectable slew rate control.
- Supports 5V-tolerance function except analog I/O. (Except PA.8 ~ 15; PB.0 ~ 15; PD.10 ~ 12; PF.2 ~ 5; All USB High Speed PIN; nReset.)

Control Interfaces**Quadrature Encoder Interface (QEI)**

- Two QEI phase inputs (QEI_A, QEI_B) and one Index input (QEI_INDEX).
- Supports 2/4 times free-counting mode and 2/4 compare-counting mode.
- Supports encoder pulse width measurement mode with ECAP.

Enhanced Capture (ECAP) Input Capture Timer/Counter

-
- Supports three input channels with independent capture counter hold register.
 - 24-bit Input Capture up-counting timer/counter supports captured events reset and/or reload capture counter.
 - Supports rising edge, falling edge and both edge detector options with noise filter in front of input ports.
 - Supports compare-match function.
-

Advanced Connectivity

USB 2.0 Full Speed OTG (On-The-Go)

- On-chip USB 2.0 full speed OTG transceiver.
- Compliant with USB OTG Supplement 2.0
- Configurable as host-only, device-only or ID-dependent

USB 2.0 Full Speed Host Controller

- Compliant with USB Revision 1.1 Specification.
- Compatible with OHCI (Open Host Controller Interface) Revision 1.0.
- Supports full-speed (12Mbps) and low-speed (1.5Mbps) USB devices.
- Supports Control, Bulk, Interrupt, Isochronous and Split transfers.
- Integrated a port routing logic to route full/low speed device to OHCI controller.
- Supports an integrated Root Hub.
- Supports port power control and port over current detection.
- Built-in DMA.

USB 2.0 Full Speed Device Controller

- Compliant with USB Revision 2.0 Specification.
 - Supports suspend function when no bus activity existing for 3 ms.
 - 12 configurable endpoints for configurable Isochronous, Bulk, Interrupt and Control transfer types.
 - 1024 bytes configurable RAM for endpoint buffer.
 - Remote wake-up capability.
-

USB 2.0 High Speed OTG (On-The-Go)

- On-chip USB 2.0 high speed OTG transceiver.
- Compliant with USB OTG Supplement 2.0.
- Configurable as host-only, device-only or ID-dependent.

USB 2.0 High Speed Host Controller

- Compliant with USB Revision 2.0 Specification.
- Compatible with EHCI (Enhanced Host Controller Interface) Revision 1.0.
- Compatible with OHCI (Open Host Controller Interface) Revision 1.0.

USB 2.0 High Speed with on-chip transceiver

- Supports high-speed (480Mbps), full-speed (12Mbps) and low-speed (1.5Mbps) USB devices.
- Integrated a port routing logic to route full/low speed device to OHCI controller.
- Supports an integrated Root Hub.
- Built-in DMA.

USB 2.0 High Speed Device Controller

- Compliant with USB Revision 2.0 Specification.
- Supports one dedicate control endpoint and 12 configurable endpoints; each can be Isochronous, Bulk or Interrupt and either IN or OUT direction.
- 4096 bytes configurable RAM for endpoint buffer and up to 1024 bytes maximum packet size.
- Three different operation modes of an in-endpoint: Auto Validation mode, Manual Validation mode and Fly mode.
- Suspend, resume and remote wake-up capability.
- Built-in DMA.

-
- IEEE Std. 802.3 CSMA/CD protocol.
 - Ethernet frame time stamping for IEEE Std. 1588 – 2002 protocol.
 - Supports both half and full duplex for 10 Mbps or 100 Mbps operation.
 - RMII (Reduced Media Independent Interface) and serial management interface (MDC/MDIO).

Ethernet MAC

- Pause and remote pause function for flow control.
- Long frame (more than 1518 bytes) and short frame (less than 64 bytes) reception.
- CAM function for Ethernet MAC address recognition.
- Supports Magic Packet recognition to wake system up from Power-down mode.
- Built-in DMA.

Cryptography Accelerator

Elliptic Curve Cryptography (ECC)

- Hardware ECC accelerator.
- Supports 192-bit and 256-bit key length.
- Supports both prime field GF(p) and binary field GF(2^m).
- Supports NIST P-192, P-224, P-256, P-384 and P-521 curve sizes.
- Supports NIST B-163, B-233, B-283, B-409 and B-571 curve sizes.
- Supports NIST K-163, K-233, K-283, K-409 and K-571 curve sizes.
- Supports point multiplication, addition and doubling operations in GF(p) and GF(2^m).
- Supports modulus division, multiplication, addition and subtraction operations in GF(p).

Advanced Encryption Standard (AES)

- Hardware AES accelerator.
- Supports 128-bit, 192-bit and 256-bit key length and key expander, and is compliant with FIPS 197.
- Supports ECB, CBC, CFB, OFB, CTR, CBC-CS1, CBC-CS2 and CBC-CS3 block cipher modes
- Compliant with NIST SP800-38A and addendum.

Data Encryption Standard (DES)

- Hardware DES accelerator.
- Supports ECB, CBC, CFB, OFB, and CTR block cipher mode.
- Compliant with FIPS 46-3.

Triple Data Encryption Standard (3DES)

- Hardware Triple DES accelerator.
- Supports two or three different keys in each round.
- Supports ECB, CBC, CFB, OFB, and CTR block cipher mode.
- Implemented based on X9.52 standard and compliant with FIPS SP 800-67.

Secure Hash Algorithm (SHA)

- Hardware SHA accelerator.
- Supports SHA-160, SHA-224, SHA-256, SHA-384 and SHA-512.
- Compliant with FIPS 180/180-2.

keyed-Hash Message Authentication Code (HMAC)

- Hardware HMAC accelerator.
- Supports HMAC-SHA-160, HMAC-SHA-224, HMAC-SHA-256, HMAC-SHA-384, and HMAC-SHA-512.
- Compliant with FIPS 180/180-2.

4.2 Pin Description

4.2.1 M481 Series Pin Description

MFP* = Multi-function pin. (Refer to section SYS_GPx_MFPL and SYS_GPx_MFPH)

PA.0 MFP0 means SYS_GPA_MFPL[3:0] = 0x0.

PA.9 MFP5 means SYS_GPA_MFPH[7:4] = 0x5.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
	48	1	PB.6	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH6	A	MFP1	EADC0 channel 6 analog input.
			EBI_nWRH	O	MFP2	EBI high byte write enable output pin
			USCI1_DAT1	I/O	MFP4	USCI1 data 1 pin.
			UART1_RXD	I	MFP6	UART1 data receiver input pin.
			SD1_CLK	O	MFP7	SD/SDIO1 clock output pin
			EBI_nCS1	O	MFP8	EBI chip select 1 output pin.
			BPWM1_CH5	I/O	MFP10	BPWM1 channel 5 output/capture input.
			EPWM1_BRAKE1	I	MFP11	EPWM1 Brake 1 input pin.
			EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
	1	2	INT4	I	MFP13	External interrupt 4 input pin.
			ACMP1_O	O	MFP15	Analog comparator 1 output pin.
			PB.5	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH5	A	MFP1	EADC0 channel 5 analog input.
			ACMP1_N	A	MFP1	Analog comparator 1 negative input pin.
			EBI_ADR0	O	MFP2	EBI address bus bit 0.
			SD0_DAT3	I/O	MFP3	SD/SDIO0 data line bit 3.
			SPI1_MISO	I/O	MFP5	SPI1 MISO (Master In, Slave Out) pin.
			I2C0_SCL	I/O	MFP6	I2C0 clock pin.
			UART5_TXD	O	MFP7	UART5 data transmitter output pin.
	2	3	USCI1_CTL0	I/O	MFP8	USCI1 control 0 pin.
			SC0_CLK	O	MFP9	Smart Card 0 clock pin.
			I2S0_BCLK	O	MFP10	I2S0 bit clock output pin.
			EPWM0_CH0	I/O	MFP11	EPWM0 channel 0 output/capture input.
			TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
			INT0	I	MFP15	External interrupt 0 input pin.
			PB.4	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH4	A	MFP1	EADC0 channel 4 analog input.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			ACMP1_P1	A	MFP1	Analog comparator 1 positive input 1 pin.
			EBI_ADR1	O	MFP2	EBI address bus bit 1.
			SD0_DAT2	I/O	MFP3	SD/SDIO0 data line bit 2.
			SPI1_MOSI	I/O	MFP5	SPI1 MOSI (Master Out, Slave In) pin.
			I2C0_SDA	I/O	MFP6	I2C0 data input/output pin.
			UART5_RXD	I	MFP7	UART5 data receiver input pin.
			USCI1_CTL1	I/O	MFP8	USCI1 control 1 pin.
			SC0_DAT	I/O	MFP9	Smart Card 0 data pin.
			I2S0_MCLK	O	MFP10	I2S0 master clock output pin.
			EPWM0_CH1	I/O	MFP11	EPWM0 channel 1 output/capture input.
			TM1	I/O	MFP14	Timer1 event counter input/toggle output pin.
			INT1	I	MFP15	External interrupt 1 input pin.
			PB.3	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH3	A	MFP1	EADC0 channel 3 analog input.
			ACMP0_N	A	MFP1	Analog comparator 0 negative input pin.
			EBI_ADR2	O	MFP2	EBI address bus bit 2.
			SD0_DAT1	I/O	MFP3	SD/SDIO0 data line bit 1.
			SPI1_CLK	I/O	MFP5	SPI1 serial clock pin.
			UART1_TXD	O	MFP6	UART1 data transmitter output pin.
			UART5_nRTS	O	MFP7	UART5 request to Send output pin.
			USCI1_DAT1	I/O	MFP8	USCI1 data 1 pin.
			SC0_RST	O	MFP9	Smart Card 0 reset pin.
			I2S0_DI	I	MFP10	I2S0 data input pin.
			EPWM0_CH2	I/O	MFP11	EPWM0 channel 2 output/capture input.
			TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
			INT2	I	MFP15	External interrupt 2 input pin.
			PB.2	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH2	A	MFP1	EADC0 channel 2 analog input.
			ACMP0_P1	A	MFP1	Analog comparator 0 positive input 1 pin.
			OPA0_O	A	MFP1	Operational amplifier 0 output pin.
			EBI_ADR3	O	MFP2	EBI address bus bit 3.
			SD0_DAT0	I/O	MFP3	SD/SDIO0 data line bit 0.
			SPI1_SS	I/O	MFP5	SPI1 slave select pin.
			UART1_RXD	I	MFP6	UART1 data receiver input pin.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			UART5_nCTS	I	MFP7	UART5 clear to Send input pin.
			USCI1_DAT0	I/O	MFP8	USCI1 data 0 pin.
			SC0_PWR	O	MFP9	Smart Card 0 power pin.
			I2S0_DO	O	MFP10	I2S0 data output pin.
			EPWM0_CH3	I/O	MFP11	EPWM0 channel 3 output/capture input.
			TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
			INT3	I	MFP15	External interrupt 3 input pin.
			PB.1	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH1	A	MFP1	EADC0 channel 1 analog input.
			OPA0_N	A	MFP1	Operational amplifier 0 negative input pin.
			EBI_ADR8	O	MFP2	EBI address bus bit 8.
			SD0_CLK	O	MFP3	SD/SDIO0 clock output pin
			SPI1_I2SMCLK	I/O	MFP5	SPI1 I2S master clock output pin
			SPI3_I2SMCLK	I/O	MFP6	SPI3 I2S master clock output pin
			UART2_TXD	O	MFP7	UART2 data transmitter output pin.
			USCI1_CLK	I/O	MFP8	USCI1 clock pin.
			I2C1_SCL	I/O	MFP9	I2C1 clock pin.
			I2S0_LRCK	O	MFP10	I2S0 left right channel clock output pin.
			EPWM0_CH4	I/O	MFP11	EPWM0 channel 4 output/capture input.
			EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
			EPWM0_BRAKE0	I	MFP13	EPWM0 Brake 0 input pin.
			PB.0	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH0	A	MFP1	EADC0 channel 0 analog input.
			OPA0_P	A	MFP1	Operational amplifier 0 positive input pin.
			EBI_ADR9	O	MFP2	EBI address bus bit 9.
			SD0_CMD	I/O	MFP3	SD/SDIO0 command/response pin
			UART2_RXD	I	MFP7	UART2 data receiver input pin.
			SPI0_I2SMCLK	I/O	MFP8	SPI0 I2S master clock output pin
			I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
			EPWM0_CH5	I/O	MFP11	EPWM0 channel 5 output/capture input.
			EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
			EPWM0_BRAKE1	I	MFP13	EPWM0 Brake 1 input pin.
			PA.11	I/O	MFP0	General purpose digital I/O pin.
			ACMP0_P0	A	MFP1	Analog comparator 0 positive input 0 pin.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			EBI_nRD	O	MFP2	EBI read enable output pin.
			SC2_PWR	O	MFP3	Smart Card 2 power pin.
			SPI2_SS	I/O	MFP4	SPI2 slave select pin.
			SD1_DAT3	I/O	MFP5	SD/SDIO1 data line bit 3.
			USCI0_CLK	I/O	MFP6	USCI0 clock pin.
			I2C2_SCL	I/O	MFP7	I2C2 clock pin.
			BPWM0_CH0	I/O	MFP9	BPWM0 channel 0 output/capture input.
			EPWM0_SYNC_OUT	O	MFP10	EPWM0 counter synchronous trigger output pin.
			TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
			DAC1_ST	I	MFP14	DAC1 external trigger input.
		8 9	PA.10	I/O	MFP0	General purpose digital I/O pin.
			ACMP1_P0	A	MFP1	Analog comparator 1 positive input 0 pin.
			OPA1_O	A	MFP1	Operational amplifier 1 output pin.
			EBI_nWR	O	MFP2	EBI write enable output pin.
			SC2_RST	O	MFP3	Smart Card 2 reset pin.
			SPI2_CLK	I/O	MFP4	SPI2 serial clock pin.
			SD1_DAT2	I/O	MFP5	SD/SDIO1 data line bit 2.
			USCI0_DAT0	I/O	MFP6	USCI0 data 0 pin.
			I2C2_SDA	I/O	MFP7	I2C2 data input/output pin.
			BPWM0_CH1	I/O	MFP9	BPWM0 channel 1 output/capture input.
			QE1_INDEX	I	MFP10	Quadrature encoder 1 index input
			ECAP0_IC0	I	MFP11	Enhanced capture unit 0 input 0 pin.
			TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
			DAC0_ST	I	MFP14	DAC0 external trigger input.
		9 10	PA.9	I/O	MFP0	General purpose digital I/O pin.
			OPA1_N	A	MFP1	Operational amplifier 1 negative input pin.
			EBI_MCLK	O	MFP2	EBI external clock output pin.
			SC2_DAT	I/O	MFP3	Smart Card 2 data pin.
			SPI2_MISO	I/O	MFP4	SPI2 MISO (Master In, Slave Out) pin.
			SD1_DAT1	I/O	MFP5	SD/SDIO1 data line bit 1.
			USCI0_DAT1	I/O	MFP6	USCI0 data 1 pin.
			UART1_TXD	O	MFP7	UART1 data transmitter output pin.
			BPWM0_CH2	I/O	MFP9	BPWM0 channel 2 output/capture input.
			QE1_A	I	MFP10	Quadrature encoder 1 phase A input

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description	
			ECAPO_IC1	I	MFP11	Enhanced capture unit 0 input 1 pin.	
			TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.	
	10	11	PA.8	I/O	MFP0	General purpose digital I/O pin.	
			OPA1_P	A	MFP1	Operational amplifier 1 positive input pin.	
			EBI_ALE	O	MFP2	EBI address latch enable output pin.	
			SC2_CLK	O	MFP3	Smart Card 2 clock pin.	
			SPI2_MOSI	I/O	MFP4	SPI2 MOSI (Master Out, Slave In) pin.	
			SD1_DAT0	I/O	MFP5	SD/SDIO1 data line bit 0.	
			USCI0_CTL1	I/O	MFP6	USCI0 control 1 pin.	
			UART1_RXD	I	MFP7	UART1 data receiver input pin.	
			BPWM0_CH3	I/O	MFP9	BPWM0 channel 3 output/capture input.	
			QEI1_B	I	MFP10	Quadrature encoder 1 phase B input	
			ECAPO_IC2	I	MFP11	Enhanced capture unit 0 input 2 pin.	
			TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.	
			INT4	I	MFP15	External interrupt 4 input pin.	
	12		PF.6	I/O	MFP0	General purpose digital I/O pin.	
			EBI_ADR19	O	MFP2	EBI address bus bit 19.	
			SC0_CLK	O	MFP3	Smart Card 0 clock pin.	
			I2S0_LRCK	O	MFP4	I2S0 left right channel clock output pin.	
			SPI0_MOSI	I/O	MFP5	SPI0 MOSI (Master Out, Slave In) pin.	
			UART4_RXD	I	MFP6	UART4 data receiver input pin.	
			EBI_nCS0	O	MFP7	EBI chip select 0 output pin.	
			TAMPER0	I/O	MFP10	TAMPER detector loop pin 0.	
		13	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.	
	7	11	PF.5	I/O	MFP0	General purpose digital I/O pin.	
			UART2_RXD	I	MFP2	UART2 data receiver input pin.	
			UART2_nCTS	I	MFP4	UART2 clear to Send input pin.	
			BPWM0_CH4	I/O	MFP8	BPWM0 channel 4 output/capture input.	
			EPWM0_SYNC_OUT	O	MFP9	EPWM0 counter synchronous trigger output pin.	
			X32_IN	I	MFP10	External 32.768 kHz crystal input pin.	
			EADC0_ST	I	MFP11	EADC0 external trigger input.	
	8	12	15	PF.4	I/O	MFP0	General purpose digital I/O pin.
				UART2_TXD	O	MFP2	UART2 data transmitter output pin.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			UART2_nRTS	O	MFP4	UART2 request to Send output pin.
			BPWM0_CH5	I/O	MFP8	BPWM0 channel 5 output/capture input.
			X32_OUT	O	MFP10	External 32.768 kHz crystal output pin.
9	13	16	PF.3	I/O	MFP0	General purpose digital I/O pin.
			EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
			UART0_TXD	O	MFP3	UART0 data transmitter output pin.
			I2C0_SCL	I/O	MFP4	I2C0 clock pin.
			XT1_IN	I	MFP10	External 4~24 MHz (high speed) crystal input pin.
			BPWM1_CH0	I/O	MFP11	BPWM1 channel 0 output/capture input.
10	14	17	PF.2	I/O	MFP0	General purpose digital I/O pin.
			EBI_nCS1	O	MFP2	EBI chip select 1 output pin.
			UART0_RXD	I	MFP3	UART0 data receiver input pin.
			I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
			QSPI0_CLK	I/O	MFP5	Quad SPI0 serial clock pin.
			XT1_OUT	O	MFP10	External 4~24 MHz (high speed) crystal output pin.
			BPWM1_CH1	I/O	MFP11	BPWM1 channel 1 output/capture input.
		18	PC.7	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
			SPI1_MISO	I/O	MFP4	SPI1 MISO (Master In, Slave Out) pin.
			UART4_TXD	O	MFP5	UART4 data transmitter output pin.
			SC2_PWR	O	MFP6	Smart Card 2 power pin.
			UART0_nCTS	I	MFP7	UART0 clear to Send input pin.
			I2C1_SMBAL	O	MFP8	I2C1 SMBus SMBALTER pin
			EPWM1_CH2	I/O	MFP11	EPWM1 channel 2 output/capture input.
			BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
			TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
		19	INT3	I	MFP15	External interrupt 3 input pin.
			PC.6	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD8	I/O	MFP2	EBI address/data bus bit 8.
			SPI1_MOSI	I/O	MFP4	SPI1 MOSI (Master Out, Slave In) pin.
			UART4_RXD	I	MFP5	UART4 data receiver input pin.
			SC2_RST	O	MFP6	Smart Card 2 reset pin.
			UART0_nRTS	O	MFP7	UART0 request to Send output pin.
			I2C1_SMBSUS	O	MFP8	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			EPWM1_CH3	I/O	MFP11	EPWM1 channel 3 output/capture input.
			BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
			TM1	I/O	MFP14	Timer1 event counter input/toggle output pin.
			INT2	I	MFP15	External interrupt 2 input pin.
	15	20	PA.7	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
			SPI1_CLK	I/O	MFP4	SPI1 serial clock pin.
			SC2_DAT	I/O	MFP6	Smart Card 2 data pin.
			UART0_TXD	O	MFP7	UART0 data transmitter output pin.
			I2C1_SCL	I/O	MFP8	I2C1 clock pin.
			EPWM1_CH4	I/O	MFP11	EPWM1 channel 4 output/capture input.
			BPWM1_CH2	I/O	MFP12	BPWM1 channel 2 output/capture input.
			ACMP0_WLAT	I	MFP13	Analog comparator 0 window latch input pin
			TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
			INT1	I	MFP15	External interrupt 1 input pin.
	16	21	PA.6	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
			SPI1_SS	I/O	MFP4	SPI1 slave select pin.
			SD1_nCD	I	MFP5	SD/SDIO1 card detect input pin
			SC2_CLK	O	MFP6	Smart Card 2 clock pin.
			UART0_RXD	I	MFP7	UART0 data receiver input pin.
			I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.
			EPWM1_CH5	I/O	MFP11	EPWM1 channel 5 output/capture input.
			BPWM1_CH3	I/O	MFP12	BPWM1 channel 3 output/capture input.
			ACMP1_WLAT	I	MFP13	Analog comparator 1 window latch input pin
			TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
			INT0	I	MFP15	External interrupt 0 input pin.
	22	V _{ss}		P	MFP0	Ground pin for digital circuit.
	23	V _{DD}		P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
	24	LDO_CAP		A	MFP0	LDO output pin.
	17	25	PA.5	I/O	MFP0	General purpose digital I/O pin.
			SPIM_D2	I/O	MFP2	SPIM data 2 pin for Quad Mode I/O.
			QSPI0_MISO1	I/O	MFP3	Quad SPI0 MISO1 (Master In, Slave Out) pin.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			SPI1_I2SMCLK	I/O	MFP4	SPI1 I2S master clock output pin
			SD1_CMD	I/O	MFP5	SD/SDIO1 command/response pin
			SC2_nCD	I	MFP6	Smart Card 2 card detect pin.
			UART0_nCTS	I	MFP7	UART0 clear to Send input pin.
			UART5_TXD	O	MFP8	UART5 data transmitter output pin.
			I2C0_SCL	I/O	MFP9	I2C0 clock pin.
			BPWM0_CH5	I/O	MFP12	BPWM0 channel 5 output/capture input.
			EPWM0_CH0	I/O	MFP13	EPWM0 channel 0 output/capture input.
			QEIO_INDEX	I	MFP14	Quadrature encoder 0 index input
		18	PA.4	I/O	MFP0	General purpose digital I/O pin.
			SPIM_D3	I/O	MFP2	SPIM data 3 pin for Quad Mode I/O.
			QSPI0_MOSI1	I/O	MFP3	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
			SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
			SD1_CLK	O	MFP5	SD/SDIO1 clock output pin
			SC0_nCD	I	MFP6	Smart Card 0 card detect pin.
			UART0_nRTS	O	MFP7	UART0 request to Send output pin.
			UART5_RXD	I	MFP8	UART5 data receiver input pin.
			I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.
			BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.
			EPWM0_CH1	I/O	MFP13	EPWM0 channel 1 output/capture input.
			QEIO_A	I	MFP14	Quadrature encoder 0 phase A input
		19	PA.3	I/O	MFP0	General purpose digital I/O pin.
			SPIM_SS	I/O	MFP2	SPIM slave select pin.
			QSPI0_SS	I/O	MFP3	Quad SPI0 slave select pin.
			SPI0_SS	I/O	MFP4	SPI0 slave select pin.
			SD1_DAT3	I/O	MFP5	SD/SDIO1 data line bit 3.
			SC0_PWR	O	MFP6	Smart Card 0 power pin.
			UART4_TXD	O	MFP7	UART4 data transmitter output pin.
			UART1_TXD	O	MFP8	UART1 data transmitter output pin.
			I2C1_SCL	I/O	MFP9	I2C1 clock pin.
			BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.
			EPWM0_CH2	I/O	MFP13	EPWM0 channel 2 output/capture input.
			QEIO_B	I	MFP14	Quadrature encoder 0 phase B input
12	20	28	PA.2	I/O	MFP0	General purpose digital I/O pin.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			SPIM_CLK	I/O	MFP2	SPIM serial clock pin.
			QSPI0_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
			SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
			SD1_DAT2	I/O	MFP5	SD/SDIO1 data line bit 2.
			SC0_RST	O	MFP6	Smart Card 0 reset pin.
			UART4_RXD	I	MFP7	UART4 data receiver input pin.
			UART1_RXD	I	MFP8	UART1 data receiver input pin.
			I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
			BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
			EPWM0_CH3	I/O	MFP13	EPWM0 channel 3 output/capture input.
			PA.1	I/O	MFP0	General purpose digital I/O pin.
			SPIM_MISO	I/O	MFP2	SPIM MISO (Master In, Slave Out) pin.
			QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
			SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
			SD1_DAT1	I/O	MFP5	SD/SDIO1 data line bit 1.
			SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
			UART0_TXD	O	MFP7	UART0 data transmitter output pin.
			UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
			I2C2_SCL	I/O	MFP9	I2C2 clock pin.
			BPWM0_CH1	I/O	MFP12	BPWM0 channel 1 output/capture input.
			EPWM0_CH4	I/O	MFP13	EPWM0 channel 4 output/capture input.
			DAC1_ST	I	MFP15	DAC1 external trigger input.
			PA.0	I/O	MFP0	General purpose digital I/O pin.
			SPIM_MOSI	I/O	MFP2	SPIM MOSI (Master Out, Slave In) pin.
			QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
			SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
			SD1_DAT0	I/O	MFP5	SD/SDIO1 data line bit 0.
			SC0_CLK	O	MFP6	Smart Card 0 clock pin.
			UART0_RXD	I	MFP7	UART0 data receiver input pin.
			UART1_nRTS	O	MFP8	UART1 request to Send output pin.
			I2C2_SDA	I/O	MFP9	I2C2 data input/output pin.
			BPWM0_CH0	I/O	MFP12	BPWM0 channel 0 output/capture input.
			EPWM0_CH5	I/O	MFP13	EPWM0 channel 5 output/capture input.
			DAC0_ST	I	MFP15	DAC0 external trigger input.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
15	23	31	V _{DDIO}	P	MFP0	Power supply for PA.0~PA.5.
16	24	32	nRESET	I	MFP0	External reset input: active LOW, with an internal pull-up. Set this pin low reset to initial state.
17	25	33	PF.0	I/O	MFP0	General purpose digital I/O pin.
			UART1_TXD	O	MFP2	UART1 data transmitter output pin.
			I2C1_SCL	I/O	MFP3	I2C1 clock pin.
			BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
			ICE_DAT	O	MFP14	Serial wired debugger data pin.
18	26	34	PF.1	I/O	MFP0	General purpose digital I/O pin.
			UART1_RXD	I	MFP2	UART1 data receiver input pin.
			I2C1_SDA	I/O	MFP3	I2C1 data input/output pin.
			BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
			ICE_CLK	I	MFP14	Serial wired debugger clock pin.
27	35	PC.5	I/O	MFP0	General purpose digital I/O pin.	
		EBI_AD5	I/O	MFP2	EBI address/data bus bit 5.	
		SPIM_D2	I/O	MFP3	SPIM data 2 pin for Quad Mode I/O.	
		QSPI0_MISO1	I/O	MFP4	Quad SPI0 MISO1 (Master In, Slave Out) pin.	
		UART2_TXD	O	MFP8	UART2 data transmitter output pin.	
		I2C1_SCL	I/O	MFP9	I2C1 clock pin.	
		UART4_TXD	O	MFP11	UART4 data transmitter output pin.	
		EPWM1_CH0	I/O	MFP12	EPWM1 channel 0 output/capture input.	
28	36	PC.4	I/O	MFP0	General purpose digital I/O pin.	
		EBI_AD4	I/O	MFP2	EBI address/data bus bit 4.	
		SPIM_D3	I/O	MFP3	SPIM data 3 pin for Quad Mode I/O.	
		QSPI0_MOSI1	I/O	MFP4	Quad SPI0 MOSI1 (Master Out, Slave In) pin.	
		SC1_nCD	I	MFP5	Smart Card 1 card detect pin.	
		I2S0_BCLK	O	MFP6	I2S0 bit clock output pin.	
		SPI1_I2SMCLK	I/O	MFP7	SPI1 I2S master clock output pin	
		UART2_RXD	I	MFP8	UART2 data receiver input pin.	
		I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.	
		UART4_RXD	I	MFP11	UART4 data receiver input pin.	
	29	37	EPWM1_CH1	I/O	MFP12	EPWM1 channel 1 output/capture input.
			PC.3	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			SPIM_SS	I/O	MFP3	SPIM slave select pin.
			QSPI0_SS	I/O	MFP4	Quad SPI0 slave select pin.
			SC1_PWR	O	MFP5	Smart Card 1 power pin.
			I2S0_MCLK	O	MFP6	I2S0 master clock output pin.
			SPI1_MISO	I/O	MFP7	SPI1 MISO (Master In, Slave Out) pin.
			UART2_nRTS	O	MFP8	UART2 request to Send output pin.
			I2C0_SMBAL	O	MFP9	I2C0 SMBus SMBALTER pin
			UART3_TXD	O	MFP11	UART3 data transmitter output pin.
			EPWM1_CH2	I/O	MFP12	EPWM1 channel 2 output/capture input.
		30	PC.2	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
			SPIM_CLK	I/O	MFP3	SPIM serial clock pin.
			QSPI0_CLK	I/O	MFP4	Quad SPI0 serial clock pin.
			SC1_RST	O	MFP5	Smart Card 1 reset pin.
			I2S0_DI	I	MFP6	I2S0 data input pin.
			SPI1_MOSI	I/O	MFP7	SPI1 MOSI (Master Out, Slave In) pin.
			UART2_nCTS	I	MFP8	UART2 clear to Send input pin.
			I2C0_SMBSUS	O	MFP9	I2C0 SMBus SMBSUS pin (PMBus CONTROL pin)
			UART3_RXD	I	MFP11	UART3 data receiver input pin.
			EPWM1_CH3	I/O	MFP12	EPWM1 channel 3 output/capture input.
		31	PC.1	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.
			SPIM_MISO	I/O	MFP3	SPIM MISO (Master In, Slave Out) pin.
			QSPI0_MISO0	I/O	MFP4	Quad SPI0 MISO0 (Master In, Slave Out) pin.
			SC1_DAT	I/O	MFP5	Smart Card 1 data pin.
			I2S0_DO	O	MFP6	I2S0 data output pin.
			SPI1_CLK	I/O	MFP7	SPI1 serial clock pin.
			UART2_TXD	O	MFP8	UART2 data transmitter output pin.
			I2C0_SCL	I/O	MFP9	I2C0 clock pin.
			EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
			ACMP0_O	O	MFP14	Analog comparator 0 output pin.
		40	PC.0	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD0	I/O	MFP2	EBI address/data bus bit 0.
			SPIM_MOSI	I/O	MFP3	SPIM MOSI (Master Out, Slave In) pin.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			QSPI0_MOSI0	I/O	MFP4	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
			SC1_CLK	O	MFP5	Smart Card 1 clock pin.
			I2S0_LRCK	O	MFP6	I2S0 left right channel clock output pin.
			SPI1_SS	I/O	MFP7	SPI1 slave select pin.
			UART2_RXD	I	MFP8	UART2 data receiver input pin.
			I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.
			EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
			ACMP1_O	O	MFP14	Analog comparator 1 output pin.
		41	PD.3	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
			USCI0_CTL1	I/O	MFP3	USCI0 control 1 pin.
			SPI0_SS	I/O	MFP4	SPI0 slave select pin.
			UART3_nRTS	O	MFP5	UART3 request to Send output pin.
			USCI1_CTL0	I/O	MFP6	USCI1 control 0 pin.
			SC2_PWR	O	MFP7	Smart Card 2 power pin.
			SC1_nCD	I	MFP8	Smart Card 1 card detect pin.
			UART0_TXD	O	MFP9	UART0 data transmitter output pin.
		42	PD.2	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
			USCI0_DAT1	I/O	MFP3	USCI0 data 1 pin.
			SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
			UART3_nCTS	I	MFP5	UART3 clear to Send input pin.
			SC2_RST	O	MFP7	Smart Card 2 reset pin.
			UART0_RXD	I	MFP9	UART0 data receiver input pin.
		43	PD.1	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
			USCI0_DAT0	I/O	MFP3	USCI0 data 0 pin.
			SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
			UART3_TXD	O	MFP5	UART3 data transmitter output pin.
			I2C2_SCL	I/O	MFP6	I2C2 clock pin.
			SC2_DAT	I/O	MFP7	Smart Card 2 data pin.
		44	PD.0	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
			USCI0_CLK	I/O	MFP3	USCI0 clock pin.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
			UART3_RXD	I	MFP5	UART3 data receiver input pin.
			I2C2_SDA	I/O	MFP6	I2C2 data input/output pin.
			SC2_CLK	O	MFP7	Smart Card 2 clock pin.
			TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
21	33	45	PA.12	I/O	MFP0	General purpose digital I/O pin.
			I2S0_BCLK	O	MFP2	I2S0 bit clock output pin.
			UART4_TXD	O	MFP3	UART4 data transmitter output pin.
			I2C1_SCL	I/O	MFP4	I2C1 clock pin.
			SPI2_SS	I/O	MFP5	SPI2 slave select pin.
			SC2_PWR	O	MFP7	Smart Card 2 power pin.
			BPWM1_CH2	I/O	MFP11	BPWM1 channel 2 output/capture input.
			QEI1_INDEX	I	MFP12	Quadrature encoder 1 index input
22	34	46	PA.13	I/O	MFP0	General purpose digital I/O pin.
			I2S0_MCLK	O	MFP2	I2S0 master clock output pin.
			UART4_RXD	I	MFP3	UART4 data receiver input pin.
			I2C1_SDA	I/O	MFP4	I2C1 data input/output pin.
			SPI2_CLK	I/O	MFP5	SPI2 serial clock pin.
			SC2_RST	O	MFP7	Smart Card 2 reset pin.
			BPWM1_CH3	I/O	MFP11	BPWM1 channel 3 output/capture input.
			QEI1_A	I	MFP12	Quadrature encoder 1 phase A input
23	35	47	PA.14	I/O	MFP0	General purpose digital I/O pin.
			I2S0_DI	I	MFP2	I2S0 data input pin.
			UART0_TXD	O	MFP3	UART0 data transmitter output pin.
			SPI2_MISO	I/O	MFP5	SPI2 MISO (Master In, Slave Out) pin.
			I2C2_SCL	I/O	MFP6	I2C2 clock pin.
			SC2_DAT	I/O	MFP7	Smart Card 2 data pin.
			BPWM1_CH4	I/O	MFP11	BPWM1 channel 4 output/capture input.
			QEI1_B	I	MFP12	Quadrature encoder 1 phase B input
24	36	48	PA.15	I/O	MFP0	General purpose digital I/O pin.
			I2S0_DO	O	MFP2	I2S0 data output pin.
			UART0_RXD	I	MFP3	UART0 data receiver input pin.
			SPI2_MOSI	I/O	MFP5	SPI2 MOSI (Master Out, Slave In) pin.
			I2C2_SDA	I/O	MFP6	I2C2 data input/output pin.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			SC2_CLK	O	MFP7	Smart Card 2 clock pin.
			BPWM1_CH5	I/O	MFP11	BPWM1 channel 5 output/capture input.
			EPWM0_SYNC_IN	I	MFP12	EPWM0 counter synchronous trigger input pin.
25	37	49	V _{ss}	P	MFP0	Ground pin for digital circuit.
26	38	50	LDO_CAP	A	MFP0	LDO output pin.
27	39	51	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
			PC.14	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
			SC1_nCD	I	MFP3	Smart Card 1 card detect pin.
			SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
			USCI0_CTL0	I/O	MFP5	USCI0 control 0 pin.
			QSPI0_CLK	I/O	MFP6	Quad SPI0 serial clock pin.
			EPWM0_SYNC_IN	I	MFP11	EPWM0 counter synchronous trigger input pin.
			TM1	I/O	MFP13	Timer1 event counter input/toggle output pin.
28			PB.15	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH15	A	MFP1	EADC0 channel 15 analog input.
			EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
			SC1_PWR	O	MFP3	Smart Card 1 power pin.
			SPI0_SS	I/O	MFP4	SPI0 slave select pin.
			USCI0_CTL1	I/O	MFP5	USCI0 control 1 pin.
			UART0_nCTS	I	MFP6	UART0 clear to Send input pin.
			UART3_TXD	O	MFP7	UART3 data transmitter output pin.
			I2C2_SMBAL	O	MFP8	I2C2 SMBus SMBALTER pin
			EPWM1_CH0	I/O	MFP11	EPWM1 channel 0 output/capture input.
			TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
29			PB.14	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH14	A	MFP1	EADC0 channel 14 analog input.
			EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
			SC1_RST	O	MFP3	Smart Card 1 reset pin.
			SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
			USCI0_DAT1	I/O	MFP5	USCI0 data 1 pin.
			UART0_nRTS	O	MFP6	UART0 request to Send output pin.
			UART3_RXD	I	MFP7	UART3 data receiver input pin.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			I2C2_SMBSUS	O	MFP8	I2C2 SMBus SMBSUS pin (PMBus CONTROL pin)
			EPWM1_CH1	I/O	MFP11	EPWM1 channel 1 output/capture input.
			TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
			CLKO	O	MFP14	Clock Out
			PB.13	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH13	A	MFP1	EADC0 channel 13 analog input.
			DAC1_OUT	A	MFP1	DAC1 channel analog output.
			ACMP0_P3	A	MFP1	Analog comparator 0 positive input 3 pin.
			ACMP1_P3	A	MFP1	Analog comparator 1 positive input 3 pin.
			EBI_AD14	I/O	MFP2	EBI address/data bus bit 14.
			SC1_DAT	I/O	MFP3	Smart Card 1 data pin.
			SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
			USCI0_DAT0	I/O	MFP5	USCI0 data 0 pin.
			UART0_TXD	O	MFP6	UART0 data transmitter output pin.
			UART3_nRTS	O	MFP7	UART3 request to Send output pin.
			I2C2_SCL	I/O	MFP8	I2C2 clock pin.
			EPWM1_CH2	I/O	MFP11	EPWM1 channel 2 output/capture input.
			TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.
			PB.12	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH12	A	MFP1	EADC0 channel 12 analog input.
			DAC0_OUT	A	MFP1	DAC0 channel analog output.
			ACMP0_P2	A	MFP1	Analog comparator 0 positive input 2 pin.
			ACMP1_P2	A	MFP1	Analog comparator 1 positive input 2 pin.
			EBI_AD15	I/O	MFP2	EBI address/data bus bit 15.
			SC1_CLK	O	MFP3	Smart Card 1 clock pin.
			SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
			USCI0_CLK	I/O	MFP5	USCI0 clock pin.
			UART0_RXD	I	MFP6	UART0 data receiver input pin.
			UART3_nCTS	I	MFP7	UART3 clear to Send input pin.
			I2C2_SDA	I/O	MFP8	I2C2 data input/output pin.
			SD0_nCD	I	MFP9	SD/SDIO0 card detect input pin
			EPWM1_CH3	I/O	MFP11	EPWM1 channel 3 output/capture input.
			TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
32	45	57	AV _{DD}	P	MFP0	Power supply for internal analog circuit.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
		58	V _{REF}	A	MFP0	ADC reference voltage input. Note: This pin needs to be connected with a 1uF capacitor.
	46	59	A _{VSS}	P	MFP0	Ground pin for analog circuit.
		60	PB.11	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH11	A	MFP1	EADC0 channel 11 analog input.
			EBI_ADR16	O	MFP2	EBI address bus bit 16.
			UART0_nCTS	I	MFP5	UART0 clear to Send input pin.
			UART4_TXD	O	MFP6	UART4 data transmitter output pin.
			I2C1_SCL	I/O	MFP7	I2C1 clock pin.
			SPI0_I2SMCLK	I/O	MFP9	SPI0 I2S master clock output pin
			BPWM1_CH0	I/O	MFP10	BPWM1 channel 0 output/capture input.
			SPI3_CLK	I/O	MFP11	SPI3 serial clock pin.
		61	PB.10	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH10	A	MFP1	EADC0 channel 10 analog input.
			EBI_ADR17	O	MFP2	EBI address bus bit 17.
			USCI1_CTL0	I/O	MFP4	USCI1 control 0 pin.
			UART0_nRTS	O	MFP5	UART0 request to Send output pin.
			UART4_RXD	I	MFP6	UART4 data receiver input pin.
			I2C1_SDA	I/O	MFP7	I2C1 data input/output pin.
			BPWM1_CH1	I/O	MFP10	BPWM1 channel 1 output/capture input.
			SPI3_SS	I/O	MFP11	SPI3 slave select pin.
		62	PB.9	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH9	A	MFP1	EADC0 channel 9 analog input.
			EBI_ADR18	O	MFP2	EBI address bus bit 18.
			USCI1_CTL1	I/O	MFP4	USCI1 control 1 pin.
			UART0_TXD	O	MFP5	UART0 data transmitter output pin.
			UART1_nCTS	I	MFP6	UART1 clear to Send input pin.
			I2C1_SMBAL	O	MFP7	I2C1 SMBus SMBALTER pin
			BPWM1_CH2	I/O	MFP10	BPWM1 channel 2 output/capture input.
			SPI3_MISO	I/O	MFP11	SPI3 MISO (Master In, Slave Out) pin.
		63	INT7	I	MFP13	External interrupt 7 input pin.
			PB.8	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH8	A	MFP1	EADC0 channel 8 analog input.
			EBI_ADR19	O	MFP2	EBI address bus bit 19.

32 Pin	48 Pin	64 Pin	Pin Name	Type	MFP	Description
			USCI1_CLK	I/O	MFP4	USCI1 clock pin.
			UART0_RXD	I	MFP5	UART0 data receiver input pin.
			UART1_nRTS	O	MFP6	UART1 request to Send output pin.
			I2C1_SMBSUS	O	MFP7	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
			BPWM1_CH3	I/O	MFP10	BPWM1 channel 3 output/capture input.
			SPI3_MOSI	I/O	MFP11	SPI3 MOSI (Master Out, Slave In) pin.
			INT6	I	MFP13	External interrupt 6 input pin.
	47	64	PB.7	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH7	A	MFP1	EADC0 channel 7 analog input.
			EBI_nWRL	O	MFP2	EBI low byte write enable output pin.
			USCI1_DAT0	I/O	MFP4	USCI1 data 0 pin.
			UART1_TXD	O	MFP6	UART1 data transmitter output pin.
			SD1_CMD	I/O	MFP7	SD/SDIO1 command/response pin
			EBI_nCS0	O	MFP8	EBI chip select 0 output pin.
			BPWM1_CH4	I/O	MFP10	BPWM1 channel 4 output/capture input.
			EPWM1_BRAKE0	I	MFP11	EPWM1 Brake 0 input pin.
			EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
			INT5	I	MFP13	External interrupt 5 input pin.
			ACMP0_O	O	MFP15	Analog comparator 0 output pin.

4.2.2 M482 Series Pin Description

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
1	1	2	1	PB.5	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH5	A	MFP1	EADC0 channel 5 analog input.
				ACMP1_N	A	MFP1	Analog comparator 1 negative input pin.
				EBI_ADR0	O	MFP2	EBI address bus bit 0.
				SD0_DAT3	I/O	MFP3	SD/SDIO0 data line bit 3.
				SPI1_MISO	I/O	MFP5	SPI1 MISO (Master In, Slave Out) pin.
				I2C0_SCL	I/O	MFP6	I2C0 clock pin.
				UART5_TXD	O	MFP7	UART5 data transmitter output pin.
				USCI1_CTL0	I/O	MFP8	USCI1 control 0 pin.
				SC0_CLK	O	MFP9	Smart Card 0 clock pin.
				I2S0_BCLK	O	MFP10	I2S0 bit clock output pin.
				EPWM0_CH0	I/O	MFP11	EPWM0 channel 0 output/capture input.
				TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
				INT0	I	MFP15	External interrupt 0 input pin.
2	2	3	2	PB.4	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH4	A	MFP1	EADC0 channel 4 analog input.
				ACMP1_P1	A	MFP1	Analog comparator 1 positive input 1 pin.
				EBI_ADR1	O	MFP2	EBI address bus bit 1.
				SD0_DAT2	I/O	MFP3	SD/SDIO0 data line bit 2.
				SPI1_MOSI	I/O	MFP5	SPI1 MOSI (Master Out, Slave In) pin.
				I2C0_SDA	I/O	MFP6	I2C0 data input/output pin.
				UART5_RXD	I	MFP7	UART5 data receiver input pin.
				USCI1_CTL1	I/O	MFP8	USCI1 control 1 pin.
				SC0_DAT	I/O	MFP9	Smart Card 0 data pin.
				I2S0_MCLK	O	MFP10	I2S0 master clock output pin.
				EPWM0_CH1	I/O	MFP11	EPWM0 channel 1 output/capture input.
				TM1	I/O	MFP14	Timer1 event counter input/toggle output pin.
				INT1	I	MFP15	External interrupt 1 input pin.
3	3	4	3	PB.3	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH3	A	MFP1	EADC0 channel 3 analog input.
				ACMP0_N	A	MFP1	Analog comparator 0 negative input pin.
				EBI_ADR2	O	MFP2	EBI address bus bit 2.
				SD0_DAT1	I/O	MFP3	SD/SDIO0 data line bit 1.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
4 4 5 4	5	5	4	SPI1_CLK	I/O	MFP5	SPI1 serial clock pin.
				UART1_TXD	O	MFP6	UART1 data transmitter output pin.
				UART5_nRTS	O	MFP7	UART5 request to Send output pin.
				USCI1_DAT1	I/O	MFP8	USCI1 data 1 pin.
				SC0_RST	O	MFP9	Smart Card 0 reset pin.
				I2S0_DI	I	MFP10	I2S0 data input pin.
				EPWM0_CH2	I/O	MFP11	EPWM0 channel 2 output/capture input.
				TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
				INT2	I	MFP15	External interrupt 2 input pin.
				PB.2	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH2	A	MFP1	EADC0 channel 2 analog input.

					TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
					INT0	I	MFP15	External interrupt 0 input pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
		22	52	V _{SS}	P	MFP0	Ground pin for digital circuit.
		23	53	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
		24	54	LDO_CAP	A	MFP0	LDO output pin.
17	25	55	PA.5	I/O	MFP0	General purpose digital I/O pin.	
			SPIM_D2	I/O	MFP2	SPIM data 2 pin for Quad Mode I/O.	
			QSPI0_MISO1	I/O	MFP3	Quad SPI0 MISO1 (Master In, Slave Out) pin.	
			SPI1_I2SMCLK	I/O	MFP4	SPI1 I2S master clock output pin	
			SD1_CMD	I/O	MFP5	SD/SDIO1 command/response pin	
			SC2_nCD	I	MFP6	Smart Card 2 card detect pin.	
			UART0_nCTS	I	MFP7	UART0 clear to Send input pin.	
			UART5_TXD	O	MFP8	UART5 data transmitter output pin.	
			I2C0_SCL	I/O	MFP9	I2C0 clock pin.	
			CAN0_TXD	O	MFP10	CAN0 bus transmitter output.	
			BPWM0_CH5	I/O	MFP12	BPWM0 channel 5 output/capture input.	
			EPWM0_CH0	I/O	MFP13	EPWM0 channel 0 output/capture input.	
18	26	56	PA.4	I/O	MFP0	General purpose digital I/O pin.	
			SPIM_D3	I/O	MFP2	SPIM data 3 pin for Quad Mode I/O.	
			QSPI0_MOSI1	I/O	MFP3	Quad SPI0 MOSI1 (Master Out, Slave In) pin.	
			SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin	
			SD1_CLK	O	MFP5	SD/SDIO1 clock output pin	
			SC0_nCD	I	MFP6	Smart Card 0 card detect pin.	
			UART0_nRTS	O	MFP7	UART0 request to Send output pin.	
			UART5_RXD	I	MFP8	UART5 data receiver input pin.	
			I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.	
			CAN0_RXD	I	MFP10	CAN0 bus receiver input.	
			BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.	
			EPWM0_CH1	I/O	MFP13	EPWM0 channel 1 output/capture input.	
11	19	27	57	PA.3	I/O	MFP0	General purpose digital I/O pin.
				SPIM_SS	I/O	MFP2	SPIM slave select pin.
				QSPI0_SS	I/O	MFP3	Quad SPI0 slave select pin.
				SPI0_SS	I/O	MFP4	SPI0 slave select pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				SD1_DAT3	I/O	MFP5	SD/SDIO1 data line bit 3.
				SC0_PWR	O	MFP6	Smart Card 0 power pin.
				UART4_TXD	O	MFP7	UART4 data transmitter output pin.
				UART1_TXD	O	MFP8	UART1 data transmitter output pin.
				I2C1_SCL	I/O	MFP9	I2C1 clock pin.
				BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.
				EPWM0_CH2	I/O	MFP13	EPWM0 channel 2 output/capture input.
				QEI0_B	I	MFP14	Quadrature encoder 0 phase B input
12	20	28	58	PA.2	I/O	MFP0	General purpose digital I/O pin.
				SPIM_CLK	I/O	MFP2	SPIM serial clock pin.
				QSPI0_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
				SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
				SD1_DAT2	I/O	MFP5	SD/SDIO1 data line bit 2.
				SC0_RST	O	MFP6	Smart Card 0 reset pin.
				UART4_RXD	I	MFP7	UART4 data receiver input pin.
				UART1_RXD	I	MFP8	UART1 data receiver input pin.
				I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
				BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
				EPWM0_CH3	I/O	MFP13	EPWM0 channel 3 output/capture input.
13	21	29	59	PA.1	I/O	MFP0	General purpose digital I/O pin.
				SPIM_MISO	I/O	MFP2	SPIM MISO (Master In, Slave Out) pin.
				QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
				SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
				SD1_DAT1	I/O	MFP5	SD/SDIO1 data line bit 1.
				SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
				UART0_TXD	O	MFP7	UART0 data transmitter output pin.
				UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
				I2C2_SCL	I/O	MFP9	I2C2 clock pin.
				BPWM0_CH1	I/O	MFP12	BPWM0 channel 1 output/capture input.
				EPWM0_CH4	I/O	MFP13	EPWM0 channel 4 output/capture input.
				DAC1_ST	I	MFP15	DAC1 external trigger input.
14	22	30	60	PA.0	I/O	MFP0	General purpose digital I/O pin.
				SPIM_MOSI	I/O	MFP2	SPIM MOSI (Master Out, Slave In) pin.
				QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
				SD1_DAT0	I/O	MFP5	SD/SDIO1 data line bit 0.
				SC0_CLK	O	MFP6	Smart Card 0 clock pin.
				UART0_RXD	I	MFP7	UART0 data receiver input pin.
				UART1_nRTS	O	MFP8	UART1 request to Send output pin.
				I2C2_SDA	I/O	MFP9	I2C2 data input/output pin.
				BPWM0_CH0	I/O	MFP12	BPWM0 channel 0 output/capture input.
				EPWM0_CH5	I/O	MFP13	EPWM0 channel 5 output/capture input.
				DAC0_ST	I	MFP15	DAC0 external trigger input.
15	23	31	61	V _{DDIO}	P	MFP0	Power supply for PA.0~PA.5.
			62	PE.14	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD8	I/O	MFP2	EBI address/data bus bit 8.
				UART2_TXD	O	MFP3	UART2 data transmitter output pin.
				CAN0_TXD	O	MFP4	CAN0 bus transmitter output.
				SD1_nCD	I	MFP5	SD/SDIO1 card detect input pin
			63	PE.15	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
				UART2_RXD	I	MFP3	UART2 data receiver input pin.
				CAN0_RXD	I	MFP4	CAN0 bus receiver input.
16	24	32	64	nRESET	I	MFP0	External reset input: active LOW, with an internal pull-up. Set this pin low reset to initial state.
			65	PF.0	I/O	MFP0	General purpose digital I/O pin.
				UART1_TXD	O	MFP2	UART1 data transmitter output pin.
				I2C1_SCL	I/O	MFP3	I2C1 clock pin.
				BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
				ICE_DAT	O	MFP14	Serial wired debugger data pin.
			66	PF.1	I/O	MFP0	General purpose digital I/O pin.
				UART1_RXD	I	MFP2	UART1 data receiver input pin.
				I2C1_SDA	I/O	MFP3	I2C1 data input/output pin.
				BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
				ICE_CLK	I	MFP14	Serial wired debugger clock pin.
			67	PD.9	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
				I2C2_SCL	I/O	MFP3	I2C2 clock pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				UART2_nCTS	I	MFP4	UART2 clear to Send input pin.
		68		PD.8	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
				I2C2_SDA	I/O	MFP3	I2C2 data input/output pin.
				UART2_nRTS	O	MFP4	UART2 request to Send output pin.
	27	35	69	PC.5	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD5	I/O	MFP2	EBI address/data bus bit 5.
				SPIM_D2	I/O	MFP3	SPIM data 2 pin for Quad Mode I/O.
				QSPI0_MISO1	I/O	MFP4	Quad SPI0 MISO1 (Master In, Slave Out) pin.
				UART2_TXD	O	MFP8	UART2 data transmitter output pin.
				I2C1_SCL	I/O	MFP9	I2C1 clock pin.
				CAN0_TXD	O	MFP10	CAN0 bus transmitter output.
				UART4_TXD	O	MFP11	UART4 data transmitter output pin.
				EPWM1_CH0	I/O	MFP12	EPWM1 channel 0 output/capture input.
				PC.4	I/O	MFP0	General purpose digital I/O pin.
	28	36	70	EBI_AD4	I/O	MFP2	EBI address/data bus bit 4.
				SPIM_D3	I/O	MFP3	SPIM data 3 pin for Quad Mode I/O.
				QSPI0_MOSI1	I/O	MFP4	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
				SC1_nCD	I	MFP5	Smart Card 1 card detect pin.
				I2S0_BCLK	O	MFP6	I2S0 bit clock output pin.
				SPI1_I2SMCLK	I/O	MFP7	SPI1 I2S master clock output pin
				UART2_RXD	I	MFP8	UART2 data receiver input pin.
				I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
				CAN0_RXD	I	MFP10	CAN0 bus receiver input.
				UART4_RXD	I	MFP11	UART4 data receiver input pin.
				EPWM1_CH1	I/O	MFP12	EPWM1 channel 1 output/capture input.
	29	37	71	PC.3	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.
				SPIM_SS	I/O	MFP3	SPIM slave select pin.
				QSPI0_SS	I/O	MFP4	Quad SPI0 slave select pin.
				SC1_PWR	O	MFP5	Smart Card 1 power pin.
				I2S0_MCLK	O	MFP6	I2S0 master clock output pin.
				SPI1_MISO	I/O	MFP7	SPI1 MISO (Master In, Slave Out) pin.
				UART2_nRTS	O	MFP8	UART2 request to Send output pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				I2C0_SMBAL	O	MFP9	I2C0 SMBus SMBALTER pin
				CAN1_TXD	O	MFP10	CAN1 bus transmitter output.
				UART3_TXD	O	MFP11	UART3 data transmitter output pin.
				EPWM1_CH2	I/O	MFP12	EPWM1 channel 2 output/capture input.
				PC.2	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
				SPIM_CLK	I/O	MFP3	SPIM serial clock pin.
				QSPI0_CLK	I/O	MFP4	Quad SPI0 serial clock pin.
				SC1_RST	O	MFP5	Smart Card 1 reset pin.
				I2S0_DI	I	MFP6	I2S0 data input pin.
				SPI1_MOSI	I/O	MFP7	SPI1 MOSI (Master Out, Slave In) pin.
				UART2_nCTS	I	MFP8	UART2 clear to Send input pin.
				I2C0_SMBSUS	O	MFP9	I2C0 SMBus SMBSUS pin (PMBus CONTROL pin)
				CAN1_RXD	I	MFP10	CAN1 bus receiver input.
				UART3_RXD	I	MFP11	UART3 data receiver input pin.
				EPWM1_CH3	I/O	MFP12	EPWM1 channel 3 output/capture input.
				PC.1	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.
				SPIM_MISO	I/O	MFP3	SPIM MISO (Master In, Slave Out) pin.
				QSPI0_MISO0	I/O	MFP4	Quad SPI0 MISO0 (Master In, Slave Out) pin.
				SC1_DAT	I/O	MFP5	Smart Card 1 data pin.
				I2S0_DO	O	MFP6	I2S0 data output pin.
				SPI1_CLK	I/O	MFP7	SPI1 serial clock pin.
				UART2_TXD	O	MFP8	UART2 data transmitter output pin.
				I2C0_SCL	I/O	MFP9	I2C0 clock pin.
				EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
				ACMP0_O	O	MFP14	Analog comparator 0 output pin.
				PC.0	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD0	I/O	MFP2	EBI address/data bus bit 0.
				SPIM_MOSI	I/O	MFP3	SPIM MOSI (Master Out, Slave In) pin.
				QSPI0_MOSI0	I/O	MFP4	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
				SC1_CLK	O	MFP5	Smart Card 1 clock pin.
				I2S0_LRCK	O	MFP6	I2S0 left right channel clock output pin.
				SPI1_SS	I/O	MFP7	SPI1 slave select pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				UART2_RXD	I	MFP8	UART2 data receiver input pin.
				I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.
				EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
				ACMP1_O	O	MFP14	Analog comparator 1 output pin.
			75	V _{SS}	P	MFP0	Ground pin for digital circuit.
			76	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
			77	PG.9	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD0	I/O	MFP2	EBI address/data bus bit 0.
				SD1_DAT3	I/O	MFP3	SD/SDIO1 data line bit 3.
				SPI_M_D2	I/O	MFP4	SPI_M data 2 pin for Quad Mode I/O.
				BPWM0_CH5	I/O	MFP12	BPWM0 channel 5 output/capture input.
			78	PG.10	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.
				SD1_DAT2	I/O	MFP3	SD/SDIO1 data line bit 2.
				SPI_M_D3	I/O	MFP4	SPI_M data 3 pin for Quad Mode I/O.
				BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.
			79	PG.11	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
				SD1_DAT1	I/O	MFP3	SD/SDIO1 data line bit 1.
				SPI_M_SS	I/O	MFP4	SPI_M slave select pin.
				BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.
			80	PG.12	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.
				SD1_DAT0	I/O	MFP3	SD/SDIO1 data line bit 0.
				SPI_M_CLK	I/O	MFP4	SPI_M serial clock pin.
				BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
			81	PG.13	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD4	I/O	MFP2	EBI address/data bus bit 4.
				SD1_CMD	I/O	MFP3	SD/SDIO1 command/response pin
				SPI_M_MISO	I/O	MFP4	SPI_M MISO (Master In, Slave Out) pin.
				BPWM0_CH1	I/O	MFP12	BPWM0 channel 1 output/capture input.
			82	PG.14	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD5	I/O	MFP2	EBI address/data bus bit 5.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				SD1_CLK	O	MFP3	SD/SDIO1 clock output pin
				SPI_MOSI	I/O	MFP4	SPI MOSI (Master Out, Slave In) pin.
				BPWM0_CH0	I/O	MFP12	BPWM0 channel 0 output/capture input.
		83		PG.15	I/O	MFP0	General purpose digital I/O pin.
				SD1_nCD	I	MFP3	SD/SDIO1 card detect input pin
				CLKO	O	MFP14	Clock Out
				EADC0_ST	I	MFP15	EADC0 external trigger input.
		41		PD.3	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
				USCI0_CTL1	I/O	MFP3	USCI0 control 1 pin.
				SPI0_SS	I/O	MFP4	SPI0 slave select pin.
				UART3_nRTS	O	MFP5	UART3 request to Send output pin.
				USCI1_CTL0	I/O	MFP6	USCI1 control 0 pin.
				SC2_PWR	O	MFP7	Smart Card 2 power pin.
				SC1_nCD	I	MFP8	Smart Card 1 card detect pin.
				UART0_TXD	O	MFP9	UART0 data transmitter output pin.
		42		PD.2	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
				USCI0_DAT1	I/O	MFP3	USCI0 data 1 pin.
				SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
				UART3_nCTS	I	MFP5	UART3 clear to Send input pin.
				SC2_RST	O	MFP7	Smart Card 2 reset pin.
				UART0_RXD	I	MFP9	UART0 data receiver input pin.
		43		PD.1	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
				USCI0_DAT0	I/O	MFP3	USCI0 data 0 pin.
				SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
				UART3_TXD	O	MFP5	UART3 data transmitter output pin.
				I2C2_SCL	I/O	MFP6	I2C2 clock pin.
				SC2_DAT	I/O	MFP7	Smart Card 2 data pin.
		44		PD.0	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
				USCI0_CLK	I/O	MFP3	USCI0 clock pin.
				SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				UART3_RXD	I	MFP5	UART3 data receiver input pin.
				I2C2_SDA	I/O	MFP6	I2C2 data input/output pin.
				SC2_CLK	O	MFP7	Smart Card 2 clock pin.
				TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
			84	PD.13	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
				SD0_nCD	I	MFP3	SD/SDIO0 card detect input pin
				SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
				SPI1_I2SMCLK	I/O	MFP5	SPI1 I2S master clock output pin
				SC2_nCD	I	MFP7	Smart Card 2 card detect pin.
				PA.12	I/O	MFP0	General purpose digital I/O pin.
				I2S0_BCLK	O	MFP2	I2S0 bit clock output pin.
				UART4_TXD	O	MFP3	UART4 data transmitter output pin.
			85	I2C1_SCL	I/O	MFP4	I2C1 clock pin.
				SPI2_SS	I/O	MFP5	SPI2 slave select pin.
				CAN0_TXD	O	MFP6	CAN0 bus transmitter output.
				SC2_PWR	O	MFP7	Smart Card 2 power pin.
				BPWM1_CH2	I/O	MFP11	BPWM1 channel 2 output/capture input.
				QEI1_INDEX	I	MFP12	Quadrature encoder 1 index input
				USB_VBUS	P	MFP14	Power supply from USB host or HUB.
				PA.13	I/O	MFP0	General purpose digital I/O pin.
				I2S0_MCLK	O	MFP2	I2S0 master clock output pin.
				UART4_RXD	I	MFP3	UART4 data receiver input pin.
			86	I2C1_SDA	I/O	MFP4	I2C1 data input/output pin.
				SPI2_CLK	I/O	MFP5	SPI2 serial clock pin.
				CAN0_RXD	I	MFP6	CAN0 bus receiver input.
				SC2_RST	O	MFP7	Smart Card 2 reset pin.
				BPWM1_CH3	I/O	MFP11	BPWM1 channel 3 output/capture input.
				QEI1_A	I	MFP12	Quadrature encoder 1 phase A input
				USB_D-	A	MFP14	USB differential signal D-.
				PA.14	I/O	MFP0	General purpose digital I/O pin.
				I2S0_DI	I	MFP2	I2S0 data input pin.
				UART0_TXD	O	MFP3	UART0 data transmitter output pin.
			87	SPI2_MISO	I/O	MFP5	SPI2 MISO (Master In, Slave Out) pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				I2C2_SCL	I/O	MFP6	I2C2 clock pin.
				SC2_DAT	I/O	MFP7	Smart Card 2 data pin.
				BPWM1_CH4	I/O	MFP11	BPWM1 channel 4 output/capture input.
				QEI1_B	I	MFP12	Quadrature encoder 1 phase B input
				USB_D+	A	MFP14	USB differential signal D+.
24	36	48	88	PA.15	I/O	MFP0	General purpose digital I/O pin.
				I2S0_DO	O	MFP2	I2S0 data output pin.
				UART0_RXD	I	MFP3	UART0 data receiver input pin.
				SPI2_MOSI	I/O	MFP5	SPI2 MOSI (Master Out, Slave In) pin.
				I2C2_SDA	I/O	MFP6	I2C2 data input/output pin.
				SC2_CLK	O	MFP7	Smart Card 2 clock pin.
				BPWM1_CH5	I/O	MFP11	BPWM1 channel 5 output/capture input.
				EPWM0_SYNC_IN	I	MFP12	EPWM0 counter synchronous trigger input pin.
				USB_OTG_ID	I	MFP14	USB_ identification.
			89	NC			
			90	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
			91	NC			
			92	NC			
			93	V _{SS}	P	MFP0	Ground pin for digital circuit.
			94	NC			
			95	LDO_CAP	A	MFP0	LDO output pin. Note: This pin needs to be connected with a 1uF capacitor.
			96	NC			
			97	PE.7	I/O	MFP0	General purpose digital I/O pin.

				EBI_ADR16	O	MFP2	EBI address bus bit 16.
				UART0_nCTS	I	MFP5	UART0 clear to Send input pin.
				UART4_TXD	O	MFP6	UART4 data transmitter output pin.
				I2C1_SCL	I/O	MFP7	I2C1 clock pin.
				CAN0_TXD	O	MFP8	CAN0 bus transmitter output.
				SPI0_I2SMCLK	I/O	MFP9	SPI0 I2S master clock output pin
				BPWM1_CH0	I/O	MFP10	BPWM1 channel 0 output/capture input.
				SPI3_CLK	I/O	MFP11	SPI3 serial clock pin.
				PB.10	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH10	A	MFP1	EADC0 channel 10 analog input.
				EBI_ADR17	O	MFP2	EBI address bus bit 17.
				USCI1_CTL0	I/O	MFP4	USCI1 control 0 pin.
				UART0_nRTS	O	MFP5	UART0 request to Send output pin.
				UART4_RXD	I	MFP6	UART4 data receiver input pin.
				I2C1_SDA	I/O	MFP7	I2C1 data input/output pin.
				CAN0_RXD	I	MFP8	CAN0 bus receiver input.
				BPWM1_CH1	I/O	MFP10	BPWM1 channel 1 output/capture input.
				SPI3_SS	I/O	MFP11	SPI3 slave select pin.
				PB.9	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH9	A	MFP1	EADC0 channel 9 analog input.
				EBI_ADR18	O	MFP2	EBI address bus bit 18.
				USCI1_CTL1	I/O	MFP4	USCI1 control 1 pin.
				UART0_TXD	O	MFP5	UART0 data transmitter output pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description	
				UART1_nCTS	I	MFP6	UART1 clear to Send input pin.	
				I2C1_SMBAL	O	MFP7	I2C1 SMBus SMBALTER pin	
				BPWM1_CH2	I/O	MFP10	BPWM1 channel 2 output/capture input.	
				SPI3_MISO	I/O	MFP11	SPI3 MISO (Master In, Slave Out) pin.	
				INT7	I	MFP13	External interrupt 7 input pin.	
		63	126	PB.8	I/O	MFP0	General purpose digital I/O pin.	
				EADC0_CH8	A	MFP1	EADC0 channel 8 analog input.	
				EBI_ADR19	O	MFP2	EBI address bus bit 19.	
				USCI1_CLK	I/O	MFP4	USCI1 clock pin.	
				UART0_RXD	I	MFP5	UART0 data receiver input pin.	
				UART1_nRTS	O	MFP6	UART1 request to Send output pin.	
				I2C1_SMBSUS	O	MFP7	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)	
				BPWM1_CH3	I/O	MFP10	BPWM1 channel 3 output/capture input.	
				SPI3_MOSI	I/O	MFP11	SPI3 MOSI (Master Out, Slave In) pin.	
				INT6	I	MFP13	External interrupt 6 input pin.	
		47	64	127	PB.7	I/O	MFP0	General purpose digital I/O pin.
					EADC0_CH7	A	MFP1	EADC0 channel 7 analog input.
					EBI_nWRL	O	MFP2	EBI low byte write enable output pin.
					USCI1_DAT0	I/O	MFP4	USCI1 data 0 pin.
					CAN1_TXD	O	MFP5	CAN1 bus transmitter output.
					UART1_TXD	O	MFP6	UART1 data transmitter output pin.
					SD1_CMD	I/O	MFP7	SD/SDIO1 command/response pin
					EBI_nCS0	O	MFP8	EBI chip select 0 output pin.
					BPWM1_CH4	I/O	MFP10	BPWM1 channel 4 output/capture input.
					EPWM1_BRAKE0	I	MFP11	EPWM1 Brake 0 input pin.
					EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
					INT5	I	MFP13	External interrupt 5 input pin.
					USB_VBUS_ST	I	MFP14	USB external VBUS regulator status pin.
					ACMP0_O	O	MFP15	Analog comparator 0 output pin.
		48	1	128	PB.6	I/O	MFP0	General purpose digital I/O pin.
					EADC0_CH6	A	MFP1	EADC0 channel 6 analog input.
					EBI_nWRH	O	MFP2	EBI high byte write enable output pin
					USCI1_DAT1	I/O	MFP4	USCI1 data 1 pin.
					CAN1_RXD	I	MFP5	CAN1 bus receiver input.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				UART1_RXD	I	MFP6	UART1 data receiver input pin.
				SD1_CLK	O	MFP7	SD/SDIO1 clock output pin
				EBI_nCS1	O	MFP8	EBI chip select 1 output pin.
				BPWM1_CH5	I/O	MFP10	BPWM1 channel 5 output/capture input.

				EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
				INT4	I	MFP13	External interrupt 4 input pin.
				USB_VBUS_EN	O	MFP14	USB external VBUS regulator enable pin.
				ACMP1_O	O	MFP15	Analog comparator 1 output pin.

4.2.3 M483 Series Pin Description

64 Pin	128 Pin	Pin Name	Type	MFP	Description
2	1	PB.5	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH5	A	MFP1	EADC0 channel 5 analog input.
		ACMP1_N	A	MFP1	Analog comparator 1 negative input pin.
		EBI_ADR0	O	MFP2	EBI address bus bit 0.
		SD0_DAT3	I/O	MFP3	SD/SDIO0 data line bit 3.
		SPI1_MISO	I/O	MFP5	SPI1 MISO (Master In, Slave Out) pin.
		I2C0_SCL	I/O	MFP6	I2C0 clock pin.
		UART5_TXD	O	MFP7	UART5 data transmitter output pin.
		USCI1_CTL0	I/O	MFP8	USCI1 control 0 pin.
		SC0_CLK	O	MFP9	Smart Card 0 clock pin.
		I2S0_BCLK	O	MFP10	I2S0 bit clock output pin.
		EPWM0_CH0	I/O	MFP11	EPWM0 channel 0 output/capture input.
		TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
		INT0	I	MFP15	External interrupt 0 input pin.
3	2	PB.4	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH4	A	MFP1	EADC0 channel 4 analog input.
		ACMP1_P1	A	MFP1	Analog comparator 1 positive input 1 pin.
		EBI_ADR1	O	MFP2	EBI address bus bit 1.
		SD0_DAT2	I/O	MFP3	SD/SDIO0 data line bit 2.
		SPI1_MOSI	I/O	MFP5	SPI1 MOSI (Master Out, Slave In) pin.
		I2C0_SDA	I/O	MFP6	I2C0 data input/output pin.
		UART5_RXD	I	MFP7	UART5 data receiver input pin.
		USCI1_CTL1	I/O	MFP8	USCI1 control 1 pin.
		SC0_DAT	I/O	MFP9	Smart Card 0 data pin.
		I2S0_MCLK	O	MFP10	I2S0 master clock output pin.
		EPWM0_CH1	I/O	MFP11	EPWM0 channel 1 output/capture input.
		TM1	I/O	MFP14	Timer1 event counter input/toggle output pin.
		INT1	I	MFP15	External interrupt 1 input pin.
4	3	PB.3	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH3	A	MFP1	EADC0 channel 3 analog input.
		ACMP0_N	A	MFP1	Analog comparator 0 negative input pin.
		EBI_ADR2	O	MFP2	EBI address bus bit 2.
		SD0_DAT1	I/O	MFP3	SD/SDIO0 data line bit 1.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		SPI1_CLK	I/O	MFP5	SPI1 serial clock pin.
		UART1_TXD	O	MFP6	UART1 data transmitter output pin.
		UART5_nRTS	O	MFP7	UART5 request to Send output pin.
		USCI1_DAT1	I/O	MFP8	USCI1 data 1 pin.
		SC0_RST	O	MFP9	Smart Card 0 reset pin.
		I2S0_DI	I	MFP10	I2S0 data input pin.
		EPWM0_CH2	I/O	MFP11	EPWM0 channel 2 output/capture input.
		TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
		INT2	I	MFP15	External interrupt 2 input pin.
	5	PB.2	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH2	A	MFP1	EADC0 channel 2 analog input.
		ACMP0_P1	A	MFP1	Analog comparator 0 positive input 1 pin.
		OPA0_O	A	MFP1	Operational amplifier 0 output pin.
		EBI_ADR3	O	MFP2	EBI address bus bit 3.
		SD0_DAT0	I/O	MFP3	SD/SDIO0 data line bit 0.
		SPI1_SS	I/O	MFP5	SPI1 slave select pin.
		UART1_RXD	I	MFP6	UART1 data receiver input pin.
		UART5_nCTS	I	MFP7	UART5 clear to Send input pin.
		USCI1_DAT0	I/O	MFP8	USCI1 data 0 pin.
		SC0_PWR	O	MFP9	Smart Card 0 power pin.
		I2S0_DO	O	MFP10	I2S0 data output pin.
		EPWM0_CH3	I/O	MFP11	EPWM0 channel 3 output/capture input.
		TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
		INT3	I	MFP15	External interrupt 3 input pin.
		PC.12	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR4	O	MFP2	EBI address bus bit 4.
		UART0_TXD	O	MFP3	UART0 data transmitter output pin.
		I2C0_SCL	I/O	MFP4	I2C0 clock pin.
		SPI3_MISO	I/O	MFP6	SPI3 MISO (Master In, Slave Out) pin.
		SC0_nCD	I	MFP9	Smart Card 0 card detect pin.
		ECAP1_IC2	I	MFP11	Enhanced capture unit 1 input 2 pin.
		EPWM1_CH0	I/O	MFP12	EPWM1 channel 0 output/capture input.
		ACMP0_O	O	MFP14	Analog comparator 0 output pin.
	6	PC.11	I/O	MFP0	General purpose digital I/O pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		EBI_ADR5	O	MFP2	EBI address bus bit 5.
		UART0_RXD	I	MFP3	UART0 data receiver input pin.
		I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
		SPI3_MOSI	I/O	MFP6	SPI3 MOSI (Master Out, Slave In) pin.
		ECAP1_IC1	I	MFP11	Enhanced capture unit 1 input 1 pin.
		EPWM1_CH1	I/O	MFP12	EPWM1 channel 1 output/capture input.
		ACMP1_O	O	MFP14	Analog comparator 1 output pin.
	7	PC.10	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR6	O	MFP2	EBI address bus bit 6.
		SPI3_CLK	I/O	MFP6	SPI3 serial clock pin.
		UART3_TXD	O	MFP7	UART3 data transmitter output pin.
		CAN1_TXD	O	MFP9	CAN1 bus transmitter output.
		ECAP1_IC0	I	MFP11	Enhanced capture unit 1 input 0 pin.
		EPWM1_CH2	I/O	MFP12	EPWM1 channel 2 output/capture input.
	8	PC.9	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR7	O	MFP2	EBI address bus bit 7.
		SPI3_SS	I/O	MFP6	SPI3 slave select pin.
		UART3_RXD	I	MFP7	UART3 data receiver input pin.
		CAN1_RXD	I	MFP9	CAN1 bus receiver input.
		EPWM1_CH3	I/O	MFP12	EPWM1 channel 3 output/capture input.
	9	PB.1	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH1	A	MFP1	EADC0 channel 1 analog input.
		OPA0_N	A	MFP1	Operational amplifier 0 negative input pin.
		EBI_ADR8	O	MFP2	EBI address bus bit 8.
		SD0_CLK	O	MFP3	SD/SDIO0 clock output pin
		SPI1_I2SMCLK	I/O	MFP5	SPI1 I2S master clock output pin
		SPI3_I2SMCLK	I/O	MFP6	SPI3 I2S master clock output pin
		UART2_TXD	O	MFP7	UART2 data transmitter output pin.
		USCI1_CLK	I/O	MFP8	USCI1 clock pin.
		I2C1_SCL	I/O	MFP9	I2C1 clock pin.
		I2S0_LRCK	O	MFP10	I2S0 left right channel clock output pin.
		EPWM0_CH4	I/O	MFP11	EPWM0 channel 4 output/capture input.
		EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
		EPWM0_BRAKE0	I	MFP13	EPWM0 Brake 0 input pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
7	10	PB.0	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH0	A	MFP1	EADC0 channel 0 analog input.
		OPA0_P	A	MFP1	Operational amplifier 0 positive input pin.
		EBI_ADR9	O	MFP2	EBI address bus bit 9.
		SD0_CMD	I/O	MFP3	SD/SDIO0 command/response pin
		UART2_RXD	I	MFP7	UART2 data receiver input pin.
		SPI0_I2SMCLK	I/O	MFP8	SPI0 I2S master clock output pin
		I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
		EPWM0_CH5	I/O	MFP11	EPWM0 channel 5 output/capture input.
		EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
		EPWM0_BRAKE1	I	MFP13	EPWM0 Brake 1 input pin.
	11	V _{ss}	P	MFP0	Ground pin for digital circuit.
	12	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
8	13	PA.11	I/O	MFP0	General purpose digital I/O pin.
		ACMP0_P0	A	MFP1	Analog comparator 0 positive input 0 pin.
		EBI_nRD	O	MFP2	EBI read enable output pin.
		SC2_PWR	O	MFP3	Smart Card 2 power pin.
		SPI2_SS	I/O	MFP4	SPI2 slave select pin.
		SD1_DAT3	I/O	MFP5	SD/SDIO1 data line bit 3.
		USCI0_CLK	I/O	MFP6	USCI0 clock pin.
		I2C2_SCL	I/O	MFP7	I2C2 clock pin.
		BPWM0_CH0	I/O	MFP9	BPWM0 channel 0 output/capture input.
		EPWM0_SYNC_OUT	O	MFP10	EPWM0 counter synchronous trigger output pin.
9	14	TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
		DAC1_ST	I	MFP14	DAC1 external trigger input.
		PA.10	I/O	MFP0	General purpose digital I/O pin.
		ACMP1_P0	A	MFP1	Analog comparator 1 positive input 0 pin.
		OPA1_O	A	MFP1	Operational amplifier 1 output pin.
		EBI_nWR	O	MFP2	EBI write enable output pin.
		SC2_RST	O	MFP3	Smart Card 2 reset pin.
		SPI2_CLK	I/O	MFP4	SPI2 serial clock pin.
		SD1_DAT2	I/O	MFP5	SD/SDIO1 data line bit 2.
		USCI0_DAT0	I/O	MFP6	USCI0 data 0 pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		I2C2_SDA	I/O	MFP7	I2C2 data input/output pin.
		BPWM0_CH1	I/O	MFP9	BPWM0 channel 1 output/capture input.
		QEI1_INDEX	I	MFP10	Quadrature encoder 1 index input
		ECAP0_IC0	I	MFP11	Enhanced capture unit 0 input 0 pin.
		TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
		DAC0_ST	I	MFP14	DAC0 external trigger input.
	10	PA.9	I/O	MFP0	General purpose digital I/O pin.
		OPA1_N	A	MFP1	Operational amplifier 1 negative input pin.
		EBI_MCLK	O	MFP2	EBI external clock output pin.
		SC2_DAT	I/O	MFP3	Smart Card 2 data pin.
		SPI2_MISO	I/O	MFP4	SPI2 MISO (Master In, Slave Out) pin.
		SD1_DAT1	I/O	MFP5	SD/SDIO1 data line bit 1.
		USCI0_DAT1	I/O	MFP6	USCI0 data 1 pin.
		UART1_TXD	O	MFP7	UART1 data transmitter output pin.
		BPWM0_CH2	I/O	MFP9	BPWM0 channel 2 output/capture input.
		QEI1_A	I	MFP10	Quadrature encoder 1 phase A input
		ECAP0_IC1	I	MFP11	Enhanced capture unit 0 input 1 pin.
		TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.
		PA.8	I/O	MFP0	General purpose digital I/O pin.
		OPA1_P	A	MFP1	Operational amplifier 1 positive input pin.
	11	EBI_ALE	O	MFP2	EBI address latch enable output pin.
		SC2_CLK	O	MFP3	Smart Card 2 clock pin.
		SPI2_MOSI	I/O	MFP4	SPI2 MOSI (Master Out, Slave In) pin.
		SD1_DAT0	I/O	MFP5	SD/SDIO1 data line bit 0.
		USCI0_CTL1	I/O	MFP6	USCI0 control 1 pin.
		UART1_RXD	I	MFP7	UART1 data receiver input pin.
		BPWM0_CH3	I/O	MFP9	BPWM0 channel 3 output/capture input.
		QEI1_B	I	MFP10	Quadrature encoder 1 phase B input
		ECAP0_IC2	I	MFP11	Enhanced capture unit 0 input 2 pin.
		TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
		INT4	I	MFP15	External interrupt 4 input pin.
		PC.13	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR10	O	MFP2	EBI address bus bit 10.
		SC2_nCD	I	MFP3	Smart Card 2 card detect pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		SPI2_I2SMCLK	I/O	MFP4	SPI2 I2S master clock output pin
		CAN1_TXD	O	MFP5	CAN1 bus transmitter output.
		USCI0_CTL0	I/O	MFP6	USCI0 control 0 pin.
		UART2_TXD	O	MFP7	UART2 data transmitter output pin.
		BPWM0_CH4	I/O	MFP9	BPWM0 channel 4 output/capture input.
		CLKO	O	MFP13	Clock Out
		EADC0_ST	I	MFP14	EADC0 external trigger input.
	18	PD.12	I/O	MFP0	General purpose digital I/O pin.
		OPA2_O	A	MFP1	Operational amplifier 2 output pin.
		EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
		CAN1_RXD	I	MFP5	CAN1 bus receiver input.
		UART2_RXD	I	MFP7	UART2 data receiver input pin.
		BPWM0_CH5	I/O	MFP9	BPWM0 channel 5 output/capture input.
		QEIO_INDEX	I	MFP10	Quadrature encoder 0 index input
		CLKO	O	MFP13	Clock Out
		EADC0_ST	I	MFP14	EADC0 external trigger input.
		INT5	I	MFP15	External interrupt 5 input pin.
	19	PD.11	I/O	MFP0	General purpose digital I/O pin.
		OPA2_N	A	MFP1	Operational amplifier 2 negative input pin.
		EBI_nCS1	O	MFP2	EBI chip select 1 output pin.
		UART1_TXD	O	MFP3	UART1 data transmitter output pin.
		CAN0_TXD	O	MFP4	CAN0 bus transmitter output.
		QEIO_A	I	MFP10	Quadrature encoder 0 phase A input
		INT6	I	MFP15	External interrupt 6 input pin.
	20	PD.10	I/O	MFP0	General purpose digital I/O pin.
		OPA2_P	A	MFP1	Operational amplifier 2 positive input pin.
		EBI_nCS2	O	MFP2	EBI chip select 2 output pin.
		UART1_RXD	I	MFP3	UART1 data receiver input pin.
		CAN0_RXD	I	MFP4	CAN0 bus receiver input.
		QEIO_B	I	MFP10	Quadrature encoder 0 phase B input
		INT7	I	MFP15	External interrupt 7 input pin.
	21	PG.2	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR11	O	MFP2	EBI address bus bit 11.
		SPI2_SS	I/O	MFP3	SPI2 slave select pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		I2C0_SMBAL	O	MFP4	I2C0 SMBus SMBALTER pin
		I2C1_SCL	I/O	MFP5	I2C1 clock pin.
		TM0	I/O	MFP13	Timer0 event counter input/toggle output pin.
	22	PG.3	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR12	O	MFP2	EBI address bus bit 12.
		SPI2_CLK	I/O	MFP3	SPI2 serial clock pin.
		I2C0_SMBSUS	O	MFP4	I2C0 SMBus SMBSUS pin (PMBus CONTROL pin)
		I2C1_SDA	I/O	MFP5	I2C1 data input/output pin.
		TM1	I/O	MFP13	Timer1 event counter input/toggle output pin.
	23	PG.4	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR13	O	MFP2	EBI address bus bit 13.
		SPI2_MISO	I/O	MFP3	SPI2 MISO (Master In, Slave Out) pin.
		TM2	I/O	MFP13	Timer2 event counter input/toggle output pin.
	24	PF.11	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR14	O	MFP2	EBI address bus bit 14.
		SPI2_MOSI	I/O	MFP3	SPI2 MOSI (Master Out, Slave In) pin.
		TAMPER5	I/O	MFP10	TAMPER detector loop pin 5.
		TM3	I/O	MFP13	Timer3 event counter input/toggle output pin.
	25	PF.10	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR15	O	MFP2	EBI address bus bit 15.
		SC0_nCD	I	MFP3	Smart Card 0 card detect pin.
		I2S0_BCLK	O	MFP4	I2S0 bit clock output pin.
		SPI0_I2SMCLK	I/O	MFP5	SPI0 I2S master clock output pin
		TAMPER4	I/O	MFP10	TAMPER detector loop pin 4.
	26	PF.9	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR16	O	MFP2	EBI address bus bit 16.
		SC0_PWR	O	MFP3	Smart Card 0 power pin.
		I2S0_MCLK	O	MFP4	I2S0 master clock output pin.
		SPI0_SS	I/O	MFP5	SPI0 slave select pin.
		TAMPER3	I/O	MFP10	TAMPER detector loop pin 3.
	27	PF.8	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR17	O	MFP2	EBI address bus bit 17.
		SC0_RST	O	MFP3	Smart Card 0 reset pin.
		I2S0_DI	I	MFP4	I2S0 data input pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		SPI0_CLK	I/O	MFP5	SPI0 serial clock pin.
		TAMPER2	I/O	MFP10	TAMPER detector loop pin 2.
	28	PF.7	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR18	O	MFP2	EBI address bus bit 18.
		SC0_DAT	I/O	MFP3	Smart Card 0 data pin.
		I2S0_DO	O	MFP4	I2S0 data output pin.
		SPI0_MISO	I/O	MFP5	SPI0 MISO (Master In, Slave Out) pin.
		UART4_TXD	O	MFP6	UART4 data transmitter output pin.
		TAMPER1	I/O	MFP10	TAMPER detector loop pin 1.
12	29	PF.6	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR19	O	MFP2	EBI address bus bit 19.
		SC0_CLK	O	MFP3	Smart Card 0 clock pin.
		I2S0_LRCK	O	MFP4	I2S0 left right channel clock output pin.
		SPI0_MOSI	I/O	MFP5	SPI0 MOSI (Master Out, Slave In) pin.
		UART4_RXD	I	MFP6	UART4 data receiver input pin.
		EBI_nCS0	O	MFP7	EBI chip select 0 output pin.
		TAMPER0	I/O	MFP10	TAMPER detector loop pin 0.
13	30	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
14	31	PF.5	I/O	MFP0	General purpose digital I/O pin.
		UART2_RXD	I	MFP2	UART2 data receiver input pin.
		UART2_nCTS	I	MFP4	UART2 clear to Send input pin.
		BPWM0_CH4	I/O	MFP8	BPWM0 channel 4 output/capture input.
		EPWM0_SYNC_OUT	O	MFP9	EPWM0 counter synchronous trigger output pin.
		X32_IN	I	MFP10	External 32.768 kHz crystal input pin.
		EADC0_ST	I	MFP11	EADC0 external trigger input.
15	32	PF.4	I/O	MFP0	General purpose digital I/O pin.
		UART2_TXD	O	MFP2	UART2 data transmitter output pin.
		UART2_nRTS	O	MFP4	UART2 request to Send output pin.
		BPWM0_CH5	I/O	MFP8	BPWM0 channel 5 output/capture input.
		X32_OUT	O	MFP10	External 32.768 kHz crystal output pin.
	33	PH.4	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR3	O	MFP2	EBI address bus bit 3.
		SPI1_MISO	I/O	MFP3	SPI1 MISO (Master In, Slave Out) pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
	34	PH.5	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR2	O	MFP2	EBI address bus bit 2.
		SPI1_MOSI	I/O	MFP3	SPI1 MOSI (Master Out, Slave In) pin.
	35	PH.6	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR1	O	MFP2	EBI address bus bit 1.
		SPI1_CLK	I/O	MFP3	SPI1 serial clock pin.
	36	PH.7	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR0	O	MFP2	EBI address bus bit 0.
		SPI1_SS	I/O	MFP3	SPI1 slave select pin.
	37	PF.3	I/O	MFP0	General purpose digital I/O pin.
		EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
		UART0_TXD	O	MFP3	UART0 data transmitter output pin.
		I2C0_SCL	I/O	MFP4	I2C0 clock pin.
		XT1_IN	I	MFP10	External 4~24 MHz (high speed) crystal input pin.
		BPWM1_CH0	I/O	MFP11	BPWM1 channel 0 output/capture input.
	38	PF.2	I/O	MFP0	General purpose digital I/O pin.
		EBI_nCS1	O	MFP2	EBI chip select 1 output pin.
		UART0_RXD	I	MFP3	UART0 data receiver input pin.
		I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
		QSPI0_CLK	I/O	MFP5	Quad SPI0 serial clock pin.
		XT1_OUT	O	MFP10	External 4~24 MHz (high speed) crystal output pin.
		BPWM1_CH1	I/O	MFP11	BPWM1 channel 1 output/capture input.
	39	V _{SS}	P	MFP0	Ground pin for digital circuit.
	40	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
	41	PE.8	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR10	O	MFP2	EBI address bus bit 10.
		I2S0_BCLK	O	MFP4	I2S0 bit clock output pin.
		SPI2_CLK	I/O	MFP5	SPI2 serial clock pin.
		USCI1_CTL1	I/O	MFP6	USCI1 control 1 pin.
		UART2_TXD	O	MFP7	UART2 data transmitter output pin.
		EPWM0_CH0	I/O	MFP10	EPWM0 channel 0 output/capture input.
		EPWM0_BRAKE0	I	MFP11	EPWM0 Brake 0 input pin.
		ECAP0_IC0	I	MFP12	Enhanced capture unit 0 input 0 pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		TRACE_CLK	O	MFP14	ETM Trace Clock output pin
42	42	PE.9	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR11	O	MFP2	EBI address bus bit 11.
		I2S0_MCLK	O	MFP4	I2S0 master clock output pin.
		SPI2_MISO	I/O	MFP5	SPI2 MISO (Master In, Slave Out) pin.
		USCI1_CTL0	I/O	MFP6	USCI1 control 0 pin.
		UART2_RXD	I	MFP7	UART2 data receiver input pin.
		EPWM0_CH1	I/O	MFP10	EPWM0 channel 1 output/capture input.
		EPWM0_BRAKE1	I	MFP11	EPWM0 Brake 1 input pin.
		ECAP0_IC1	I	MFP12	Enhanced capture unit 0 input 1 pin.
		TRACE_DATA0	O	MFP14	ETM Trace Data 0 output pin
43	43	PE.10	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR12	O	MFP2	EBI address bus bit 12.
		I2S0_DI	I	MFP4	I2S0 data input pin.
		SPI2_MOSI	I/O	MFP5	SPI2 MOSI (Master Out, Slave In) pin.
		USCI1_DAT0	I/O	MFP6	USCI1 data 0 pin.
		UART3_TXD	O	MFP7	UART3 data transmitter output pin.
		EPWM0_CH2	I/O	MFP10	EPWM0 channel 2 output/capture input.
		EPWM1_BRAKE0	I	MFP11	EPWM1 Brake 0 input pin.
		ECAP0_IC2	I	MFP12	Enhanced capture unit 0 input 2 pin.
		TRACE_DATA1	O	MFP14	ETM Trace Data 1 output pin
44	44	PE.11	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR13	O	MFP2	EBI address bus bit 13.
		I2S0_DO	O	MFP4	I2S0 data output pin.
		SPI2_SS	I/O	MFP5	SPI2 slave select pin.
		USCI1_DAT1	I/O	MFP6	USCI1 data 1 pin.
		UART3_RXD	I	MFP7	UART3 data receiver input pin.
		UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
		EPWM0_CH3	I/O	MFP10	EPWM0 channel 3 output/capture input.
		EPWM1_BRAKE1	I	MFP11	EPWM1 Brake 1 input pin.
		ECAP1_IC2	I	MFP13	Enhanced capture unit 1 input 2 pin.
45	45	TRACE_DATA2	O	MFP14	ETM Trace Data 2 output pin
		PE.12	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR14	O	MFP2	EBI address bus bit 14.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		I2S0_LRCK	O	MFP4	I2S0 left right channel clock output pin.
		SPI2_I2SMCLK	I/O	MFP5	SPI2 I2S master clock output pin
		USCI1_CLK	I/O	MFP6	USCI1 clock pin.
		UART1_nRTS	O	MFP8	UART1 request to Send output pin.
		EPWM0_CH4	I/O	MFP10	EPWM0 channel 4 output/capture input.
		ECAP1_IC1	I	MFP13	Enhanced capture unit 1 input 1 pin.
		TRACE_DATA3	O	MFP14	ETM Trace Data 3 output pin
	46	PE.13	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR15	O	MFP2	EBI address bus bit 15.
		I2C0_SCL	I/O	MFP4	I2C0 clock pin.
		UART4_nRTS	O	MFP5	UART4 request to Send output pin.
		UART1_TXD	O	MFP8	UART1 data transmitter output pin.
		EPWM0_CH5	I/O	MFP10	EPWM0 channel 5 output/capture input.
		EPWM1_CH0	I/O	MFP11	EPWM1 channel 0 output/capture input.
		BPWM1_CH5	I/O	MFP12	BPWM1 channel 5 output/capture input.
		ECAP1_IC0	I	MFP13	Enhanced capture unit 1 input 0 pin.
	47	PC.8	I/O	MFP0	General purpose digital I/O pin.
		EBI_ADR16	O	MFP2	EBI address bus bit 16.
		I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
		UART4_nCTS	I	MFP5	UART4 clear to Send input pin.
		UART1_RXD	I	MFP8	UART1 data receiver input pin.
		EPWM1_CH1	I/O	MFP11	EPWM1 channel 1 output/capture input.
		BPWM1_CH4	I/O	MFP12	BPWM1 channel 4 output/capture input.
	48	PC.7	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
		SPI1_MISO	I/O	MFP4	SPI1 MISO (Master In, Slave Out) pin.
		UART4_TXD	O	MFP5	UART4 data transmitter output pin.
		SC2_PWR	O	MFP6	Smart Card 2 power pin.
		UART0_nCTS	I	MFP7	UART0 clear to Send input pin.
		I2C1_SMBAL	O	MFP8	I2C1 SMBus SMBALTER pin
		EPWM1_CH2	I/O	MFP11	EPWM1 channel 2 output/capture input.
		BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
		TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
		INT3	I	MFP15	External interrupt 3 input pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
19	49	PC.6	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD8	I/O	MFP2	EBI address/data bus bit 8.
		SPI1_MOSI	I/O	MFP4	SPI1 MOSI (Master Out, Slave In) pin.
		UART4_RXD	I	MFP5	UART4 data receiver input pin.
		SC2_RST	O	MFP6	Smart Card 2 reset pin.
		UART0_nRTS	O	MFP7	UART0 request to Send output pin.
		I2C1_SMBSUS	O	MFP8	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
		EPWM1_CH3	I/O	MFP11	EPWM1 channel 3 output/capture input.
		BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
		TM1	I/O	MFP14	Timer1 event counter input/toggle output pin.
20	50	INT2	I	MFP15	External interrupt 2 input pin.
		PA.7	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
		SPI1_CLK	I/O	MFP4	SPI1 serial clock pin.
		SC2_DAT	I/O	MFP6	Smart Card 2 data pin.
		UART0_TXD	O	MFP7	UART0 data transmitter output pin.
		I2C1_SCL	I/O	MFP8	I2C1 clock pin.
		EPWM1_CH4	I/O	MFP11	EPWM1 channel 4 output/capture input.
		BPWM1_CH2	I/O	MFP12	BPWM1 channel 2 output/capture input.
		ACMP0_WLAT	I	MFP13	Analog comparator 0 window latch input pin
21	51	TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
		INT1	I	MFP15	External interrupt 1 input pin.
		PA.6	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
		SPI1_SS	I/O	MFP4	SPI1 slave select pin.
		SD1_nCD	I	MFP5	SD/SDIO1 card detect input pin
		SC2_CLK	O	MFP6	Smart Card 2 clock pin.
		UART0_RXD	I	MFP7	UART0 data receiver input pin.
		I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.
		EPWM1_CH5	I/O	MFP11	EPWM1 channel 5 output/capture input.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
22	52	V _{ss}	P	MFP0	Ground pin for digital circuit.
23	53	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
24	54	LDO_CAP	A	MFP0	LDO output pin.
25	55	PA.5	I/O	MFP0	General purpose digital I/O pin.
		SPIM_D2	I/O	MFP2	SPIM data 2 pin for Quad Mode I/O.
		QSPI0_MISO1	I/O	MFP3	Quad SPI0 MISO1 (Master In, Slave Out) pin.
		SPI1_I2SMCLK	I/O	MFP4	SPI1 I2S master clock output pin
		SD1_CMD	I/O	MFP5	SD/SDIO1 command/response pin
		SC2_nCD	I	MFP6	Smart Card 2 card detect pin.
		UART0_nCTS	I	MFP7	UART0 clear to Send input pin.
		UART5_TXD	O	MFP8	UART5 data transmitter output pin.
		I2C0_SCL	I/O	MFP9	I2C0 clock pin.
		CAN0_TXD	O	MFP10	CAN0 bus transmitter output.
		BPWM0_CH5	I/O	MFP12	BPWM0 channel 5 output/capture input.
		EPWM0_CH0	I/O	MFP13	EPWM0 channel 0 output/capture input.
		QEIO_INDEX	I	MFP14	Quadrature encoder 0 index input
26	56	PA.4	I/O	MFP0	General purpose digital I/O pin.
		SPIM_D3	I/O	MFP2	SPIM data 3 pin for Quad Mode I/O.
		QSPI0_MOSI1	I/O	MFP3	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
		SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
		SD1_CLK	O	MFP5	SD/SDIO1 clock output pin
		SC0_nCD	I	MFP6	Smart Card 0 card detect pin.
		UART0_nRTS	O	MFP7	UART0 request to Send output pin.
		UART5_RXD	I	MFP8	UART5 data receiver input pin.
		I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.
		CAN0_RXD	I	MFP10	CAN0 bus receiver input.
		BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.
		EPWM0_CH1	I/O	MFP13	EPWM0 channel 1 output/capture input.
		QEIO_A	I	MFP14	Quadrature encoder 0 phase A input
27	57	PA.3	I/O	MFP0	General purpose digital I/O pin.
		SPIM_SS	I/O	MFP2	SPIM slave select pin.
		QSPI0_SS	I/O	MFP3	Quad SPI0 slave select pin.
		SPI0_SS	I/O	MFP4	SPI0 slave select pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		SD1_DAT3	I/O	MFP5	SD/SDIO1 data line bit 3.
		SC0_PWR	O	MFP6	Smart Card 0 power pin.
		UART4_TXD	O	MFP7	UART4 data transmitter output pin.
		UART1_TXD	O	MFP8	UART1 data transmitter output pin.
		I2C1_SCL	I/O	MFP9	I2C1 clock pin.
		BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.
		EPWM0_CH2	I/O	MFP13	EPWM0 channel 2 output/capture input.
		QE10_B	I	MFP14	Quadrature encoder 0 phase B input
		PA.2	I/O	MFP0	General purpose digital I/O pin.
		SPI_M_CLK	I/O	MFP2	SPI_M serial clock pin.
		QSPI0_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
		SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
		SD1_DAT2	I/O	MFP5	SD/SDIO1 data line bit 2.
		SC0_RST	O	MFP6	Smart Card 0 reset pin.
		UART4_RXD	I	MFP7	UART4 data receiver input pin.
		UART1_RXD	I	MFP8	UART1 data receiver input pin.
		I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
		BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
		EPWM0_CH3	I/O	MFP13	EPWM0 channel 3 output/capture input.
		PA.1	I/O	MFP0	General purpose digital I/O pin.
		SPI_M_MISO	I/O	MFP2	SPI_M MISO (Master In, Slave Out) pin.
		QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
		SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
		SD1_DAT1	I/O	MFP5	SD/SDIO1 data line bit 1.
		SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
		UART0_TXD	O	MFP7	UART0 data transmitter output pin.
		UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
		I2C2_SCL	I/O	MFP9	I2C2 clock pin.
		BPWM0_CH1	I/O	MFP12	BPWM0 channel 1 output/capture input.
		EPWM0_CH4	I/O	MFP13	EPWM0 channel 4 output/capture input.
		DAC1_ST	I	MFP15	DAC1 external trigger input.
		PA.0	I/O	MFP0	General purpose digital I/O pin.
		SPI_M_MOSI	I/O	MFP2	SPI_M MOSI (Master Out, Slave In) pin.
		QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
		SD1_DAT0	I/O	MFP5	SD/SDIO1 data line bit 0.
		SC0_CLK	O	MFP6	Smart Card 0 clock pin.
		UART0_RXD	I	MFP7	UART0 data receiver input pin.
		UART1_nRTS	O	MFP8	UART1 request to Send output pin.
		I2C2_SDA	I/O	MFP9	I2C2 data input/output pin.
		BPWM0_CH0	I/O	MFP12	BPWM0 channel 0 output/capture input.
		EPWM0_CH5	I/O	MFP13	EPWM0 channel 5 output/capture input.
		DAC0_ST	I	MFP15	DAC0 external trigger input.
31	61	V _{DDIO}	P	MFP0	Power supply for PA.0~PA.5.
	62	PE.14	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD8	I/O	MFP2	EBI address/data bus bit 8.
		UART2_TXD	O	MFP3	UART2 data transmitter output pin.
		CAN0_TXD	O	MFP4	CAN0 bus transmitter output.
		SD1_nCD	I	MFP5	SD/SDIO1 card detect input pin
	63	PE.15	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
		UART2_RXD	I	MFP3	UART2 data receiver input pin.
		CAN0_RXD	I	MFP4	CAN0 bus receiver input.
32	64	nRESET	I	MFP0	External reset input: active LOW, with an internal pull-up. Set this pin low reset to initial state.
	65	PF.0	I/O	MFP0	General purpose digital I/O pin.
		UART1_TXD	O	MFP2	UART1 data transmitter output pin.
		I2C1_SCL	I/O	MFP3	I2C1 clock pin.
		BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
		ICE_DAT	O	MFP14	Serial wired debugger data pin.
	66	PF.1	I/O	MFP0	General purpose digital I/O pin.
		UART1_RXD	I	MFP2	UART1 data receiver input pin.
		I2C1_SDA	I/O	MFP3	I2C1 data input/output pin.
		BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
		ICE_CLK	I	MFP14	Serial wired debugger clock pin.
	67	PD.9	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
		I2C2_SCL	I/O	MFP3	I2C2 clock pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		UART2_nCTS	I	MFP4	UART2 clear to Send input pin.
68	69	PD.8	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
		I2C2_SDA	I/O	MFP3	I2C2 data input/output pin.
		UART2_nRTS	O	MFP4	UART2 request to Send output pin.
35	69	PC.5	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD5	I/O	MFP2	EBI address/data bus bit 5.
		SPIM_D2	I/O	MFP3	SPIM data 2 pin for Quad Mode I/O.
		QSPI0_MISO1	I/O	MFP4	Quad SPI0 MISO1 (Master In, Slave Out) pin.
		UART2_TXD	O	MFP8	UART2 data transmitter output pin.
		I2C1_SCL	I/O	MFP9	I2C1 clock pin.
		CAN0_TXD	O	MFP10	CAN0 bus transmitter output.
		UART4_TXD	O	MFP11	UART4 data transmitter output pin.
		EPWM1_CH0	I/O	MFP12	EPWM1 channel 0 output/capture input.
		PC.4	I/O	MFP0	General purpose digital I/O pin.
36	70	EBI_AD4	I/O	MFP2	EBI address/data bus bit 4.
		SPIM_D3	I/O	MFP3	SPIM data 3 pin for Quad Mode I/O.
		QSPI0_MOSI1	I/O	MFP4	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
		SC1_nCD	I	MFP5	Smart Card 1 card detect pin.
		I2S0_BCLK	O	MFP6	I2S0 bit clock output pin.
		SPI1_I2SMCLK	I/O	MFP7	SPI1 I2S master clock output pin
		UART2_RXD	I	MFP8	UART2 data receiver input pin.
		I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
		CAN0_RXD	I	MFP10	CAN0 bus receiver input.
		UART4_RXD	I	MFP11	UART4 data receiver input pin.
		EPWM1_CH1	I/O	MFP12	EPWM1 channel 1 output/capture input.
		PC.3	I/O	MFP0	General purpose digital I/O pin.
37	71	EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.
		SPIM_SS	I/O	MFP3	SPIM slave select pin.
		QSPI0_SS	I/O	MFP4	Quad SPI0 slave select pin.
		SC1_PWR	O	MFP5	Smart Card 1 power pin.
		I2S0_MCLK	O	MFP6	I2S0 master clock output pin.
		SPI1_MISO	I/O	MFP7	SPI1 MISO (Master In, Slave Out) pin.
		UART2_nRTS	O	MFP8	UART2 request to Send output pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		I2C0_SMBAL	O	MFP9	I2C0 SMBus SMBALTER pin
		CAN1_TXD	O	MFP10	CAN1 bus transmitter output.
		UART3_TXD	O	MFP11	UART3 data transmitter output pin.
		EPWM1_CH2	I/O	MFP12	EPWM1 channel 2 output/capture input.
	38	PC.2	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
		SPIM_CLK	I/O	MFP3	SPIM serial clock pin.
		QSPI0_CLK	I/O	MFP4	Quad SPI0 serial clock pin.
		SC1_RST	O	MFP5	Smart Card 1 reset pin.
		I2S0_DI	I	MFP6	I2S0 data input pin.
		SPI1_MOSI	I/O	MFP7	SPI1 MOSI (Master Out, Slave In) pin.
		UART2_nCTS	I	MFP8	UART2 clear to Send input pin.
		I2C0_SMBSUS	O	MFP9	I2C0 SMBus SMBSUS pin (PMBus CONTROL pin)
		CAN1_RXD	I	MFP10	CAN1 bus receiver input.
		UART3_RXD	I	MFP11	UART3 data receiver input pin.
		EPWM1_CH3	I/O	MFP12	EPWM1 channel 3 output/capture input.
	39	PC.1	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.
		SPIM_MISO	I/O	MFP3	SPIM MISO (Master In, Slave Out) pin.
		QSPI0_MISO0	I/O	MFP4	Quad SPI0 MISO0 (Master In, Slave Out) pin.
		SC1_DAT	I/O	MFP5	Smart Card 1 data pin.
		I2S0_DO	O	MFP6	I2S0 data output pin.
		SPI1_CLK	I/O	MFP7	SPI1 serial clock pin.
		UART2_TXD	O	MFP8	UART2 data transmitter output pin.
		I2C0_SCL	I/O	MFP9	I2C0 clock pin.
		EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
	40	ACMP0_O	O	MFP14	Analog comparator 0 output pin.
		PC.0	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD0	I/O	MFP2	EBI address/data bus bit 0.
		SPIM_MOSI	I/O	MFP3	SPIM MOSI (Master Out, Slave In) pin.
		QSPI0_MOSI0	I/O	MFP4	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
		SC1_CLK	O	MFP5	Smart Card 1 clock pin.
		I2S0_LRCK	O	MFP6	I2S0 left right channel clock output pin.
		SPI1_SS	I/O	MFP7	SPI1 slave select pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		UART2_RXD	I	MFP8	UART2 data receiver input pin.
		I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.
		EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
		ACMP1_O	O	MFP14	Analog comparator 1 output pin.
	75	V _{ss}	P	MFP0	Ground pin for digital circuit.
	76	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
	77	PG.9	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD0	I/O	MFP2	EBI address/data bus bit 0.
		SD1_DAT3	I/O	MFP3	SD/SDIO1 data line bit 3.
		SPI_M_D2	I/O	MFP4	SPI_M data 2 pin for Quad Mode I/O.
		BPWM0_CH5	I/O	MFP12	BPWM0 channel 5 output/capture input.
	78	PG.10	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.
		SD1_DAT2	I/O	MFP3	SD/SDIO1 data line bit 2.
		SPI_M_D3	I/O	MFP4	SPI_M data 3 pin for Quad Mode I/O.
		BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.
	79	PG.11	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
		SD1_DAT1	I/O	MFP3	SD/SDIO1 data line bit 1.
		SPI_M_SS	I/O	MFP4	SPI_M slave select pin.
		BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.
	80	PG.12	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.
		SD1_DAT0	I/O	MFP3	SD/SDIO1 data line bit 0.
		SPI_M_CLK	I/O	MFP4	SPI_M serial clock pin.
		BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
	81	PG.13	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD4	I/O	MFP2	EBI address/data bus bit 4.
		SD1_CMD	I/O	MFP3	SD/SDIO1 command/response pin
		SPI_M_MISO	I/O	MFP4	SPI_M MISO (Master In, Slave Out) pin.
		BPWM0_CH1	I/O	MFP12	BPWM0 channel 1 output/capture input.
	82	PG.14	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD5	I/O	MFP2	EBI address/data bus bit 5.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		SD1_CLK	O	MFP3	SD/SDIO1 clock output pin
		SPIM_MOSI	I/O	MFP4	SPIM MOSI (Master Out, Slave In) pin.
		BPWM0_CH0	I/O	MFP12	BPWM0 channel 0 output/capture input.
	83	PG.15	I/O	MFP0	General purpose digital I/O pin.
		SD1_nCD	I	MFP3	SD/SDIO1 card detect input pin
		CLKO	O	MFP14	Clock Out
		EADC0_ST	I	MFP15	EADC0 external trigger input.
	84	PD.13	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
		SD0_nCD	I	MFP3	SD/SDIO0 card detect input pin
		SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
		SPI1_I2SMCLK	I/O	MFP5	SPI1 I2S master clock output pin
		SC2_nCD	I	MFP7	Smart Card 2 card detect pin.
	85	PA.12	I/O	MFP0	General purpose digital I/O pin.
		I2S0_BCLK	O	MFP2	I2S0 bit clock output pin.
		UART4_TXD	O	MFP3	UART4 data transmitter output pin.
		I2C1_SCL	I/O	MFP4	I2C1 clock pin.
		SPI2_SS	I/O	MFP5	SPI2 slave select pin.
		CAN0_TXD	O	MFP6	CAN0 bus transmitter output.
		SC2_PWR	O	MFP7	Smart Card 2 power pin.
		BPWM1_CH2	I/O	MFP11	BPWM1 channel 2 output/capture input.
		QEI1_INDEX	I	MFP12	Quadrature encoder 1 index input
		USB_VBUS	P	MFP14	Power supply from USB host or HUB.
	86	PA.13	I/O	MFP0	General purpose digital I/O pin.
		I2S0_MCLK	O	MFP2	I2S0 master clock output pin.
		UART4_RXD	I	MFP3	UART4 data receiver input pin.
		I2C1_SDA	I/O	MFP4	I2C1 data input/output pin.
		SPI2_CLK	I/O	MFP5	SPI2 serial clock pin.
		CAN0_RXD	I	MFP6	CAN0 bus receiver input.
		SC2_RST	O	MFP7	Smart Card 2 reset pin.
		BPWM1_CH3	I/O	MFP11	BPWM1 channel 3 output/capture input.
		QEI1_A	I	MFP12	Quadrature encoder 1 phase A input
		USB_D-	A	MFP14	USB differential signal D-.
	87	PA.14	I/O	MFP0	General purpose digital I/O pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		I2S0_DI	I	MFP2	I2S0 data input pin.
		UART0_TXD	O	MFP3	UART0 data transmitter output pin.
		SPI2_MISO	I/O	MFP5	SPI2 MISO (Master In, Slave Out) pin.
		I2C2_SCL	I/O	MFP6	I2C2 clock pin.
		SC2_DAT	I/O	MFP7	Smart Card 2 data pin.
		BPWM1_CH4	I/O	MFP11	BPWM1 channel 4 output/capture input.
		QEI1_B	I	MFP12	Quadrature encoder 1 phase B input
		USB_D+	A	MFP14	USB differential signal D+.
	88	PA.15	I/O	MFP0	General purpose digital I/O pin.
		I2S0_DO	O	MFP2	I2S0 data output pin.
		UART0_RXD	I	MFP3	UART0 data receiver input pin.
		SPI2_MOSI	I/O	MFP5	SPI2 MOSI (Master Out, Slave In) pin.
		I2C2_SDA	I/O	MFP6	I2C2 data input/output pin.
		SC2_CLK	O	MFP7	Smart Card 2 clock pin.
		BPWM1_CH5	I/O	MFP11	BPWM1 channel 5 output/capture input.
		EPWM0_SYNC_IN	I	MFP12	EPWM0 counter synchronous trigger input pin.
		USB_OTG_ID	I	MFP14	USB_ identification.
41	89	HSUSB_VRES	A	MFP0	HSUSB module reference resister
42	90	HSUSB_VDD33	P	MFP0	Power supply for HSUSB VDD33
43	91	HSUSB_VBUS	P	MFP0	HSUSB Power supply from USB host or HUB.
44	92	HSUSB_D-	A	MFP0	HSUSB differential signal D-.
45	93	HSUSB_VSS	P	MFP0	Ground pin for HSUSB.
46	94	HSUSB_D+	A	MFP0	HSUSB differential signal D+.
47	95	HSUSB_VDD12_CAP	A	MFP0	HSUSB Internal power regulator output 1.2V decoupling pin. Note: This pin needs to be connected with a 1uF capacitor.
48	96	HSUSB_ID	I	MFP0	HSUSB identification.
	97	PE.7	I/O	MFP0	General purpose digital I/O pin.
		SD0_CMD	I/O	MFP3	SD/SDIO0 command/response pin
		SPIM_D2	I/O	MFP4	SPIM data 2 pin for Quad Mode I/O.
		UART5_TXD	O	MFP8	UART5 data transmitter output pin.
		CAN1_TXD	O	MFP9	CAN1 bus transmitter output.
		QEI1_INDEX	I	MFP11	Quadrature encoder 1 index input
		EPWM0_CH0	I/O	MFP12	EPWM0 channel 0 output/capture input.
		BPWM0_CH5	I/O	MFP13	BPWM0 channel 5 output/capture input.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
	98	PE.6	I/O	MFP0	General purpose digital I/O pin.
		SD0_CLK	O	MFP3	SD/SDIO0 clock output pin
		SPIM_D3	I/O	MFP4	SPIM data 3 pin for Quad Mode I/O.
		SPI3_I2SMCLK	I/O	MFP5	SPI3 I2S master clock output pin
		SC0_nCD	I	MFP6	Smart Card 0 card detect pin.
		USCI0_CTL0	I/O	MFP7	USCI0 control 0 pin.
		UART5_RXD	I	MFP8	UART5 data receiver input pin.
		CAN1_RXD	I	MFP9	CAN1 bus receiver input.
		QEI1_A	I	MFP11	Quadrature encoder 1 phase A input
		EPWM0_CH1	I/O	MFP12	EPWM0 channel 1 output/capture input.
	99	BPWM0_CH4	I/O	MFP13	BPWM0 channel 4 output/capture input.
		PE.5	I/O	MFP0	General purpose digital I/O pin.
		EBI_nRD	O	MFP2	EBI read enable output pin.
		SD0_DAT3	I/O	MFP3	SD/SDIO0 data line bit 3.
		SPIM_SS	I/O	MFP4	SPIM slave select pin.
		SPI3_SS	I/O	MFP5	SPI3 slave select pin.
		SC0_PWR	O	MFP6	Smart Card 0 power pin.
		USCI0_CTL1	I/O	MFP7	USCI0 control 1 pin.
		QEI1_B	I	MFP11	Quadrature encoder 1 phase B input
		EPWM0_CH2	I/O	MFP12	EPWM0 channel 2 output/capture input.
	100	BPWM0_CH3	I/O	MFP13	BPWM0 channel 3 output/capture input.
		PE.4	I/O	MFP0	General purpose digital I/O pin.
		EBI_nWR	O	MFP2	EBI write enable output pin.
		SD0_DAT2	I/O	MFP3	SD/SDIO0 data line bit 2.
		SPIM_CLK	I/O	MFP4	SPIM serial clock pin.
		SPI3_CLK	I/O	MFP5	SPI3 serial clock pin.
		SC0_RST	O	MFP6	Smart Card 0 reset pin.
		USCI0_DAT1	I/O	MFP7	USCI0 data 1 pin.
		QEI0_INDEX	I	MFP11	Quadrature encoder 0 index input
		EPWM0_CH3	I/O	MFP12	EPWM0 channel 3 output/capture input.
	101	BPWM0_CH2	I/O	MFP13	BPWM0 channel 2 output/capture input.
		PE.3	I/O	MFP0	General purpose digital I/O pin.
		EBI_MCLK	O	MFP2	EBI external clock output pin.
		SD0_DAT1	I/O	MFP3	SD/SDIO0 data line bit 1.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		SPIM_MISO	I/O	MFP4	SPIM MISO (Master In, Slave Out) pin.
		SPI3_MISO	I/O	MFP5	SPI3 MISO (Master In, Slave Out) pin.
		SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
		USCI0_DAT0	I/O	MFP7	USCI0 data 0 pin.
		QEI0_A	I	MFP11	Quadrature encoder 0 phase A input
		EPWM0_CH4	I/O	MFP12	EPWM0 channel 4 output/capture input.
		BPWM0_CH1	I/O	MFP13	BPWM0 channel 1 output/capture input.
	102	PE.2	I/O	MFP0	General purpose digital I/O pin.
		EBI_ALE	O	MFP2	EBI address latch enable output pin.
		SD0_DAT0	I/O	MFP3	SD/SDIO0 data line bit 0.
		SPIM_MOSI	I/O	MFP4	SPIM MOSI (Master Out, Slave In) pin.
		SPI3_MOSI	I/O	MFP5	SPI3 MOSI (Master Out, Slave In) pin.
		SC0_CLK	O	MFP6	Smart Card 0 clock pin.
		USCI0_CLK	I/O	MFP7	USCI0 clock pin.
		QEI0_B	I	MFP11	Quadrature encoder 0 phase B input
		EPWM0_CH5	I/O	MFP12	EPWM0 channel 5 output/capture input.
		BPWM0_CH0	I/O	MFP13	BPWM0 channel 0 output/capture input.
	103	V _{SS}	P	MFP0	Ground pin for digital circuit.
	104	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
	105	PE.1	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
		QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
		SC2_DAT	I/O	MFP4	Smart Card 2 data pin.
		I2S0_BCLK	O	MFP5	I2S0 bit clock output pin.
		SPI1_MISO	I/O	MFP6	SPI1 MISO (Master In, Slave Out) pin.
		UART3_TXD	O	MFP7	UART3 data transmitter output pin.
		I2C1_SCL	I/O	MFP8	I2C1 clock pin.
		UART4_nCTS	I	MFP9	UART4 clear to Send input pin.
	106	PE.0	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
		QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
		SC2_CLK	O	MFP4	Smart Card 2 clock pin.
		I2S0_MCLK	O	MFP5	I2S0 master clock output pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		SPI1_MOSI	I/O	MFP6	SPI1 MOSI (Master Out, Slave In) pin.
		UART3_RXD	I	MFP7	UART3 data receiver input pin.
		I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.
		UART4_nRTS	O	MFP9	UART4 request to Send output pin.
	107	PH.8	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
		QSPI0_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
		SC2_PWR	O	MFP4	Smart Card 2 power pin.
		I2S0_DI	I	MFP5	I2S0 data input pin.
		SPI1_CLK	I/O	MFP6	SPI1 serial clock pin.
		UART3_nRTS	O	MFP7	UART3 request to Send output pin.
		I2C1_SMBAL	O	MFP8	I2C1 SMBus SMBALTER pin
		I2C2_SCL	I/O	MFP9	I2C2 clock pin.
		UART1_TXD	O	MFP10	UART1 data transmitter output pin.
	108	PH.9	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
		QSPI0_SS	I/O	MFP3	Quad SPI0 slave select pin.
		SC2_RST	O	MFP4	Smart Card 2 reset pin.
		I2S0_DO	O	MFP5	I2S0 data output pin.
		SPI1_SS	I/O	MFP6	SPI1 slave select pin.
		UART3_nCTS	I	MFP7	UART3 clear to Send input pin.
		I2C1_SMBSUS	O	MFP8	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
		I2C2_SDA	I/O	MFP9	I2C2 data input/output pin.
		UART1_RXD	I	MFP10	UART1 data receiver input pin.
	109	PH.10	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD14	I/O	MFP2	EBI address/data bus bit 14.
		QSPI0_MISO1	I/O	MFP3	Quad SPI0 MISO1 (Master In, Slave Out) pin.
		SC2_nCD	I	MFP4	Smart Card 2 card detect pin.
		I2S0_LRCK	O	MFP5	I2S0 left right channel clock output pin.
		SPI1_I2SMCLK	I/O	MFP6	SPI1 I2S master clock output pin
		UART4_TXD	O	MFP7	UART4 data transmitter output pin.
		UART0_TXD	O	MFP8	UART0 data transmitter output pin.
	110	PH.11	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD15	I/O	MFP2	EBI address/data bus bit 15.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		QSPI0_MOSI1	I/O	MFP3	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
		UART4_RXD	I	MFP7	UART4 data receiver input pin.
		UART0_RXD	I	MFP8	UART0 data receiver input pin.
		EPWM0_CH5	I/O	MFP11	EPWM0 channel 5 output/capture input.
	111	PD.14	I/O	MFP0	General purpose digital I/O pin.
		EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
		SPI3_I2SMCLK	I/O	MFP3	SPI3 I2S master clock output pin
		SC1_nCD	I	MFP4	Smart Card 1 card detect pin.
		EPWM0_CH4	I/O	MFP11	EPWM0 channel 4 output/capture input.
49	112	V _{ss}	P	MFP0	Ground pin for digital circuit.
50	113	LDO_CAP	A	MFP0	LDO output pin.
51	114	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
	115	PC.14	I/O	MFP0	General purpose digital I/O pin.
		EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
		SC1_nCD	I	MFP3	Smart Card 1 card detect pin.
		SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
		USCI0_CTL0	I/O	MFP5	USCI0 control 0 pin.
		QSPI0_CLK	I/O	MFP6	Quad SPI0 serial clock pin.
		EPWM0_SYNC_IN	I	MFP11	EPWM0 counter synchronous trigger input pin.
		TM1	I/O	MFP13	Timer1 event counter input/toggle output pin.
		USB_VBUS_ST	I	MFP14	USB external VBUS regulator status pin.
	116	HSUSB_VBUS_ST	I	MFP15	HSUSB external VBUS regulator status pin.
		PB.15	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH15	A	MFP1	EADC0 channel 15 analog input.
		EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
		SC1_PWR	O	MFP3	Smart Card 1 power pin.
		SPI0_SS	I/O	MFP4	SPI0 slave select pin.
		USCI0_CTL1	I/O	MFP5	USCI0 control 1 pin.
		UART0_nCTS	I	MFP6	UART0 clear to Send input pin.
		UART3_TXD	O	MFP7	UART3 data transmitter output pin.
		I2C2_SMBAL	O	MFP8	I2C2 SMBus SMBALTER pin
		EPWM1_CH0	I/O	MFP11	EPWM1 channel 0 output/capture input.
		TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		USB_VBUS_EN	O	MFP14	USB external VBUS regulator enable pin.
		HSUSB_VBUS_EN	O	MFP15	HSUSB external VBUS regulator enable pin.
54	117	PB.14	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH14	A	MFP1	EADC0 channel 14 analog input.
		EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
		SC1_RST	O	MFP3	Smart Card 1 reset pin.
		SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
		USCI0_DAT1	I/O	MFP5	USCI0 data 1 pin.
		UART0_nRTS	O	MFP6	UART0 request to Send output pin.
		UART3_RXD	I	MFP7	UART3 data receiver input pin.
		I2C2_SMBSUS	O	MFP8	I2C2 SMBus SMBSUS pin (PMBus CONTROL pin)
		EPWM1_CH1	I/O	MFP11	EPWM1 channel 1 output/capture input.
		TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
		CLKO	O	MFP14	Clock Out
55	118	PB.13	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH13	A	MFP1	EADC0 channel 13 analog input.
		DAC1_OUT	A	MFP1	DAC1 channel analog output.
		ACMP0_P3	A	MFP1	Analog comparator 0 positive input 3 pin.
		ACMP1_P3	A	MFP1	Analog comparator 1 positive input 3 pin.
		EBI_AD14	I/O	MFP2	EBI address/data bus bit 14.
		SC1_DAT	I/O	MFP3	Smart Card 1 data pin.
		SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
		USCI0_DAT0	I/O	MFP5	USCI0 data 0 pin.
		UART0_TXD	O	MFP6	UART0 data transmitter output pin.
		UART3_nRTS	O	MFP7	UART3 request to Send output pin.
		I2C2_SCL	I/O	MFP8	I2C2 clock pin.
		EPWM1_CH2	I/O	MFP11	EPWM1 channel 2 output/capture input.
		TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.
56	119	PB.12	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH12	A	MFP1	EADC0 channel 12 analog input.
		DAC0_OUT	A	MFP1	DAC0 channel analog output.
		ACMP0_P2	A	MFP1	Analog comparator 0 positive input 2 pin.
		ACMP1_P2	A	MFP1	Analog comparator 1 positive input 2 pin.
		EBI_AD15	I/O	MFP2	EBI address/data bus bit 15.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		SC1_CLK	O	MFP3	Smart Card 1 clock pin.
		SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
		USCI0_CLK	I/O	MFP5	USCI0 clock pin.
		UART0_RXD	I	MFP6	UART0 data receiver input pin.
		UART3_nCTS	I	MFP7	UART3 clear to Send input pin.
		I2C2_SDA	I/O	MFP8	I2C2 data input/output pin.
		SD0_nCD	I	MFP9	SD/SDIO0 card detect input pin
		EPWM1_CH3	I/O	MFP11	EPWM1 channel 3 output/capture input.
		TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
57	120	AV _{DD}	P	MFP0	Power supply for internal analog circuit.
58	121	V _{REF}	A	MFP0	ADC reference voltage input. Note: This pin needs to be connected with a 1uF capacitor.
59	122	AV _{SS}	P	MFP0	Ground pin for analog circuit.
		PB.11	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH11	A	MFP1	EADC0 channel 11 analog input.
		EBI_ADR16	O	MFP2	EBI address bus bit 16.
		UART0_nCTS	I	MFP5	UART0 clear to Send input pin.
		UART4_TXD	O	MFP6	UART4 data transmitter output pin.
		I2C1_SCL	I/O	MFP7	I2C1 clock pin.
		CAN0_TXD	O	MFP8	CAN0 bus transmitter output.
		SPI0_I2SMCLK	I/O	MFP9	SPI0 I2S master clock output pin
		BPWM1_CH0	I/O	MFP10	BPWM1 channel 0 output/capture input.
		SPI3_CLK	I/O	MFP11	SPI3 serial clock pin.
		HSUSB_VBUS_ST	I	MFP14	HSUSB external VBUS regulator status pin.
		PB.10	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH10	A	MFP1	EADC0 channel 10 analog input.
		EBI_ADR17	O	MFP2	EBI address bus bit 17.
		USCI1_CTL0	I/O	MFP4	USCI1 control 0 pin.
		UART0_nRTS	O	MFP5	UART0 request to Send output pin.
		UART4_RXD	I	MFP6	UART4 data receiver input pin.
		I2C1_SDA	I/O	MFP7	I2C1 data input/output pin.
		CAN0_RXD	I	MFP8	CAN0 bus receiver input.
		BPWM1_CH1	I/O	MFP10	BPWM1 channel 1 output/capture input.
		SPI3_SS	I/O	MFP11	SPI3 slave select pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		HSUSB_VBUS_EN	O	MFP14	HSUSB external VBUS regulator enable pin.
62	125	PB.9	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH9	A	MFP1	EADC0 channel 9 analog input.
		EBI_ADR18	O	MFP2	EBI address bus bit 18.
		USCI1_CTL1	I/O	MFP4	USCI1 control 1 pin.
		UART0_TXD	O	MFP5	UART0 data transmitter output pin.
		UART1_nCTS	I	MFP6	UART1 clear to Send input pin.
		I2C1_SMBAL	O	MFP7	I2C1 SMBus SMBALTER pin
		BPWM1_CH2	I/O	MFP10	BPWM1 channel 2 output/capture input.
		SPI3_MISO	I/O	MFP11	SPI3 MISO (Master In, Slave Out) pin.
		INT7	I	MFP13	External interrupt 7 input pin.
63	126	PB.8	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH8	A	MFP1	EADC0 channel 8 analog input.
		EBI_ADR19	O	MFP2	EBI address bus bit 19.
		USCI1_CLK	I/O	MFP4	USCI1 clock pin.
		UART0_RXD	I	MFP5	UART0 data receiver input pin.
		UART1_nRTS	O	MFP6	UART1 request to Send output pin.
		I2C1_SMBSUS	O	MFP7	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
		BPWM1_CH3	I/O	MFP10	BPWM1 channel 3 output/capture input.
		SPI3_MOSI	I/O	MFP11	SPI3 MOSI (Master Out, Slave In) pin.
		INT6	I	MFP13	External interrupt 6 input pin.
64	127	PB.7	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH7	A	MFP1	EADC0 channel 7 analog input.
		EBI_nWRL	O	MFP2	EBI low byte write enable output pin.
		USCI1_DAT0	I/O	MFP4	USCI1 data 0 pin.
		CAN1_TXD	O	MFP5	CAN1 bus transmitter output.
		UART1_TXD	O	MFP6	UART1 data transmitter output pin.
		SD1_CMD	I/O	MFP7	SD/SDIO1 command/response pin
		EBI_nCS0	O	MFP8	EBI chip select 0 output pin.
		BPWM1_CH4	I/O	MFP10	BPWM1 channel 4 output/capture input.
		EPWM1_BRAKE0	I	MFP11	EPWM1 Brake 0 input pin.
		EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
		INT5	I	MFP13	External interrupt 5 input pin.
		USB_VBUS_ST	I	MFP14	USB external VBUS regulator status pin.

64 Pin	128 Pin	Pin Name	Type	MFP	Description
		ACMP0_O	O	MFP15	Analog comparator 0 output pin.
1	128	PB.6	I/O	MFP0	General purpose digital I/O pin.
		EADC0_CH6	A	MFP1	EADC0 channel 6 analog input.
		EBI_nWRH	O	MFP2	EBI high byte write enable output pin
		USCI1_DAT1	I/O	MFP4	USCI1 data 1 pin.
		CAN1_RXD	I	MFP5	CAN1 bus receiver input.
		UART1_RXD	I	MFP6	UART1 data receiver input pin.
		SD1_CLK	O	MFP7	SD/SDIO1 clock output pin
		EBI_nCS1	O	MFP8	EBI chip select 1 output pin.
		BPWM1_CH5	I/O	MFP10	BPWM1 channel 5 output/capture input.
		EPWM1_BRAKE1	I	MFP11	EPWM1 Brake 1 input pin.
		EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
		INT4	I	MFP13	External interrupt 4 input pin.
		USB_VBUS_EN	O	MFP14	USB external VBUS regulator enable pin.
		ACMP1_O	O	MFP15	Analog comparator 1 output pin.

4.2.4 M484 Series Pin Description

64 Pin: M484SGAAE, M484SIDAE

64 Pin 2 USB: M484SGAAE2U, M484SIDAE2U

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
2	2	1	PB.5	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH5	A	MFP1	EADC0 channel 5 analog input.
			ACMP1_N	A	MFP1	Analog comparator 1 negative input pin.
			EBI_ADR0	O	MFP2	EBI address bus bit 0.
			SD0_DAT3	I/O	MFP3	SD/SDIO0 data line bit 3.

				EADC0_CH1	A	MFP1	EADC0 channel 1 analog input.
				OPA0_N	A	MFP1	Operational amplifier 0 negative input pin.
				EBI_ADR8	O	MFP2	EBI address bus bit 8.
				SD0_CLK	O	MFP3	SD/SDIO0 clock output pin
				SPI1_I2SMCLK	I/O	MFP5	SPI1 I2S master clock output pin
				SPI3_I2SMCLK	I/O	MFP6	SPI3 I2S master clock output pin
				UART2_TXD	O	MFP7	UART2 data transmitter output pin.
				USCI1_CLK	I/O	MFP8	USCI1 clock pin.
				I2C1_SCL	I/O	MFP9	I2C1 clock pin.
				I2S0_LRCK	O	MFP10	I2S0 left right channel clock output pin.
				EPWM0_CH4	I/O	MFP11	EPWM0 channel 4 output/capture input.
				EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
				EPWM0_BRAKE0	I	MFP13	EPWM0 Brake 0 input pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
7	7	10	PB.0	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH0	A	MFP1	EADC0 channel 0 analog input.
			OPA0_P	A	MFP1	Operational amplifier 0 positive input pin.
			EBI_ADR9	O	MFP2	EBI address bus bit 9.
			SD0_CMD	I/O	MFP3	SD/SDIO0 command/response pin
			UART2_RXD	I	MFP7	UART2 data receiver input pin.
			SPI0_I2SMCLK	I/O	MFP8	SPI0 I2S master clock output pin
			I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
			EPWM0_CH5	I/O	MFP11	EPWM0 channel 5 output/capture input.
			EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
			EPWM0_BRAKE1	I	MFP13	EPWM0 Brake 1 input pin.
		11	V _{ss}	P	MFP0	Ground pin for digital circuit.
		12	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
8	8	13	PA.11	I/O	MFP0	General purpose digital I/O pin.
			ACMP0_P0	A	MFP1	Analog comparator 0 positive input 0 pin.
			EBI_nRD	O	MFP2	EBI read enable output pin.
			SC2_PWR	O	MFP3	Smart Card 2 power pin.
			SPI2_SS	I/O	MFP4	SPI2 slave select pin.
			SD1_DAT3	I/O	MFP5	SD/SDIO1 data line bit 3.
			USCI0_CLK	I/O	MFP6	USCI0 clock pin.
			I2C2_SCL	I/O	MFP7	I2C2 clock pin.
			BPWM0_CH0	I/O	MFP9	BPWM0 channel 0 output/capture input.
			EPWM0_SYNC_OUT	O	MFP10	EPWM0 counter synchronous trigger output pin.
9	9	14	TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
			DAC1_ST	I	MFP14	DAC1 external trigger input.
			PA.10	I/O	MFP0	General purpose digital I/O pin.
			ACMP1_P0	A	MFP1	Analog comparator 1 positive input 0 pin.
			OPA1_O	A	MFP1	Operational amplifier 1 output pin.
			EBI_nWR	O	MFP2	EBI write enable output pin.
			SC2_RST	O	MFP3	Smart Card 2 reset pin.
			SPI2_CLK	I/O	MFP4	SPI2 serial clock pin.
			SD1_DAT2	I/O	MFP5	SD/SDIO1 data line bit 2.
			USCI0_DAT0	I/O	MFP6	USCI0 data 0 pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			I2C2_SDA	I/O	MFP7	I2C2 data input/output pin.
			BPWM0_CH1	I/O	MFP9	BPWM0 channel 1 output/capture input.
			QEI1_INDEX	I	MFP10	Quadrature encoder 1 index input
			ECAPO_IC0	I	MFP11	Enhanced capture unit 0 input 0 pin.
			TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
			DAC0_ST	I	MFP14	DAC0 external trigger input.
		15	PA.9	I/O	MFP0	General purpose digital I/O pin.
			OPA1_N	A	MFP1	Operational amplifier 1 negative input pin.
			EBI_MCLK	O	MFP2	EBI external clock output pin.
			SC2_DAT	I/O	MFP3	Smart Card 2 data pin.
			SPI2_MISO	I/O	MFP4	SPI2 MISO (Master In, Slave Out) pin.
			SD1_DAT1	I/O	MFP5	SD/SDIO1 data line bit 1.
			USCI0_DAT1	I/O	MFP6	USCI0 data 1 pin.
			UART1_TXD	O	MFP7	UART1 data transmitter output pin.
			BPWM0_CH2	I/O	MFP9	BPWM0 channel 2 output/capture input.
			QEI1_A	I	MFP10	Quadrature encoder 1 phase A input
			ECAPO_IC1	I	MFP11	Enhanced capture unit 0 input 1 pin.
			TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.
		16	PA.8	I/O	MFP0	General purpose digital I/O pin.
			OPA1_P	A	MFP1	Operational amplifier 1 positive input pin.
			EBI_ALE	O	MFP2	EBI address latch enable output pin.
			SC2_CLK	O	MFP3	Smart Card 2 clock pin.
			SPI2_MOSI	I/O	MFP4	SPI2 MOSI (Master Out, Slave In) pin.
			SD1_DAT0	I/O	MFP5	SD/SDIO1 data line bit 0.
			USCI0_CTL1	I/O	MFP6	USCI0 control 1 pin.
			UART1_RXD	I	MFP7	UART1 data receiver input pin.
			BPWM0_CH3	I/O	MFP9	BPWM0 channel 3 output/capture input.
			QEI1_B	I	MFP10	Quadrature encoder 1 phase B input
			ECAPO_IC2	I	MFP11	Enhanced capture unit 0 input 2 pin.
			TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
			INT4	I	MFP15	External interrupt 4 input pin.
		17	PC.13	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR10	O	MFP2	EBI address bus bit 10.
			SC2_nCD	I	MFP3	Smart Card 2 card detect pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			SPI2_I2SMCLK	I/O	MFP4	SPI2 I2S master clock output pin
			USCI0_CTL0	I/O	MFP6	USCI0 control 0 pin.
			UART2_TXD	O	MFP7	UART2 data transmitter output pin.
			BPWM0_CH4	I/O	MFP9	BPWM0 channel 4 output/capture input.
			CLKO	O	MFP13	Clock Out
			EADC0_ST	I	MFP14	EADC0 external trigger input.
		18	PD.12	I/O	MFP0	General purpose digital I/O pin.
			OPA2_O	A	MFP1	Operational amplifier 2 output pin.
			EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
			UART2_RXD	I	MFP7	UART2 data receiver input pin.
			BPWM0_CH5	I/O	MFP9	BPWM0 channel 5 output/capture input.
			QEIO_INDEX	I	MFP10	Quadrature encoder 0 index input
			CLKO	O	MFP13	Clock Out
			EADC0_ST	I	MFP14	EADC0 external trigger input.
			INT5	I	MFP15	External interrupt 5 input pin.
		19	PD.11	I/O	MFP0	General purpose digital I/O pin.
			OPA2_N	A	MFP1	Operational amplifier 2 negative input pin.
			EBI_nCS1	O	MFP2	EBI chip select 1 output pin.
			UART1_TXD	O	MFP3	UART1 data transmitter output pin.
			QEIO_A	I	MFP10	Quadrature encoder 0 phase A input
			INT6	I	MFP15	External interrupt 6 input pin.
		20	PD.10	I/O	MFP0	General purpose digital I/O pin.
			OPA2_P	A	MFP1	Operational amplifier 2 positive input pin.
			EBI_nCS2	O	MFP2	EBI chip select 2 output pin.
			UART1_RXD	I	MFP3	UART1 data receiver input pin.
			QEIO_B	I	MFP10	Quadrature encoder 0 phase B input
			INT7	I	MFP15	External interrupt 7 input pin.
		21	PG.2	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR11	O	MFP2	EBI address bus bit 11.
			SPI2_SS	I/O	MFP3	SPI2 slave select pin.
			I2C0_SMBAL	O	MFP4	I2C0 SMBus SMBALTER pin
			I2C1_SCL	I/O	MFP5	I2C1 clock pin.
			TM0	I/O	MFP13	Timer0 event counter input/toggle output pin.
		22	PG.3	I/O	MFP0	General purpose digital I/O pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			EBI_ADR12	O	MFP2	EBI address bus bit 12.
			SPI2_CLK	I/O	MFP3	SPI2 serial clock pin.
			I2C0_SMBSUS	O	MFP4	I2C0 SMBus SMBSUS pin (PMBus CONTROL pin)
			I2C1_SDA	I/O	MFP5	I2C1 data input/output pin.
			TM1	I/O	MFP13	Timer1 event counter input/toggle output pin.
		23	PG.4	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR13	O	MFP2	EBI address bus bit 13.
			SPI2_MISO	I/O	MFP3	SPI2 MISO (Master In, Slave Out) pin.
			TM2	I/O	MFP13	Timer2 event counter input/toggle output pin.
		24	PF.11	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR14	O	MFP2	EBI address bus bit 14.
			SPI2_MOSI	I/O	MFP3	SPI2 MOSI (Master Out, Slave In) pin.
			TAMPER5	I/O	MFP10	TAMPER detector loop pin 5.
			TM3	I/O	MFP13	Timer3 event counter input/toggle output pin.
		25	PF.10	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR15	O	MFP2	EBI address bus bit 15.
			SC0_nCD	I	MFP3	Smart Card 0 card detect pin.
			I2S0_BCLK	O	MFP4	I2S0 bit clock output pin.
			SPI0_I2SMCLK	I/O	MFP5	SPI0 I2S master clock output pin
			TAMPER4	I/O	MFP10	TAMPER detector loop pin 4.
		26	PF.9	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR16	O	MFP2	EBI address bus bit 16.
			SC0_PWR	O	MFP3	Smart Card 0 power pin.
			I2S0_MCLK	O	MFP4	I2S0 master clock output pin.
			SPI0_SS	I/O	MFP5	SPI0 slave select pin.
			TAMPER3	I/O	MFP10	TAMPER detector loop pin 3.
		27	PF.8	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR17	O	MFP2	EBI address bus bit 17.
			SC0_RST	O	MFP3	Smart Card 0 reset pin.
			I2S0_DI	I	MFP4	I2S0 data input pin.
			SPI0_CLK	I/O	MFP5	SPI0 serial clock pin.
			TAMPER2	I/O	MFP10	TAMPER detector loop pin 2.
		28	PF.7	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR18	O	MFP2	EBI address bus bit 18.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			SC0_DAT	I/O	MFP3	Smart Card 0 data pin.
			I2S0_DO	O	MFP4	I2S0 data output pin.
			SPI0_MISO	I/O	MFP5	SPI0 MISO (Master In, Slave Out) pin.
			UART4_TXD	O	MFP6	UART4 data transmitter output pin.
			TAMPER1	I/O	MFP10	TAMPER detector loop pin 1.
12	12	29	PF.6	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR19	O	MFP2	EBI address bus bit 19.
			SC0_CLK	O	MFP3	Smart Card 0 clock pin.
			I2S0_LRCK	O	MFP4	I2S0 left right channel clock output pin.
			SPI0_MOSI	I/O	MFP5	SPI0 MOSI (Master Out, Slave In) pin.
			UART4_RXD	I	MFP6	UART4 data receiver input pin.
			EBI_nCS0	O	MFP7	EBI chip select 0 output pin.
			TAMPER0	I/O	MFP10	TAMPER detector loop pin 0.
13	13	30	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
14	14	31	PF.5	I/O	MFP0	General purpose digital I/O pin.
			UART2_RXD	I	MFP2	UART2 data receiver input pin.
			UART2_nCTS	I	MFP4	UART2 clear to Send input pin.
			BPWM0_CH4	I/O	MFP8	BPWM0 channel 4 output/capture input.
			EPWM0_SYNC_OUT	O	MFP9	EPWM0 counter synchronous trigger output pin.
			X32_IN	I	MFP10	External 32.768 kHz crystal input pin.
			EADC0_ST	I	MFP11	EADC0 external trigger input.
15	15	32	PF.4	I/O	MFP0	General purpose digital I/O pin.
			UART2_TXD	O	MFP2	UART2 data transmitter output pin.
			UART2_nRTS	O	MFP4	UART2 request to Send output pin.
			BPWM0_CH5	I/O	MFP8	BPWM0 channel 5 output/capture input.
			X32_OUT	O	MFP10	External 32.768 kHz crystal output pin.
		33	PH.4	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR3	O	MFP2	EBI address bus bit 3.
			SPI1_MISO	I/O	MFP3	SPI1 MISO (Master In, Slave Out) pin.
		34	PH.5	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR2	O	MFP2	EBI address bus bit 2.
			SPI1_MOSI	I/O	MFP3	SPI1 MOSI (Master Out, Slave In) pin.
		35	PH.6	I/O	MFP0	General purpose digital I/O pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			EBI_ADR1	O	MFP2	EBI address bus bit 1.
			SPI1_CLK	I/O	MFP3	SPI1 serial clock pin.
		36	PH.7	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR0	O	MFP2	EBI address bus bit 0.
			SPI1_SS	I/O	MFP3	SPI1 slave select pin.
16	16	37	PF.3	I/O	MFP0	General purpose digital I/O pin.
			EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
			UART0_TXD	O	MFP3	UART0 data transmitter output pin.
			I2C0_SCL	I/O	MFP4	I2C0 clock pin.
			XT1_IN	I	MFP10	External 4~24 MHz (high speed) crystal input pin.
			BPWM1_CH0	I/O	MFP11	BPWM1 channel 0 output/capture input.
17	17	38	PF.2	I/O	MFP0	General purpose digital I/O pin.
			EBI_nCS1	O	MFP2	EBI chip select 1 output pin.
			UART0_RXD	I	MFP3	UART0 data receiver input pin.
			I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
			QSPI0_CLK	I/O	MFP5	Quad SPI0 serial clock pin.
			XT1_OUT	O	MFP10	External 4~24 MHz (high speed) crystal output pin.
			BPWM1_CH1	I/O	MFP11	BPWM1 channel 1 output/capture input.
		39	V _{ss}	P	MFP0	Ground pin for digital circuit.
		40	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
		41	PE.8	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR10	O	MFP2	EBI address bus bit 10.
			I2S0_BCLK	O	MFP4	I2S0 bit clock output pin.
			SPI2_CLK	I/O	MFP5	SPI2 serial clock pin.
			USCI1_CTL1	I/O	MFP6	USCI1 control 1 pin.
			UART2_TXD	O	MFP7	UART2 data transmitter output pin.
			EPWM0_CH0	I/O	MFP10	EPWM0 channel 0 output/capture input.
			EPWM0_BRAKE0	I	MFP11	EPWM0 Brake 0 input pin.
			ECAPO_IC0	I	MFP12	Enhanced capture unit 0 input 0 pin.
			TRACE_CLK	O	MFP14	ETM Trace Clock output pin
		42	PE.9	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR11	O	MFP2	EBI address bus bit 11.
			I2S0_MCLK	O	MFP4	I2S0 master clock output pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			SPI2_MISO	I/O	MFP5	SPI2 MISO (Master In, Slave Out) pin.
			USCI1_CTL0	I/O	MFP6	USCI1 control 0 pin.
			UART2_RXD	I	MFP7	UART2 data receiver input pin.
			EPWM0_CH1	I/O	MFP10	EPWM0 channel 1 output/capture input.
			EPWM0_BRAKE1	I	MFP11	EPWM0 Brake 1 input pin.
			ECAPO_IC1	I	MFP12	Enhanced capture unit 0 input 1 pin.
			TRACE_DATA0	O	MFP14	ETM Trace Data 0 output pin
		43	PE.10	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR12	O	MFP2	EBI address bus bit 12.
			I2S0_DI	I	MFP4	I2S0 data input pin.
			SPI2_MOSI	I/O	MFP5	SPI2 MOSI (Master Out, Slave In) pin.
			USCI1_DAT0	I/O	MFP6	USCI1 data 0 pin.
			UART3_TXD	O	MFP7	UART3 data transmitter output pin.
			EPWM0_CH2	I/O	MFP10	EPWM0 channel 2 output/capture input.
			EPWM1_BRAKE0	I	MFP11	EPWM1 Brake 0 input pin.
			ECAPO_IC2	I	MFP12	Enhanced capture unit 0 input 2 pin.
			TRACE_DATA1	O	MFP14	ETM Trace Data 1 output pin
		44	PE.11	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR13	O	MFP2	EBI address bus bit 13.
			I2S0_DO	O	MFP4	I2S0 data output pin.
			SPI2_SS	I/O	MFP5	SPI2 slave select pin.
			USCI1_DAT1	I/O	MFP6	USCI1 data 1 pin.
			UART3_RXD	I	MFP7	UART3 data receiver input pin.
			UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
			EPWM0_CH3	I/O	MFP10	EPWM0 channel 3 output/capture input.
			EPWM1_BRAKE1	I	MFP11	EPWM1 Brake 1 input pin.
			ECAPO_IC2	I	MFP13	Enhanced capture unit 1 input 2 pin.

			EPWM0_CH4	I/O	MFP10	EPWM0 channel 4 output/capture input.
			ECAP1_IC1	I	MFP13	Enhanced capture unit 1 input 1 pin.
			TRACE_DATA3	O	MFP14	ETM Trace Data 3 output pin
		46	PE.13	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR15	O	MFP2	EBI address bus bit 15.
			I2C0_SCL	I/O	MFP4	I2C0 clock pin.
			UART4_nRTS	O	MFP5	UART4 request to Send output pin.
			UART1_TXD	O	MFP8	UART1 data transmitter output pin.
			EPWM0_CH5	I/O	MFP10	EPWM0 channel 5 output/capture input.
			EPWM1_CH0	I/O	MFP11	EPWM1 channel 0 output/capture input.
			BPWM1_CH5	I/O	MFP12	BPWM1 channel 5 output/capture input.
			ECAP1_IC0	I	MFP13	Enhanced capture unit 1 input 0 pin.
		47	PC.8	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR16	O	MFP2	EBI address bus bit 16.
			I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
			UART4_nCTS	I	MFP5	UART4 clear to Send input pin.
			UART1_RXD	I	MFP8	UART1 data receiver input pin.
			EPWM1_CH1	I/O	MFP11	EPWM1 channel 1 output/capture input.
			BPWM1_CH4	I/O	MFP12	BPWM1 channel 4 output/capture input.
		48	PC.7	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
			SPI1_MISO	I/O	MFP4	SPI1 MISO (Master In, Slave Out) pin.
			UART4_TXD	O	MFP5	UART4 data transmitter output pin.
			SC2_PWR	O	MFP6	Smart Card 2 power pin.
			UART0_nCTS	I	MFP7	UART0 clear to Send input pin.
			I2C1_SMBAL	O	MFP8	I2C1 SMBus SMBALTER pin
			EPWM1_CH2	I/O	MFP11	EPWM1 channel 2 output/capture input.
			BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
			TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
		49	INT3	I	MFP15	External interrupt 3 input pin.
			PC.6	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD8	I/O	MFP2	EBI address/data bus bit 8.
			SPI1_MOSI	I/O	MFP4	SPI1 MOSI (Master Out, Slave In) pin.
			UART4_RXD	I	MFP5	UART4 data receiver input pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			SC2_RST	O	MFP6	Smart Card 2 reset pin.
			UART0_nRTS	O	MFP7	UART0 request to Send output pin.
			I2C1_SMBSUS	O	MFP8	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
			EPWM1_CH3	I/O	MFP11	EPWM1 channel 3 output/capture input.
			BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
			TM1	I/O	MFP14	Timer1 event counter input/toggle output pin.
			INT2	I	MFP15	External interrupt 2 input pin.
		50	PA.7	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
			SPI1_CLK	I/O	MFP4	SPI1 serial clock pin.
			SC2_DAT	I/O	MFP6	Smart Card 2 data pin.
			UART0_TXD	O	MFP7	UART0 data transmitter output pin.
			I2C1_SCL	I/O	MFP8	I2C1 clock pin.
			EPWM1_CH4	I/O	MFP11	EPWM1 channel 4 output/capture input.
			BPWM1_CH2	I/O	MFP12	BPWM1 channel 2 output/capture input.
			ACMP0_WLAT	I	MFP13	Analog comparator 0 window latch input pin
			TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
			INT1	I	MFP15	External interrupt 1 input pin.
		51	PA.6	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
			SPI1_SS	I/O	MFP4	SPI1 slave select pin.
			SD1_nCD	I	MFP5	SD/SDIO1 card detect input pin
			SC2_CLK	O	MFP6	Smart Card 2 clock pin.
			UART0_RXD	I	MFP7	UART0 data receiver input pin.
			I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.
			EPWM1_CH5	I/O	MFP11	EPWM1 channel 5 output/capture input.
			BPWM1_CH3	I/O	MFP12	BPWM1 channel 3 output/capture input.
			ACMP1_WLAT	I	MFP13	Analog comparator 1 window latch input pin
			TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
			INT0	I	MFP15	External interrupt 0 input pin.
22	22	52	V _{SS}	P	MFP0	Ground pin for digital circuit.
23	23	53	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
24	24	54	LDO_CAP	A	MFP0	LDO output pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
25	25	55	PA.5	I/O	MFP0	General purpose digital I/O pin.
			SPIM_D2	I/O	MFP2	SPIM data 2 pin for Quad Mode I/O.
			QSPI0_MISO1	I/O	MFP3	Quad SPI0 MISO1 (Master In, Slave Out) pin.
			SPI1_I2SMCLK	I/O	MFP4	SPI1 I2S master clock output pin
			SD1_CMD	I/O	MFP5	SD/SDIO1 command/response pin
			SC2_nCD	I	MFP6	Smart Card 2 card detect pin.
			UART0_nCTS	I	MFP7	UART0 clear to Send input pin.
			UART5_TXD	O	MFP8	UART5 data transmitter output pin.
			I2C0_SCL	I/O	MFP9	I2C0 clock pin.
			BPWM0_CH5	I/O	MFP12	BPWM0 channel 5 output/capture input.
26	26	56	PA.4	I/O	MFP0	General purpose digital I/O pin.
			SPIM_D3	I/O	MFP2	SPIM data 3 pin for Quad Mode I/O.
			QSPI0_MOSI1	I/O	MFP3	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
			SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
			SD1_CLK	O	MFP5	SD/SDIO1 clock output pin
			SC0_nCD	I	MFP6	Smart Card 0 card detect pin.
			UART0_nRTS	O	MFP7	UART0 request to Send output pin.
			UART5_RXD	I	MFP8	UART5 data receiver input pin.
			I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.
			BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.
27	27	57	PA.3	I/O	MFP0	General purpose digital I/O pin.
			SPIM_SS	I/O	MFP2	SPIM slave select pin.
			QSPI0_SS	I/O	MFP3	Quad SPI0 slave select pin.
			SPI0_SS	I/O	MFP4	SPI0 slave select pin.
			SD1_DAT3	I/O	MFP5	SD/SDIO1 data line bit 3.
			SC0_PWR	O	MFP6	Smart Card 0 power pin.
			UART4_TXD	O	MFP7	UART4 data transmitter output pin.
			UART1_TXD	O	MFP8	UART1 data transmitter output pin.
			I2C1_SCL	I/O	MFP9	I2C1 clock pin.
			BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			EPWM0_CH2	I/O	MFP13	EPWM0 channel 2 output/capture input.
			QEIO_B	I	MFP14	Quadrature encoder 0 phase B input
28	28	58	PA.2	I/O	MFP0	General purpose digital I/O pin.
			SPI_M_CLK	I/O	MFP2	SPI_M serial clock pin.
			QSPI0_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
			SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
			SD1_DAT2	I/O	MFP5	SD/SDIO1 data line bit 2.
			SC0_RST	O	MFP6	Smart Card 0 reset pin.
			UART4_RXD	I	MFP7	UART4 data receiver input pin.
			UART1_RXD	I	MFP8	UART1 data receiver input pin.
			I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
			BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
			EPWM0_CH3	I/O	MFP13	EPWM0 channel 3 output/capture input.
29	29	59	PA.1	I/O	MFP0	General purpose digital I/O pin.
			SPI_M_MISO	I/O	MFP2	SPI_M MISO (Master In, Slave Out) pin.
			QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
			SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
			SD1_DAT1	I/O	MFP5	SD/SDIO1 data line bit 1.
			SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
			UART0_TXD	O	MFP7	UART0 data transmitter output pin.
			UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
			I2C2_SCL	I/O	MFP9	I2C2 clock pin.
			BPWM0_CH1	I/O	MFP12	BPWM0 channel 1 output/capture input.
			EPWM0_CH4	I/O	MFP13	EPWM0 channel 4 output/capture input.
			DAC1_ST	I	MFP15	DAC1 external trigger input.
30	30	60	PA.0	I/O	MFP0	General purpose digital I/O pin.
			SPI_M_MOSI	I/O	MFP2	SPI_M MOSI (Master Out, Slave In) pin.
			QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
			SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
			SD1_DAT0	I/O	MFP5	SD/SDIO1 data line bit 0.
			SC0_CLK	O	MFP6	Smart Card 0 clock pin.
			UART0_RXD	I	MFP7	UART0 data receiver input pin.
			UART1_nRTS	O	MFP8	UART1 request to Send output pin.
			I2C2_SDA	I/O	MFP9	I2C2 data input/output pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			BPWM0_CH0	I/O	MFP12	BPWM0 channel 0 output/capture input.
			EPWM0_CH5	I/O	MFP13	EPWM0 channel 5 output/capture input.
			DAC0_ST	I	MFP15	DAC0 external trigger input.
31	31	61	V _{DDIO}	P	MFP0	Power supply for PA.0~PA.5.
			PE.14	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD8	I/O	MFP2	EBI address/data bus bit 8.
			UART2_TXD	O	MFP3	UART2 data transmitter output pin.
			SD1_nCD	I	MFP5	SD/SDIO1 card detect input pin
			PE.15	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
			UART2_RXD	I	MFP3	UART2 data receiver input pin.
32	32	64	nRESET	I	MFP0	External reset input: active LOW, with an internal pull-up. Set this pin low reset to initial state.
33	33		PF.0	I/O	MFP0	General purpose digital I/O pin.
			UART1_TXD	O	MFP2	UART1 data transmitter output pin.
			I2C1_SCL	I/O	MFP3	I2C1 clock pin.
			BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
			ICE_DAT	O	MFP14	Serial wired debugger data pin.
34	34		PF.1	I/O	MFP0	General purpose digital I/O pin.
			UART1_RXD	I	MFP2	UART1 data receiver input pin.
			I2C1_SDA	I/O	MFP3	I2C1 data input/output pin.
			BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
			ICE_CLK	I	MFP14	Serial wired debugger clock pin.
			PD.9	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
			I2C2_SCL	I/O	MFP3	I2C2 clock pin.
			UART2_nCTS	I	MFP4	UART2 clear to Send input pin.
			PD.8	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
			I2C2_SDA	I/O	MFP3	I2C2 data input/output pin.
			UART2_nRTS	O	MFP4	UART2 request to Send output pin.
35			PC.5	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD5	I/O	MFP2	EBI address/data bus bit 5.
			SPIM_D2	I/O	MFP3	SPIM data 2 pin for Quad Mode I/O.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			QSPI0_MISO1	I/O	MFP4	Quad SPI0 MISO1 (Master In, Slave Out) pin.
			UART2_TXD	O	MFP8	UART2 data transmitter output pin.
			I2C1_SCL	I/O	MFP9	I2C1 clock pin.
			UART4_TXD	O	MFP11	UART4 data transmitter output pin.
			EPWM1_CH0	I/O	MFP12	EPWM1 channel 0 output/capture input.
		70	PC.4	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD4	I/O	MFP2	EBI address/data bus bit 4.
			SPIM_D3	I/O	MFP3	SPIM data 3 pin for Quad Mode I/O.
			QSPI0_MOSI1	I/O	MFP4	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
			SC1_nCD	I	MFP5	Smart Card 1 card detect pin.
			I2S0_BCLK	O	MFP6	I2S0 bit clock output pin.
			SPI1_I2SMCLK	I/O	MFP7	SPI1 I2S master clock output pin
			UART2_RXD	I	MFP8	UART2 data receiver input pin.
			I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
			UART4_RXD	I	MFP11	UART4 data receiver input pin.
		71	PC.3	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.
			SPIM_SS	I/O	MFP3	SPIM slave select pin.
			QSPI0_SS	I/O	MFP4	Quad SPI0 slave select pin.
			SC1_PWR	O	MFP5	Smart Card 1 power pin.
			I2S0_MCLK	O	MFP6	I2S0 master clock output pin.
			SPI1_MISO	I/O	MFP7	SPI1 MISO (Master In, Slave Out) pin.
			UART2_nRTS	O	MFP8	UART2 request to Send output pin.
			I2C0_SMBAL	O	MFP9	I2C0 SMBus SMBALTER pin
			UART3_TXD	O	MFP11	UART3 data transmitter output pin.
		72	EPWM1_CH2	I/O	MFP12	EPWM1 channel 2 output/capture input.
			PC.2	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
			SPIM_CLK	I/O	MFP3	SPIM serial clock pin.
			QSPI0_CLK	I/O	MFP4	Quad SPI0 serial clock pin.
			SC1_RST	O	MFP5	Smart Card 1 reset pin.
			I2S0_DI	I	MFP6	I2S0 data input pin.
			SPI1_MOSI	I/O	MFP7	SPI1 MOSI (Master Out, Slave In) pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			UART2_nCTS	I	MFP8	UART2 clear to Send input pin.
			I2C0_SMBSUS	O	MFP9	I2C0 SMBus SMBSUS pin (PMBus CONTROL pin)
			UART3_RXD	I	MFP11	UART3 data receiver input pin.
			EPWM1_CH3	I/O	MFP12	EPWM1 channel 3 output/capture input.
39	35	73	PC.1	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.
			SPIM_MISO	I/O	MFP3	SPIM MISO (Master In, Slave Out) pin.
			QSPI0_MISO0	I/O	MFP4	Quad SPI0 MISO0 (Master In, Slave Out) pin.
			SC1_DAT	I/O	MFP5	Smart Card 1 data pin.
			I2S0_DO	O	MFP6	I2S0 data output pin.
			SPI1_CLK	I/O	MFP7	SPI1 serial clock pin.
			UART2_TXD	O	MFP8	UART2 data transmitter output pin.
			I2C0_SCL	I/O	MFP9	I2C0 clock pin.
			EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
40	36	74	ACMP0_O	O	MFP14	Analog comparator 0 output pin.
			PC.0	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD0	I/O	MFP2	EBI address/data bus bit 0.
			SPIM_MOSI	I/O	MFP3	SPIM MOSI (Master Out, Slave In) pin.
			QSPI0_MOSI0	I/O	MFP4	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
			SC1_CLK	O	MFP5	Smart Card 1 clock pin.
			I2S0_LRCK	O	MFP6	I2S0 left right channel clock output pin.
			SPI1_SS	I/O	MFP7	SPI1 slave select pin.
			UART2_RXD	I	MFP8	UART2 data receiver input pin.
			I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.
		75	EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
			ACMP1_O	O	MFP14	Analog comparator 1 output pin.
			V _{SS}	P	MFP0	Ground pin for digital circuit.
			V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
			PG.9	I/O	MFP0	General purpose digital I/O pin.
		77	EBI_AD0	I/O	MFP2	EBI address/data bus bit 0.
			SD1_DAT3	I/O	MFP3	SD/SDIO1 data line bit 3.
			SPIM_D2	I/O	MFP4	SPIM data 2 pin for Quad Mode I/O.
			BPWM0_CH5	I/O	MFP12	BPWM0 channel 5 output/capture input.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
		78	PG.10	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.
			SD1_DAT2	I/O	MFP3	SD/SDIO1 data line bit 2.
			SPIM_D3	I/O	MFP4	SPIM data 3 pin for Quad Mode I/O.
			BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.
		79	PG.11	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
			SD1_DAT1	I/O	MFP3	SD/SDIO1 data line bit 1.
			SPIM_SS	I/O	MFP4	SPIM slave select pin.
			BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.
		80	PG.12	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.
			SD1_DAT0	I/O	MFP3	SD/SDIO1 data line bit 0.
			SPIM_CLK	I/O	MFP4	SPIM serial clock pin.
			BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
		81	PG.13	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD4	I/O	MFP2	EBI address/data bus bit 4.
			SD1_CMD	I/O	MFP3	SD/SDIO1 command/response pin
			SPIM_MISO	I/O	MFP4	SPIM MISO (Master In, Slave Out) pin.
			BPWM0_CH1	I/O	MFP12	BPWM0 channel 1 output/capture input.
		82	PG.14	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD5	I/O	MFP2	EBI address/data bus bit 5.
			SD1_CLK	O	MFP3	SD/SDIO1 clock output pin
			SPIM_MOSI	I/O	MFP4	SPIM MOSI (Master Out, Slave In) pin.
			BPWM0_CH0	I/O	MFP12	BPWM0 channel 0 output/capture input.
		83	PG.15	I/O	MFP0	General purpose digital I/O pin.
			SD1_nCD	I	MFP3	SD/SDIO1 card detect input pin
			CLKO	O	MFP14	Clock Out
			EADCO_ST	I	MFP15	EADC0 external trigger input.
		84	PD.13	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
			SD0_nCD	I	MFP3	SD/SDIO0 card detect input pin
			SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
			SPI1_I2SMCLK	I/O	MFP5	SPI1 I2S master clock output pin

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			SC2_nCD	I	MFP7	Smart Card 2 card detect pin.
	37	85	PA.12	I/O	MFP0	General purpose digital I/O pin.
			I2S0_BCLK	O	MFP2	I2S0 bit clock output pin.
			UART4_TXD	O	MFP3	UART4 data transmitter output pin.
			I2C1_SCL	I/O	MFP4	I2C1 clock pin.
			SPI2_SS	I/O	MFP5	SPI2 slave select pin.
			SC2_PWR	O	MFP7	Smart Card 2 power pin.
			BPWM1_CH2	I/O	MFP11	BPWM1 channel 2 output/capture input.
			QEI1_INDEX	I	MFP12	Quadrature encoder 1 index input
			USB_VBUS	P	MFP14	Power supply from USB host or HUB.
	38	86	PA.13	I/O	MFP0	General purpose digital I/O pin.
			I2S0_MCLK	O	MFP2	I2S0 master clock output pin.
			UART4_RXD	I	MFP3	UART4 data receiver input pin.
			I2C1_SDA	I/O	MFP4	I2C1 data input/output pin.
			SPI2_CLK	I/O	MFP5	SPI2 serial clock pin.
			SC2_RST	O	MFP7	Smart Card 2 reset pin.
			BPWM1_CH3	I/O	MFP11	BPWM1 channel 3 output/capture input.
			QEI1_A	I	MFP12	Quadrature encoder 1 phase A input
			USB_D-	A	MFP14	USB differential signal D-.
	39	87	PA.14	I/O	MFP0	General purpose digital I/O pin.
			I2S0_DI	I	MFP2	I2S0 data input pin.
			UART0_TXD	O	MFP3	UART0 data transmitter output pin.
			SPI2_MISO	I/O	MFP5	SPI2 MISO (Master In, Slave Out) pin.
			I2C2_SCL	I/O	MFP6	I2C2 clock pin.
			SC2_DAT	I/O	MFP7	Smart Card 2 data pin.
			BPWM1_CH4	I/O	MFP11	BPWM1 channel 4 output/capture input.
			QEI1_B	I	MFP12	Quadrature encoder 1 phase B input
			USB_D+	A	MFP14	USB differential signal D+.
	40	88	PA.15	I/O	MFP0	General purpose digital I/O pin.
			I2S0_DO	O	MFP2	I2S0 data output pin.
			UART0_RXD	I	MFP3	UART0 data receiver input pin.
			SPI2_MOSI	I/O	MFP5	SPI2 MOSI (Master Out, Slave In) pin.
			I2C2_SDA	I/O	MFP6	I2C2 data input/output pin.
			SC2_CLK	O	MFP7	Smart Card 2 clock pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			BPWM1_CH5	I/O	MFP11	BPWM1 channel 5 output/capture input.
			EPWM0_SYNC_IN	I	MFP12	EPWM0 counter synchronous trigger input pin.
			USB_OTG_ID	I	MFP14	USB_ identification.
41	41	89	HSUSB_VRES	A	MFP0	HSUSB module reference resister
42	42	90	HSUSB_VDD33	P	MFP0	Power supply for HSUSB VDD33
43	43	91	HSUSB_VBUS	P	MFP0	HSUSB Power supply from USB host or HUB.
44	44	92	HSUSB_D-	A	MFP0	HSUSB differential signal D-.
45	45	93	HSUSB_VSS	P	MFP0	Ground pin for HSUSB.
46	46	94	HSUSB_D+	A	MFP0	HSUSB differential signal D+.
47	47	95	HSUSB_VDD12_CAP	A	MFP0	HSUSB Internal power regulator output 1.2V decoupling pin. Note: This pin needs to be connected with a 1uF capacitor.
48	48	96	HSUSB_ID	I	MFP0	HSUSB identification.
		97	PE.7	I/O	MFP0	General purpose digital I/O pin.
			SD0_CMD	I/O	MFP3	SD/SDIO0 command/response pin
			SPIM_D2	I/O	MFP4	SPIM data 2 pin for Quad Mode I/O.
			UART5_TXD	O	MFP8	UART5 data transmitter output pin.
			QEI1_INDEX	I	MFP11	Quadrature encoder 1 index input
			EPWM0_CH0	I/O	MFP12	EPWM0 channel 0 output/capture input.
			BPWM0_CH5	I/O	MFP13	BPWM0 channel 5 output/capture input.
		98	PE.6	I/O	MFP0	General purpose digital I/O pin.
			SD0_CLK	O	MFP3	SD/SDIO0 clock output pin
			SPIM_D3	I/O	MFP4	SPIM data 3 pin for Quad Mode I/O.
			SPI3_I2SMCLK	I/O	MFP5	SPI3 I2S master clock output pin
			SC0_nCD	I	MFP6	Smart Card 0 card detect pin.
			USCI0_CTL0	I/O	MFP7	USCI0 control 0 pin.
			UART5_RXD	I	MFP8	UART5 data receiver input pin.
			QEI1_A	I	MFP11	Quadrature encoder 1 phase A input
			EPWM0_CH1	I/O	MFP12	EPWM0 channel 1 output/capture input.
		99	BPWM0_CH4	I/O	MFP13	BPWM0 channel 4 output/capture input.
			PE.5	I/O	MFP0	General purpose digital I/O pin.
			EBI_nRD	O	MFP2	EBI read enable output pin.
			SD0_DAT3	I/O	MFP3	SD/SDIO0 data line bit 3.
			SPIM_SS	I/O	MFP4	SPIM slave select pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			SPI3_SS	I/O	MFP5	SPI3 slave select pin.
			SC0_PWR	O	MFP6	Smart Card 0 power pin.
			USCI0_CTL1	I/O	MFP7	USCI0 control 1 pin.
			QEI1_B	I	MFP11	Quadrature encoder 1 phase B input
			EPWM0_CH2	I/O	MFP12	EPWM0 channel 2 output/capture input.
			BPWM0_CH3	I/O	MFP13	BPWM0 channel 3 output/capture input.
		100	PE.4	I/O	MFP0	General purpose digital I/O pin.
			EBI_nWR	O	MFP2	EBI write enable output pin.
			SD0_DAT2	I/O	MFP3	SD/SDIO0 data line bit 2.
			SPIM_CLK	I/O	MFP4	SPIM serial clock pin.
			SPI3_CLK	I/O	MFP5	SPI3 serial clock pin.
			SC0_RST	O	MFP6	Smart Card 0 reset pin.
			USCI0_DAT1	I/O	MFP7	USCI0 data 1 pin.
			QEI0_INDEX	I	MFP11	Quadrature encoder 0 index input
			EPWM0_CH3	I/O	MFP12	EPWM0 channel 3 output/capture input.
			BPWM0_CH2	I/O	MFP13	BPWM0 channel 2 output/capture input.
		101	PE.3	I/O	MFP0	General purpose digital I/O pin.
			EBI_MCLK	O	MFP2	EBI external clock output pin.
			SD0_DAT1	I/O	MFP3	SD/SDIO0 data line bit 1.
			SPIM_MISO	I/O	MFP4	SPIM MISO (Master In, Slave Out) pin.
			SPI3_MISO	I/O	MFP5	SPI3 MISO (Master In, Slave Out) pin.
			SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
			USCI0_DAT0	I/O	MFP7	USCI0 data 0 pin.
			QEI0_A	I	MFP11	Quadrature encoder 0 phase A input
			EPWM0_CH4	I/O	MFP12	EPWM0 channel 4 output/capture input.
			BPWM0_CH1	I/O	MFP13	BPWM0 channel 1 output/capture input.
		102	PE.2	I/O	MFP0	General purpose digital I/O pin.
			EBI_ALE	O	MFP2	EBI address latch enable output pin.
			SD0_DAT0	I/O	MFP3	SD/SDIO0 data line bit 0.
			SPIM_MOSI	I/O	MFP4	SPIM MOSI (Master Out, Slave In) pin.
			SPI3_MOSI	I/O	MFP5	SPI3 MOSI (Master Out, Slave In) pin.
			SC0_CLK	O	MFP6	Smart Card 0 clock pin.
			USCI0_CLK	I/O	MFP7	USCI0 clock pin.
			QEI0_B	I	MFP11	Quadrature encoder 0 phase B input

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			EPWM0_CH5	I/O	MFP12	EPWM0 channel 5 output/capture input.
			BPWM0_CH0	I/O	MFP13	BPWM0 channel 0 output/capture input.
		103	V _{ss}	P	MFP0	Ground pin for digital circuit.
		104	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
		105	PE.1	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
			QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
			SC2_DAT	I/O	MFP4	Smart Card 2 data pin.
			I2S0_BCLK	O	MFP5	I2S0 bit clock output pin.
			SPI1_MISO	I/O	MFP6	SPI1 MISO (Master In, Slave Out) pin.
			UART3_TXD	O	MFP7	UART3 data transmitter output pin.
			I2C1_SCL	I/O	MFP8	I2C1 clock pin.
			UART4_nCTS	I	MFP9	UART4 clear to Send input pin.
			106	PE.0	MFP0	General purpose digital I/O pin.
		106	EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
			QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
			SC2_CLK	O	MFP4	Smart Card 2 clock pin.
			I2S0_MCLK	O	MFP5	I2S0 master clock output pin.
			SPI1_MOSI	I/O	MFP6	SPI1 MOSI (Master Out, Slave In) pin.
			UART3_RXD	I	MFP7	UART3 data receiver input pin.
			I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.
			UART4_nRTS	O	MFP9	UART4 request to Send output pin.
			107	PH.8	MFP0	General purpose digital I/O pin.
			EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
		107	QSPI0_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
			SC2_PWR	O	MFP4	Smart Card 2 power pin.
			I2S0_DI	I	MFP5	I2S0 data input pin.
			SPI1_CLK	I/O	MFP6	SPI1 serial clock pin.
			UART3_nRTS	O	MFP7	UART3 request to Send output pin.
			I2C1_SMBAL	O	MFP8	I2C1 SMBus SMBALTER pin
			I2C2_SCL	I/O	MFP9	I2C2 clock pin.
			UART1_TXD	O	MFP10	UART1 data transmitter output pin.
		108	PH.9	I/O	MFP0	General purpose digital I/O pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
			QSPI0_SS	I/O	MFP3	Quad SPI0 slave select pin.
			SC2_RST	O	MFP4	Smart Card 2 reset pin.
			I2S0_DO	O	MFP5	I2S0 data output pin.
			SPI1_SS	I/O	MFP6	SPI1 slave select pin.
			UART3_nCTS	I	MFP7	UART3 clear to Send input pin.
			I2C1_SMBSUS	O	MFP8	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
			I2C2_SDA	I/O	MFP9	I2C2 data input/output pin.
			UART1_RXD	I	MFP10	UART1 data receiver input pin.
			109	PH.10	MFP0	General purpose digital I/O pin.
			EBI_AD14	I/O	MFP2	EBI address/data bus bit 14.
			QSPI0_MISO1	I/O	MFP3	Quad SPI0 MISO1 (Master In, Slave Out) pin.
			SC2_nCD	I	MFP4	Smart Card 2 card detect pin.
			I2S0_LRCK	O	MFP5	I2S0 left right channel clock output pin.
			SPI1_I2SMCLK	I/O	MFP6	SPI1 I2S master clock output pin
			UART4_TXD	O	MFP7	UART4 data transmitter output pin.
			UART0_TXD	O	MFP8	UART0 data transmitter output pin.
			110	PH.11	MFP0	General purpose digital I/O pin.
			EBI_AD15	I/O	MFP2	EBI address/data bus bit 15.
			QSPI0_MOSI1	I/O	MFP3	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
			UART4_RXD	I	MFP7	UART4 data receiver input pin.
			UART0_RXD	I	MFP8	UART0 data receiver input pin.
			EPWM0_CH5	I/O	MFP11	EPWM0 channel 5 output/capture input.
			111	PD.14	MFP0	General purpose digital I/O pin.
			EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
			SPI3_I2SMCLK	I/O	MFP3	SPI3 I2S master clock output pin
			SC1_nCD	I	MFP4	Smart Card 1 card detect pin.
			EPWM0_CH4	I/O	MFP11	EPWM0 channel 4 output/capture input.
49	49	112	V _{ss}	P	MFP0	Ground pin for digital circuit.
50	50	113	LDO_CAP	A	MFP0	LDO output pin.
51	51	114	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
			PC.14	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			SC1_nCD	I	MFP3	Smart Card 1 card detect pin.
			SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
			USCI0_CTL0	I/O	MFP5	USCI0 control 0 pin.
			QSPI0_CLK	I/O	MFP6	Quad SPI0 serial clock pin.
			EPWM0_SYNC_IN	I	MFP11	EPWM0 counter synchronous trigger input pin.
			TM1	I/O	MFP13	Timer1 event counter input/toggle output pin.
			USB_VBUS_ST	I	MFP14	USB external VBUS regulator status pin.
			HSUSB_VBUS_ST	I	MFP15	HSUSB external VBUS regulator status pin.
		53	PB.15	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH15	A	MFP1	EADC0 channel 15 analog input.
			EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
			SC1_PWR	O	MFP3	Smart Card 1 power pin.
			SPI0_SS	I/O	MFP4	SPI0 slave select pin.
			USCI0_CTL1	I/O	MFP5	USCI0 control 1 pin.
			UART0_nCTS	I	MFP6	UART0 clear to Send input pin.
			UART3_TXD	O	MFP7	UART3 data transmitter output pin.
			I2C2_SMBAL	O	MFP8	I2C2 SMBus SMBALTER pin
			EPWM1_CH0	I/O	MFP11	EPWM1 channel 0 output/capture input.
			TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
			USB_VBUS_EN	O	MFP14	USB external VBUS regulator enable pin.
			HSUSB_VBUS_EN	O	MFP15	HSUSB external VBUS regulator enable pin.
		54	PB.14	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH14	A	MFP1	EADC0 channel 14 analog input.
			EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
			SC1_RST	O	MFP3	Smart Card 1 reset pin.
			SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
			USCI0_DAT1	I/O	MFP5	USCI0 data 1 pin.
			UART0_nRTS	O	MFP6	UART0 request to Send output pin.
			UART3_RXD	I	MFP7	UART3 data receiver input pin.
			I2C2_SMBSUS	O	MFP8	I2C2 SMBus SMBSUS pin (PMBus CONTROL pin)
			EPWM1_CH1	I/O	MFP11	EPWM1 channel 1 output/capture input.
			TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
			CLKO	O	MFP14	Clock Out
55	55	118	PB.13	I/O	MFP0	General purpose digital I/O pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			EADC0_CH13	A	MFP1	EADC0 channel 13 analog input.
			DAC1_OUT	A	MFP1	DAC1 channel analog output.
			ACMP0_P3	A	MFP1	Analog comparator 0 positive input 3 pin.
			ACMP1_P3	A	MFP1	Analog comparator 1 positive input 3 pin.
			EBI_AD14	I/O	MFP2	EBI address/data bus bit 14.
			SC1_DAT	I/O	MFP3	Smart Card 1 data pin.
			SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
			USCI0_DAT0	I/O	MFP5	USCI0 data 0 pin.
			UART0_TXD	O	MFP6	UART0 data transmitter output pin.
			UART3_nRTS	O	MFP7	UART3 request to Send output pin.
			I2C2_SCL	I/O	MFP8	I2C2 clock pin.
			EPWM1_CH2	I/O	MFP11	EPWM1 channel 2 output/capture input.
			TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.
		119	PB.12	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH12	A	MFP1	EADC0 channel 12 analog input.
			DAC0_OUT	A	MFP1	DAC0 channel analog output.
			ACMP0_P2	A	MFP1	Analog comparator 0 positive input 2 pin.
			ACMP1_P2	A	MFP1	Analog comparator 1 positive input 2 pin.
			EBI_AD15	I/O	MFP2	EBI address/data bus bit 15.
			SC1_CLK	O	MFP3	Smart Card 1 clock pin.
			SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
			USCI0_CLK	I/O	MFP5	USCI0 clock pin.
			UART0_RXD	I	MFP6	UART0 data receiver input pin.
			UART3_nCTS	I	MFP7	UART3 clear to Send input pin.
			I2C2_SDA	I/O	MFP8	I2C2 data input/output pin.
			SD0_nCD	I	MFP9	SD/SDIO0 card detect input pin
			EPWM1_CH3	I/O	MFP11	EPWM1 channel 3 output/capture input.
		120	TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
			AV _{DD}	P	MFP0	Power supply for internal analog circuit.
58	58	121	V _{REF}	A	MFP0	ADC reference voltage input. Note: This pin needs to be connected with a 1uF capacitor.
59	59	122	AV _{SS}	P	MFP0	Ground pin for analog circuit.
		123	PB.11	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH11	A	MFP1	EADC0 channel 11 analog input.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			EBI_ADR16	O	MFP2	EBI address bus bit 16.
			UART0_nCTS	I	MFP5	UART0 clear to Send input pin.
			UART4_TXD	O	MFP6	UART4 data transmitter output pin.
			I2C1_SCL	I/O	MFP7	I2C1 clock pin.
			SPI0_I2SMCLK	I/O	MFP9	SPI0 I2S master clock output pin
			BPWM1_CH0	I/O	MFP10	BPWM1 channel 0 output/capture input.
			SPI3_CLK	I/O	MFP11	SPI3 serial clock pin.
			HSUSB_VBUS_ST	I	MFP14	HSUSB external VBUS regulator status pin.
			PB.10	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH10	A	MFP1	EADC0 channel 10 analog input.
			EBI_ADR17	O	MFP2	EBI address bus bit 17.
			USCI1_CTL0	I/O	MFP4	USCI1 control 0 pin.
			UART0_nRTS	O	MFP5	UART0 request to Send output pin.
			UART4_RXD	I	MFP6	UART4 data receiver input pin.
			I2C1_SDA	I/O	MFP7	I2C1 data input/output pin.
			BPWM1_CH1	I/O	MFP10	BPWM1 channel 1 output/capture input.
			SPI3_SS	I/O	MFP11	SPI3 slave select pin.
			HSUSB_VBUS_EN	O	MFP14	HSUSB external VBUS regulator enable pin.
			PB.9	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH9	A	MFP1	EADC0 channel 9 analog input.
			EBI_ADR18	O	MFP2	EBI address bus bit 18.
			USCI1_CTL1	I/O	MFP4	USCI1 control 1 pin.
			UART0_TXD	O	MFP5	UART0 data transmitter output pin.
			UART1_nCTS	I	MFP6	UART1 clear to Send input pin.
			I2C1_SMBAL	O	MFP7	I2C1 SMBus SMBALTER pin
			BPWM1_CH2	I/O	MFP10	BPWM1 channel 2 output/capture input.
			SPI3_MISO	I/O	MFP11	SPI3 MISO (Master In, Slave Out) pin.
			INT7	I	MFP13	External interrupt 7 input pin.
			PB.8	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH8	A	MFP1	EADC0 channel 8 analog input.
			EBI_ADR19	O	MFP2	EBI address bus bit 19.
			USCI1_CLK	I/O	MFP4	USCI1 clock pin.
			UART0_RXD	I	MFP5	UART0 data receiver input pin.
			UART1_nRTS	O	MFP6	UART1 request to Send output pin.

64 Pin	64 Pin 2 USB	128 Pin	Pin Name	Type	MFP	Description
			I2C1_SMBSUS	O	MFP7	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
			BPWM1_CH3	I/O	MFP10	BPWM1 channel 3 output/capture input.
			SPI3_MOSI	I/O	MFP11	SPI3 MOSI (Master Out, Slave In) pin.
			INT6	I	MFP13	External interrupt 6 input pin.
		127	PB.7	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH7	A	MFP1	EADC0 channel 7 analog input.
			EBI_nWRL	O	MFP2	EBI low byte write enable output pin.
			USCI1_DAT0	I/O	MFP4	USCI1 data 0 pin.
			UART1_TXD	O	MFP6	UART1 data transmitter output pin.
			SD1_CMD	I/O	MFP7	SD/SDIO1 command/response pin
			EBI_nCS0	O	MFP8	EBI chip select 0 output pin.
			BPWM1_CH4	I/O	MFP10	BPWM1 channel 4 output/capture input.
			EPWM1_BRAKE0	I	MFP11	EPWM1 Brake 0 input pin.
			EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
			INT5	I	MFP13	External interrupt 5 input pin.
			USB_VBUS_ST	I	MFP14	USB external VBUS regulator status pin.
			ACMP0_O	O	MFP15	Analog comparator 0 output pin.
		128	PB.6	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH6	A	MFP1	EADC0 channel 6 analog input.
			EBI_nWRH	O	MFP2	EBI high byte write enable output pin
			USCI1_DAT1	I/O	MFP4	USCI1 data 1 pin.
			UART1_RXD	I	MFP6	UART1 data receiver input pin.
			SD1_CLK	O	MFP7	SD/SDIO1 clock output pin
			EBI_nCS1	O	MFP8	EBI chip select 1 output pin.
			BPWM1_CH5	I/O	MFP10	BPWM1 channel 5 output/capture input.
			EPWM1_BRAKE1	I	MFP11	EPWM1 Brake 1 input pin.
			EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
			INT4	I	MFP13	External interrupt 4 input pin.
			USB_VBUS_EN	O	MFP14	USB external VBUS regulator enable pin.
			ACMP1_O	O	MFP15	Analog comparator 1 output pin.

4.2.5 M485 Series Pin Description

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
1	1	2	1	PB.5	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH5	A	MFP1	EADC0 channel 5 analog input.
				ACMP1_N	A	MFP1	Analog comparator 1 negative input pin.
				EBI_ADR0	O	MFP2	EBI address bus bit 0.
				SD0_DAT3	I/O	MFP3	SD/SDIO0 data line bit 3.
				SPI1_MISO	I/O	MFP5	SPI1 MISO (Master In, Slave Out) pin.
				I2C0_SCL	I/O	MFP6	I2C0 clock pin.
				UART5_TXD	O	MFP7	UART5 data transmitter output pin.
				USCI1_CTL0	I/O	MFP8	USCI1 control 0 pin.
				SC0_CLK	O	MFP9	Smart Card 0 clock pin.
				I2S0_BCLK	O	MFP10	I2S0 bit clock output pin.
				EPWM0_CH0	I/O	MFP11	EPWM0 channel 0 output/capture input.
				TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
				INT0	I	MFP15	External interrupt 0 input pin.
2	2	3	2	PB.4	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH4	A	MFP1	EADC0 channel 4 analog input.
				ACMP1_P1	A	MFP1	Analog comparator 1 positive input 1 pin.
				EBI_ADR1	O	MFP2	EBI address bus bit 1.
				SD0_DAT2	I/O	MFP3	SD/SDIO0 data line bit 2.

			UART0_nRTS	O	MFP7	UART0 request to Send output pin.	
			UART5_RXD	I	MFP8	UART5 data receiver input pin.	
			I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.	
			CAN0_RXD	I	MFP10	CAN0 bus receiver input.	
			BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.	
			EPWM0_CH1	I/O	MFP13	EPWM0 channel 1 output/capture input.	
11	19	27	57	PA.3	I/O	MFP0	General purpose digital I/O pin.
				SPIM_SS	I/O	MFP2	SPIM slave select pin.
				QSPI0_SS	I/O	MFP3	Quad SPI0 slave select pin.
				SPI0_SS	I/O	MFP4	SPI0 slave select pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				SD1_DAT3	I/O	MFP5	SD/SDIO1 data line bit 3.
				SC0_PWR	O	MFP6	Smart Card 0 power pin.
				UART4_TXD	O	MFP7	UART4 data transmitter output pin.
				UART1_TXD	O	MFP8	UART1 data transmitter output pin.
				I2C1_SCL	I/O	MFP9	I2C1 clock pin.
				BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.
				EPWM0_CH2	I/O	MFP13	EPWM0 channel 2 output/capture input.
				QEI0_B	I	MFP14	Quadrature encoder 0 phase B input
12	20	28	58	PA.2	I/O	MFP0	General purpose digital I/O pin.
				SPIM_CLK	I/O	MFP2	SPIM serial clock pin.
				QSPI0_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
				SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
				SD1_DAT2	I/O	MFP5	SD/SDIO1 data line bit 2.
				SC0_RST	O	MFP6	Smart Card 0 reset pin.
				UART4_RXD	I	MFP7	UART4 data receiver input pin.
				UART1_RXD	I	MFP8	UART1 data receiver input pin.
				I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
				BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
				EPWM0_CH3	I/O	MFP13	EPWM0 channel 3 output/capture input.
13	21	29	59	PA.1	I/O	MFP0	General purpose digital I/O pin.
				SPIM_MISO	I/O	MFP2	SPIM MISO (Master In, Slave Out) pin.
				QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
				SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
				SD1_DAT1	I/O	MFP5	SD/SDIO1 data line bit 1.
				SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
				UART0_TXD	O	MFP7	UART0 data transmitter output pin.
				UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
				I2C2_SCL	I/O	MFP9	I2C2 clock pin.
				BPWM0_CH1	I/O	MFP12	BPWM0 channel 1 output/capture input.
				EPWM0_CH4	I/O	MFP13	EPWM0 channel 4 output/capture input.
				DAC1_ST	I	MFP15	DAC1 external trigger input.
14	22	30	60	PA.0	I/O	MFP0	General purpose digital I/O pin.
				SPIM_MOSI	I/O	MFP2	SPIM MOSI (Master Out, Slave In) pin.
				QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
				SD1_DAT0	I/O	MFP5	SD/SDIO1 data line bit 0.
				SC0_CLK	O	MFP6	Smart Card 0 clock pin.
				UART0_RXD	I	MFP7	UART0 data receiver input pin.
				UART1_nRTS	O	MFP8	UART1 request to Send output pin.
				I2C2_SDA	I/O	MFP9	I2C2 data input/output pin.
				BPWM0_CH0	I/O	MFP12	BPWM0 channel 0 output/capture input.
				EPWM0_CH5	I/O	MFP13	EPWM0 channel 5 output/capture input.
				DAC0_ST	I	MFP15	DAC0 external trigger input.
15	23	31	61	V _{DDIO}	P	MFP0	Power supply for PA.0~PA.5.
			62	PE.14	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD8	I/O	MFP2	EBI address/data bus bit 8.
				UART2_TXD	O	MFP3	UART2 data transmitter output pin.
				CAN0_TXD	O	MFP4	CAN0 bus transmitter output.
				SD1_nCD	I	MFP5	SD/SDIO1 card detect input pin
			63	PE.15	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
				UART2_RXD	I	MFP3	UART2 data receiver input pin.
				CAN0_RXD	I	MFP4	CAN0 bus receiver input.
16	24	32	64	nRESET	I	MFP0	External reset input: active LOW, with an internal pull-up. Set this pin low reset to initial state.
			65	PF.0	I/O	MFP0	General purpose digital I/O pin.
				UART1_TXD	O	MFP2	UART1 data transmitter output pin.
				I2C1_SCL	I/O	MFP3	I2C1 clock pin.
				BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
				ICE_DAT	O	MFP14	Serial wired debugger data pin.
			66	PF.1	I/O	MFP0	General purpose digital I/O pin.
				UART1_RXD	I	MFP2	UART1 data receiver input pin.
				I2C1_SDA	I/O	MFP3	I2C1 data input/output pin.
				BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
				ICE_CLK	I	MFP14	Serial wired debugger clock pin.
			67	PD.9	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
				I2C2_SCL	I/O	MFP3	I2C2 clock pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				UART2_nCTS	I	MFP4	UART2 clear to Send input pin.
		68		PD.8	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
				I2C2_SDA	I/O	MFP3	I2C2 data input/output pin.
				UART2_nRTS	O	MFP4	UART2 request to Send output pin.
	27	35	69	PC.5	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD5	I/O	MFP2	EBI address/data bus bit 5.
				SPIM_D2	I/O	MFP3	SPIM data 2 pin for Quad Mode I/O.
				QSPI0_MISO1	I/O	MFP4	Quad SPI0 MISO1 (Master In, Slave Out) pin.
				UART2_TXD	O	MFP8	UART2 data transmitter output pin.
				I2C1_SCL	I/O	MFP9	I2C1 clock pin.
				CAN0_TXD	O	MFP10	CAN0 bus transmitter output.
				UART4_TXD	O	MFP11	UART4 data transmitter output pin.
				EPWM1_CH0	I/O	MFP12	EPWM1 channel 0 output/capture input.
				PC.4	I/O	MFP0	General purpose digital I/O pin.
	28	36	70	EBI_AD4	I/O	MFP2	EBI address/data bus bit 4.
				SPIM_D3	I/O	MFP3	SPIM data 3 pin for Quad Mode I/O.
				QSPI0_MOSI1	I/O	MFP4	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
				SC1_nCD	I	MFP5	Smart Card 1 card detect pin.
				I2S0_BCLK	O	MFP6	I2S0 bit clock output pin.
				SPI1_I2SMCLK	I/O	MFP7	SPI1 I2S master clock output pin
				UART2_RXD	I	MFP8	UART2 data receiver input pin.
				I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
				CAN0_RXD	I	MFP10	CAN0 bus receiver input.
				UART4_RXD	I	MFP11	UART4 data receiver input pin.
				EPWM1_CH1	I/O	MFP12	EPWM1 channel 1 output/capture input.
	29	37	71	PC.3	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.
				SPIM_SS	I/O	MFP3	SPIM slave select pin.
				QSPI0_SS	I/O	MFP4	Quad SPI0 slave select pin.
				SC1_PWR	O	MFP5	Smart Card 1 power pin.
				I2S0_MCLK	O	MFP6	I2S0 master clock output pin.
				SPI1_MISO	I/O	MFP7	SPI1 MISO (Master In, Slave Out) pin.
				UART2_nRTS	O	MFP8	UART2 request to Send output pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				I2C0_SMBAL	O	MFP9	I2C0 SMBus SMBALTER pin
				CAN1_TXD	O	MFP10	CAN1 bus transmitter output.
				UART3_TXD	O	MFP11	UART3 data transmitter output pin.
				EPWM1_CH2	I/O	MFP12	EPWM1 channel 2 output/capture input.
				PC.2	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
				SPIM_CLK	I/O	MFP3	SPIM serial clock pin.
				QSPI0_CLK	I/O	MFP4	Quad SPI0 serial clock pin.
				SC1_RST	O	MFP5	Smart Card 1 reset pin.
				I2S0_DI	I	MFP6	I2S0 data input pin.
				SPI1_MOSI	I/O	MFP7	SPI1 MOSI (Master Out, Slave In) pin.
				UART2_nCTS	I	MFP8	UART2 clear to Send input pin.
				I2C0_SMBSUS	O	MFP9	I2C0 SMBus SMBSUS pin (PMBus CONTROL pin)
				CAN1_RXD	I	MFP10	CAN1 bus receiver input.
				UART3_RXD	I	MFP11	UART3 data receiver input pin.
				EPWM1_CH3	I/O	MFP12	EPWM1 channel 3 output/capture input.
				PC.1	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.
				SPIM_MISO	I/O	MFP3	SPIM MISO (Master In, Slave Out) pin.
				QSPI0_MISO0	I/O	MFP4	Quad SPI0 MISO0 (Master In, Slave Out) pin.
				SC1_DAT	I/O	MFP5	Smart Card 1 data pin.
				I2S0_DO	O	MFP6	I2S0 data output pin.
				SPI1_CLK	I/O	MFP7	SPI1 serial clock pin.
				UART2_TXD	O	MFP8	UART2 data transmitter output pin.
				I2C0_SCL	I/O	MFP9	I2C0 clock pin.
				EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
				ACMP0_O	O	MFP14	Analog comparator 0 output pin.
				PC.0	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD0	I/O	MFP2	EBI address/data bus bit 0.
				SPIM_MOSI	I/O	MFP3	SPIM MOSI (Master Out, Slave In) pin.
				QSPI0_MOSI0	I/O	MFP4	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
				SC1_CLK	O	MFP5	Smart Card 1 clock pin.
				I2S0_LRCK	O	MFP6	I2S0 left right channel clock output pin.
				SPI1_SS	I/O	MFP7	SPI1 slave select pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				UART2_RXD	I	MFP8	UART2 data receiver input pin.
				I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.
				EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
				ACMP1_O	O	MFP14	Analog comparator 1 output pin.
			75	V _{SS}	P	MFP0	Ground pin for digital circuit.
			76	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
			77	PG.9	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD0	I/O	MFP2	EBI address/data bus bit 0.
				SD1_DAT3	I/O	MFP3	SD/SDIO1 data line bit 3.
				SPI_M_D2	I/O	MFP4	SPI_M data 2 pin for Quad Mode I/O.
				BPWM0_CH5	I/O	MFP12	BPWM0 channel 5 output/capture input.
			78	PG.10	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.
				SD1_DAT2	I/O	MFP3	SD/SDIO1 data line bit 2.
				SPI_M_D3	I/O	MFP4	SPI_M data 3 pin for Quad Mode I/O.
				BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.
			79	PG.11	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
				SD1_DAT1	I/O	MFP3	SD/SDIO1 data line bit 1.
				SPI_M_SS	I/O	MFP4	SPI_M slave select pin.
				BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.
			80	PG.12	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.
				SD1_DAT0	I/O	MFP3	SD/SDIO1 data line bit 0.
				SPI_M_CLK	I/O	MFP4	SPI_M serial clock pin.
				BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
			81	PG.13	I/O	MFP0	General purpose digital I/O pin.

			85	PA.12	I/O	MFP0	General purpose digital I/O pin.
				I2S0_BCLK	O	MFP2	I2S0 bit clock output pin.
				UART4_TXD	O	MFP3	UART4 data transmitter output pin.
				I2C1_SCL	I/O	MFP4	I2C1 clock pin.
				SPI2_SS	I/O	MFP5	SPI2 slave select pin.
				CAN0_TXD	O	MFP6	CAN0 bus transmitter output.
				SC2_PWR	O	MFP7	Smart Card 2 power pin.
				BPWM1_CH2	I/O	MFP11	BPWM1 channel 2 output/capture input.
				QEI1_INDEX	I	MFP12	Quadrature encoder 1 index input
				USB_VBUS	P	MFP14	Power supply from USB host or HUB.
			86	PA.13	I/O	MFP0	General purpose digital I/O pin.
				I2S0_MCLK	O	MFP2	I2S0 master clock output pin.
				UART4_RXD	I	MFP3	UART4 data receiver input pin.
				I2C1_SDA	I/O	MFP4	I2C1 data input/output pin.
				SPI2_CLK	I/O	MFP5	SPI2 serial clock pin.
				CAN0_RXD	I	MFP6	CAN0 bus receiver input.
				SC2_RST	O	MFP7	Smart Card 2 reset pin.
				BPWM1_CH3	I/O	MFP11	BPWM1 channel 3 output/capture input.
				QEI1_A	I	MFP12	Quadrature encoder 1 phase A input
				USB_D-	A	MFP14	USB differential signal D-.
23	35		87	PA.14	I/O	MFP0	General purpose digital I/O pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				I2S0_DI	I	MFP2	I2S0 data input pin.
				UART0_TXD	O	MFP3	UART0 data transmitter output pin.
				SPI2_MISO	I/O	MFP5	SPI2 MISO (Master In, Slave Out) pin.
				I2C2_SCL	I/O	MFP6	I2C2 clock pin.
				SC2_DAT	I/O	MFP7	Smart Card 2 data pin.
				BPWM1_CH4	I/O	MFP11	BPWM1 channel 4 output/capture input.
				QEI1_B	I	MFP12	Quadrature encoder 1 phase B input
				USB_D+	A	MFP14	USB differential signal D+.
24	36	88		PA.15	I/O	MFP0	General purpose digital I/O pin.
				I2S0_DO	O	MFP2	I2S0 data output pin.
				UART0_RXD	I	MFP3	UART0 data receiver input pin.
				SPI2_MOSI	I/O	MFP5	SPI2 MOSI (Master Out, Slave In) pin.
				I2C2_SDA	I/O	MFP6	I2C2 data input/output pin.
				SC2_CLK	O	MFP7	Smart Card 2 clock pin.
				BPWM1_CH5	I/O	MFP11	BPWM1 channel 5 output/capture input.
				EPWM0_SYNC_IN	I	MFP12	EPWM0 counter synchronous trigger input pin.
				USB_OTG_ID	I	MFP14	USB_ identification.
	41	89		HSUSB_VRES	A	MFP0	HSUSB module reference resister
	42	90		HSUSB_VDD33	P	MFP0	Power supply for HSUSB VDD33
	43	91		HSUSB_VBUS	P	MFP0	HSUSB Power supply from USB host or HUB.
	44	92		HSUSB_D-	A	MFP0	HSUSB differential signal D-.
	45	93		HSUSB_VSS	P	MFP0	Ground pin for HSUSB.
	46	94		HSUSB_D+	A	MFP0	HSUSB differential signal D+.
	47	95		HSUSB_VDD12_CAP	A	MFP0	HSUSB Internal power regulator output 1.2V decoupling pin. Note: This pin needs to be connected with a 1uF capacitor.
	48	96		HSUSB_ID	I	MFP0	HSUSB identification.
		97		PE.7	I/O	MFP0	General purpose digital I/O pin.
				SD0_CMD	I/O	MFP3	SD/SDIO0 command/response pin
				SPIM_D2	I/O	MFP4	SPIM data 2 pin for Quad Mode I/O.
				UART5_TXD	O	MFP8	UART5 data transmitter output pin.
				CAN1_TXD	O	MFP9	CAN1 bus transmitter output.
				QEI1_INDEX	I	MFP11	Quadrature encoder 1 index input
				EPWM0_CH0	I/O	MFP12	EPWM0 channel 0 output/capture input.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				BPWM0_CH5	I/O	MFP13	BPWM0 channel 5 output/capture input.
			98	PE.6	I/O	MFP0	General purpose digital I/O pin.
				SD0_CLK	O	MFP3	SD/SDIO0 clock output pin
				SPIM_D3	I/O	MFP4	SPIM data 3 pin for Quad Mode I/O.
				SPI3_I2SMCLK	I/O	MFP5	SPI3 I2S master clock output pin
				SC0_nCD	I	MFP6	Smart Card 0 card detect pin.
				USCI0_CTL0	I/O	MFP7	USCI0 control 0 pin.
				UART5_RXD	I	MFP8	UART5 data receiver input pin.
				CAN1_RXD	I	MFP9	CAN1 bus receiver input.
				QEI1_A	I	MFP11	Quadrature encoder 1 phase A input
				EPWM0_CH1	I/O	MFP12	EPWM0 channel 1 output/capture input.
				BPWM0_CH4	I/O	MFP13	BPWM0 channel 4 output/capture input.
			99	PE.5	I/O	MFP0	General purpose digital I/O pin.
				EBI_nRD	O	MFP2	EBI read enable output pin.
				SD0_DAT3	I/O	MFP3	SD/SDIO0 data line bit 3.
				SPIM_SS	I/O	MFP4	SPIM slave select pin.
				SPI3_SS	I/O	MFP5	SPI3 slave select pin.
				SC0_PWR	O	MFP6	Smart Card 0 power pin.
				USCI0_CTL1	I/O	MFP7	USCI0 control 1 pin.
				QEI1_B	I	MFP11	Quadrature encoder 1 phase B input
				EPWM0_CH2	I/O	MFP12	EPWM0 channel 2 output/capture input.
				BPWM0_CH3	I/O	MFP13	BPWM0 channel 3 output/capture input.
			100	PE.4	I/O	MFP0	General purpose digital I/O pin.
				EBI_nWR	O	MFP2	EBI write enable output pin.
				SD0_DAT2	I/O	MFP3	SD/SDIO0 data line bit 2.
				SPIM_CLK	I/O	MFP4	SPIM serial clock pin.
				SPI3_CLK	I/O	MFP5	SPI3 serial clock pin.
				SC0_RST	O	MFP6	Smart Card 0 reset pin.
				USCI0_DAT1	I/O	MFP7	USCI0 data 1 pin.
				QEIO_INDEX	I	MFP11	Quadrature encoder 0 index input
				EPWM0_CH3	I/O	MFP12	EPWM0 channel 3 output/capture input.
				BPWM0_CH2	I/O	MFP13	BPWM0 channel 2 output/capture input.
			101	PE.3	I/O	MFP0	General purpose digital I/O pin.
				EBI_MCLK	O	MFP2	EBI external clock output pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				SD0_DAT1	I/O	MFP3	SD/SDIO0 data line bit 1.
				SPIIM_MISO	I/O	MFP4	SPIIM MISO (Master In, Slave Out) pin.
				SPI3_MISO	I/O	MFP5	SPI3 MISO (Master In, Slave Out) pin.
				SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
				USCI0_DAT0	I/O	MFP7	USCI0 data 0 pin.
				QEI0_A	I	MFP11	Quadrature encoder 0 phase A input
				EPWM0_CH4	I/O	MFP12	EPWM0 channel 4 output/capture input.
				BPWM0_CH1	I/O	MFP13	BPWM0 channel 1 output/capture input.
			102	PE.2	I/O	MFP0	General purpose digital I/O pin.
				EBI_ALE	O	MFP2	EBI address latch enable output pin.
				SD0_DAT0	I/O	MFP3	SD/SDIO0 data line bit 0.
				SPIIM_MOSI	I/O	MFP4	SPIIM MOSI (Master Out, Slave In) pin.
				SPI3_MOSI	I/O	MFP5	SPI3 MOSI (Master Out, Slave In) pin.
				SC0_CLK	O	MFP6	Smart Card 0 clock pin.
				USCI0_CLK	I/O	MFP7	USCI0 clock pin.
				QEI0_B	I	MFP11	Quadrature encoder 0 phase B input
				EPWM0_CH5	I/O	MFP12	EPWM0 channel 5 output/capture input.
				BPWM0_CH0	I/O	MFP13	BPWM0 channel 0 output/capture input.
			103	V _{ss}	P	MFP0	Ground pin for digital circuit.
			104	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
			105	PE.1	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
				QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
				SC2_DAT	I/O	MFP4	Smart Card 2 data pin.
				I2S0_BCLK	O	MFP5	I2S0 bit clock output pin.
				SPI1_MISO	I/O	MFP6	SPI1 MISO (Master In, Slave Out) pin.
				UART3_TXD	O	MFP7	UART3 data transmitter output pin.
				I2C1_SCL	I/O	MFP8	I2C1 clock pin.
				UART4_nCTS	I	MFP9	UART4 clear to Send input pin.
			106	PE.0	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
				QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
				SC2_CLK	O	MFP4	Smart Card 2 clock pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				I2S0_MCLK	O	MFP5	I2S0 master clock output pin.
				SPI1_MOSI	I/O	MFP6	SPI1 MOSI (Master Out, Slave In) pin.
				UART3_RXD	I	MFP7	UART3 data receiver input pin.
				I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.
				UART4_nRTS	O	MFP9	UART4 request to Send output pin.
			107	PH.8	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
				QSPI0_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
				SC2_PWR	O	MFP4	Smart Card 2 power pin.
				I2S0_DI	I	MFP5	I2S0 data input pin.
				SPI1_CLK	I/O	MFP6	SPI1 serial clock pin.
				UART3_nRTS	O	MFP7	UART3 request to Send output pin.
				I2C1_SMBAL	O	MFP8	I2C1 SMBus SMBALTER pin
				I2C2_SCL	I/O	MFP9	I2C2 clock pin.
				UART1_TXD	O	MFP10	UART1 data transmitter output pin.
			108	PH.9	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
				QSPI0_SS	I/O	MFP3	Quad SPI0 slave select pin.
				SC2_RST	O	MFP4	Smart Card 2 reset pin.
				I2S0_DO	O	MFP5	I2S0 data output pin.
				SPI1_SS	I/O	MFP6	SPI1 slave select pin.
				UART3_nCTS	I	MFP7	UART3 clear to Send input pin.
				I2C1_SMBSUS	O	MFP8	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
				I2C2_SDA	I/O	MFP9	I2C2 data input/output pin.
				UART1_RXD	I	MFP10	UART1 data receiver input pin.
			109	PH.10	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD14	I/O	MFP2	EBI address/data bus bit 14.
				QSPI0_MISO1	I/O	MFP3	Quad SPI0 MISO1 (Master In, Slave Out) pin.
				SC2_nCD	I	MFP4	Smart Card 2 card detect pin.
				I2S0_LRCK	O	MFP5	I2S0 left right channel clock output pin.
				SPI1_I2SMCLK	I/O	MFP6	SPI1 I2S master clock output pin
				UART4_TXD	O	MFP7	UART4 data transmitter output pin.
				UART0_TXD	O	MFP8	UART0 data transmitter output pin.
			110	PH.11	I/O	MFP0	General purpose digital I/O pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				EBI_AD15	I/O	MFP2	EBI address/data bus bit 15.
				QSPI0_MOSI1	I/O	MFP3	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
				UART4_RXD	I	MFP7	UART4 data receiver input pin.
				UART0_RXD	I	MFP8	UART0 data receiver input pin.
				EPWM0_CH5	I/O	MFP11	EPWM0 channel 5 output/capture input.
			111	PD.14	I/O	MFP0	General purpose digital I/O pin.
				EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
				SPI3_I2SMCLK	I/O	MFP3	SPI3 I2S master clock output pin
				SC1_nCD	I	MFP4	Smart Card 1 card detect pin.
				EPWM0_CH4	I/O	MFP11	EPWM0 channel 4 output/capture input.
25	37	49	112	V _{SS}	P	MFP0	Ground pin for digital circuit.
26	38	50	113	LDO_CAP	A	MFP0	LDO output pin.
27	39	51	114	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
			115	PC.14	I/O	MFP0	General purpose digital I/O pin.
				EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
				SC1_nCD	I	MFP3	Smart Card 1 card detect pin.
				SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
				USCI0_CTL0	I/O	MFP5	USCI0 control 0 pin.
				QSPI0_CLK	I/O	MFP6	Quad SPI0 serial clock pin.
				EPWM0_SYNC_IN	I	MFP11	EPWM0 counter synchronous trigger input pin.
				TM1	I/O	MFP13	Timer1 event counter input/toggle output pin.
				USB_VBUS_ST	I	MFP14	USB external VBUS regulator status pin.
				HSUSB_VBUS_ST	I	MFP15	HSUSB external VBUS regulator status pin.
			116	PB.15	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH15	A	MFP1	EADC0 channel 15 analog input.
				EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
				SC1_PWR	O	MFP3	Smart Card 1 power pin.
				SPI0_SS	I/O	MFP4	SPI0 slave select pin.
				USCI0_CTL1	I/O	MFP5	USCI0 control 1 pin.
				UART0_nCTS	I	MFP6	UART0 clear to Send input pin.
				UART3_TXD	O	MFP7	UART3 data transmitter output pin.
				I2C2_SMBAL	O	MFP8	I2C2 SMBus SMBALTER pin
				EPWM1_CH0	I/O	MFP11	EPWM1 channel 0 output/capture input.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
				USB_VBUS_EN	O	MFP14	USB external VBUS regulator enable pin.
				HSUSB_VBUS_EN	O	MFP15	HSUSB external VBUS regulator enable pin.
29	42	54	117	PB.14	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH14	A	MFP1	EADC0 channel 14 analog input.
				EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
				SC1_RST	O	MFP3	Smart Card 1 reset pin.
				SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
				USCI0_DAT1	I/O	MFP5	USCI0 data 1 pin.
				UART0_nRTS	O	MFP6	UART0 request to Send output pin.
				UART3_RXD	I	MFP7	UART3 data receiver input pin.
				I2C2_SMBSUS	O	MFP8	I2C2 SMBus SMBSUS pin (PMBus CONTROL pin)
				EPWM1_CH1	I/O	MFP11	EPWM1 channel 1 output/capture input.
				TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
				CLKO	O	MFP14	Clock Out
30	43	55	118	PB.13	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH13	A	MFP1	EADC0 channel 13 analog input.
				DAC1_OUT	A	MFP1	DAC1 channel analog output.
				ACMP0_P3	A	MFP1	Analog comparator 0 positive input 3 pin.
				ACMP1_P3	A	MFP1	Analog comparator 1 positive input 3 pin.
				EBI_AD14	I/O	MFP2	EBI address/data bus bit 14.
				SC1_DAT	I/O	MFP3	Smart Card 1 data pin.
				SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
				USCI0_DAT0	I/O	MFP5	USCI0 data 0 pin.
				UART0_TXD	O	MFP6	UART0 data transmitter output pin.
				UART3_nRTS	O	MFP7	UART3 request to Send output pin.
				I2C2_SCL	I/O	MFP8	I2C2 clock pin.
				EPWM1_CH2	I/O	MFP11	EPWM1 channel 2 output/capture input.
				TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.
31	44	56	119	PB.12	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH12	A	MFP1	EADC0 channel 12 analog input.
				DAC0_OUT	A	MFP1	DAC0 channel analog output.
				ACMP0_P2	A	MFP1	Analog comparator 0 positive input 2 pin.
				ACMP1_P2	A	MFP1	Analog comparator 1 positive input 2 pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				EBI_AD15	I/O	MFP2	EBI address/data bus bit 15.
				SC1_CLK	O	MFP3	Smart Card 1 clock pin.
				SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
				USCI0_CLK	I/O	MFP5	USCI0 clock pin.
				UART0_RXD	I	MFP6	UART0 data receiver input pin.
				UART3_nCTS	I	MFP7	UART3 clear to Send input pin.
				I2C2_SDA	I/O	MFP8	I2C2 data input/output pin.
				SD0_nCD	I	MFP9	SD/SDIO0 card detect input pin
				EPWM1_CH3	I/O	MFP11	EPWM1 channel 3 output/capture input.
				TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
32	45	57	120	AV _{DD}	P	MFP0	Power supply for internal analog circuit.
		58	121	V _{REF}	A	MFP0	ADC reference voltage input. Note: This pin needs to be connected with a 1uF capacitor.
	46	59	122	AV _{ss}	P	MFP0	Ground pin for analog circuit.
				PB.11	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH11	A	MFP1	EADC0 channel 11 analog input.
				EBI_ADR16	O	MFP2	EBI address bus bit 16.
				UART0_nCTS	I	MFP5	UART0 clear to Send input pin.
				UART4_TXD	O	MFP6	UART4 data transmitter output pin.
				I2C1_SCL	I/O	MFP7	I2C1 clock pin.
				CAN0_TXD	O	MFP8	CAN0 bus transmitter output.
				SPI0_I2SMCLK	I/O	MFP9	SPI0 I2S master clock output pin
				BPWM1_CH0	I/O	MFP10	BPWM1 channel 0 output/capture input.
				SPI3_CLK	I/O	MFP11	SPI3 serial clock pin.
				HSUSB_VBUS_ST	I	MFP14	HSUSB external VBUS regulator status pin.
				PB.10	I/O	MFP0	General purpose digital I/O pin.
				EADC0_CH10	A	MFP1	EADC0 channel 10 analog input.
				EBI_ADR17	O	MFP2	EBI address bus bit 17.
				USCI1_CTL0	I/O	MFP4	USCI1 control 0 pin.
				UART0_nRTS	O	MFP5	UART0 request to Send output pin.
				UART4_RXD	I	MFP6	UART4 data receiver input pin.
				I2C1_SDA	I/O	MFP7	I2C1 data input/output pin.
				CAN0_RXD	I	MFP8	CAN0 bus receiver input.
				BPWM1_CH1	I/O	MFP10	BPWM1 channel 1 output/capture input.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description	
				SPI3_SS	I/O	MFP11	SPI3 slave select pin.	
				HSUSB_VBUS_EN	O	MFP14	HSUSB external VBUS regulator enable pin.	
		62	125	PB.9	I/O	MFP0	General purpose digital I/O pin.	
				EADC0_CH9	A	MFP1	EADC0 channel 9 analog input.	
				EBI_ADR18	O	MFP2	EBI address bus bit 18.	
				USCI1_CTL1	I/O	MFP4	USCI1 control 1 pin.	
				UART0_TXD	O	MFP5	UART0 data transmitter output pin.	
				UART1_nCTS	I	MFP6	UART1 clear to Send input pin.	
				I2C1_SMBAL	O	MFP7	I2C1 SMBus SMBALTER pin	
				BPWM1_CH2	I/O	MFP10	BPWM1 channel 2 output/capture input.	
				SPI3_MISO	I/O	MFP11	SPI3 MISO (Master In, Slave Out) pin.	
				INT7	I	MFP13	External interrupt 7 input pin.	
		63	126	PB.8	I/O	MFP0	General purpose digital I/O pin.	
				EADC0_CH8	A	MFP1	EADC0 channel 8 analog input.	
				EBI_ADR19	O	MFP2	EBI address bus bit 19.	
				USCI1_CLK	I/O	MFP4	USCI1 clock pin.	
				UART0_RXD	I	MFP5	UART0 data receiver input pin.	
				UART1_nRTS	O	MFP6	UART1 request to Send output pin.	
				I2C1_SMBSUS	O	MFP7	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)	
				BPWM1_CH3	I/O	MFP10	BPWM1 channel 3 output/capture input.	
				SPI3_MOSI	I/O	MFP11	SPI3 MOSI (Master Out, Slave In) pin.	
				INT6	I	MFP13	External interrupt 6 input pin.	
		47	64	127	PB.7	I/O	MFP0	General purpose digital I/O pin.
					EADC0_CH7	A	MFP1	EADC0 channel 7 analog input.
					EBI_nWRL	O	MFP2	EBI low byte write enable output pin.
					USCI1_DAT0	I/O	MFP4	USCI1 data 0 pin.
					CAN1_TXD	O	MFP5	CAN1 bus transmitter output.
					UART1_TXD	O	MFP6	UART1 data transmitter output pin.
					SD1_CMD	I/O	MFP7	SD/SDIO1 command/response pin
					EBI_nCS0	O	MFP8	EBI chip select 0 output pin.
					BPWM1_CH4	I/O	MFP10	BPWM1 channel 4 output/capture input.
					EPWM1_BRAKE0	I	MFP11	EPWM1 Brake 0 input pin.
					EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
					INT5	I	MFP13	External interrupt 5 input pin.

32 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
				USB_VBUS_ST	I	MFP14	USB external VBUS regulator status pin.
				ACMP0_O	O	MFP15	Analog comparator 0 output pin.
48	1	128	PB.6	I/O	MFP0		General purpose digital I/O pin.
			EADC0_CH6	A	MFP1		EADC0 channel 6 analog input.
			EBI_nWRH	O	MFP2		EBI high byte write enable output pin
			USCI1_DAT1	I/O	MFP4		USCI1 data 1 pin.
			CAN1_RXD	I	MFP5		CAN1 bus receiver input.
			UART1_RXD	I	MFP6		UART1 data receiver input pin.
			SD1_CLK	O	MFP7		SD/SDIO1 clock output pin
			EBI_nCS1	O	MFP8		EBI chip select 1 output pin.
			BPWM1_CH5	I/O	MFP10		BPWM1 channel 5 output/capture input.
			EPWM1_BRAKE1	I	MFP11		EPWM1 Brake 1 input pin.
			EPWM1_CH5	I/O	MFP12		EPWM1 channel 5 output/capture input.
			INT4	I	MFP13		External interrupt 4 input pin.
			USB_VBUS_EN	O	MFP14		USB external VBUS regulator enable pin.
			ACMP1_O	O	MFP15		Analog comparator 1 output pin.

4.2.6 M487 Series Pin Description

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
2	1	1	PB.5	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH5	A	MFP1	EADC0 channel 5 analog input.
			ACMP1_N	A	MFP1	Analog comparator 1 negative input pin.
			EBI_ADR0	O	MFP2	EBI address bus bit 0.
			SD0_DAT3	I/O	MFP3	SD/SDIO0 data line bit 3.
			EMAC_RMII_REFCLK	I	MFP4	EMAC RMII reference clock input pin.
			SPI1_MISO	I/O	MFP5	SPI1 MISO (Master In, Slave Out) pin.
			I2C0_SCL	I/O	MFP6	I2C0 clock pin.
			UART5_TXD	O	MFP7	UART5 data transmitter output pin.
			USCI1_CTL0	I/O	MFP8	USCI1 control 0 pin.
			SC0_CLK	O	MFP9	Smart Card 0 clock pin.
			I2S0_BCLK	O	MFP10	I2S0 bit clock output pin.
			EPWM0_CH0	I/O	MFP11	EPWM0 channel 0 output/capture input.
			TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
			INT0	I	MFP15	External interrupt 0 input pin.
3	2	2	PB.4	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH4	A	MFP1	EADC0 channel 4 analog input.
			ACMP1_P1	A	MFP1	Analog comparator 1 positive input 1 pin.
			EBI_ADR1	O	MFP2	EBI address bus bit 1.
			SD0_DAT2	I/O	MFP3	SD/SDIO0 data line bit 2.
			EMAC_RMII_RXD0	I	MFP4	EMAC RMII Receive Data bus bit 0.
			SPI1_MOSI	I/O	MFP5	SPI1 MOSI (Master Out, Slave In) pin.
			I2C0_SDA	I/O	MFP6	I2C0 data input/output pin.
			UART5_RXD	I	MFP7	UART5 data receiver input pin.
			USCI1_CTL1	I/O	MFP8	USCI1 control 1 pin.
			SC0_DAT	I/O	MFP9	Smart Card 0 data pin.
			I2S0_MCLK	O	MFP10	I2S0 master clock output pin.
			EPWM0_CH1	I/O	MFP11	EPWM0 channel 1 output/capture input.
			TM1	I/O	MFP14	Timer1 event counter input/toggle output pin.
			INT1	I	MFP15	External interrupt 1 input pin.
4	3	3	PB.3	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH3	A	MFP1	EADC0 channel 3 analog input.
			ACMP0_N	A	MFP1	Analog comparator 0 negative input pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			EBI_ADR2	O	MFP2	EBI address bus bit 2.
			SD0_DAT1	I/O	MFP3	SD/SDIO0 data line bit 1.
			EMAC_RMII_RXD1	I	MFP4	EMAC RMII Receive Data bus bit 1.
			SPI1_CLK	I/O	MFP5	SPI1 serial clock pin.
			UART1_TXD	O	MFP6	UART1 data transmitter output pin.
			UART5_nRTS	O	MFP7	UART5 request to Send output pin.
			USCI1_DAT1	I/O	MFP8	USCI1 data 1 pin.
			SC0_RST	O	MFP9	Smart Card 0 reset pin.
			I2S0_DI	I	MFP10	I2S0 data input pin.
			EPWM0_CH2	I/O	MFP11	EPWM0 channel 2 output/capture input.
			TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
			INT2	I	MFP15	External interrupt 2 input pin.
			PB.2	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH2	A	MFP1	EADC0 channel 2 analog input.
			ACMP0_P1	A	MFP1	Analog comparator 0 positive input 1 pin.
			OPA0_O	A	MFP1	Operational amplifier 0 output pin.
			EBI_ADR3	O	MFP2	EBI address bus bit 3.
			SD0_DAT0	I/O	MFP3	SD/SDIO0 data line bit 0.
			EMAC_RMII_CRSDV	I	MFP4	EMAC RMII Carrier Sense/Receive Data input pin.
			SPI1_SS	I/O	MFP5	SPI1 slave select pin.
			UART1_RXD	I	MFP6	UART1 data receiver input pin.
			UART5_nCTS	I	MFP7	UART5 clear to Send input pin.
			USCI1_DAT0	I/O	MFP8	USCI1 data 0 pin.
			SC0_PWR	O	MFP9	Smart Card 0 power pin.
			I2S0_DO	O	MFP10	I2S0 data output pin.
			EPWM0_CH3	I/O	MFP11	EPWM0 channel 3 output/capture input.
			TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
			INT3	I	MFP15	External interrupt 3 input pin.
			PC.12	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR4	O	MFP2	EBI address bus bit 4.
			UART0_TXD	O	MFP3	UART0 data transmitter output pin.
			I2C0_SCL	I/O	MFP4	I2C0 clock pin.
			SPI3_MISO	I/O	MFP6	SPI3 MISO (Master In, Slave Out) pin.
			SC0_nCD	I	MFP9	Smart Card 0 card detect pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			ECAP1_IC2	I	MFP11	Enhanced capture unit 1 input 2 pin.
			EPWM1_CH0	I/O	MFP12	EPWM1 channel 0 output/capture input.
			ACMP0_O	O	MFP14	Analog comparator 0 output pin.
	6	6	PC.11	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR5	O	MFP2	EBI address bus bit 5.
			UART0_RXD	I	MFP3	UART0 data receiver input pin.
			I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
			SPI3_MOSI	I/O	MFP6	SPI3 MOSI (Master Out, Slave In) pin.
			ECAP1_IC1	I	MFP11	Enhanced capture unit 1 input 1 pin.
			EPWM1_CH1	I/O	MFP12	EPWM1 channel 1 output/capture input.
			ACMP1_O	O	MFP14	Analog comparator 1 output pin.
	7	7	PC.10	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR6	O	MFP2	EBI address bus bit 6.
			SPI3_CLK	I/O	MFP6	SPI3 serial clock pin.
			UART3_TXD	O	MFP7	UART3 data transmitter output pin.
			CAN1_TXD	O	MFP9	CAN1 bus transmitter output.
			ECAP1_IC0	I	MFP11	Enhanced capture unit 1 input 0 pin.
			EPWM1_CH2	I/O	MFP12	EPWM1 channel 2 output/capture input.
	8	8	PC.9	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR7	O	MFP2	EBI address bus bit 7.
			SPI3_SS	I/O	MFP6	SPI3 slave select pin.
			UART3_RXD	I	MFP7	UART3 data receiver input pin.
			CAN1_RXD	I	MFP9	CAN1 bus receiver input.
			EPWM1_CH3	I/O	MFP12	EPWM1 channel 3 output/capture input.
	9	9	PB.1	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH1	A	MFP1	EADC0 channel 1 analog input.
			OPA0_N	A	MFP1	Operational amplifier 0 negative input pin.
			EBI_ADR8	O	MFP2	EBI address bus bit 8.
			SD0_CLK	O	MFP3	SD/SDIO0 clock output pin
			EMAC_RMII_RXERR	I	MFP4	EMAC RMII Receive Data Error input pin.
			SPI1_I2SMCLK	I/O	MFP5	SPI1 I2S master clock output pin
			SPI3_I2SMCLK	I/O	MFP6	SPI3 I2S master clock output pin
			UART2_TXD	O	MFP7	UART2 data transmitter output pin.
			USCI1_CLK	I/O	MFP8	USCI1 clock pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			I2C1_SCL	I/O	MFP9	I2C1 clock pin.
			I2S0_LRCK	O	MFP10	I2S0 left right channel clock output pin.
			EPWM0_CH4	I/O	MFP11	EPWM0 channel 4 output/capture input.
			EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
			EPWM0_BRAKE0	I	MFP13	EPWM0 Brake 0 input pin.
7	10	10	PB.0	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH0	A	MFP1	EADC0 channel 0 analog input.
			OPA0_P	A	MFP1	Operational amplifier 0 positive input pin.
			EBI_ADR9	O	MFP2	EBI address bus bit 9.
			SD0_CMD	I/O	MFP3	SD/SDIO0 command/response pin
			UART2_RXD	I	MFP7	UART2 data receiver input pin.
			SPI0_I2SMCLK	I/O	MFP8	SPI0 I2S master clock output pin
			I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
			EPWM0_CH5	I/O	MFP11	EPWM0 channel 5 output/capture input.
			EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
	11	11	V _{SS}	P	MFP0	Ground pin for digital circuit.
			V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
8	13	13	PA.11	I/O	MFP0	General purpose digital I/O pin.
			ACMP0_P0	A	MFP1	Analog comparator 0 positive input 0 pin.
			EBI_nRD	O	MFP2	EBI read enable output pin.
			SC2_PWR	O	MFP3	Smart Card 2 power pin.
			SPI2_SS	I/O	MFP4	SPI2 slave select pin.
			SD1_DAT3	I/O	MFP5	SD/SDIO1 data line bit 3.
			USCI0_CLK	I/O	MFP6	USCI0 clock pin.
			I2C2_SCL	I/O	MFP7	I2C2 clock pin.
			BPWM0_CH0	I/O	MFP9	BPWM0 channel 0 output/capture input.
			EPWM0_SYNC_OUT	O	MFP10	EPWM0 counter synchronous trigger output pin.
			TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
			DAC1_ST	I	MFP14	DAC1 external trigger input.
9	14	14	PA.10	I/O	MFP0	General purpose digital I/O pin.
			ACMP1_P0	A	MFP1	Analog comparator 1 positive input 0 pin.
			OPA1_O	A	MFP1	Operational amplifier 1 output pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			EBI_nWR	O	MFP2	EBI write enable output pin.
			SC2_RST	O	MFP3	Smart Card 2 reset pin.
			SPI2_CLK	I/O	MFP4	SPI2 serial clock pin.
			SD1_DAT2	I/O	MFP5	SD/SDIO1 data line bit 2.
			USCI0_DAT0	I/O	MFP6	USCI0 data 0 pin.
			I2C2_SDA	I/O	MFP7	I2C2 data input/output pin.
			BPWM0_CH1	I/O	MFP9	BPWM0 channel 1 output/capture input.
			QE1_INDEX	I	MFP10	Quadrature encoder 1 index input
			ECAP0_IC0	I	MFP11	Enhanced capture unit 0 input 0 pin.
			TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
			DAC0_ST	I	MFP14	DAC0 external trigger input.
			PA.9	I/O	MFP0	General purpose digital I/O pin.
			OPA1_N	A	MFP1	Operational amplifier 1 negative input pin.
			EBI_MCLK	O	MFP2	EBI external clock output pin.
			SC2_DAT	I/O	MFP3	Smart Card 2 data pin.
			SPI2_MISO	I/O	MFP4	SPI2 MISO (Master In, Slave Out) pin.
			SD1_DAT1	I/O	MFP5	SD/SDIO1 data line bit 1.
			USCI0_DAT1	I/O	MFP6	USCI0 data 1 pin.
			UART1_TXD	O	MFP7	UART1 data transmitter output pin.
			BPWM0_CH2	I/O	MFP9	BPWM0 channel 2 output/capture input.
			QE1_A	I	MFP10	Quadrature encoder 1 phase A input
			ECAP0_IC1	I	MFP11	Enhanced capture unit 0 input 1 pin.
			TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.
			PA.8	I/O	MFP0	General purpose digital I/O pin.
			OPA1_P	A	MFP1	Operational amplifier 1 positive input pin.
			EBI_ALE	O	MFP2	EBI address latch enable output pin.
			SC2_CLK	O	MFP3	Smart Card 2 clock pin.
			SPI2_MOSI	I/O	MFP4	SPI2 MOSI (Master Out, Slave In) pin.
			SD1_DAT0	I/O	MFP5	SD/SDIO1 data line bit 0.
			USCI0_CTL1	I/O	MFP6	USCI0 control 1 pin.
			UART1_RXD	I	MFP7	UART1 data receiver input pin.
			BPWM0_CH3	I/O	MFP9	BPWM0 channel 3 output/capture input.
			QE1_B	I	MFP10	Quadrature encoder 1 phase B input
			ECAP0_IC2	I	MFP11	Enhanced capture unit 0 input 2 pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
			INT4	I	MFP15	External interrupt 4 input pin.
	17	17	PC.13	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR10	O	MFP2	EBI address bus bit 10.
			SC2_nCD	I	MFP3	Smart Card 2 card detect pin.
			SPI2_I2SMCLK	I/O	MFP4	SPI2 I2S master clock output pin
			CAN1_TXD	O	MFP5	CAN1 bus transmitter output.
			USCI0_CTL0	I/O	MFP6	USCI0 control 0 pin.
			UART2_TXD	O	MFP7	UART2 data transmitter output pin.
			BPWM0_CH4	I/O	MFP9	BPWM0 channel 4 output/capture input.
			CLKO	O	MFP13	Clock Out
			EADC0_ST	I	MFP14	EADC0 external trigger input.
	18	18	PD.12	I/O	MFP0	General purpose digital I/O pin.
			OPA2_O	A	MFP1	Operational amplifier 2 output pin.
			EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
			CAN1_RXD	I	MFP5	CAN1 bus receiver input.
			UART2_RXD	I	MFP7	UART2 data receiver input pin.
			BPWM0_CH5	I/O	MFP9	BPWM0 channel 5 output/capture input.
			QEIO_INDEX	I	MFP10	Quadrature encoder 0 index input
			CLKO	O	MFP13	Clock Out
			EADC0_ST	I	MFP14	EADC0 external trigger input.
			INT5	I	MFP15	External interrupt 5 input pin.
	19	19	PD.11	I/O	MFP0	General purpose digital I/O pin.
			OPA2_N	A	MFP1	Operational amplifier 2 negative input pin.
			EBI_nCS1	O	MFP2	EBI chip select 1 output pin.
			UART1_TXD	O	MFP3	UART1 data transmitter output pin.
			CAN0_TXD	O	MFP4	CAN0 bus transmitter output.
			QEIO_A	I	MFP10	Quadrature encoder 0 phase A input
			INT6	I	MFP15	External interrupt 6 input pin.
	20	20	PD.10	I/O	MFP0	General purpose digital I/O pin.
			OPA2_P	A	MFP1	Operational amplifier 2 positive input pin.
			EBI_nCS2	O	MFP2	EBI chip select 2 output pin.
			UART1_RXD	I	MFP3	UART1 data receiver input pin.
			CAN0_RXD	I	MFP4	CAN0 bus receiver input.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			QEIO_B	I	MFP10	Quadrature encoder 0 phase B input
			INT7	I	MFP15	External interrupt 7 input pin.
		21	V _{ss}	P	MFP0	Ground pin for digital circuit.
			22 V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
			23 PG.0	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR8	O	MFP2	EBI address bus bit 8.
			I2C0_SCL	I/O	MFP4	I2C0 clock pin.
			I2C1_SMBAL	O	MFP5	I2C1 SMBus SMBALTER pin
			UART2_RXD	I	MFP6	UART2 data receiver input pin.
			CAN1_TXD	O	MFP7	CAN1 bus transmitter output.
			UART1_TXD	O	MFP8	UART1 data transmitter output pin.
			24 PG.1	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR9	O	MFP2	EBI address bus bit 9.
			SPI2_I2SMCLK	I/O	MFP3	SPI2 I2S master clock output pin
			I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
			I2C1_SMBSUS	O	MFP5	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
			UART2_TXD	O	MFP6	UART2 data transmitter output pin.
			CAN1_RXD	I	MFP7	CAN1 bus receiver input.
			UART1_RXD	I	MFP8	UART1 data receiver input pin.
	21		25 PG.2	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR11	O	MFP2	EBI address bus bit 11.
			SPI2_SS	I/O	MFP3	SPI2 slave select pin.
			I2C0_SMBAL	O	MFP4	I2C0 SMBus SMBALTER pin
			I2C1_SCL	I/O	MFP5	I2C1 clock pin.
			TM0	I/O	MFP13	Timer0 event counter input/toggle output pin.
	22		26 PG.3	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR12	O	MFP2	EBI address bus bit 12.
			SPI2_CLK	I/O	MFP3	SPI2 serial clock pin.
			I2C0_SMBSUS	O	MFP4	I2C0 SMBus SMBSUS pin (PMBus CONTROL pin)
			I2C1_SDA	I/O	MFP5	I2C1 data input/output pin.
			TM1	I/O	MFP13	Timer1 event counter input/toggle output pin.
	23		PG.4	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR13	O	MFP2	EBI address bus bit 13.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			SPI2_MISO	I/O	MFP3	SPI2 MISO (Master In, Slave Out) pin.
			TM2	I/O	MFP13	Timer2 event counter input/toggle output pin.
	24	28	PF.11	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR14	O	MFP2	EBI address bus bit 14.
			SPI2_MOSI	I/O	MFP3	SPI2 MOSI (Master Out, Slave In) pin.
			TAMPER5	I/O	MFP10	TAMPER detector loop pin 5.
			TM3	I/O	MFP13	Timer3 event counter input/toggle output pin.
	25	29	PF.10	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR15	O	MFP2	EBI address bus bit 15.
			SC0_nCD	I	MFP3	Smart Card 0 card detect pin.
			I2S0_BCLK	O	MFP4	I2S0 bit clock output pin.
			SPI0_I2SMCLK	I/O	MFP5	SPI0 I2S master clock output pin
			TAMPER4	I/O	MFP10	TAMPER detector loop pin 4.
	26	30	PF.9	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR16	O	MFP2	EBI address bus bit 16.
			SC0_PWR	O	MFP3	Smart Card 0 power pin.
			I2S0_MCLK	O	MFP4	I2S0 master clock output pin.
			SPI0_SS	I/O	MFP5	SPI0 slave select pin.
			TAMPER3	I/O	MFP10	TAMPER detector loop pin 3.
	27	31	PF.8	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR17	O	MFP2	EBI address bus bit 17.
			SC0_RST	O	MFP3	Smart Card 0 reset pin.
			I2S0_DI	I	MFP4	I2S0 data input pin.
			SPI0_CLK	I/O	MFP5	SPI0 serial clock pin.
			TAMPER2	I/O	MFP10	TAMPER detector loop pin 2.
	28	32	PF.7	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR18	O	MFP2	EBI address bus bit 18.
			SC0_DAT	I/O	MFP3	Smart Card 0 data pin.
			I2S0_DO	O	MFP4	I2S0 data output pin.
			SPI0_MISO	I/O	MFP5	SPI0 MISO (Master In, Slave Out) pin.
			UART4_TXD	O	MFP6	UART4 data transmitter output pin.
			TAMPER1	I/O	MFP10	TAMPER detector loop pin 1.
	12	29	PF.6	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR19	O	MFP2	EBI address bus bit 19.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			SC0_CLK	O	MFP3	Smart Card 0 clock pin.
			I2S0_LRCK	O	MFP4	I2S0 left right channel clock output pin.
			SPI0_MOSI	I/O	MFP5	SPI0 MOSI (Master Out, Slave In) pin.
			UART4_RXD	I	MFP6	UART4 data receiver input pin.
			EBI_nCS0	O	MFP7	EBI chip select 0 output pin.
			TAMPER0	I/O	MFP10	TAMPER detector loop pin 0.
13	30	34	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
			PF.5	I/O	MFP0	General purpose digital I/O pin.
			UART2_RXD	I	MFP2	UART2 data receiver input pin.
			UART2_nCTS	I	MFP4	UART2 clear to Send input pin.
			BPWM0_CH4	I/O	MFP8	BPWM0 channel 4 output/capture input.
			EPWM0_SYNC_OUT	O	MFP9	EPWM0 counter synchronous trigger output pin.
			X32_IN	I	MFP10	External 32.768 kHz crystal input pin.
			EADC0_ST	I	MFP11	EADC0 external trigger input.
			PF.4	I/O	MFP0	General purpose digital I/O pin.
			UART2_TXD	O	MFP2	UART2 data transmitter output pin.
			UART2_nRTS	O	MFP4	UART2 request to Send output pin.
			BPWM0_CH5	I/O	MFP8	BPWM0 channel 5 output/capture input.
			X32_OUT	O	MFP10	External 32.768 kHz crystal output pin.
			PH.0	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR7	O	MFP2	EBI address bus bit 7.
			UART5_TXD	O	MFP4	UART5 data transmitter output pin.
			TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
			PH.1	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR6	O	MFP2	EBI address bus bit 6.
			UART5_RXD	I	MFP4	UART5 data receiver input pin.
			TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
			PH.2	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR5	O	MFP2	EBI address bus bit 5.
			UART5_nRTS	O	MFP4	UART5 request to Send output pin.
			UART4_TXD	O	MFP5	UART4 data transmitter output pin.
			I2C0_SCL	I/O	MFP6	I2C0 clock pin.
			TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description	
		40	PH.3	I/O	MFP0	General purpose digital I/O pin.	
			EBI_ADR4	O	MFP2	EBI address bus bit 4.	
			SPI1_I2SMCLK	I/O	MFP3	SPI1 I2S master clock output pin	
			UART5_nCTS	I	MFP4	UART5 clear to Send input pin.	
			UART4_RXD	I	MFP5	UART4 data receiver input pin.	
			I2C0_SDA	I/O	MFP6	I2C0 data input/output pin.	
			TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.	
	33	41	PH.4	I/O	MFP0	General purpose digital I/O pin.	
			EBI_ADR3	O	MFP2	EBI address bus bit 3.	
			SPI1_MISO	I/O	MFP3	SPI1 MISO (Master In, Slave Out) pin.	
	34	42	PH.5	I/O	MFP0	General purpose digital I/O pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
	44	52	PE.11	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR13	O	MFP2	EBI address bus bit 13.
			EMAC_RMII_TXD1	O	MFP3	EMAC RMII Transmit Data bus bit 1.
			I2S0_DO	O	MFP4	I2S0 data output pin.
			SPI2_SS	I/O	MFP5	SPI2 slave select pin.
			USCI1_DAT1	I/O	MFP6	USCI1 data 1 pin.
			UART3_RXD	I	MFP7	UART3 data receiver input pin.
			UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
			EPWM0_CH3	I/O	MFP10	EPWM0 channel 3 output/capture input.
			EPWM1_BRAKE1	I	MFP11	EPWM1 Brake 1 input pin.
			ECAP1_IC2	I	MFP13	Enhanced capture unit 1 input 2 pin.
			TRACE_DATA2	O	MFP14	ETM Trace Data 2 output pin
	45	53	PE.12	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR14	O	MFP2	EBI address bus bit 14.
			EMAC_RMII_TXEN	O	MFP3	EMAC RMII Transmit Enable output pin.
			I2S0_LRCK	O	MFP4	I2S0 left right channel clock output pin.
			SPI2_I2SMCLK	I/O	MFP5	SPI2 I2S master clock output pin
			USCI1_CLK	I/O	MFP6	USCI1 clock pin.
			UART1_nRTS	O	MFP8	UART1 request to Send output pin.
			EPWM0_CH4	I/O	MFP10	EPWM0 channel 4 output/capture input.
			ECAP1_IC1	I	MFP13	Enhanced capture unit 1 input 1 pin.
			TRACE_DATA3	O	MFP14	ETM Trace Data 3 output pin
	46	54	PE.13	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR15	O	MFP2	EBI address bus bit 15.
			EMAC_PPS	O	MFP3	EMAC Pulse Per Second output pin.
			I2C0_SCL	I/O	MFP4	I2C0 clock pin.
			UART4_nRTS	O	MFP5	UART4 request to Send output pin.
			UART1_TXD	O	MFP8	UART1 data transmitter output pin.
			EPWM0_CH5	I/O	MFP10	EPWM0 channel 5 output/capture input.
			EPWM1_CH0	I/O	MFP11	EPWM1 channel 0 output/capture input.
			BPWM1_CH5	I/O	MFP12	BPWM1 channel 5 output/capture input.
			ECAP1_IC0	I	MFP13	Enhanced capture unit 1 input 0 pin.
	47	55	PC.8	I/O	MFP0	General purpose digital I/O pin.
			EBI_ADR16	O	MFP2	EBI address bus bit 16.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			EMAC_RMII_REFCLK	I	MFP3	EMAC RMII reference clock input pin.
			I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
			UART4_nCTS	I	MFP5	UART4 clear to Send input pin.
			UART1_RXD	I	MFP8	UART1 data receiver input pin.
			EPWM1_CH1	I/O	MFP11	EPWM1 channel 1 output/capture input.
			BPWM1_CH4	I/O	MFP12	BPWM1 channel 4 output/capture input.
			PC.7	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
			EMAC_RMII_RXD0	I	MFP3	EMAC RMII Receive Data bus bit 0.
			SPI1_MISO	I/O	MFP4	SPI1 MISO (Master In, Slave Out) pin.
			UART4_TXD	O	MFP5	UART4 data transmitter output pin.
			SC2_PWR	O	MFP6	Smart Card 2 power pin.
			UART0_nCTS	I	MFP7	UART0 clear to Send input pin.
			I2C1_SMBAL	O	MFP8	I2C1 SMBus SMBALTER pin
			EPWM1_CH2	I/O	MFP11	EPWM1 channel 2 output/capture input.
			BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
			TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
			INT3	I	MFP15	External interrupt 3 input pin.
			PC.6	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD8	I/O	MFP2	EBI address/data bus bit 8.
			EMAC_RMII_RXD1	I	MFP3	EMAC RMII Receive Data bus bit 1.
			SPI1_MOSI	I/O	MFP4	SPI1 MOSI (Master Out, Slave In) pin.
			UART4_RXD	I	MFP5	UART4 data receiver input pin.
			SC2_RST	O	MFP6	Smart Card 2 reset pin.
			UART0_nRTS	O	MFP7	UART0 request to Send output pin.
			I2C1_SMBSUS	O	MFP8	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
			EPWM1_CH3	I/O	MFP11	EPWM1 channel 3 output/capture input.
			BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
			TM1	I/O	MFP14	Timer1 event counter input/toggle output pin.
			INT2	I	MFP15	External interrupt 2 input pin.
			PA.7	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
			EMAC_RMII_CRSDV	I	MFP3	EMAC RMII Carrier Sense/Receive Data input pin.
			SPI1_CLK	I/O	MFP4	SPI1 serial clock pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			SC2_DAT	I/O	MFP6	Smart Card 2 data pin.
			UART0_TXD	O	MFP7	UART0 data transmitter output pin.
			I2C1_SCL	I/O	MFP8	I2C1 clock pin.
			EPWM1_CH4	I/O	MFP11	EPWM1 channel 4 output/capture input.
			BPWM1_CH2	I/O	MFP12	BPWM1 channel 2 output/capture input.
			ACMP0_WLAT	I	MFP13	Analog comparator 0 window latch input pin
			TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
			INT1	I	MFP15	External interrupt 1 input pin.
21	51	59	PA.6	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
			EMAC_RMII_RXERR	I	MFP3	EMAC RMII Receive Data Error input pin.
			SPI1_SS	I/O	MFP4	SPI1 slave select pin.
			SD1_nCD	I	MFP5	SD/SDIO1 card detect input pin
			SC2_CLK	O	MFP6	Smart Card 2 clock pin.
			UART0_RXD	I	MFP7	UART0 data receiver input pin.
			I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.
			EPWM1_CH5	I/O	MFP11	EPWM1 channel 5 output/capture input.
			BPWM1_CH3	I/O	MFP12	BPWM1 channel 3 output/capture input.
			ACMP1_WLAT	I	MFP13	Analog comparator 1 window latch input pin
			TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
			INT0	I	MFP15	External interrupt 0 input pin.
22	52	60	V _{SS}	P	MFP0	Ground pin for digital circuit.
23	53	61	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
24	54	62	LDO_CAP	A	MFP0	LDO output pin.
25	55	63	PA.5	I/O	MFP0	General purpose digital I/O pin.
			SPIM_D2	I/O	MFP2	SPIM data 2 pin for Quad Mode I/O.
			QSPI0_MISO1	I/O	MFP3	Quad SPI0 MISO1 (Master In, Slave Out) pin.
			SPI1_I2SMCLK	I/O	MFP4	SPI1 I2S master clock output pin
			SD1_CMD	I/O	MFP5	SD/SDIO1 command/response pin
			SC2_nCD	I	MFP6	Smart Card 2 card detect pin.
			UART0_nCTS	I	MFP7	UART0 clear to Send input pin.
			UART5_TXD	O	MFP8	UART5 data transmitter output pin.
			I2C0_SCL	I/O	MFP9	I2C0 clock pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			CAN0_TXD	O	MFP10	CAN0 bus transmitter output.
			BPWM0_CH5	I/O	MFP12	BPWM0 channel 5 output/capture input.
			EPWM0_CH0	I/O	MFP13	EPWM0 channel 0 output/capture input.
			QEIO_INDEX	I	MFP14	Quadrature encoder 0 index input
26	56	64	PA.4	I/O	MFP0	General purpose digital I/O pin.
			SPIIM_D3	I/O	MFP2	SPIIM data 3 pin for Quad Mode I/O.
			QSPI0_MOSI1	I/O	MFP3	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
			SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
			SD1_CLK	O	MFP5	SD/SDIO1 clock output pin
			SC0_nCD	I	MFP6	Smart Card 0 card detect pin.
			UART0_nRTS	O	MFP7	UART0 request to Send output pin.
			UART5_RXD	I	MFP8	UART5 data receiver input pin.
			I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.
			CAN0_RXD	I	MFP10	CAN0 bus receiver input.
			BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.
			EPWM0_CH1	I/O	MFP13	EPWM0 channel 1 output/capture input.
27	57	65	QEIO_A	I	MFP14	Quadrature encoder 0 phase A input
			PA.3	I/O	MFP0	General purpose digital I/O pin.
			SPIIM_SS	I/O	MFP2	SPIIM slave select pin.
			QSPI0_SS	I/O	MFP3	Quad SPI0 slave select pin.
			SPI0_SS	I/O	MFP4	SPI0 slave select pin.
			SD1_DAT3	I/O	MFP5	SD/SDIO1 data line bit 3.
			SC0_PWR	O	MFP6	Smart Card 0 power pin.
			UART4_TXD	O	MFP7	UART4 data transmitter output pin.
			UART1_TXD	O	MFP8	UART1 data transmitter output pin.
			I2C1_SCL	I/O	MFP9	I2C1 clock pin.
			BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.
			EPWM0_CH2	I/O	MFP13	EPWM0 channel 2 output/capture input.
28	58	66	QEIO_B	I	MFP14	Quadrature encoder 0 phase B input
			PA.2	I/O	MFP0	General purpose digital I/O pin.
			SPIIM_CLK	I/O	MFP2	SPIIM serial clock pin.
			QSPI0_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
			SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
			SD1_DAT2	I/O	MFP5	SD/SDIO1 data line bit 2.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			SC0_RST	O	MFP6	Smart Card 0 reset pin.
			UART4_RXD	I	MFP7	UART4 data receiver input pin.
			UART1_RXD	I	MFP8	UART1 data receiver input pin.
			I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
			BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
			EPWM0_CH3	I/O	MFP13	EPWM0 channel 3 output/capture input.
			PA.1	I/O	MFP0	General purpose digital I/O pin.
			SPIIM_MISO	I/O	MFP2	SPIIM MISO (Master In, Slave Out) pin.
			QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
			SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
			SD1_DAT1	I/O	MFP5	SD/SDIO1 data line bit 1.
			SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
			UART0_TXD	O	MFP7	UART0 data transmitter output pin.
			UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
			I2C2_SCL	I/O	MFP9	I2C2 clock pin.
			BPWM0_CH1	I/O	MFP12	BPWM0 channel 1 output/capture input.
			EPWM0_CH4	I/O	MFP13	EPWM0 channel 4 output/capture input.
			DAC1_ST	I	MFP15	DAC1 external trigger input.
			PA.0	I/O	MFP0	General purpose digital I/O pin.
			SPIIM_MOSI	I/O	MFP2	SPIIM MOSI (Master Out, Slave In) pin.
			QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
			SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
			SD1_DAT0	I/O	MFP5	SD/SDIO1 data line bit 0.
			SC0_CLK	O	MFP6	Smart Card 0 clock pin.
			UART0_RXD	I	MFP7	UART0 data receiver input pin.
			UART1_nRTS	O	MFP8	UART1 request to Send output pin.
			I2C2_SDA	I/O	MFP9	I2C2 data input/output pin.
			BPWM0_CH0	I/O	MFP12	BPWM0 channel 0 output/capture input.
			EPWM0_CH5	I/O	MFP13	EPWM0 channel 5 output/capture input.
			DAC0_ST	I	MFP15	DAC0 external trigger input.
31	61	69	V _{DDIO}	P	MFP0	Power supply for PA.0~PA.5.
			PE.14	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD8	I/O	MFP2	EBI address/data bus bit 8.
			UART2_TXD	O	MFP3	UART2 data transmitter output pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			CAN0_TXD	O	MFP4	CAN0 bus transmitter output.
			SD1_nCD	I	MFP5	SD/SDIO1 card detect input pin
	63	71	PE.15	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
			UART2_RXD	I	MFP3	UART2 data receiver input pin.
			CAN0_RXD	I	MFP4	CAN0 bus receiver input.
32	64	72	nRESET	I	MFP0	External reset input: active LOW, with an internal pull-up. Set this pin low reset to initial state.
	65	73	PF.0	I/O	MFP0	General purpose digital I/O pin.
			UART1_TXD	O	MFP2	UART1 data transmitter output pin.
			I2C1_SCL	I/O	MFP3	I2C1 clock pin.
			BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
			ICE_DAT	O	MFP14	Serial wired debugger data pin.
	66	74	PF.1	I/O	MFP0	General purpose digital I/O pin.
			UART1_RXD	I	MFP2	UART1 data receiver input pin.
			I2C1_SDA	I/O	MFP3	I2C1 data input/output pin.
			BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
			ICE_CLK	I	MFP14	Serial wired debugger clock pin.
	67	75	PD.9	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
			I2C2_SCL	I/O	MFP3	I2C2 clock pin.
			UART2_nCTS	I	MFP4	UART2 clear to Send input pin.
	68	76	PD.8	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
			I2C2_SDA	I/O	MFP3	I2C2 data input/output pin.
			UART2_nRTS	O	MFP4	UART2 request to Send output pin.
	69	77	PC.5	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD5	I/O	MFP2	EBI address/data bus bit 5.
			SPIM_D2	I/O	MFP3	SPIM data 2 pin for Quad Mode I/O.
			QSPI0_MISO1	I/O	MFP4	Quad SPI0 MISO1 (Master In, Slave Out) pin.
			UART2_TXD	O	MFP8	UART2 data transmitter output pin.
			I2C1_SCL	I/O	MFP9	I2C1 clock pin.
			CAN0_TXD	O	MFP10	CAN0 bus transmitter output.
			UART4_TXD	O	MFP11	UART4 data transmitter output pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			EPWM1_CH0	I/O	MFP12	EPWM1 channel 0 output/capture input.
36	70	78	PC.4	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD4	I/O	MFP2	EBI address/data bus bit 4.
			SPIIM_D3	I/O	MFP3	SPIIM data 3 pin for Quad Mode I/O.
			QSPI0_MOSI1	I/O	MFP4	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
			SC1_nCD	I	MFP5	Smart Card 1 card detect pin.
			I2S0_BCLK	O	MFP6	I2S0 bit clock output pin.
			SPI1_I2SMCLK	I/O	MFP7	SPI1 I2S master clock output pin
			UART2_RXD	I	MFP8	UART2 data receiver input pin.
			I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
			CAN0_RXD	I	MFP10	CAN0 bus receiver input.
37	71	79	UART4_RXD	I	MFP11	UART4 data receiver input pin.
			EPWM1_CH1	I/O	MFP12	EPWM1 channel 1 output/capture input.
			PC.3	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.
			SPIIM_SS	I/O	MFP3	SPIIM slave select pin.
			QSPI0_SS	I/O	MFP4	Quad SPI0 slave select pin.
			SC1_PWR	O	MFP5	Smart Card 1 power pin.
			I2S0_MCLK	O	MFP6	I2S0 master clock output pin.
			SPI1_MISO	I/O	MFP7	SPI1 MISO (Master In, Slave Out) pin.
			UART2_nRTS	O	MFP8	UART2 request to Send output pin.
38	72	80	I2C0_SMBAL	O	MFP9	I2C0 SMBus SMBALTER pin
			CAN1_TXD	O	MFP10	CAN1 bus transmitter output.
			UART3_TXD	O	MFP11	UART3 data transmitter output pin.
			EPWM1_CH2	I/O	MFP12	EPWM1 channel 2 output/capture input.
			PC.2	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
			SPIIM_CLK	I/O	MFP3	SPIIM serial clock pin.
			QSPI0_CLK	I/O	MFP4	Quad SPI0 serial clock pin.
			SC1_RST	O	MFP5	Smart Card 1 reset pin.
			I2S0_DI	I	MFP6	I2S0 data input pin.
39	73	81	SPI1_MOSI	I/O	MFP7	SPI1 MOSI (Master Out, Slave In) pin.
			UART2_nCTS	I	MFP8	UART2 clear to Send input pin.
40	74	82	I2C0_SMBSUS	O	MFP9	I2C0 SMBus SMBSUS pin (PMBus CONTROL pin)

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			CAN1_RXD	I	MFP10	CAN1 bus receiver input.
			UART3_RXD	I	MFP11	UART3 data receiver input pin.
			EPWM1_CH3	I/O	MFP12	EPWM1 channel 3 output/capture input.
39	73	81	PC.1	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.

		83	PG.15	I/O	MFP0	General purpose digital I/O pin.
			SD1_nCD	I	MFP3	SD/SDIO1 card detect input pin
			CLK_O	O	MFP14	Clock Out
			EADC0_ST	I	MFP15	EADC0 external trigger input.
		92	PD.3	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
			USCI0_CTL1	I/O	MFP3	USCI0 control 1 pin.
			SPI0_SS	I/O	MFP4	SPI0 slave select pin.
			UART3_nRTS	O	MFP5	UART3 request to Send output pin.
			USCI1_CTL0	I/O	MFP6	USCI1 control 0 pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			SC2_PWR	O	MFP7	Smart Card 2 power pin.
			SC1_nCD	I	MFP8	Smart Card 1 card detect pin.
			UART0_TXD	O	MFP9	UART0 data transmitter output pin.
		93	PD.2	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
			USCI0_DAT1	I/O	MFP3	USCI0 data 1 pin.
			SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
			UART3_nCTS	I	MFP5	UART3 clear to Send input pin.
			SC2_RST	O	MFP7	Smart Card 2 reset pin.
			UART0_RXD	I	MFP9	UART0 data receiver input pin.
		94	PD.1	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
			USCI0_DAT0	I/O	MFP3	USCI0 data 0 pin.
			SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
			UART3_TXD	O	MFP5	UART3 data transmitter output pin.
			I2C2_SCL	I/O	MFP6	I2C2 clock pin.
			SC2_DAT	I/O	MFP7	Smart Card 2 data pin.
		95	PD.0	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
			USCI0_CLK	I/O	MFP3	USCI0 clock pin.
			SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
			UART3_RXD	I	MFP5	UART3 data receiver input pin.
			I2C2_SDA	I/O	MFP6	I2C2 data input/output pin.
			SC2_CLK	O	MFP7	Smart Card 2 clock pin.
			TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
		96	PD.13	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
			SD0_nCD	I	MFP3	SD/SDIO0 card detect input pin
			SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
			SPI1_I2SMCLK	I/O	MFP5	SPI1 I2S master clock output pin
			SC2_nCD	I	MFP7	Smart Card 2 card detect pin.
		97	PA.12	I/O	MFP0	General purpose digital I/O pin.
			I2S0_BCLK	O	MFP2	I2S0 bit clock output pin.
			UART4_TXD	O	MFP3	UART4 data transmitter output pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			I2C1_SCL	I/O	MFP4	I2C1 clock pin.
			SPI2_SS	I/O	MFP5	SPI2 slave select pin.
			CAN0_TXD	O	MFP6	CAN0 bus transmitter output.
			SC2_PWR	O	MFP7	Smart Card 2 power pin.
			BPWM1_CH2	I/O	MFP11	BPWM1 channel 2 output/capture input.
			QEI1_INDEX	I	MFP12	Quadrature encoder 1 index input
			USB_VBUS	P	MFP14	Power supply from USB host or HUB.
		98	PA.13	I/O	MFP0	General purpose digital I/O pin.
			I2S0_MCLK	O	MFP2	I2S0 master clock output pin.
			UART4_RXD	I	MFP3	UART4 data receiver input pin.
			I2C1_SDA	I/O	MFP4	I2C1 data input/output pin.
			SPI2_CLK	I/O	MFP5	SPI2 serial clock pin.
			CAN0_RXD	I	MFP6	CAN0 bus receiver input.
			SC2_RST	O	MFP7	Smart Card 2 reset pin.
			BPWM1_CH3	I/O	MFP11	BPWM1 channel 3 output/capture input.
			QEI1_A	I	MFP12	Quadrature encoder 1 phase A input
			USB_D-	A	MFP14	USB differential signal D-.
		99	PA.14	I/O	MFP0	General purpose digital I/O pin.
			I2S0_DI	I	MFP2	I2S0 data input pin.
			UART0_TXD	O	MFP3	UART0 data transmitter output pin.
			SPI2_MISO	I/O	MFP5	SPI2 MISO (Master In, Slave Out) pin.
			I2C2_SCL	I/O	MFP6	I2C2 clock pin.
			SC2_DAT	I/O	MFP7	Smart Card 2 data pin.
			BPWM1_CH4	I/O	MFP11	BPWM1 channel 4 output/capture input.
			QEI1_B	I	MFP12	Quadrature encoder 1 phase B input
			USB_D+	A	MFP14	USB differential signal D+.
		100	PA.15	I/O	MFP0	General purpose digital I/O pin.
			I2S0_DO	O	MFP2	I2S0 data output pin.
			UART0_RXD	I	MFP3	UART0 data receiver input pin.
			SPI2_MOSI	I/O	MFP5	SPI2 MOSI (Master Out, Slave In) pin.
			I2C2_SDA	I/O	MFP6	I2C2 data input/output pin.
			SC2_CLK	O	MFP7	Smart Card 2 clock pin.
			BPWM1_CH5	I/O	MFP11	BPWM1 channel 5 output/capture input.
			EPWM0_SYNC_IN	I	MFP12	EPWM0 counter synchronous trigger input pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			USB_OTG_ID	I	MFP14	USB_ identification.
41	89	101	HSUSB_VRES	A	MFP0	HSUSB module reference resister
42	90	102	HSUSB_VDD33	P	MFP0	Power supply for HSUSB VDD33
43	91	103	HSUSB_VBUS	P	MFP0	HSUSB Power supply from USB host or HUB.
44	92	104	HSUSB_D-	A	MFP0	HSUSB differential signal D-.
45	93	105	HSUSB_VSS	P	MFP0	Ground pin for HSUSB.
46	94	106	HSUSB_D+	A	MFP0	HSUSB differential signal D+.
47	95	107	HSUSB_VDD12_CAP	A	MFP0	HSUSB Internal power regulator output 1.2V decoupling pin. Note: This pin needs to be connected with a 1uF capacitor.
48	96	108	HSUSB_ID	I	MFP0	HSUSB identification.
	97	109	PE.7	I/O	MFP0	General purpose digital I/O pin.
			SD0_CMD	I/O	MFP3	SD/SDIO0 command/response pin
			SPIM_D2	I/O	MFP4	SPIM data 2 pin for Quad Mode I/O.
			UART5_TXD	O	MFP8	UART5 data transmitter output pin.
			CAN1_TXD	O	MFP9	CAN1 bus transmitter output.
			QE11_INDEX	I	MFP11	Quadrature encoder 1 index input
			EPWM0_CH0	I/O	MFP12	EPWM0 channel 0 output/capture input.
			BPWM0_CH5	I/O	MFP13	BPWM0 channel 5 output/capture input.
	98	110	PE.6	I/O	MFP0	General purpose digital I/O pin.
			SD0_CLK	O	MFP3	SD/SDIO0 clock output pin
			SPIM_D3	I/O	MFP4	SPIM data 3 pin for Quad Mode I/O.
			SPI3_I2SMCLK	I/O	MFP5	SPI3 I2S master clock output pin
			SC0_nCD	I	MFP6	Smart Card 0 card detect pin.
			USCI0_CTL0	I/O	MFP7	USCI0 control 0 pin.
			UART5_RXD	I	MFP8	UART5 data receiver input pin.
			CAN1_RXD	I	MFP9	CAN1 bus receiver input.
			QE11_A	I	MFP11	Quadrature encoder 1 phase A input
			EPWM0_CH1	I/O	MFP12	EPWM0 channel 1 output/capture input.
	99	111	BPWM0_CH4	I/O	MFP13	BPWM0 channel 4 output/capture input.
			PE.5	I/O	MFP0	General purpose digital I/O pin.
			EBI_nRD	O	MFP2	EBI read enable output pin.
			SD0_DAT3	I/O	MFP3	SD/SDIO0 data line bit 3.
			SPIM_SS	I/O	MFP4	SPIM slave select pin.
			SPI3_SS	I/O	MFP5	SPI3 slave select pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			SC0_PWR	O	MFP6	Smart Card 0 power pin.
			USCI0_CTL1	I/O	MFP7	USCI0 control 1 pin.
			QEI0_B	I	MFP11	Quadrature encoder 0 phase B input
			EPWM0_CH2	I/O	MFP12	EPWM0 channel 2 output/capture input.
			BPWM0_CH3	I/O	MFP13	BPWM0 channel 3 output/capture input.
		100	PE.4	I/O	MFP0	General purpose digital I/O pin.
			EBI_nWR	O	MFP2	EBI write enable output pin.
			SD0_DAT2	I/O	MFP3	SD/SDIO0 data line bit 2.
			SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
			SPI3_CLK	I/O	MFP5	SPI3 serial clock pin.
			SC0_RST	O	MFP6	Smart Card 0 reset pin.
			USCI0_DAT1	I/O	MFP7	USCI0 data 1 pin.
			QEI0_INDEX	I	MFP11	Quadrature encoder 0 index input
			EPWM0_CH3	I/O	MFP12	EPWM0 channel 3 output/capture input.
			BPWM0_CH2	I/O	MFP13	BPWM0 channel 2 output/capture input.
		101	PE.3	I/O	MFP0	General purpose digital I/O pin.
			EBI_MCLK	O	MFP2	EBI external clock output pin.
			SD0_DAT1	I/O	MFP3	SD/SDIO0 data line bit 1.
			SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
			SPI3_MISO	I/O	MFP5	SPI3 MISO (Master In, Slave Out) pin.
			SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
			USCI0_DAT0	I/O	MFP7	USCI0 data 0 pin.
			QEI0_A	I	MFP11	Quadrature encoder 0 phase A input
			EPWM0_CH4	I/O	MFP12	EPWM0 channel 4 output/capture input.
			BPWM0_CH1	I/O	MFP13	BPWM0 channel 1 output/capture input.
		102	PE.2	I/O	MFP0	General purpose digital I/O pin.
			EBI_ALE	O	MFP2	EBI address latch enable output pin.
			SD0_DAT0	I/O	MFP3	SD/SDIO0 data line bit 0.
			SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
			SPI3_MOSI	I/O	MFP5	SPI3 MOSI (Master Out, Slave In) pin.
			SC0_CLK	O	MFP6	Smart Card 0 clock pin.
			USCI0_CLK	I/O	MFP7	USCI0 clock pin.
			QEI0_B	I	MFP11	Quadrature encoder 0 phase B input
			EPWM0_CH5	I/O	MFP12	EPWM0 channel 5 output/capture input.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			BPWM0_CH0	I/O	MFP13	BPWM0 channel 0 output/capture input.
	103	115	V _{SS}	P	MFP0	Ground pin for digital circuit.
	104	116	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
	105	117	PE.1	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
			QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
			SC2_DAT	I/O	MFP4	Smart Card 2 data pin.
			I2S0_BCLK	O	MFP5	I2S0 bit clock output pin.
			SPI1_MISO	I/O	MFP6	SPI1 MISO (Master In, Slave Out) pin.
			UART3_TXD	O	MFP7	UART3 data transmitter output pin.
			I2C1_SCL	I/O	MFP8	I2C1 clock pin.
			UART4_nCTS	I	MFP9	UART4 clear to Send input pin.
	106	118	PE.0	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
			QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
			SC2_CLK	O	MFP4	Smart Card 2 clock pin.
			I2S0_MCLK	O	MFP5	I2S0 master clock output pin.
			SPI1_MOSI	I/O	MFP6	SPI1 MOSI (Master Out, Slave In) pin.
			UART3_RXD	I	MFP7	UART3 data receiver input pin.
			I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.
			UART4_nRTS	O	MFP9	UART4 request to Send output pin.
	107	119	PH.8	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
			QSPI0_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
			SC2_PWR	O	MFP4	Smart Card 2 power pin.
			I2S0_DI	I	MFP5	I2S0 data input pin.
			SPI1_CLK	I/O	MFP6	SPI1 serial clock pin.
			UART3_nRTS	O	MFP7	UART3 request to Send output pin.
			I2C1_SMBAL	O	MFP8	I2C1 SMBus SMBALTER pin
			I2C2_SCL	I/O	MFP9	I2C2 clock pin.
			UART1_TXD	O	MFP10	UART1 data transmitter output pin.
	108	120	PH.9	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			QSPI0_SS	I/O	MFP3	Quad SPI0 slave select pin.
			SC2_RST	O	MFP4	Smart Card 2 reset pin.
			I2S0_DO	O	MFP5	I2S0 data output pin.
			SPI1_SS	I/O	MFP6	SPI1 slave select pin.
			UART3_nCTS	I	MFP7	UART3 clear to Send input pin.
			I2C1_SMBSUS	O	MFP8	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
			I2C2_SDA	I/O	MFP9	I2C2 data input/output pin.
			UART1_RXD	I	MFP10	UART1 data receiver input pin.
	109	121	PH.10	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD14	I/O	MFP2	EBI address/data bus bit 14.
			QSPI0_MISO1	I/O	MFP3	Quad SPI0 MISO1 (Master In, Slave Out) pin.
			SC2_nCD	I	MFP4	Smart Card 2 card detect pin.
			I2S0_LRCK	O	MFP5	I2S0 left right channel clock output pin.
			SPI1_I2SMCLK	I/O	MFP6	SPI1 I2S master clock output pin
			UART4_TXD	O	MFP7	UART4 data transmitter output pin.
			UART0_TXD	O	MFP8	UART0 data transmitter output pin.
	110	122	PH.11	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD15	I/O	MFP2	EBI address/data bus bit 15.
			QSPI0_MOSI1	I/O	MFP3	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
			UART4_RXD	I	MFP7	UART4 data receiver input pin.
			UART0_RXD	I	MFP8	UART0 data receiver input pin.
			EPWM0_CH5	I/O	MFP11	EPWM0 channel 5 output/capture input.
	111	123	PD.14	I/O	MFP0	General purpose digital I/O pin.
			EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
			SPI3_I2SMCLK	I/O	MFP3	SPI3 I2S master clock output pin
			SC1_nCD	I	MFP4	Smart Card 1 card detect pin.
			EPWM0_CH4	I/O	MFP11	EPWM0 channel 4 output/capture input.
		124	PG.5	I/O	MFP0	General purpose digital I/O pin.
			EBI_nCS1	O	MFP2	EBI chip select 1 output pin.
			SPI3_SS	I/O	MFP3	SPI3 slave select pin.
			SC1_PWR	O	MFP4	Smart Card 1 power pin.
			EPWM0_CH3	I/O	MFP11	EPWM0 channel 3 output/capture input.
		125	PG.6	I/O	MFP0	General purpose digital I/O pin.
			EBI_nCS2	O	MFP2	EBI chip select 2 output pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			SPI3_CLK	I/O	MFP3	SPI3 serial clock pin.
			SC1_RST	O	MFP4	Smart Card 1 reset pin.
			EPWM0_CH2	I/O	MFP11	EPWM0 channel 2 output/capture input.
		126	PG.7	I/O	MFP0	General purpose digital I/O pin.
			EBI_nWRL	O	MFP2	EBI low byte write enable output pin.
			SPI3_MISO	I/O	MFP3	SPI3 MISO (Master In, Slave Out) pin.
			SC1_DAT	I/O	MFP4	Smart Card 1 data pin.
			EPWM0_CH1	I/O	MFP11	EPWM0 channel 1 output/capture input.
		127	PG.8	I/O	MFP0	General purpose digital I/O pin.
			EBI_nWRH	O	MFP2	EBI high byte write enable output pin
			SPI3_MOSI	I/O	MFP3	SPI3 MOSI (Master Out, Slave In) pin.
			SC1_CLK	O	MFP4	Smart Card 1 clock pin.
			EPWM0_CH0	I/O	MFP11	EPWM0 channel 0 output/capture input.
49	112	128	V _{ss}	P	MFP0	Ground pin for digital circuit.
50	113	129	LDO_CAP	A	MFP0	LDO output pin.
51	114	130	V _{DD}	P	MFP0	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
		131	PC.14	I/O	MFP0	General purpose digital I/O pin.
			EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
			SC1_nCD	I	MFP3	Smart Card 1 card detect pin.
			SPI0_I2SMCLK	I/O	MFP4	SPI0 I2S master clock output pin
			USCI0_CTL0	I/O	MFP5	USCI0 control 0 pin.
			QSPI0_CLK	I/O	MFP6	Quad SPI0 serial clock pin.
			EPWM0_SYNC_IN	I	MFP11	EPWM0 counter synchronous trigger input pin.
			TM1	I/O	MFP13	Timer1 event counter input/toggle output pin.
			USB_VBUS_ST	I	MFP14	USB external VBUS regulator status pin.
		132	HSUSB_VBUS_ST	I	MFP15	HSUSB external VBUS regulator status pin.
			PB.15	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH15	A	MFP1	EADC0 channel 15 analog input.
			EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
			SC1_PWR	O	MFP3	Smart Card 1 power pin.
			SPI0_SS	I/O	MFP4	SPI0 slave select pin.
			USCI0_CTL1	I/O	MFP5	USCI0 control 1 pin.
			UART0_nCTS	I	MFP6	UART0 clear to Send input pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			UART3_TXD	O	MFP7	UART3 data transmitter output pin.
			I2C2_SMBAL	O	MFP8	I2C2 SMBus SMBALTER pin
			EPWM1_CH0	I/O	MFP11	EPWM1 channel 0 output/capture input.
			TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
			USB_VBUS_EN	O	MFP14	USB external VBUS regulator enable pin.
			HSUSB_VBUS_EN	O	MFP15	HSUSB external VBUS regulator enable pin.
			PB.14	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH14	A	MFP1	EADC0 channel 14 analog input.
			EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
			SC1_RST	O	MFP3	Smart Card 1 reset pin.
			SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
			USCI0_DAT1	I/O	MFP5	USCI0 data 1 pin.
			UART0_nRTS	O	MFP6	UART0 request to Send output pin.
			UART3_RXD	I	MFP7	UART3 data receiver input pin.
			I2C2_SMBSUS	O	MFP8	I2C2 SMBus SMBSUS pin (PMBus CONTROL pin)
			EPWM1_CH1	I/O	MFP11	EPWM1 channel 1 output/capture input.
			TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
			CLKO	O	MFP14	Clock Out
			PB.13	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH13	A	MFP1	EADC0 channel 13 analog input.
			DAC1_OUT	A	MFP1	DAC1 channel analog output.
			ACMP0_P3	A	MFP1	Analog comparator 0 positive input 3 pin.
			ACMP1_P3	A	MFP1	Analog comparator 1 positive input 3 pin.
			EBI_AD14	I/O	MFP2	EBI address/data bus bit 14.
			SC1_DAT	I/O	MFP3	Smart Card 1 data pin.
			SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
			USCI0_DAT0	I/O	MFP5	USCI0 data 0 pin.
			UART0_TXD	O	MFP6	UART0 data transmitter output pin.
			UART3_nRTS	O	MFP7	UART3 request to Send output pin.
			I2C2_SCL	I/O	MFP8	I2C2 clock pin.
			EPWM1_CH2	I/O	MFP11	EPWM1 channel 2 output/capture input.
			TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.
			PB.12	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH12	A	MFP1	EADC0 channel 12 analog input.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			DAC0_OUT	A	MFP1	DAC0 channel analog output.
			ACMP0_P2	A	MFP1	Analog comparator 0 positive input 2 pin.
			ACMP1_P2	A	MFP1	Analog comparator 1 positive input 2 pin.
			EBI_AD15	I/O	MFP2	EBI address/data bus bit 15.
			SC1_CLK	O	MFP3	Smart Card 1 clock pin.
			SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
			USCI0_CLK	I/O	MFP5	USCI0 clock pin.
			UART0_RXD	I	MFP6	UART0 data receiver input pin.
			UART3_nCTS	I	MFP7	UART3 clear to Send input pin.
			I2C2_SDA	I/O	MFP8	I2C2 data input/output pin.
			SD0_nCD	I	MFP9	SD/SDIO0 card detect input pin
			EPWM1_CH3	I/O	MFP11	EPWM1 channel 3 output/capture input.
			TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
57	120	136	AV _{DD}	P	MFP0	Power supply for internal analog circuit.
58	121	137	V _{REF}	A	MFP0	ADC reference voltage input. Note: This pin needs to be connected with a 1uF capacitor.
59	122	138	AV _{SS}	P	MFP0	Ground pin for analog circuit.
			PB.11	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH11	A	MFP1	EADC0 channel 11 analog input.
			EBI_ADR16	O	MFP2	EBI address bus bit 16.
			EMAC_RMII_MDC	O	MFP3	EMAC RMII PHY Management Clock output pin.
			UART0_nCTS	I	MFP5	UART0 clear to Send input pin.
			UART4_TXD	O	MFP6	UART4 data transmitter output pin.
			I2C1_SCL	I/O	MFP7	I2C1 clock pin.
			CAN0_TXD	O	MFP8	CAN0 bus transmitter output.
			SPI0_I2SMCLK	I/O	MFP9	SPI0 I2S master clock output pin
			BPWM1_CH0	I/O	MFP10	BPWM1 channel 0 output/capture input.
			SPI3_CLK	I/O	MFP11	SPI3 serial clock pin.
			HSUSB_VBUS_ST	I	MFP14	HSUSB external VBUS regulator status pin.
			PB.10	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH10	A	MFP1	EADC0 channel 10 analog input.
			EBI_ADR17	O	MFP2	EBI address bus bit 17.
			EMAC_RMII_MDIO	I/O	MFP3	EMAC RMII PHY Management Data pin.
			USCI1_CTL0	I/O	MFP4	USCI1 control 0 pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			UART0_nRTS	O	MFP5	UART0 request to Send output pin.
			UART4_RXD	I	MFP6	UART4 data receiver input pin.
			I2C1_SDA	I/O	MFP7	I2C1 data input/output pin.
			CAN0_RXD	I	MFP8	CAN0 bus receiver input.
			BPWM1_CH1	I/O	MFP10	BPWM1 channel 1 output/capture input.
			SPI3_SS	I/O	MFP11	SPI3 slave select pin.
			HSUSB_VBUS_EN	O	MFP14	HSUSB external VBUS regulator enable pin.
			PB.9	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH9	A	MFP1	EADC0 channel 9 analog input.
			EBI_ADR18	O	MFP2	EBI address bus bit 18.
			EMAC_RMII_TXD0	O	MFP3	EMAC RMII Transmit Data bus bit 0.
			USCI1_CTL1	I/O	MFP4	USCI1 control 1 pin.
			UART0_TXD	O	MFP5	UART0 data transmitter output pin.
			UART1_nCTS	I	MFP6	UART1 clear to Send input pin.
			I2C1_SMBAL	O	MFP7	I2C1 SMBus SMBALTER pin
			BPWM1_CH2	I/O	MFP10	BPWM1 channel 2 output/capture input.
			SPI3_MISO	I/O	MFP11	SPI3 MISO (Master In, Slave Out) pin.
			INT7	I	MFP13	External interrupt 7 input pin.
			PB.8	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH8	A	MFP1	EADC0 channel 8 analog input.
			EBI_ADR19	O	MFP2	EBI address bus bit 19.
			EMAC_RMII_TXD1	O	MFP3	EMAC RMII Transmit Data bus bit 1.
			USCI1_CLK	I/O	MFP4	USCI1 clock pin.
			UART0_RXD	I	MFP5	UART0 data receiver input pin.
			UART1_nRTS	O	MFP6	UART1 request to Send output pin.
			I2C1_SMBSUS	O	MFP7	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
			BPWM1_CH3	I/O	MFP10	BPWM1 channel 3 output/capture input.
			SPI3_MOSI	I/O	MFP11	SPI3 MOSI (Master Out, Slave In) pin.
			INT6	I	MFP13	External interrupt 6 input pin.
			PB.7	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH7	A	MFP1	EADC0 channel 7 analog input.
			EBI_nWRL	O	MFP2	EBI low byte write enable output pin.
			EMAC_RMII_TXEN	O	MFP3	EMAC RMII Transmit Enable output pin.
			USCI1_DAT0	I/O	MFP4	USCI1 data 0 pin.

64 Pin	128 Pin	144 Pin	Pin Name	Type	MFP	Description
			CAN1_TXD	O	MFP5	CAN1 bus transmitter output.
			UART1_TXD	O	MFP6	UART1 data transmitter output pin.
			SD1_CMD	I/O	MFP7	SD/SDIO1 command/response pin
			EBI_nCS0	O	MFP8	EBI chip select 0 output pin.
			BPWM1_CH4	I/O	MFP10	BPWM1 channel 4 output/capture input.
			EPWM1_BRAKE0	I	MFP11	EPWM1 Brake 0 input pin.
			EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
			INT5	I	MFP13	External interrupt 5 input pin.
			USB_VBUS_ST	I	MFP14	USB external VBUS regulator status pin.
			ACMP0_O	O	MFP15	Analog comparator 0 output pin.
		128	PB.6	I/O	MFP0	General purpose digital I/O pin.
			EADC0_CH6	A	MFP1	EADC0 channel 6 analog input.
			EBI_nWRH	O	MFP2	EBI high byte write enable output pin
			EMAC_PPS	O	MFP3	EMAC Pulse Per Second output pin.
			USCI1_DAT1	I/O	MFP4	USCI1 data 1 pin.
			CAN1_RXD	I	MFP5	CAN1 bus receiver input.
			UART1_RXD	I	MFP6	UART1 data receiver input pin.
			SD1_CLK	O	MFP7	SD/SDIO1 clock output pin
			EBI_nCS1	O	MFP8	EBI chip select 1 output pin.
			BPWM1_CH5	I/O	MFP10	BPWM1 channel 5 output/capture input.
			EPWM1_BRAKE1	I	MFP11	EPWM1 Brake 1 input pin.
			EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
			INT4	I	MFP13	External interrupt 4 input pin.
			USB_VBUS_EN	O	MFP14	USB external VBUS regulator enable pin.
			ACMP1_O	O	MFP15	Analog comparator 1 output pin.

4.2.7 M480 Multi-function Summary Table

Group	Pin Name	GPIO	MFP	Type	Description
ACMP0	ACMP0_N	PB.3	MFP1	A	Analog comparator 0 negative input pin.
	ACMP0_O	PC.12	MFP14	O	Analog comparator 0 output pin.
		PC.1	MFP14	O	
		PB.7	MFP15	O	
	ACMP0_P0	PA.11	MFP1	A	Analog comparator 0 positive input 0 pin.
	ACMP0_P1	PB.2	MFP1	A	Analog comparator 0 positive input 1 pin.
	ACMP0_P2	PB.12	MFP1	A	Analog comparator 0 positive input 2 pin.
	ACMP0_P3	PB.13	MFP1	A	Analog comparator 0 positive input 3 pin.
	ACMP0_WLAT	PA.7	MFP13	I	Analog comparator 0 window latch input pin
ACMP1	ACMP1_N	PB.5	MFP1	A	Analog comparator 1 negative input pin.
	ACMP1_O	PC.11	MFP14	O	Analog comparator 1 output pin.
		PC.0	MFP14	O	
		PB.6	MFP15	O	
	ACMP1_P0	PA.10	MFP1	A	Analog comparator 1 positive input 0 pin.
	ACMP1_P1	PB.4	MFP1	A	Analog comparator 1 positive input 1 pin.
	ACMP1_P2	PB.12	MFP1	A	Analog comparator 1 positive input 2 pin.
	ACMP1_P3	PB.13	MFP1	A	Analog comparator 1 positive input 3 pin.
	ACMP1_WLAT	PA.6	MFP13	I	Analog comparator 1 window latch input pin
BPWM0	BPWM0_CH0	PA.11	MFP9	I/O	BPWM0 channel 0 output/capture input.

4.2.8 M480 Multi-function Summary Table Sorted by GPIO

	Pin Name	Type	MFP	Description
PA.0	PA.0	I/O	MFP0	General purpose digital I/O pin.
	SPI_MOSI	I/O	MFP2	SPI_MOSI (Master Out, Slave In) pin.
	QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
	SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
	SD1_DAT0	I/O	MFP5	SD/SDIO1 data line bit 0.
	SC0_CLK	O	MFP6	Smart Card 0 clock pin.
	UART0_RXD	I	MFP7	UART0 data receiver input pin.
	UART1_nRTS	O	MFP8	UART1 request to Send output pin.
	I2C2_SDA	I/O	MFP9	I ² C2 data input/output pin.
	BPWM0_CH0	I/O	MFP12	BPWM0 channel 0 output/capture input.
	EPWM0_CH5	I/O	MFP13	EPWM0 channel 5 output/capture input.
	DAC0_ST	I	MFP15	DAC0 external trigger input.
PA.1	PA.1	I/O	MFP0	General purpose digital I/O pin.
	SPI_MISO	I/O	MFP2	SPI_MISO (Master In, Slave Out) pin.
	QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
	SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
	SD1_DAT1	I/O	MFP5	SD/SDIO1 data line bit 1.
	SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
	UART0_TXD	O	MFP7	UART0 data transmitter output pin.
	UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
	I2C2_SCL	I/O	MFP9	I ² C2 clock pin.
	BPWM0_CH1	I/O	MFP12	BPWM0 channel 1 output/capture input.
	EPWM0_CH4	I/O	MFP13	EPWM0 channel 4 output/capture input.
	DAC1_ST	I	MFP15	DAC1 external trigger input.
PA.2	PA.2	I/O	MFP0	General purpose digital I/O pin.
	SPI_MCLK	I/O	MFP2	SPI_MCLK serial clock pin.
	QSPI0_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
	SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
	SD1_DAT2	I/O	MFP5	SD/SDIO1 data line bit 2.
	SC0_RST	O	MFP6	Smart Card 0 reset pin.
	UART4_RXD	I	MFP7	UART4 data receiver input pin.
	UART1_RXD	I	MFP8	UART1 data receiver input pin.
	I2C1_SDA	I/O	MFP9	I ² C1 data input/output pin.

	Pin Name	Type	MFP	Description
	BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
	EPWM0_CH3	I/O	MFP13	EPWM0 channel 3 output/capture input.
PA.3	PA.3	I/O	MFP0	General purpose digital I/O pin.
	SPI_M_SS	I/O	MFP2	SPI_M slave select pin.
	QSPI0_SS	I/O	MFP3	Quad SPI0 slave select pin.
	SPI0_SS	I/O	MFP4	SPI0 slave select pin.
	SD1_DAT3	I/O	MFP5	SD/SDIO1 data line bit 3.
	SC0_PWR	O	MFP6	Smart Card 0 power pin.
	UART4_TXD	O	MFP7	UART4 data transmitter output pin.
	UART1_TXD	O	MFP8	UART1 data transmitter output pin.
	I2C1_SCL	I/O	MFP9	I ² C1 clock pin.
	BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.
	EPWM0_CH2	I/O	MFP13	EPWM0 channel 2 output/capture input.
	QEIO_B	I	MFP14	Quadrature encoder 0 phase B input
PA.4	PA.4	I/O	MFP0	General purpose digital I/O pin.
	SPI_M_D3	I/O	MFP2	SPI_M data 3 pin for Quad Mode I/O.
	QSPI0_MOSI1	I/O	MFP3	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
	SPI0_I2SMCLK	I/O	MFP4	SPI0 I ² S master clock output pin
	SD1_CLK	O	MFP5	SD/SDIO1 clock output pin
	SC0_nCD	I	MFP6	Smart Card 0 card detect pin.
	UART0_nRTS	O	MFP7	UART0 request to Send output pin.
	UART5_RXD	I	MFP8	UART5 data receiver input pin.
	I2C0_SDA	I/O	MFP9	I ² C0 data input/output pin.
	CAN0_RXD	I	MFP10	CAN0 bus receiver input.
	BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.
	EPWM0_CH1	I/O	MFP13	EPWM0 channel 1 output/capture input.
PA.5	QEIO_A	I	MFP14	Quadrature encoder 0 phase A input
	PA.5	I/O	MFP0	General purpose digital I/O pin.
	SPI_M_D2	I/O	MFP2	SPI_M data 2 pin for Quad Mode I/O.
	QSPI0_MISO1	I/O	MFP3	Quad SPI0 MISO1 (Master In, Slave Out) pin.
	SPI1_I2SMCLK	I/O	MFP4	SPI1 I ² S master clock output pin
	SD1_CMD	I/O	MFP5	SD/SDIO1 command/response pin
	SC2_nCD	I	MFP6	Smart Card 2 card detect pin.
	UART0_nCTS	I	MFP7	UART0 clear to Send input pin.

	Pin Name	Type	MFP	Description
PA.6	UART5_TXD	O	MFP8	UART5 data transmitter output pin.
	I2C0_SCL	I/O	MFP9	I ² C0 clock pin.
	CAN0_TXD	O	MFP10	CAN0 bus transmitter output.
	BPWM0_CH5	I/O	MFP12	BPWM0 channel 5 output/capture input.
	EPWM0_CH0	I/O	MFP13	EPWM0 channel 0 output/capture input.
	QEI0_INDEX	I	MFP14	Quadrature encoder 0 index input
PA.7	PA.6	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
	EMAC_RMII_RXERR	I	MFP3	EMAC RMII Receive Data Error input pin.
	SPI1_SS	I/O	MFP4	SPI1 slave select pin.
	SD1_nCD	I	MFP5	SD/SDIO1 card detect input pin
	SC2_CLK	O	MFP6	Smart Card 2 clock pin.
	UART0_RXD	I	MFP7	UART0 data receiver input pin.
	I2C1_SDA	I/O	MFP8	I ² C1 data input/output pin.
	EPWM1_CH5	I/O	MFP11	EPWM1 channel 5 output/capture input.
	BPWM1_CH3	I/O	MFP12	BPWM1 channel 3 output/capture input.
	ACMP1_WLAT	I	MFP13	Analog comparator 1 window latch input pin
	TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
PA.8	INT0	I	MFP15	External interrupt 0 input pin.
	PA.7	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
	EMAC_RMII_CRSDV	I	MFP3	EMAC RMII Carrier Sense/Receive Data input pin.
	SPI1_CLK	I/O	MFP4	SPI1 serial clock pin.
	SC2_DAT	I/O	MFP6	Smart Card 2 data pin.
	UART0_TXD	O	MFP7	UART0 data transmitter output pin.
	I2C1_SCL	I/O	MFP8	I ² C1 clock pin.
	EPWM1_CH4	I/O	MFP11	EPWM1 channel 4 output/capture input.
	BPWM1_CH2	I/O	MFP12	BPWM1 channel 2 output/capture input.
	ACMP0_WLAT	I	MFP13	Analog comparator 0 window latch input pin
	TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
PA.8	INT1	I	MFP15	External interrupt 1 input pin.
	PA.8	I/O	MFP0	General purpose digital I/O pin.
	OPA1_P	A	MFP1	Operational amplifier 1 positive input pin.
	EBI_ALE	O	MFP2	EBI address latch enable output pin.

	Pin Name	Type	MFP	Description
PA.9	SC2_CLK	O	MFP3	Smart Card 2 clock pin.
	SPI2_MOSI	I/O	MFP4	SPI2 MOSI (Master Out, Slave In) pin.
	SD1_DAT0	I/O	MFP5	SD/SDIO1 data line bit 0.
	USCI0_CTL1	I/O	MFP6	USCI0 control 1 pin.
	UART1_RXD	I	MFP7	UART1 data receiver input pin.
	BPWM0_CH3	I/O	MFP9	BPWM0 channel 3 output/capture input.
	QE1_B	I	MFP10	Quadrature encoder 1 phase B input
	ECAP0_IC2	I	MFP11	Enhanced capture unit 0 input 2 pin.
	TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
	INT4	I	MFP15	External interrupt 4 input pin.
PA.10	PA.9	I/O	MFP0	General purpose digital I/O pin.
	OPA1_N	A	MFP1	Operational amplifier 1 negative input pin.
	EBI_MCLK	O	MFP2	EBI external clock output pin.
	SC2_DAT	I/O	MFP3	Smart Card 2 data pin.
	SPI2_MISO	I/O	MFP4	SPI2 MISO (Master In, Slave Out) pin.
	SD1_DAT1	I/O	MFP5	SD/SDIO1 data line bit 1.
	USCI0_DAT1	I/O	MFP6	USCI0 data 1 pin.
	UART1_TXD	O	MFP7	UART1 data transmitter output pin.
	BPWM0_CH2	I/O	MFP9	BPWM0 channel 2 output/capture input.
	QE1_A	I	MFP10	Quadrature encoder 1 phase A input
PA.11	ECAP0_IC1	I	MFP11	Enhanced capture unit 0 input 1 pin.
	TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.
	PA.10	I/O	MFP0	General purpose digital I/O pin.
	ACMP1_P0	A	MFP1	Analog comparator 1 positive input 0 pin.
	OPA1_O	A	MFP1	Operational amplifier 1 output pin.
	EBI_nWR	O	MFP2	EBI write enable output pin.
	SC2_RST	O	MFP3	Smart Card 2 reset pin.
	SPI2_CLK	I/O	MFP4	SPI2 serial clock pin.
	SD1_DAT2	I/O	MFP5	SD/SDIO1 data line bit 2.
	USCI0_DAT0	I/O	MFP6	USCI0 data 0 pin.
PA.12	I2C2_SDA	I/O	MFP7	I ² C2 data input/output pin.
	BPWM0_CH1	I/O	MFP9	BPWM0 channel 1 output/capture input.
	QE1_INDEX	I	MFP10	Quadrature encoder 1 index input
	ECAP0_IC0	I	MFP11	Enhanced capture unit 0 input 0 pin.

	Pin Name	Type	MFP	Description
	TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
	DAC0_ST	I	MFP14	DAC0 external trigger input.
PA.11	PA.11	I/O	MFP0	General purpose digital I/O pin.
	ACMP0_P0	A	MFP1	Analog comparator 0 positive input 0 pin.
	EBI_nRD	O	MFP2	EBI read enable output pin.
	SC2_PWR	O	MFP3	Smart Card 2 power pin.
	SPI2_SS	I/O	MFP4	SPI2 slave select pin.
	SD1_DAT3	I/O	MFP5	SD/SDIO1 data line bit 3.
	USCI0_CLK	I/O	MFP6	USCI0 clock pin.
	I2C2_SCL	I/O	MFP7	I ² C2 clock pin.
	BPWM0_CH0	I/O	MFP9	BPWM0 channel 0 output/capture input.
	EPWM0_SYNC_OUT	O	MFP10	EPWM0 counter synchronous trigger output pin.
	TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
	DAC1_ST	I	MFP14	DAC1 external trigger input.
PA.12	PA.12	I/O	MFP0	General purpose digital I/O pin.
	I2S0_BCLK	O	MFP2	I ² S0 bit clock output pin.
	UART4_TXD	O	MFP3	UART4 data transmitter output pin.
	I2C1_SCL	I/O	MFP4	I ² C1 clock pin.
	SPI2_SS	I/O	MFP5	SPI2 slave select pin.
	CAN0_TXD	O	MFP6	CAN0 bus transmitter output.
	SC2_PWR	O	MFP7	Smart Card 2 power pin.
	BPWM1_CH2	I/O	MFP11	BPWM1 channel 2 output/capture input.
	QEI1_INDEX	I	MFP12	Quadrature encoder 1 index input
	USB_VBUS	P	MFP14	Power supply from USB host or HUB.
PA.13	PA.13	I/O	MFP0	General purpose digital I/O pin.
	I2S0_MCLK	O	MFP2	I ² S0 master clock output pin.
	UART4_RXD	I	MFP3	UART4 data receiver input pin.
	I2C1_SDA	I/O	MFP4	I ² C1 data input/output pin.
	SPI2_CLK	I/O	MFP5	SPI2 serial clock pin.
	CAN0_RXD	I	MFP6	CAN0 bus receiver input.
	SC2_RST	O	MFP7	Smart Card 2 reset pin.
	BPWM1_CH3	I/O	MFP11	BPWM1 channel 3 output/capture input.
	QEI1_A	I	MFP12	Quadrature encoder 1 phase A input
	USB_D-	A	MFP14	USB differential signal D-.

	Pin Name	Type	MFP	Description
PA.14	PA.14	I/O	MFP0	General purpose digital I/O pin.
	I2S0_DI	I	MFP2	I ² S0 data input pin.
	UART0_TXD	O	MFP3	UART0 data transmitter output pin.
	SPI2_MISO	I/O	MFP5	SPI2 MISO (Master In, Slave Out) pin.
	I2C2_SCL	I/O	MFP6	I ² C2 clock pin.
	SC2_DAT	I/O	MFP7	Smart Card 2 data pin.
	BPWM1_CH4	I/O	MFP11	BPWM1 channel 4 output/capture input.
	QEI1_B	I	MFP12	Quadrature encoder 1 phase B input
	USB_D+	A	MFP14	USB differential signal D+.
PA.15	PA.15	I/O	MFP0	General purpose digital I/O pin.
	I2S0_DO	O	MFP2	I ² S0 data output pin.
	UART0_RXD	I	MFP3	UART0 data receiver input pin.
	SPI2_MOSI	I/O	MFP5	SPI2 MOSI (Master Out, Slave In) pin.
	I2C2_SDA	I/O	MFP6	I ² C2 data input/output pin.
	SC2_CLK	O	MFP7	Smart Card 2 clock pin.
	BPWM1_CH5	I/O	MFP11	BPWM1 channel 5 output/capture input.
	EPWM0_SYNC_IN	I	MFP12	EPWM0 counter synchronous trigger input pin.
	USB_OTG_ID	I	MFP14	USB_ identification.
PB.0	PB.0	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH0	A	MFP1	EADC0 channel 0 analog input.
	OPA0_P	A	MFP1	Operational amplifier 0 positive input pin.
	EBI_ADR9	O	MFP2	EBI address bus bit 9.
	SD0_CMD	I/O	MFP3	SD/SDIO0 command/response pin
	UART2_RXD	I	MFP7	UART2 data receiver input pin.
	SPI0_I2SMCLK	I/O	MFP8	SPI0 I ² S master clock output pin
	I2C1_SDA	I/O	MFP9	I ² C1 data input/output pin.
	EPWM0_CH5	I/O	MFP11	EPWM0 channel 5 output/capture input.
	EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
PB.1	EPWM0_BRAKE1	I	MFP13	EPWM0 Brake 1 input pin.
	PB.1	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH1	A	MFP1	EADC0 channel 1 analog input.
	OPA0_N	A	MFP1	Operational amplifier 0 negative input pin.
	EBI_ADR8	O	MFP2	EBI address bus bit 8.
	SD0_CLK	O	MFP3	SD/SDIO0 clock output pin

	Pin Name	Type	MFP	Description
PB.2	EMAC_RMII_RXERR	I	MFP4	EMAC RMII Receive Data Error input pin.
	SPI1_I2SMCLK	I/O	MFP5	SPI1 I ² S master clock output pin
	SPI3_I2SMCLK	I/O	MFP6	SPI3 I ² S master clock output pin
	UART2_TXD	O	MFP7	UART2 data transmitter output pin.
	USCI1_CLK	I/O	MFP8	USCI1 clock pin.
	I ² C1_SCL	I/O	MFP9	I ² C1 clock pin.
	I ² S0_LRCK	O	MFP10	I ² S0 left right channel clock output pin.
	EPWM0_CH4	I/O	MFP11	EPWM0 channel 4 output/capture input.
	EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
	EPWM0_BRAKE0	I	MFP13	EPWM0 Brake 0 input pin.
	PB.2	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH2	A	MFP1	EADC0 channel 2 analog input.
	ACMP0_P1	A	MFP1	Analog comparator 0 positive input 1 pin.
	OPA0_O	A	MFP1	Operational amplifier 0 output pin.
PB.3	EBI_ADR3	O	MFP2	EBI address bus bit 3.
	SD0_DAT0	I/O	MFP3	SD/SDIO0 data line bit 0.
	EMAC_RMII_CRSDV	I	MFP4	EMAC RMII Carrier Sense/Receive Data input pin.
	SPI1_SS	I/O	MFP5	SPI1 slave select pin.
	UART1_RXD	I	MFP6	UART1 data receiver input pin.
	UART5_nCTS	I	MFP7	UART5 clear to Send input pin.
	USCI1_DAT0	I/O	MFP8	USCI1 data 0 pin.
	SC0_PWR	O	MFP9	Smart Card 0 power pin.
	I ² S0_DO	O	MFP10	I ² S0 data output pin.
	EPWM0_CH3	I/O	MFP11	EPWM0 channel 3 output/capture input.
	TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
	INT3	I	MFP15	External interrupt 3 input pin.
	PB.3	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH3	A	MFP1	EADC0 channel 3 analog input.
	ACMP0_N	A	MFP1	Analog comparator 0 negative input pin.
	EBI_ADR2	O	MFP2	EBI address bus bit 2.
	SD0_DAT1	I/O	MFP3	SD/SDIO0 data line bit 1.
	EMAC_RMII_RXD1	I	MFP4	EMAC RMII Receive Data bus bit 1.
	SPI1_CLK	I/O	MFP5	SPI1 serial clock pin.
	UART1_TXD	O	MFP6	UART1 data transmitter output pin.

	Pin Name	Type	MFP	Description
PB.4	UART5_nRTS	O	MFP7	UART5 request to Send output pin.
	USCI1_DAT1	I/O	MFP8	USCI1 data 1 pin.
	SC0_RST	O	MFP9	Smart Card 0 reset pin.
	I2S0_DI	I	MFP10	I ² S0 data input pin.
	EPWM0_CH2	I/O	MFP11	EPWM0 channel 2 output/capture input.
	TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
	INT2	I	MFP15	External interrupt 2 input pin.
PB.4	PB.4	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH4	A	MFP1	EADC0 channel 4 analog input.
	ACMP1_P1	A	MFP1	Analog comparator 1 positive input 1 pin.
	EBI_ADR1	O	MFP2	EBI address bus bit 1.
	SD0_DAT2	I/O	MFP3	SD/SDIO0 data line bit 2.
	EMAC_RMII_RXD0	I	MFP4	EMAC RMII Receive Data bus bit 0.
	SPI1_MOSI	I/O	MFP5	SPI1 MOSI (Master Out, Slave In) pin.
	I2C0_SDA	I/O	MFP6	I ² C0 data input/output pin.
	UART5_RXD	I	MFP7	UART5 data receiver input pin.
	USCI1_CTL1	I/O	MFP8	USCI1 control 1 pin.
	SC0_DAT	I/O	MFP9	Smart Card 0 data pin.
	I2S0_MCLK	O	MFP10	I ² S0 master clock output pin.
	EPWM0_CH1	I/O	MFP11	EPWM0 channel 1 output/capture input.
	TM1	I/O	MFP14	Timer1 event counter input/toggle output pin.
	INT1	I	MFP15	External interrupt 1 input pin.
PB.5	PB.5	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH5	A	MFP1	EADC0 channel 5 analog input.
	ACMP1_N	A	MFP1	Analog comparator 1 negative input pin.
	EBI_ADR0	O	MFP2	EBI address bus bit 0.
	SD0_DAT3	I/O	MFP3	SD/SDIO0 data line bit 3.
	EMAC_RMII_REFCLK	I	MFP4	EMAC RMII reference clock input pin.
	SPI1_MISO	I/O	MFP5	SPI1 MISO (Master In, Slave Out) pin.
	I2C0_SCL	I/O	MFP6	I ² C0 clock pin.
	UART5_TXD	O	MFP7	UART5 data transmitter output pin.
	USCI1_CTL0	I/O	MFP8	USCI1 control 0 pin.
	SC0_CLK	O	MFP9	Smart Card 0 clock pin.
	I2S0_BCLK	O	MFP10	I ² S0 bit clock output pin.

	Pin Name	Type	MFP	Description
	EPWM0_CH0	I/O	MFP11	EPWM0 channel 0 output/capture input.
	TMO	I/O	MFP14	Timer0 event counter input/toggle output pin.
	INT0	I	MFP15	External interrupt 0 input pin.
PB.6	PB.6	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH6	A	MFP1	EADC0 channel 6 analog input.
	EBI_nWRH	O	MFP2	EBI high byte write enable output pin
	EMAC_PPS	O	MFP3	EMAC Pulse Per Second output pin.
	USCI1_DAT1	I/O	MFP4	USCI1 data 1 pin.
	CAN1_RXD	I	MFP5	CAN1 bus receiver input.
	UART1_RXD	I	MFP6	UART1 data receiver input pin.
	SD1_CLK	O	MFP7	SD/SDIO1 clock output pin
	EBI_nCS1	O	MFP8	EBI chip select 1 output pin.
	BPWM1_CH5	I/O	MFP10	BPWM1 channel 5 output/capture input.
	EPWM1_BRAKE1	I	MFP11	EPWM1 Brake 1 input pin.
	EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
	INT4	I	MFP13	External interrupt 4 input pin.
	USB_VBUS_EN	O	MFP14	USB external VBUS regulator enable pin.
	ACMP1_O	O	MFP15	Analog comparator 1 output pin.
PB.7	PB.7	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH7	A	MFP1	EADC0 channel 7 analog input.
	EBI_nWRL	O	MFP2	EBI low byte write enable output pin.
	EMAC_RMII_TXEN	O	MFP3	EMAC RMII Transmit Enable output pin.
	USCI1_DAT0	I/O	MFP4	USCI1 data 0 pin.
	CAN1_TXD	O	MFP5	CAN1 bus transmitter output.
	UART1_TXD	O	MFP6	UART1 data transmitter output pin.
	SD1_CMD	I/O	MFP7	SD/SDIO1 command/response pin
	EBI_nCS0	O	MFP8	EBI chip select 0 output pin.
	BPWM1_CH4	I/O	MFP10	BPWM1 channel 4 output/capture input.
	EPWM1_BRAKE0	I	MFP11	EPWM1 Brake 0 input pin.
	EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
	INT5	I	MFP13	External interrupt 5 input pin.
	USB_VBUS_ST	I	MFP14	USB external VBUS regulator status pin.
	ACMP0_O	O	MFP15	Analog comparator 0 output pin.
PB.8	PB.8	I/O	MFP0	General purpose digital I/O pin.

	Pin Name	Type	MFP	Description
PB.9	EADC0_CH8	A	MFP1	EADC0 channel 8 analog input.
	EBI_ADR19	O	MFP2	EBI address bus bit 19.
	EMAC_RMII_TXD1	O	MFP3	EMAC RMII Transmit Data bus bit 1.
	USCI1_CLK	I/O	MFP4	USCI1 clock pin.
	UART0_RXD	I	MFP5	UART0 data receiver input pin.
	UART1_nRTS	O	MFP6	UART1 request to Send output pin.
	I2C1_SMBSUS	O	MFP7	I ² C1 SMBus SMBSUS pin (PMBus CONTROL pin)
	BPWM1_CH3	I/O	MFP10	BPWM1 channel 3 output/capture input.
	SPI3_MOSI	I/O	MFP11	SPI3 MOSI (Master Out, Slave In) pin.
	INT6	I	MFP13	External interrupt 6 input pin.
PB.10	PB.9	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH9	A	MFP1	EADC0 channel 9 analog input.
	EBI_ADR18	O	MFP2	EBI address bus bit 18.
	EMAC_RMII_TXD0	O	MFP3	EMAC RMII Transmit Data bus bit 0.
	USCI1_CTL1	I/O	MFP4	USCI1 control 1 pin.
	UART0_TXD	O	MFP5	UART0 data transmitter output pin.
	UART1_nCTS	I	MFP6	UART1 clear to Send input pin.
	I2C1_SMBAL	O	MFP7	I ² C1 SMBus SMBALTER pin
	BPWM1_CH2	I/O	MFP10	BPWM1 channel 2 output/capture input.
	SPI3_MISO	I/O	MFP11	SPI3 MISO (Master In, Slave Out) pin.
PB.11	INT7	I	MFP13	External interrupt 7 input pin.
PB.10	PB.10	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH10	A	MFP1	EADC0 channel 10 analog input.
	EBI_ADR17	O	MFP2	EBI address bus bit 17.
	EMAC_RMII_MDIO	I/O	MFP3	EMAC RMII PHY Management Data pin.
	USCI1_CTL0	I/O	MFP4	USCI1 control 0 pin.
	UART0_nRTS	O	MFP5	UART0 request to Send output pin.
	UART4_RXD	I	MFP6	UART4 data receiver input pin.
	I2C1_SDA	I/O	MFP7	I ² C1 data input/output pin.
	CAN0_RXD	I	MFP8	CAN0 bus receiver input.
	BPWM1_CH1	I/O	MFP10	BPWM1 channel 1 output/capture input.
	SPI3_SS	I/O	MFP11	SPI3 slave select pin.
	HSUSB_VBUS_EN	O	MFP14	HSUSB external VBUS regulator enable pin.
PB.11	PB.11	I/O	MFP0	General purpose digital I/O pin.

	Pin Name	Type	MFP	Description
PB.12	EADC0_CH11	A	MFP1	EADC0 channel 11 analog input.
	EBI_ADR16	O	MFP2	EBI address bus bit 16.
	EMAC_RMII_MDC	O	MFP3	EMAC RMII PHY Management Clock output pin.
	UART0_nCTS	I	MFP5	UART0 clear to Send input pin.
	UART4_TXD	O	MFP6	UART4 data transmitter output pin.
	I2C1_SCL	I/O	MFP7	I ² C1 clock pin.
	CAN0_TXD	O	MFP8	CAN0 bus transmitter output.
	SPI0_I2SMCLK	I/O	MFP9	SPI0 I ² S master clock output pin
	BPWM1_CH0	I/O	MFP10	BPWM1 channel 0 output/capture input.
	SPI3_CLK	I/O	MFP11	SPI3 serial clock pin.
	HSUSB_VBUS_ST	I	MFP14	HSUSB external VBUS regulator status pin.
	PB.12	I/O	MFP0	General purpose digital I/O pin.
PB.13	EADC0_CH12	A	MFP1	EADC0 channel 12 analog input.
	DAC0_OUT	A	MFP1	DAC0 channel analog output.
	ACMP0_P2	A	MFP1	Analog comparator 0 positive input 2 pin.
	ACMP1_P2	A	MFP1	Analog comparator 1 positive input 2 pin.
	EBI_AD15	I/O	MFP2	EBI address/data bus bit 15.
	SC1_CLK	O	MFP3	Smart Card 1 clock pin.
	SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
	USCI0_CLK	I/O	MFP5	USCI0 clock pin.
	UART0_RXD	I	MFP6	UART0 data receiver input pin.
	UART3_nCTS	I	MFP7	UART3 clear to Send input pin.
	I2C2_SDA	I/O	MFP8	I ² C2 data input/output pin.
	SD0_nCD	I	MFP9	SD/SDIO0 card detect input pin
PB.14	EPWM1_CH3	I/O	MFP11	EPWM1 channel 3 output/capture input.
	TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
	PB.13	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH13	A	MFP1	EADC0 channel 13 analog input.
PB.14	DAC1_OUT	A	MFP1	DAC1 channel analog output.
	ACMP0_P3	A	MFP1	Analog comparator 0 positive input 3 pin.
	ACMP1_P3	A	MFP1	Analog comparator 1 positive input 3 pin.
	EBI_AD14	I/O	MFP2	EBI address/data bus bit 14.
PB.15	SC1_DAT	I/O	MFP3	Smart Card 1 data pin.
	SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.

	Pin Name	Type	MFP	Description
PB.14	USCI0_DAT0	I/O	MFP5	USCI0 data 0 pin.
	UART0_TXD	O	MFP6	UART0 data transmitter output pin.
	UART3_nRTS	O	MFP7	UART3 request to Send output pin.
	I2C2_SCL	I/O	MFP8	I ² C clock pin.
	EPWM1_CH2	I/O	MFP11	EPWM1 channel 2 output/capture input.
	TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.
PB.15	PB.14	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH14	A	MFP1	EADC0 channel 14 analog input.
	EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
	SC1_RST	O	MFP3	Smart Card 1 reset pin.
	SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
	USCI0_DAT1	I/O	MFP5	USCI0 data 1 pin.
	UART0_nRTS	O	MFP6	UART0 request to Send output pin.
	UART3_RXD	I	MFP7	UART3 data receiver input pin.
	I2C2_SMBSUS	O	MFP8	I ² C SMBus SMBSUS pin (PMBus CONTROL pin)
	EPWM1_CH1	I/O	MFP11	EPWM1 channel 1 output/capture input.
	TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
	CLKO	O	MFP14	Clock Out
PC.0	PB.15	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH15	A	MFP1	EADC0 channel 15 analog input.
	EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
	SC1_PWR	O	MFP3	Smart Card 1 power pin.
	SPI0_SS	I/O	MFP4	SPI0 slave select pin.
	USCI0_CTL1	I/O	MFP5	USCI0 control 1 pin.
	UART0_nCTS	I	MFP6	UART0 clear to Send input pin.
	UART3_TXD	O	MFP7	UART3 data transmitter output pin.
	I2C2_SMBAL	O	MFP8	I ² C SMBus SMBALTER pin
	EPWM1_CH0	I/O	MFP11	EPWM1 channel 0 output/capture input.
	TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
	USB_VBUS_EN	O	MFP14	USB external VBUS regulator enable pin.

	Pin Name	Type	MFP	Description
PC.1	QSPI0_MOSI0	I/O	MFP4	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
	SC1_CLK	O	MFP5	Smart Card 1 clock pin.
	I2S0_LRCK	O	MFP6	I ² S0 left right channel clock output pin.
	SPI1_SS	I/O	MFP7	SPI1 slave select pin.
	UART2_RXD	I	MFP8	UART2 data receiver input pin.
	I2C0_SDA	I/O	MFP9	I ² C0 data input/output pin.
	EPWM1_CH5	I/O	MFP12	EPWM1 channel 5 output/capture input.
	ACMP1_O	O	MFP14	Analog comparator 1 output pin.
	PC.1	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.
PC.2	SPIM_MISO	I/O	MFP3	SPIM MISO (Master In, Slave Out) pin.
	QSPI0_MISO0	I/O	MFP4	Quad SPI0 MISO0 (Master In, Slave Out) pin.
	SC1_DAT	I/O	MFP5	Smart Card 1 data pin.
	I2S0_DO	O	MFP6	I ² S0 data output pin.
	SPI1_CLK	I/O	MFP7	SPI1 serial clock pin.
	UART2_TXD	O	MFP8	UART2 data transmitter output pin.
	I2C0_SCL	I/O	MFP9	I ² C0 clock pin.
	EPWM1_CH4	I/O	MFP12	EPWM1 channel 4 output/capture input.
	ACMP0_O	O	MFP14	Analog comparator 0 output pin.
	PC.2	I/O	MFP0	General purpose digital I/O pin.
PC.3	EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
	SPIM_CLK	I/O	MFP3	SPIM serial clock pin.
	QSPI0_CLK	I/O	MFP4	Quad SPI0 serial clock pin.
	SC1_RST	O	MFP5	Smart Card 1 reset pin.
	I2S0_DI	I	MFP6	I ² S0 data input pin.
	SPI1_MOSI	I/O	MFP7	SPI1 MOSI (Master Out, Slave In) pin.
	UART2_nCTS	I	MFP8	UART2 clear to Send input pin.
	I2C0_SMBSUS	O	MFP9	I ² C0 SMBus SMBSUS pin (PMBus CONTROL pin)
	CAN1_RXD	I	MFP10	CAN1 bus receiver input.
	UART3_RXD	I	MFP11	UART3 data receiver input pin.
PC.3	EPWM1_CH3	I/O	MFP12	EPWM1 channel 3 output/capture input.
	PC.3	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.
	SPIM_SS	I/O	MFP3	SPIM slave select pin.

	Pin Name	Type	MFP	Description
PC.4	QSPI0_SS	I/O	MFP4	Quad SPI0 slave select pin.
	SC1_PWR	O	MFP5	Smart Card 1 power pin.
	I2S0_MCLK	O	MFP6	I ² S0 master clock output pin.
	SPI1_MISO	I/O	MFP7	SPI1 MISO (Master In, Slave Out) pin.
	UART2_nRTS	O	MFP8	UART2 request to Send output pin.
	I2C0_SMBAL	O	MFP9	I ² C0 SMBus SMBALTER pin
	CAN1_TXD	O	MFP10	CAN1 bus transmitter output.
	UART3_TXD	O	MFP11	UART3 data transmitter output pin.
	EPWM1_CH2	I/O	MFP12	EPWM1 channel 2 output/capture input.
	PC.4	I/O	MFP0	General purpose digital I/O pin.
PC.5	EBI_AD4	I/O	MFP2	EBI address/data bus bit 4.
	SPIM_D3	I/O	MFP3	SPIM data 3 pin for Quad Mode I/O.
	QSPI0_MOSI1	I/O	MFP4	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
	SC1_nCD	I	MFP5	Smart Card 1 card detect pin.
	I2S0_BCLK	O	MFP6	I ² S0 bit clock output pin.
	SPI1_I2SMCLK	I/O	MFP7	SPI1 I ² S master clock output pin
	UART2_RXD	I	MFP8	UART2 data receiver input pin.
	I2C1_SDA	I/O	MFP9	I ² C1 data input/output pin.
	CAN0_RXD	I	MFP10	CAN0 bus receiver input.
	UART4_RXD	I	MFP11	UART4 data receiver input pin.
PC.6	EPWM1_CH1	I/O	MFP12	EPWM1 channel 1 output/capture input.
	PC.5	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD5	I/O	MFP2	EBI address/data bus bit 5.
	SPIM_D2	I/O	MFP3	SPIM data 2 pin for Quad Mode I/O.
	QSPI0_MISO1	I/O	MFP4	Quad SPI0 MISO1 (Master In, Slave Out) pin.
	UART2_TXD	O	MFP8	UART2 data transmitter output pin.
	I2C1_SCL	I/O	MFP9	I ² C1 clock pin.
	CAN0_TXD	O	MFP10	CAN0 bus transmitter output.
	UART4_TXD	O	MFP11	UART4 data transmitter output pin.
	EPWM1_CH0	I/O	MFP12	EPWM1 channel 0 output/capture input.

	Pin Name	Type	MFP	Description
PC.7	UART4_RXD	I	MFP5	UART4 data receiver input pin.
	SC2_RST	O	MFP6	Smart Card 2 reset pin.
	UART0_nRTS	O	MFP7	UART0 request to Send output pin.
	I2C1_SMBSUS	O	MFP8	I ² C1 SMBus SMBSUS pin (PMBus CONTROL pin)
	EPWM1_CH3	I/O	MFP11	EPWM1 channel 3 output/capture input.
	BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
	TM1	I/O	MFP14	Timer1 event counter input/toggle output pin.
	INT2	I	MFP15	External interrupt 2 input pin.
	PC.7	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
PC.8	EMAC_RMII_RXD0	I	MFP3	EMAC RMII Receive Data bus bit 0.
	SPI1_MISO	I/O	MFP4	SPI1 MISO (Master In, Slave Out) pin.
	UART4_TXD	O	MFP5	UART4 data transmitter output pin.
	SC2_PWR	O	MFP6	Smart Card 2 power pin.
	UART0_nCTS	I	MFP7	UART0 clear to Send input pin.
	I2C1_SMBAL	O	MFP8	I ² C1 SMBus SMBALTER pin
	EPWM1_CH2	I/O	MFP11	EPWM1 channel 2 output/capture input.
	BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
	TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
	INT3	I	MFP15	External interrupt 3 input pin.
PC.9	PC.8	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR16	O	MFP2	EBI address bus bit 16.
	EMAC_RMII_REFCLK	I	MFP3	EMAC RMII reference clock input pin.
	I2C0_SDA	I/O	MFP4	I ² C0 data input/output pin.
	UART4_nCTS	I	MFP5	UART4 clear to Send input pin.
	UART1_RXD	I	MFP8	UART1 data receiver input pin.
	EPWM1_CH1	I/O	MFP11	EPWM1 channel 1 output/capture input.
	BPWM1_CH4	I/O	MFP12	BPWM1 channel 4 output/capture input.

	Pin Name	Type	MFP	Description
PC.10	PC.10	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR6	O	MFP2	EBI address bus bit 6.
	SPI3_CLK	I/O	MFP6	SPI3 serial clock pin.
	UART3_TXD	O	MFP7	UART3 data transmitter output pin.
	CAN1_TXD	O	MFP9	CAN1 bus transmitter output.
	ECAP1_IC0	I	MFP11	Enhanced capture unit 1 input 0 pin.
	EPWM1_CH2	I/O	MFP12	EPWM1 channel 2 output/capture input.
PC.11	PC.11	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR5	O	MFP2	EBI address bus bit 5.
	UART0_RXD	I	MFP3	UART0 data receiver input pin.
	I2C0_SDA	I/O	MFP4	I ² C0 data input/output pin.
	SPI3_MOSI	I/O	MFP6	SPI3 MOSI (Master Out, Slave In) pin.
	ECAP1_IC1	I	MFP11	Enhanced capture unit 1 input 1 pin.
	EPWM1_CH1	I/O	MFP12	EPWM1 channel 1 output/capture input.
	ACMP1_O	O	MFP14	Analog comparator 1 output pin.
PC.12	PC.12	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR4	O	MFP2	EBI address bus bit 4.
	UART0_TXD	O	MFP3	UART0 data transmitter output pin.
	I2C0_SCL	I/O	MFP4	I ² C0 clock pin.
	SPI3_MISO	I/O	MFP6	SPI3 MISO (Master In, Slave Out) pin.
	SC0_nCD	I	MFP9	Smart Card 0 card detect pin.
	ECAP1_IC2	I	MFP11	Enhanced capture unit 1 input 2 pin.
	EPWM1_CH0	I/O	MFP12	EPWM1 channel 0 output/capture input.
	ACMP0_O	O	MFP14	Analog comparator 0 output pin.
PC.13	PC.13	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR10	O	MFP2	EBI address bus bit 10.
	SC2_nCD	I	MFP3	Smart Card 2 card detect pin.
	SPI2_I2SMCLK	I/O	MFP4	SPI2 I ² S master clock output pin
	CAN1_TXD	O	MFP5	CAN1 bus transmitter output.
	USCI0_CTL0	I/O	MFP6	USCI0 control 0 pin.
	UART2_TXD	O	MFP7	UART2 data transmitter output pin.
	BPWM0_CH4	I/O	MFP9	BPWM0 channel 4 output/capture input.
	CLKO	O	MFP13	Clock Out
	EADC0_ST	I	MFP14	EADC0 external trigger input.

	Pin Name	Type	MFP	Description
PC.14	PC.14	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
	SC1_nCD	I	MFP3	Smart Card 1 card detect pin.
	SPI0_I2SMCLK	I/O	MFP4	SPI0 I ² S master clock output pin
	USCI0_CTL0	I/O	MFP5	USCI0 control 0 pin.
	QSPI0_CLK	I/O	MFP6	Quad SPI0 serial clock pin.
	EPWM0_SYNC_IN	I	MFP11	EPWM0 counter synchronous trigger input pin.
	TM1	I/O	MFP13	Timer1 event counter input/toggle output pin.
	USB_VBUS_ST	I	MFP14	USB external VBUS regulator status pin.
	HSUSB_VBUS_ST	I	MFP15	HSUSB external VBUS regulator status pin.
PD.0	PD.0	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
	USCI0_CLK	I/O	MFP3	USCI0 clock pin.
	SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
	UART3_RXD	I	MFP5	UART3 data receiver input pin.
	I2C2_SDA	I/O	MFP6	I ² C2 data input/output pin.
	SC2_CLK	O	MFP7	Smart Card 2 clock pin.
	TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
PD.1	PD.1	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
	USCI0_DAT0	I/O	MFP3	USCI0 data 0 pin.
	SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
	UART3_TXD	O	MFP5	UART3 data transmitter output pin.
	I2C2_SCL	I/O	MFP6	I ² C2 clock pin.
	SC2_DAT	I/O	MFP7	Smart Card 2 data pin.
PD.2	PD.2	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
	USCI0_DAT1	I/O	MFP3	USCI0 data 1 pin.
	SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
	UART3_nCTS	I	MFP5	UART3 clear to Send input pin.
	SC2_RST	O	MFP7	Smart Card 2 reset pin.
	UART0_RXD	I	MFP9	UART0 data receiver input pin.
PD.3	PD.3	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.

	Pin Name	Type	MFP	Description
	USCI0_CTL1	I/O	MFP3	USCI0 control 1 pin.
	SPI0_SS	I/O	MFP4	SPI0 slave select pin.
	UART3_nRTS	O	MFP5	UART3 request to Send output pin.
	USCI1_CTL0	I/O	MFP6	USCI1 control 0 pin.
	SC2_PWR	O	MFP7	Smart Card 2 power pin.
	SC1_nCD	I	MFP8	Smart Card 1 card detect pin.
	UART0_TXD	O	MFP9	UART0 data transmitter output pin.
PD.4	PD.4	I/O	MFP0	General purpose digital I/O pin.
	USCI0_CTL0	I/O	MFP3	USCI0 control 0 pin.
	I2C1_SDA	I/O	MFP4	I ² C1 data input/output pin.
	SPI1_SS	I/O	MFP5	SPI1 slave select pin.
	USCI1_CTL1	I/O	MFP6	USCI1 control 1 pin.
	SC1_CLK	O	MFP8	Smart Card 1 clock pin.
	USB_VBUS_ST	I	MFP14	USB external VBUS regulator status pin.
PD.5	PD.5	I/O	MFP0	General purpose digital I/O pin.
	I2C1_SCL	I/O	MFP4	I ² C1 clock pin.
	SPI1_CLK	I/O	MFP5	SPI1 serial clock pin.
	USCI1_DAT0	I/O	MFP6	USCI1 data 0 pin.
	SC1_DAT	I/O	MFP8	Smart Card 1 data pin.
PD.6	PD.6	I/O	MFP0	General purpose digital I/O pin.
	UART1_RXD	I	MFP3	UART1 data receiver input pin.
	I2C0_SDA	I/O	MFP4	I ² C0 data input/output pin.
	SPI1_MOSI	I/O	MFP5	SPI1 MOSI (Master Out, Slave In) pin.
	USCI1_DAT1	I/O	MFP6	USCI1 data 1 pin.
	SC1_RST	O	MFP8	Smart Card 1 reset pin.
PD.7	PD.7	I/O	MFP0	General purpose digital I/O pin.
	UART1_TXD	O	MFP3	UART1 data transmitter output pin.
	I2C0_SCL	I/O	MFP4	I ² C0 clock pin.
	SPI1_MISO	I/O	MFP5	SPI1 MISO (Master In, Slave Out) pin.
	USCI1_CLK	I/O	MFP6	USCI1 clock pin.
	SC1_PWR	O	MFP8	Smart Card 1 power pin.
PD.8	PD.8	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
	I2C2_SDA	I/O	MFP3	I ² C2 data input/output pin.

	Pin Name	Type	MFP	Description
	UART2_nRTS	O	MFP4	UART2 request to Send output pin.
PD.9	PD.9	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
	I2C2_SCL	I/O	MFP3	I ² C clock pin.
	UART2_nCTS	I	MFP4	UART2 clear to Send input pin.
PD.10	PD.10	I/O	MFP0	General purpose digital I/O pin.
	OPA2_P	A	MFP1	Operational amplifier 2 positive input pin.
	EBI_nCS2	O	MFP2	EBI chip select 2 output pin.
	UART1_RXD	I	MFP3	UART1 data receiver input pin.
	CAN0_RXD	I	MFP4	CAN0 bus receiver input.
	QEI0_B	I	MFP10	Quadrature encoder 0 phase B input
	INT7	I	MFP15	External interrupt 7 input pin.
PD.11	PD.11	I/O	MFP0	General purpose digital I/O pin.
	OPA2_N	A	MFP1	Operational amplifier 2 negative input pin.
	EBI_nCS1	O	MFP2	EBI chip select 1 output pin.
	UART1_TXD	O	MFP3	UART1 data transmitter output pin.
	CAN0_TXD	O	MFP4	CAN0 bus transmitter output.
	QEI0_A	I	MFP10	Quadrature encoder 0 phase A input
	INT6	I	MFP15	External interrupt 6 input pin.
PD.12	PD.12	I/O	MFP0	General purpose digital I/O pin.
	OPA2_O	A	MFP1	Operational amplifier 2 output pin.
	EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
	CAN1_RXD	I	MFP5	CAN1 bus receiver input.
	UART2_RXD	I	MFP7	UART2 data receiver input pin.
	BPWM0_CH5	I/O	MFP9	BPWM0 channel 5 output/capture input.
	QEI0_INDEX	I	MFP10	Quadrature encoder 0 index input
	CLKO	O	MFP13	Clock Out
	EADC0_ST	I	MFP14	EADC0 external trigger input.
	INT5	I	MFP15	External interrupt 5 input pin.
PD.13	PD.13	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
	SD0_nCD	I	MFP3	SD/SDIO0 card detect input pin
	SPI0_I2SMCLK	I/O	MFP4	SPI0 I ² S master clock output pin
	SPI1_I2SMCLK	I/O	MFP5	SPI1 I ² S master clock output pin

	Pin Name	Type	MFP	Description
	SC2_nCD	I	MFP7	Smart Card 2 card detect pin.
PD.14	PD.14	I/O	MFP0	General purpose digital I/O pin.
	EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
	SPI3_I2SMCLK	I/O	MFP3	SPI3 I ² S master clock output pin
	SC1_nCD	I	MFP4	Smart Card 1 card detect pin.
	EPWM0_CH4	I/O	MFP11	EPWM0 channel 4 output/capture input.
PE.0	PE.0	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
	QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
	SC2_CLK	O	MFP4	Smart Card 2 clock pin.
	I2S0_MCLK	O	MFP5	I ² S0 master clock output pin.
	SPI1_MOSI	I/O	MFP6	SPI1 MOSI (Master Out, Slave In) pin.
	UART3_RXD	I	MFP7	UART3 data receiver input pin.
	I2C1_SDA	I/O	MFP8	I ² C1 data input/output pin.
	UART4_nRTS	O	MFP9	UART4 request to Send output pin.
PE.1	PE.1	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
	QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
	SC2_DAT	I/O	MFP4	Smart Card 2 data pin.
	I2S0_BCLK	O	MFP5	I ² S0 bit clock output pin.
	SPI1_MISO	I/O	MFP6	SPI1 MISO (Master In, Slave Out) pin.
	UART3_TXD	O	MFP7	UART3 data transmitter output pin.
	I2C1_SCL	I/O	MFP8	I ² C1 clock pin.
	UART4_nCTS	I	MFP9	UART4 clear to Send input pin.
PE.2	PE.2	I/O	MFP0	General purpose digital I/O pin.
	EBI_ALE	O	MFP2	EBI address latch enable output pin.
	SD0_DAT0	I/O	MFP3	SD/SDIO0 data line bit 0.
	SPIM_MOSI	I/O	MFP4	SPIM MOSI (Master Out, Slave In) pin.
	SPI3_MOSI	I/O	MFP5	SPI3 MOSI (Master Out, Slave In) pin.
	SC0_CLK	O	MFP6	Smart Card 0 clock pin.
	USCI0_CLK	I/O	MFP7	USCI0 clock pin.
	QEIO_B	I	MFP11	Quadrature encoder 0 phase B input
	EPWM0_CH5	I/O	MFP12	EPWM0 channel 5 output/capture input.
	BPWM0_CH0	I/O	MFP13	BPWM0 channel 0 output/capture input.

	Pin Name	Type	MFP	Description
PE.3	PE.3	I/O	MFP0	General purpose digital I/O pin.
	EBI_MCLK	O	MFP2	EBI external clock output pin.
	SD0_DAT1	I/O	MFP3	SD/SDIO0 data line bit 1.
	SPIIM_MISO	I/O	MFP4	SPIIM MISO (Master In, Slave Out) pin.
	SPI3_MISO	I/O	MFP5	SPI3 MISO (Master In, Slave Out) pin.
	SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
	USCI0_DAT0	I/O	MFP7	USCI0 data 0 pin.
	QEIO_A	I	MFP11	Quadrature encoder 0 phase A input
	EPWM0_CH4	I/O	MFP12	EPWM0 channel 4 output/capture input.
	BPWM0_CH1	I/O	MFP13	BPWM0 channel 1 output/capture input.
PE.4	PE.4	I/O	MFP0	General purpose digital I/O pin.
	EBI_nWR	O	MFP2	EBI write enable output pin.
	SD0_DAT2	I/O	MFP3	SD/SDIO0 data line bit 2.
	SPIIM_CLK	I/O	MFP4	SPIIM serial clock pin.
	SPI3_CLK	I/O	MFP5	SPI3 serial clock pin.
	SC0_RST	O	MFP6	Smart Card 0 reset pin.
	USCI0_DAT1	I/O	MFP7	USCI0 data 1 pin.
	QEIO_INDEX	I	MFP11	Quadrature encoder 0 index input
	EPWM0_CH3	I/O	MFP12	EPWM0 channel 3 output/capture input.
	BPWM0_CH2	I/O	MFP13	BPWM0 channel 2 output/capture input.
PE.5	PE.5	I/O	MFP0	General purpose digital I/O pin.
	EBI_nRD	O	MFP2	EBI read enable output pin.
	SD0_DAT3	I/O	MFP3	SD/SDIO0 data line bit 3.
	SPIIM_SS	I/O	MFP4	SPIIM slave select pin.
	SPI3_SS	I/O	MFP5	SPI3 slave select pin.
	SC0_PWR	O	MFP6	Smart Card 0 power pin.
	USCI0_CTL1	I/O	MFP7	USCI0 control 1 pin.
	QEII_B	I	MFP11	Quadrature encoder 1 phase B input
	EPWM0_CH2	I/O	MFP12	EPWM0 channel 2 output/capture input.
	BPWM0_CH3	I/O	MFP13	BPWM0 channel 3 output/capture input.
PE.6	PE.6	I/O	MFP0	General purpose digital I/O pin.
	SD0_CLK	O	MFP3	SD/SDIO0 clock output pin
	SPIIM_D3	I/O	MFP4	SPIIM data 3 pin for Quad Mode I/O.
	SPI3_I2SMCLK	I/O	MFP5	SPI3 I ² S master clock output pin

	Pin Name	Type	MFP	Description
PE.7	SC0_nCD	I	MFP6	Smart Card 0 card detect pin.
	USCI0_CTL0	I/O	MFP7	USCI0 control 0 pin.
	UART5_RXD	I	MFP8	UART5 data receiver input pin.
	CAN1_RXD	I	MFP9	CAN1 bus receiver input.
	QEI1_A	I	MFP11	Quadrature encoder 1 phase A input
	EPWM0_CH1	I/O	MFP12	EPWM0 channel 1 output/capture input.
	BPWM0_CH4	I/O	MFP13	BPWM0 channel 4 output/capture input.
	PE.7	I/O	MFP0	General purpose digital I/O pin.
PE.8	SD0_CMD	I/O	MFP3	SD/SDIO0 command/response pin
	SPI_M2	I/O	MFP4	SPI_M data 2 pin for Quad Mode I/O.
	UART5_TXD	O	MFP8	UART5 data transmitter output pin.
	CAN1_TXD	O	MFP9	CAN1 bus transmitter output.
	QEI1_INDEX	I	MFP11	Quadrature encoder 1 index input
	EPWM0_CH0	I/O	MFP12	EPWM0 channel 0 output/capture input.
	BPWM0_CH5	I/O	MFP13	BPWM0 channel 5 output/capture input.
	PE.8	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR10	O	MFP2	EBI address bus bit 10.
	EMAC_RMII_MDC	O	MFP3	EMAC RMII PHY Management Clock output pin.
	I2S0_BCLK	O	MFP4	I ² S0 bit clock output pin.
PE.9	SPI2_CLK	I/O	MFP5	SPI2 serial clock pin.
	USCI1_CTL1	I/O	MFP6	USCI1 control 1 pin.
	UART2_TXD	O	MFP7	UART2 data transmitter output pin.
	EPWM0_CH0	I/O	MFP10	EPWM0 channel 0 output/capture input.
	EPWM0_BRAKE0	I	MFP11	EPWM0 Brake 0 input pin.
	ECAP0_IC0	I	MFP12	Enhanced capture unit 0 input 0 pin.
	TRACE_CLK	O	MFP14	ETM Trace Clock output pin
	PE.9	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR11	O	MFP2	EBI address bus bit 11.
	EMAC_RMII_MDIO	I/O	MFP3	EMAC RMII PHY Management Data pin.
PE.10	I2S0_MCLK	O	MFP4	I ² S0 master clock output pin.
	SPI2_MISO	I/O	MFP5	SPI2 MISO (Master In, Slave Out) pin.
	USCI1_CTL0	I/O	MFP6	USCI1 control 0 pin.
	UART2_RXD	I	MFP7	UART2 data receiver input pin.
	EPWM0_CH1	I/O	MFP10	EPWM0 channel 1 output/capture input.

	Pin Name	Type	MFP	Description
	EPWM0_BRAKE1	I	MFP11	EPWM0 Brake 1 input pin.
	ECAP0_IC1	I	MFP12	Enhanced capture unit 0 input 1 pin.
	TRACE_DATA0	O	MFP14	ETM Trace Data 0 output pin
PE.10	PE.10	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR12	O	MFP2	EBI address bus bit 12.
	EMAC_RMII_TXD0	O	MFP3	EMAC RMII Transmit Data bus bit 0.
	I2S0_DI	I	MFP4	I ² S0 data input pin.
	SPI2_MOSI	I/O	MFP5	SPI2 MOSI (Master Out, Slave In) pin.
	USCI1_DAT0	I/O	MFP6	USCI1 data 0 pin.
	UART3_TXD	O	MFP7	UART3 data transmitter output pin.
	EPWM0_CH2	I/O	MFP10	EPWM0 channel 2 output/capture input.
	EPWM1_BRAKE0	I	MFP11	EPWM1 Brake 0 input pin.
	ECAP0_IC2	I	MFP12	Enhanced capture unit 0 input 2 pin.
PE.11	TRACE_DATA1	O	MFP14	ETM Trace Data 1 output pin
	PE.11	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR13	O	MFP2	EBI address bus bit 13.
	EMAC_RMII_TXD1	O	MFP3	EMAC RMII Transmit Data bus bit 1.
	I2S0_DO	O	MFP4	I ² S0 data output pin.
	SPI2_SS	I/O	MFP5	SPI2 slave select pin.
	USCI1_DAT1	I/O	MFP6	USCI1 data 1 pin.
	UART3_RXD	I	MFP7	UART3 data receiver input pin.
	UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
	EPWM0_CH3	I/O	MFP10	EPWM0 channel 3 output/capture input.
PE.12	EPWM1_BRAKE1	I	MFP11	EPWM1 Brake 1 input pin.
	ECAP1_IC2	I	MFP13	Enhanced capture unit 1 input 2 pin.
	TRACE_DATA2	O	MFP14	ETM Trace Data 2 output pin
	PE.12	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR14	O	MFP2	EBI address bus bit 14.
	EMAC_RMII_TXEN	O	MFP3	EMAC RMII Transmit Enable output pin.
	I2S0_LRCK	O	MFP4	I ² S0 left right channel clock output pin.
	SPI2_I2SMCLK	I/O	MFP5	SPI2 I ² S master clock output pin

	Pin Name	Type	MFP	Description
	ECAP1_IC1	I	MFP13	Enhanced capture unit 1 input 1 pin.
	TRACE_DATA3	O	MFP14	ETM Trace Data 3 output pin
PE.13	PE.13	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR15	O	MFP2	EBI address bus bit 15.
	EMAC_PPS	O	MFP3	EMAC Pulse Per Second output pin.
	I2C0_SCL	I/O	MFP4	I ² C0 clock pin.
	UART4_nRTS	O	MFP5	UART4 request to Send output pin.
	UART1_TXD	O	MFP8	UART1 data transmitter output pin.
	EPWM0_CH5	I/O	MFP10	EPWM0 channel 5 output/capture input.
	EPWM1_CH0	I/O	MFP11	EPWM1 channel 0 output/capture input.
	BPWM1_CH5	I/O	MFP12	BPWM1 channel 5 output/capture input.
	ECAP1_IC0	I	MFP13	Enhanced capture unit 1 input 0 pin.
PE.14	PE.14	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD8	I/O	MFP2	EBI address/data bus bit 8.
	UART2_TXD	O	MFP3	UART2 data transmitter output pin.
	CAN0_TXD	O	MFP4	CAN0 bus transmitter output.
	SD1_nCD	I	MFP5	SD/SDIO1 card detect input pin
PE.15	PE.15	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
	UART2_RXD	I	MFP3	UART2 data receiver input pin.
	CAN0_RXD	I	MFP4	CAN0 bus receiver input.
PF.0	PF.0	I/O	MFP0	General purpose digital I/O pin.
	UART1_TXD	O	MFP2	UART1 data transmitter output pin.
	I2C1_SCL	I/O	MFP3	I ² C1 clock pin.
	BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
	ICE_DAT	O	MFP14	Serial wired debugger data pin.
PF.1	PF.1	I/O	MFP0	General purpose digital I/O pin.
	UART1_RXD	I	MFP2	UART1 data receiver input pin.
	I2C1_SDA	I/O	MFP3	I ² C1 data input/output pin.
	BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
	ICE_CLK	I	MFP14	Serial wired debugger clock pin.
PF.2	PF.2	I/O	MFP0	General purpose digital I/O pin.
	EBI_nCS1	O	MFP2	EBI chip select 1 output pin.
	UART0_RXD	I	MFP3	UART0 data receiver input pin.

	Pin Name	Type	MFP	Description
PF.3	I2C0_SDA	I/O	MFP4	I ² C0 data input/output pin.
	QSPI0_CLK	I/O	MFP5	Quad SPI0 serial clock pin.
	XT1_OUT	O	MFP10	External 4~24 MHz (high speed) crystal output pin.
	BPWM1_CH1	I/O	MFP11	BPWM1 channel 1 output/capture input.
PF.4	PF.3	I/O	MFP0	General purpose digital I/O pin.
	EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
	UART0_TXD	O	MFP3	UART0 data transmitter output pin.
	I2C0_SCL	I/O	MFP4	I ² C0 clock pin.
	XT1_IN	I	MFP10	External 4~24 MHz (high speed) crystal input pin.
	BPWM1_CH0	I/O	MFP11	BPWM1 channel 0 output/capture input.
PF.5	PF.4	I/O	MFP0	General purpose digital I/O pin.
	UART2_TXD	O	MFP2	UART2 data transmitter output pin.
	UART2_nRTS	O	MFP4	UART2 request to Send output pin.
	BPWM0_CH5	I/O	MFP8	BPWM0 channel 5 output/capture input.
	X32_OUT	O	MFP10	External 32.768 kHz crystal output pin.
	PF.5	I/O	MFP0	General purpose digital I/O pin.
	UART2_RXD	I	MFP2	UART2 data receiver input pin.
PF.6	UART2_nCTS	I	MFP4	UART2 clear to Send input pin.
	BPWM0_CH4	I/O	MFP8	BPWM0 channel 4 output/capture input.
	EPWM0_SYNC_OUT	O	MFP9	EPWM0 counter synchronous trigger output pin.
	X32_IN	I	MFP10	External 32.768 kHz crystal input pin.
	EADC0_ST	I	MFP11	EADC0 external trigger input.
	PF.6	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR19	O	MFP2	EBI address bus bit 19.
	SC0_CLK	O	MFP3	Smart Card 0 clock pin.
PF.7	I2S0_LRCK	O	MFP4	I ² S0 left right channel clock output pin.
	SPI0_MOSI	I/O	MFP5	SPI0 MOSI (Master Out, Slave In) pin.
	UART4_RXD	I	MFP6	UART4 data receiver input pin.
	EBI_nCS0	O	MFP7	EBI chip select 0 output pin.
	TAMPER0	I/O	MFP10	TAMPER detector loop pin 0.
	PF.7	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR18	O	MFP2	EBI address bus bit 18.
PF.7	SC0_DAT	I/O	MFP3	Smart Card 0 data pin.
	I2S0_DO	O	MFP4	I ² S0 data output pin.

	Pin Name	Type	MFP	Description
	SPI0_MISO	I/O	MFP5	SPI0 MISO (Master In, Slave Out) pin.
	UART4_TXD	O	MFP6	UART4 data transmitter output pin.
	TAMPER1	I/O	MFP10	TAMPER detector loop pin 1.
PF.8	PF.8	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR17	O	MFP2	EBI address bus bit 17.
	SC0_RST	O	MFP3	Smart Card 0 reset pin.
	I2S0_DI	I	MFP4	I ² S0 data input pin.
	SPI0_CLK	I/O	MFP5	SPI0 serial clock pin.
	TAMPER2	I/O	MFP10	TAMPER detector loop pin 2.
PF.9	PF.9	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR16	O	MFP2	EBI address bus bit 16.
	SC0_PWR	O	MFP3	Smart Card 0 power pin.
	I2S0_MCLK	O	MFP4	I ² S0 master clock output pin.
	SPI0_SS	I/O	MFP5	SPI0 slave select pin.
	TAMPER3	I/O	MFP10	TAMPER detector loop pin 3.
PF.10	PF.10	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR15	O	MFP2	EBI address bus bit 15.
	SC0_nCD	I	MFP3	Smart Card 0 card detect pin.
	I2S0_BCLK	O	MFP4	I ² S0 bit clock output pin.
	SPI0_I2SMCLK	I/O	MFP5	SPI0 I ² S master clock output pin
	TAMPER4	I/O	MFP10	TAMPER detector loop pin 4.
PF.11	PF.11	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR14	O	MFP2	EBI address bus bit 14.
	SPI2_MOSI	I/O	MFP3	SPI2 MOSI (Master Out, Slave In) pin.
	TAMPER5	I/O	MFP10	TAMPER detector loop pin 5.
	TM3	I/O	MFP13	Timer3 event counter input/toggle output pin.
PG.0	PG.0	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR8	O	MFP2	EBI address bus bit 8.
	I2C0_SCL	I/O	MFP4	I ² C0 clock pin.
	I2C1_SMBAL	O	MFP5	I ² C1 SMBus SMBALTER pin
	UART2_RXD	I	MFP6	UART2 data receiver input pin.
	CAN1_TXD	O	MFP7	CAN1 bus transmitter output.
	UART1_TXD	O	MFP8	UART1 data transmitter output pin.
PG.1	PG.1	I/O	MFP0	General purpose digital I/O pin.

	Pin Name	Type	MFP	Description
PG.2	EBI_ADR9	O	MFP2	EBI address bus bit 9.
	SPI2_I2SMCLK	I/O	MFP3	SPI2 I ² S master clock output pin
	I2C0_SDA	I/O	MFP4	I ² C0 data input/output pin.
	I2C1_SMBSUS	O	MFP5	I ² C1 SMBus SMBSUS pin (PMBus CONTROL pin)
	UART2_TXD	O	MFP6	UART2 data transmitter output pin.
	CAN1_RXD	I	MFP7	CAN1 bus receiver input.
	UART1_RXD	I	MFP8	UART1 data receiver input pin.
PG.3	PG.2	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR11	O	MFP2	EBI address bus bit 11.
	SPI2_SS	I/O	MFP3	SPI2 slave select pin.
	I2C0_SMBAL	O	MFP4	I ² C0 SMBus SMBALTER pin
	I2C1_SCL	I/O	MFP5	I ² C1 clock pin.
	TM0	I/O	MFP13	Timer0 event counter input/toggle output pin.
PG.4	PG.3	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR12	O	MFP2	EBI address bus bit 12.
	SPI2_CLK	I/O	MFP3	SPI2 serial clock pin.
	I2C0_SMBSUS	O	MFP4	I ² C0 SMBus SMBSUS pin (PMBus CONTROL pin)
	I2C1_SDA	I/O	MFP5	I ² C1 data input/output pin.
	TM1	I/O	MFP13	Timer1 event counter input/toggle output pin.
PG.5	PG.4	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR13	O	MFP2	EBI address bus bit 13.
	SPI2_MISO	I/O	MFP3	SPI2 MISO (Master In, Slave Out) pin.
	TM2	I/O	MFP13	Timer2 event counter input/toggle output pin.
	PG.5	I/O	MFP0	General purpose digital I/O pin.
PG.6	EBI_nCS1	O	MFP2	EBI chip select 1 output pin.
	SPI3_SS	I/O	MFP3	SPI3 slave select pin.
	SC1_PWR	O	MFP4	Smart Card 1 power pin.
	EPWM0_CH3	I/O	MFP11	EPWM0 channel 3 output/capture input.
	PG.6	I/O	MFP0	General purpose digital I/O pin.
PG.7	EBI_nCS2	O	MFP2	EBI chip select 2 output pin.
	SPI3_CLK	I/O	MFP3	SPI3 serial clock pin.
	SC1_RST	O	MFP4	Smart Card 1 reset pin.
	EPWM0_CH2	I/O	MFP11	EPWM0 channel 2 output/capture input.
	PG.7	I/O	MFP0	General purpose digital I/O pin.

	Pin Name	Type	MFP	Description
PG.8	EBI_nWRL	O	MFP2	EBI low byte write enable output pin.
	SPI3_MISO	I/O	MFP3	SPI3 MISO (Master In, Slave Out) pin.
	SC1_DAT	I/O	MFP4	Smart Card 1 data pin.
	EPWM0_CH1	I/O	MFP11	EPWM0 channel 1 output/capture input.
PG.9	PG.8	I/O	MFP0	General purpose digital I/O pin.
	EBI_nWRH	O	MFP2	EBI high byte write enable output pin
	SPI3_MOSI	I/O	MFP3	SPI3 MOSI (Master Out, Slave In) pin.
	SC1_CLK	O	MFP4	Smart Card 1 clock pin.
	EPWM0_CH0	I/O	MFP11	EPWM0 channel 0 output/capture input.
PG.10	PG.9	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD0	I/O	MFP2	EBI address/data bus bit 0.
	SD1_DAT3	I/O	MFP3	SD/SDIO1 data line bit 3.
	SPIM_D2	I/O	MFP4	SPIM data 2 pin for Quad Mode I/O.
	BPWM0_CH5	I/O	MFP12	BPWM0 channel 5 output/capture input.
PG.11	PG.10	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.
	SD1_DAT2	I/O	MFP3	SD/SDIO1 data line bit 2.
	SPIM_D3	I/O	MFP4	SPIM data 3 pin for Quad Mode I/O.
	BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.
PG.12	PG.11	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
	SD1_DAT1	I/O	MFP3	SD/SDIO1 data line bit 1.
	SPIM_SS	I/O	MFP4	SPIM slave select pin.
	BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.
PG.13	PG.12	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.
	SD1_DAT0	I/O	MFP3	SD/SDIO1 data line bit 0.
	SPIM_CLK	I/O	MFP4	SPIM serial clock pin.
	BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
	PG.13	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD4	I/O	MFP2	EBI address/data bus bit 4.
	SD1_CMD	I/O	MFP3	SD/SDIO1 command/response pin
	SPIM_MISO	I/O	MFP4	SPIM MISO (Master In, Slave Out) pin.
	BPWM0_CH1	I/O	MFP12	BPWM0 channel 1 output/capture input.

	Pin Name	Type	MFP	Description
PG.14	PG.14	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD5	I/O	MFP2	EBI address/data bus bit 5.
	SD1_CLK	O	MFP3	SD/SDIO1 clock output pin
	SPI1_MOSI	I/O	MFP4	SPI1 MOSI (Master Out, Slave In) pin.
	BPWM0_CH0	I/O	MFP12	BPWM0 channel 0 output/capture input.
PG.15	PG.15	I/O	MFP0	General purpose digital I/O pin.
	SD1_nCD	I	MFP3	SD/SDIO1 card detect input pin
	CLKO	O	MFP14	Clock Out
	EADC0_ST	I	MFP15	EADC0 external trigger input.
PH.0	PH.0	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR7	O	MFP2	EBI address bus bit 7.
	UART5_TXD	O	MFP4	UART5 data transmitter output pin.
	TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
PH.1	PH.1	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR6	O	MFP2	EBI address bus bit 6.
	UART5_RXD	I	MFP4	UART5 data receiver input pin.
	TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
PH.2	PH.2	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR5	O	MFP2	EBI address bus bit 5.
	UART5_nRTS	O	MFP4	UART5 request to Send output pin.
	UART4_TXD	O	MFP5	UART4 data transmitter output pin.
	I2C0_SCL	I/O	MFP6	I ² C0 clock pin.
	TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.
PH.3	PH.3	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR4	O	MFP2	EBI address bus bit 4.
	SPI1_I2SMCLK	I/O	MFP3	SPI1 I ² S master clock output pin
	UART5_nCTS	I	MFP4	UART5 clear to Send input pin.
	UART4_RXD	I	MFP5	UART4 data receiver input pin.
	I2C0_SDA	I/O	MFP6	I ² C0 data input/output pin.
	TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
PH.4	PH.4	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR3	O	MFP2	EBI address bus bit 3.
	SPI1_MISO	I/O	MFP3	SPI1 MISO (Master In, Slave Out) pin.
PH.5	PH.5	I/O	MFP0	General purpose digital I/O pin.

	Pin Name	Type	MFP	Description
	EBI_ADR2	O	MFP2	EBI address bus bit 2.
	SPI1_MOSI	I/O	MFP3	SPI1 MOSI (Master Out, Slave In) pin.
PH.6	PH.6	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR1	O	MFP2	EBI address bus bit 1.
	SPI1_CLK	I/O	MFP3	SPI1 serial clock pin.
PH.7	PH.7	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR0	O	MFP2	EBI address bus bit 0.
	SPI1_SS	I/O	MFP3	SPI1 slave select pin.
PH.8	PH.8	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
	QSPI0_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
	SC2_PWR	O	MFP4	Smart Card 2 power pin.
	I2S0_DI	I	MFP5	I ² S0 data input pin.
	SPI1_CLK	I/O	MFP6	SPI1 serial clock pin.
	UART3_nRTS	O	MFP7	UART3 request to Send output pin.
	I2C1_SMBAL	O	MFP8	I ² C1 SMBus SMBALTER pin
	I2C2_SCL	I/O	MFP9	I ² C2 clock pin.
	UART1_TXD	O	MFP10	UART1 data transmitter output pin.
PH.9	PH.9	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
	QSPI0_SS	I/O	MFP3	Quad SPI0 slave select pin.
	SC2_RST	O	MFP4	Smart Card 2 reset pin.
	I2S0_DO	O	MFP5	I ² S0 data output pin.
	SPI1_SS	I/O	MFP6	SPI1 slave select pin.
	UART3_nCTS	I	MFP7	UART3 clear to Send input pin.
	I2C1_SMBSUS	O	MFP8	I ² C1 SMBus SMBSUS pin (PMBus CONTROL pin)
	I2C2_SDA	I/O	MFP9	I ² C2 data input/output pin.
	UART1_RXD	I	MFP10	UART1 data receiver input pin.
PH.10	PH.10	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD14	I/O	MFP2	EBI address/data bus bit 14.
	QSPI0_MISO1	I/O	MFP3	Quad SPI0 MISO1 (Master In, Slave Out) pin.
	SC2_nCD	I	MFP4	Smart Card 2 card detect pin.
	I2S0_LRCK	O	MFP5	I ² S0 left right channel clock output pin.
	SPI1_I2SMCLK	I/O	MFP6	SPI1 I ² S master clock output pin

	Pin Name	Type	MFP	Description
	UART4_TXD	O	MFP7	UART4 data transmitter output pin.
	UART0_TXD	O	MFP8	UART0 data transmitter output pin.
PH.11	PH.11	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD15	I/O	MFP2	EBI address/data bus bit 15.
	QSPI0_MOSI1	I/O	MFP3	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
	UART4_RXD	I	MFP7	UART4 data receiver input pin.
	UART0_RXD	I	MFP8	UART0 data receiver input pin.
	EPWM0_CH5	I/O	MFP11	EPWM0 channel 5 output/capture input.

6 FUNCTIONAL DESCRIPTION

6.1 ARM® Cortex®-M4 Core

The Cortex®-M4 processor, a configurable, multistage, 32-bit RISC processor, has three AMBA AHB-Lite interfaces for best parallel performance and includes an NVIC component. The processor with optional hardware debug functionality can execute Thumb code and is compatible with other Cortex-M profile processors. The profile supports two modes -Thread mode and Handler mode. Handler mode is entered as a result of an exception. An exception return can only be issued in Handler mode. Thread mode is entered on Reset, and can be entered as a result of an exception return. The Cortex®-M4F is a processor with the same capability as the Cortex®-M4 processor and includes floating point arithmetic functionality. The NuMicro® M480 series is embedded with Cortex®-M4F processor. Throughout this document, the name Cortex®-M4 refers to both Cortex®-M4 and Cortex®-M4F processors. Figure 6.1-1 shows the functional controller of the processor.

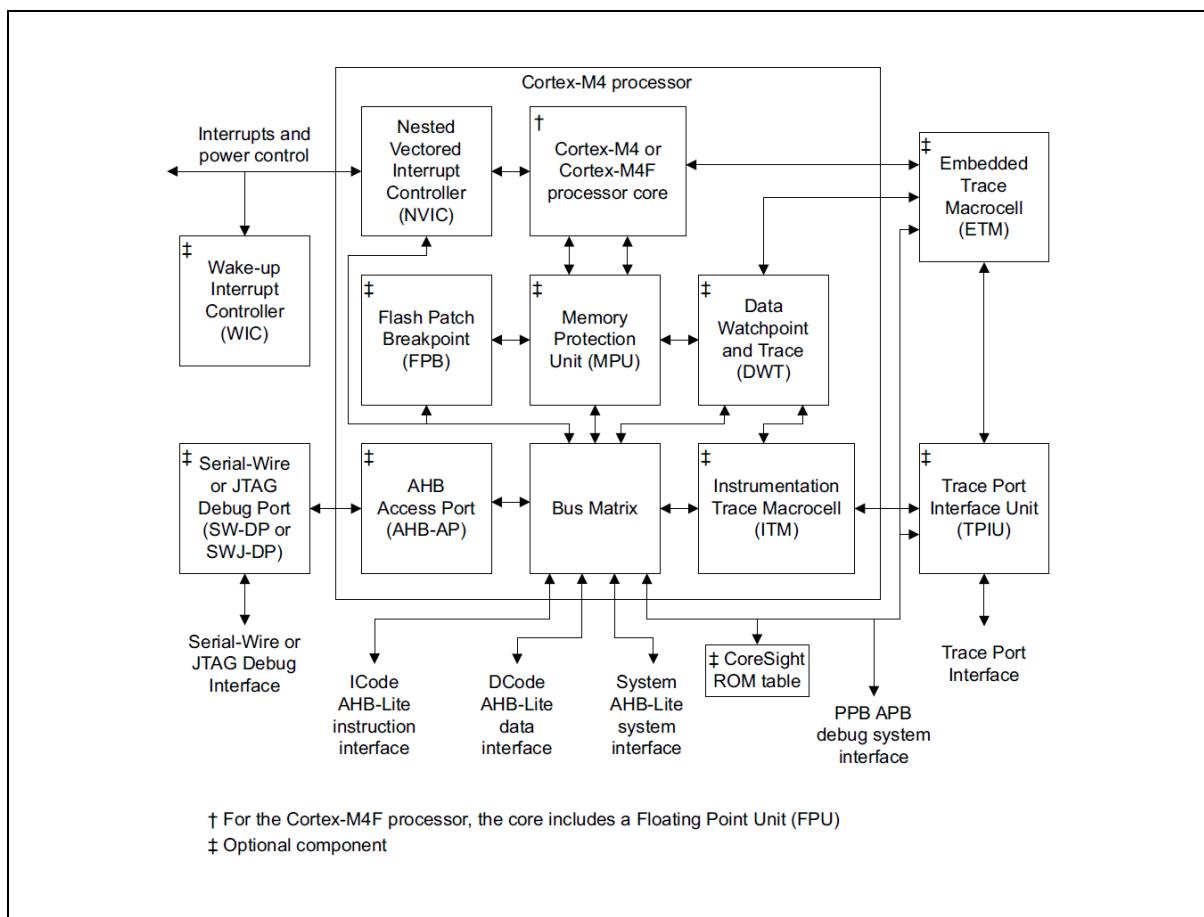

Figure 6.1-1 Cortex®-M4 Block Diagram

Cortex®-M4 processor features:

- A low gate count processor core, with low latency interrupt processing that has:
 - A subset of the Thumb instruction set, defined in the *ARMv7-M Architecture Reference Manual*
 - Banked Stack Pointer (SP)
 - Hardware integer divide instructions, SDIV and UDIV
 - Handler and Thread modes

- Thumb and Debug states
- Support for interruptible-continued instructions LDM, STM, PUSH, and POP for low interrupt latency
- Automatic processor state saving and restoration for low latency *Interrupt Service Routine (ISR)* entry and exit
- Support for ARMv6 big-endian byte-invariant or little-endian accesses
- Support for ARMv6 unaligned accesses
- Floating Point Unit (FPU) in the Cortex®-M4F processor providing:
 - 32-bit instructions for single-precision (C float) data-processing operations
 - Combined Multiply and Accumulate instructions for increased precision (Fused MAC)
 - Hardware support for conversion, addition, subtraction, multiplication with optional accumulate, division, and square-root
 - Hardware support for denormals and all IEEE rounding modes
 - 32 dedicated 32-bit single precision registers, also addressable as 16 double-word registers
 - Decoupled three stage pipeline
- Nested Vectored Interrupt Controller (NVIC) closely integrated with the processor core to achieve low latency interrupt processing. Features include:
 - External interrupts. Configurable from 1 to 240 (the NuMicro® M480 series configured with 64 interrupts)
 - Bits of priority, configurable from 3 to 8
 - Dynamic reprioritization of interrupts
 - Priority grouping which enables selection of preempting interrupt levels and nonpreempting interrupt levels
 - Support for tril-chaining and late arrival of interrupts, which enables back-to-back interrupt processing without the overhead of state saving and restoration between interrupts.
 - Processor state automatically saved on interrupt entry, and restored on interrupt exit with no instruction overhead
 - Support for Wake-up Interrupt Controller (WIC) with Ultra-low Power Sleep mode
- Memory Protection Unit (MPU). An optional MPU for memory protection, including:
 - Eight memory regions
 - Sub Region Disable (SRD), enabling efficient use of memory regions
 - The ability to enable a background region that implements the default memory map attributes
- Low-cost debug solution that features:
 - Debug access to all memory and registers in the system, including access to memory mapped devices, access to internal core registers when the core is halted, and access to debug control registers even while SYSRESETn is asserted.
 - Serial Wire Debug Port(SW-DP) or Serial Wire JTAG Debug Port (SWJ-DP) debug access
 - Optional Flash Patch and Breakpoint (FPB) unit for implementing breakpoints and

code patches

- Optional Data Watchpoint and Trace (DWT) unit for implementing watchpoints, data tracing, and system profiling
- Optional Instrumentation Trace Macrocell (ITM) for support of printf() style debugging
- Optional Trace Port Interface Unit (TPIU) for bridging to a Trace Port Analyzer (TPA), including Single Wire Output (SWO) mode
- Optional Embedded Trace Macrocell (ETM) for instruction trace.
- Bus interfaces:
 - Three Advanced High-performance Bus-Lite (AHB-Lite) interfaces: ICode, Dcode, and System bus interfaces
 - Private Peripheral Bus (PPB) based on Advanced Peripheral Bus (APB) interface
 - Bit-band support that includes atomic bit-band write and read operations.
 - Memory access alignment
 - Write buffer for buffering of write data
 - Exclusive access transfers for multiprocessor systems

6.2 System Manager

6.2.1 Overview

System management includes the following sections:

- System Reset
- System Power Distribution
- SRAM Memory Organization
- System Timer (SysTick)
- Nested Vectored Interrupt Controller (NVIC)
- System Control register

6.2.2 System Reset

The system reset can be issued by one of the events listed below. These reset event flags can be read from SYS_RSTSTS register to determine the reset source. Hardware reset sources are from peripheral signals. Software reset can trigger reset through setting control registers.

- Hardware Reset Sources
 - Power-on Reset
 - Low level on the nRESET pin
 - Watchdog Time-out Reset and Window Watchdog Reset (WDT/WWDT Reset)
 - Low Voltage Reset (LVR)
 - Brown-out Detector Reset (BOD Reset)
 - CPU Lockup Reset
- Software Reset Sources
 - CHIP Reset will reset whole chip by writing 1 to CHIPRST (SYS_IPRST0[0])
 - MCU Reset to reboot but keeping the booting setting from APROM or LDROM by writing 1 to SYSRESETREQ (AIRCR[2])
 - CPU Reset for Cortex®-M4 core only by writing 1 to CPURST (SYS_IPRST0[1])

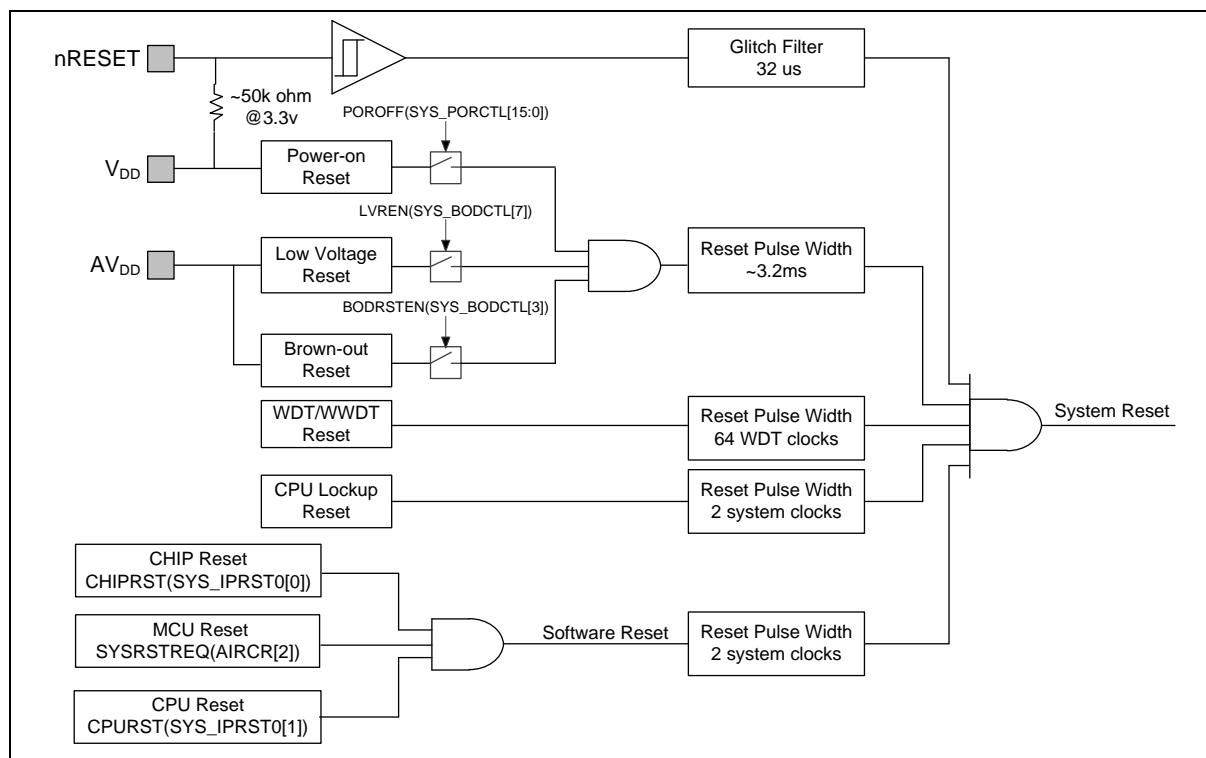

Figure 6.2-1 System Reset Sources

There are a total of 9 reset sources in the NuMicro® family. In general, CPU reset is used to reset Cortex®-M4 only; the other reset sources will reset Cortex®-M4 and all peripherals. However, there are small differences between each reset source and they are listed in Table 6.2-1

Reset Sources Register	POR	NRESET	WDT	LVR	BOD	Lockup	CHIP	MCU	CPU
SYS_RSTSTS	Bit 0 = 1	Bit 1 = 1	Bit 2 = 1	Bit 3 = 1	Bit 4 = 1	Bit 8 = 1	Bit 0 = 1	Bit 5 = 1	Bit 7 = 1
CHIPRST (SYS_IPRST0[0])	0x0	-	-	-	-	-	-	-	-

Other Peripheral Registers	Reset Value							-	
FMC Registers	Reset Value								
Note: '-' means that the value of register keeps original setting.									

Table 6.2-1 Reset Value of Registers

6.2.2.1 nRESET Reset

The nRESET reset means to generate a reset signal by pulling low nRESET pin, which is an asynchronous reset input pin and can be used to reset system at any time. When the nRESET voltage is lower than $0.2 V_{DD}$ and the state keeps longer than 32 us (glitch filter), chip will be reset. The nRESET reset will control the chip in reset state until the nRESET voltage rises above $0.7 V_{DD}$ and the state keeps longer than 32 us (glitch filter). The PINRF(SYS_RSTSTS[1]) will be set to 1 if the previous reset source is nRESET reset. Figure 6.2-2 shows the nRESET reset waveform.

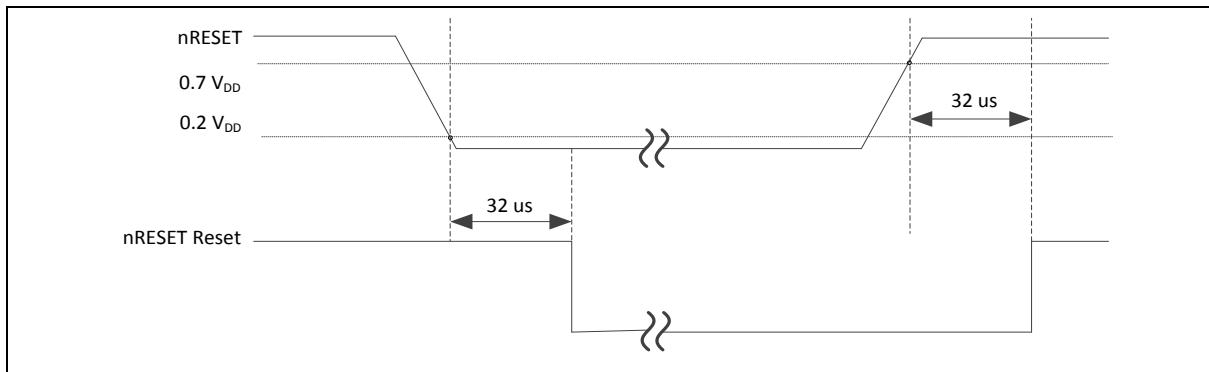

Figure 6.2-2 nRESET Reset Waveform

6.2.2.2 Power-on Reset (POR)

The Power-on reset (POR) is used to generate a stable system reset signal and forces the system to be reset when power-on to avoid unexpected behavior of MCU. When applying the power to MCU, the POR module will detect the rising voltage and generate reset signal to system until the voltage is ready for MCU operation. At POR reset, the PORF(SYS_RSTSTS[0]) will be set to 1 to indicate there is a POR reset event. The PORF(SYS_RSTSTS[0]) bit can be cleared by writing 1 to it. Figure 6.2-3 shows the power-on reset waveform.

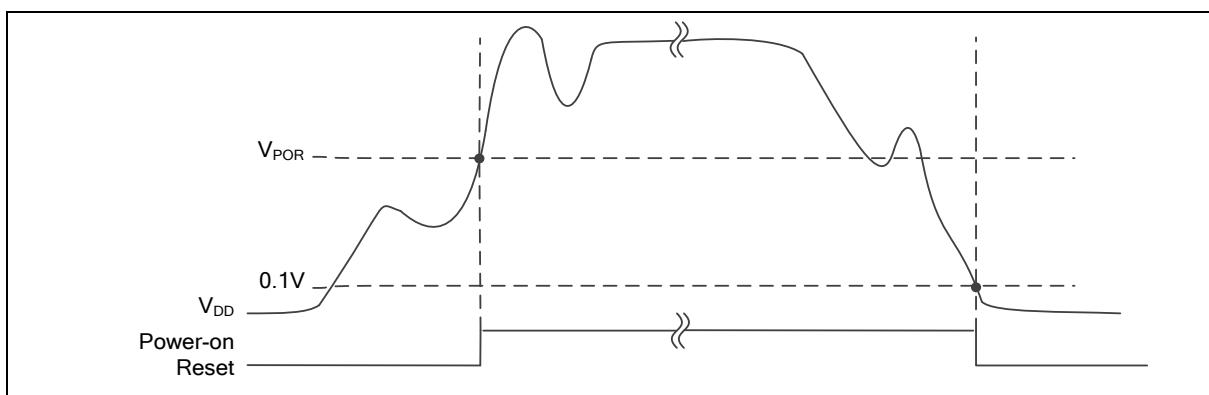

Figure 6.2-3 Power-on Reset (POR) Waveform

6.2.2.3 Low Voltage Reset (LVR)

If the Low Voltage Reset function is enabled by setting the Low Voltage Reset Enable Bit LVREN (SYS_BODCTL[7]) to 1, after 200us delay, LVR detection circuit will be stable and the LVR function will be active. Then LVR function will detect AV_{DD} during system operation. When the AV_{DD} voltage is lower than V_{LVR} and the state keeps longer than De-glitch time set by LVRDGSEL (SYS_BODCTL[14:12]), chip will be reset. The LVR reset will control the chip in reset state until the

AV_{DD} voltage rises above V_{LVR} and the state keeps longer than De-glitch time set by LVRDGSEL (SYS_BODCTL[14:12]). The default setting of Low Voltage Reset is enabled without De-glitch function. Figure 6.2-4 shows the Low Voltage Reset waveform.

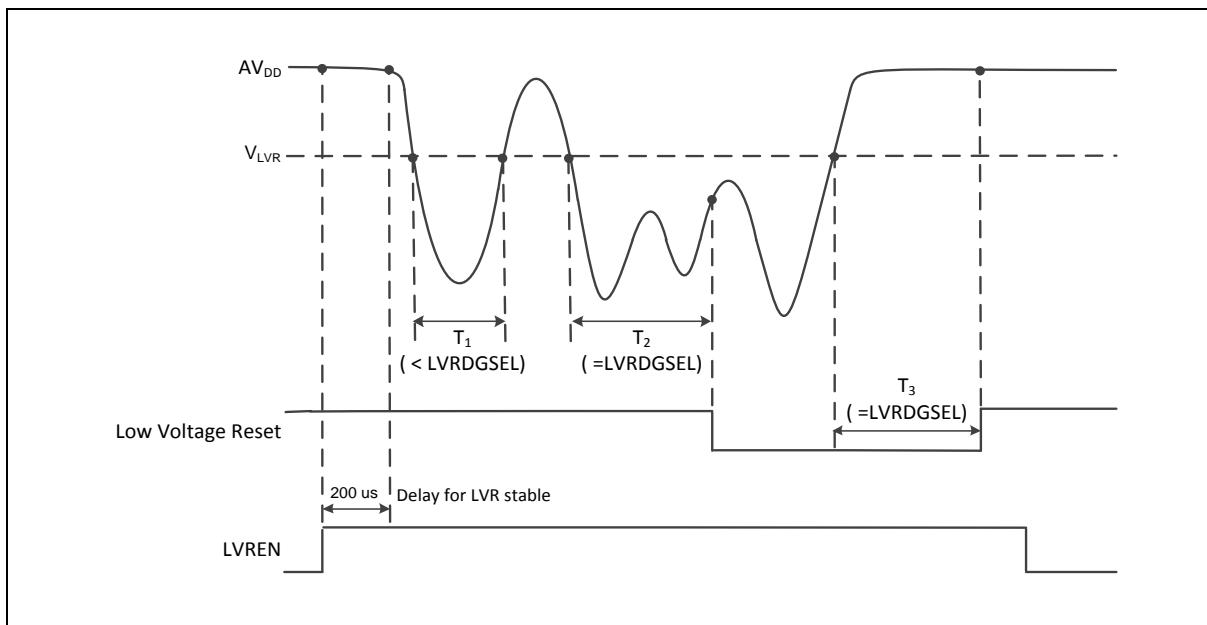

Figure 6.2-4 Low Voltage Reset (LVR) Waveform

6.2.2.4 Brown-out Detector Reset (BOD Reset)

If the Brown-out Detector (BOD) function is enabled by setting the Brown-out Detector Enable Bit BODEN (SYS_BODCTL[0]), Brown-out Detector function will detect AV_{DD} during system operation. When the AV_{DD} voltage is lower than V_{BOD} which is decided by BODEN and BODVL (SYS_BODCTL[18:16]) and the state keeps longer than De-glitch time set by BODDGSEL (SYS_BODCTL[10:8]), chip will be reset. The BOD reset will control the chip in reset state until the AV_{DD} voltage rises above V_{BOD} and the state keeps longer than De-glitch time set by BODDGSEL. The default value of BODEN, BODVL and BODRSTEN (SYS_BODCTL[3]) is set by flash controller user configuration register CBODEN (CONFIG0 [19]), CBOV (CONFIG0 [23:21]) and CBORST(CONFIG0[20]) respectively. User can determine the initial BOD setting by setting the CONFIG0 register. Figure 6.2-5 shows the Brown-out Detector waveform.

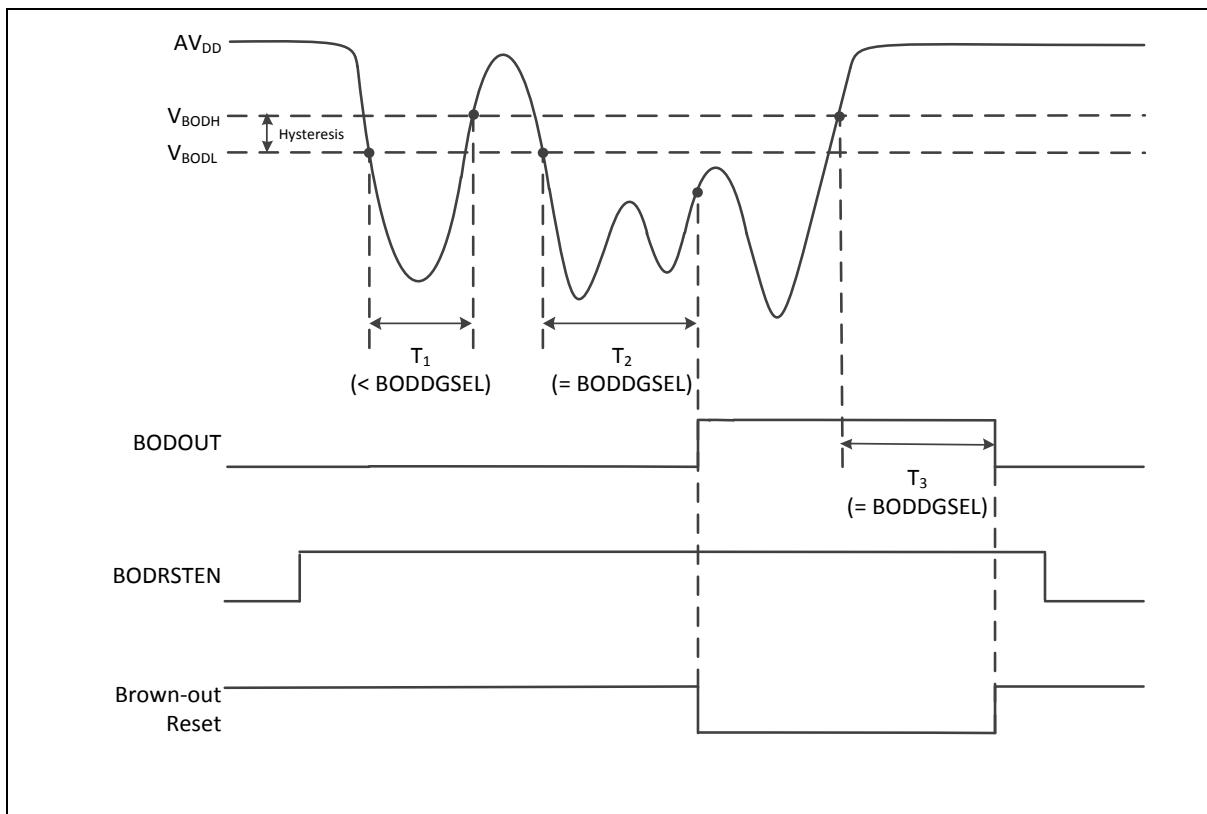

Figure 6.2-5 Brown-out Detector (BOD) Waveform

6.2.2.5 Watchdog Timer Reset (WDT)

In most industrial applications, system reliability is very important. To automatically recover the MCU from failure status is one way to improve system reliability. The watchdog timer(WDT) is widely used to check if the system works fine. If the MCU is crashed or out of control, it may cause the watchdog time-out. User may decide to enable system reset during watchdog time-out to recover the system and take action for the system crash/out-of-control after reset.

Software can check if the reset is caused by watchdog time-out to indicate the previous reset is a watchdog reset and handle the failure of MCU after watchdog time-out reset by checking WDTRF(SYS_RSTSTS[2]).

6.2.2.6 CPU Lockup Reset

CPU enters lockup status after CPU produces hardfault at hardfault handler and chip gives immediate indication of seriously errant kernel software. This is the result of the CPU being locked because of an unrecoverable exception following the activation of the processor's built in system state protection hardware. When chip enters debug mode, the CPU lockup reset will be ignored.

6.2.2.7 CPU Reset, CHIP Reset and MCU Reset

The CPU Reset means only Cortex®-M4 core is reset and all other peripherals remain the same status after CPU reset. User can set the CPURST(SYS_IPRST0[1]) to 1 to assert the CPU Reset signal.

The CHIP Reset is same with Power-on Reset. The CPU and all peripherals are reset and BS(FMC_ISPCTL[1]) bit is automatically reloaded from CONFIG0 setting. User can set the CHIPRST(SYS_IPRST0[1]) to 1 to assert the CHIP Reset signal.

The MCU Reset is similar with CHIP Reset. The difference is that BS(FMC_ISPCTL[1]) will not be reloaded from CONFIG0 setting and keep its original software setting for booting from APROM or LDROM. User can set the SYSRESETREQ(AIRCR[2]) to 1 to assert the MCU Reset.

6.2.3 System Power Distribution

In this chip, power distribution is divided into four segments:

- Analog power from AV_{DD} and AV_{SS} provides the power for analog components operation.
- Digital power from V_{DD} and V_{SS} supplies the power to the internal regulator which provides a fixed 1.8 V power for digital operation and I/O pins.
- USB transceiver power from VBUS offers the power for operating the USB transceiver.
- RTC power from V_{DD} provides the power for RTC and 80 bytes backup registers.

The outputs of internal voltage regulators, LDO and VDD33, require an external capacitor which should be located close to the corresponding pin. Analog power (AV_{DD}) should be the same voltage level of the digital power (V_{DD}). Figure 6.2-6 shows the NuMicro® M480 power distribution.

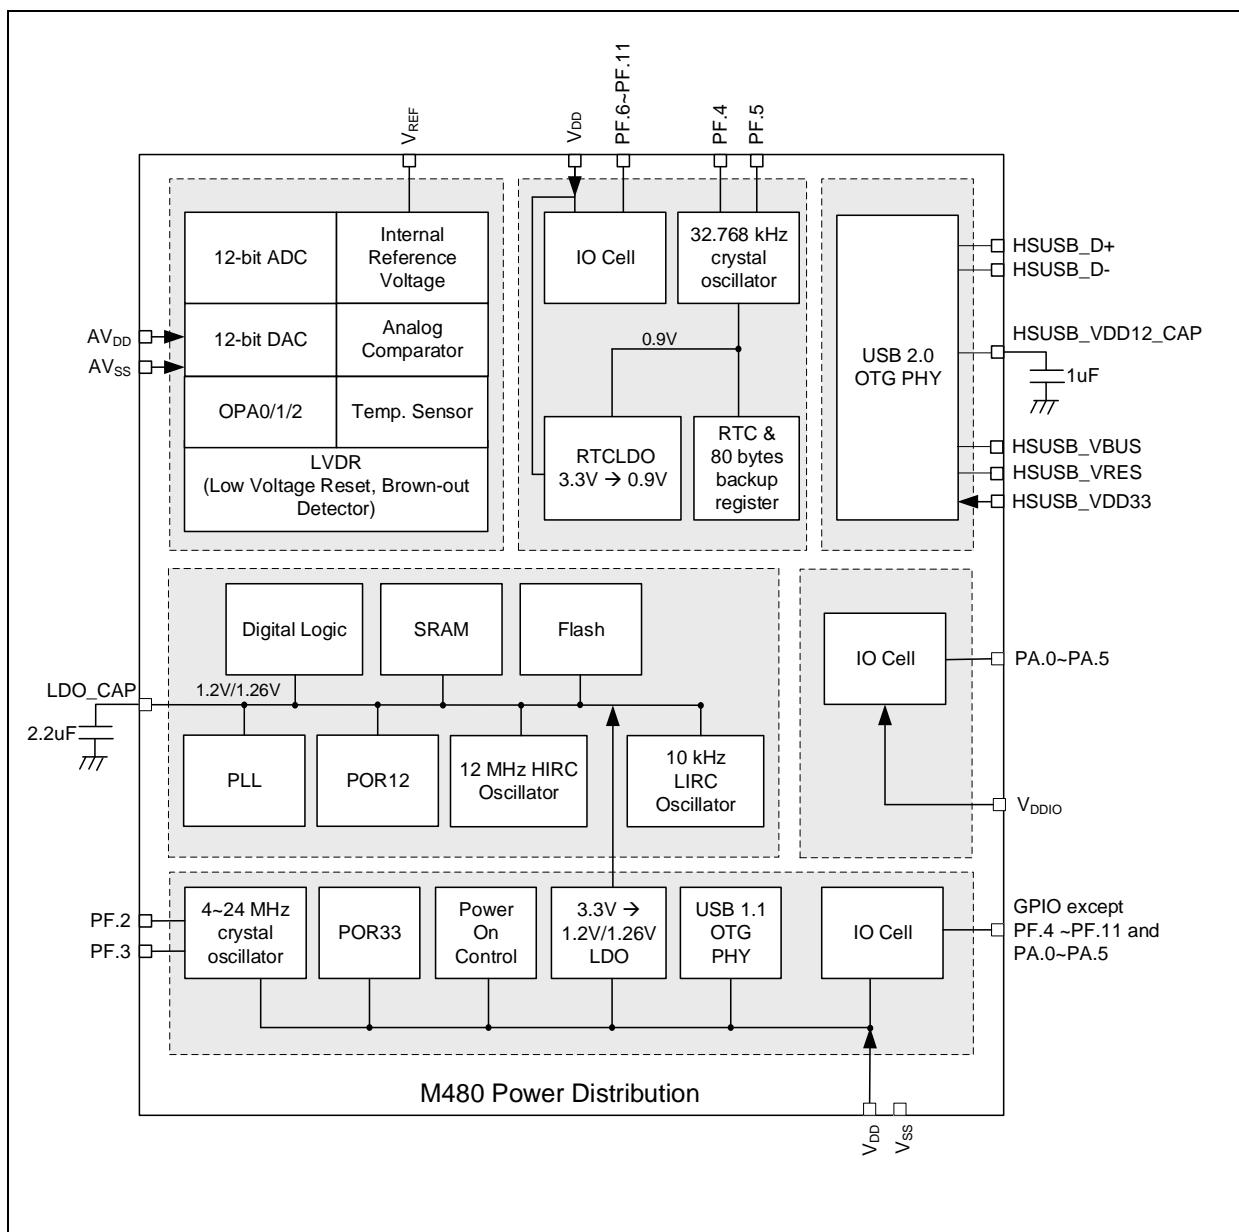

Figure 6.2-6 NuMicro® M480 Power Distribution Diagram

6.2.4 Power Modes and Wake-up Sources

The NuMicro® M480 series has power manager unit to support several operating modes for saving power. Table 6.2-2 lists all power modes in the NuMicro® M480 series.

Mode	CPU Operating Maximum Speed (MHz)	LDO_CAP (V)	Clock Disable
Normal mode	160	1.20	All clocks are disabled by control register.
Turbo mode	192	1.26	All clocks are disabled by control register.
Idle mode	CPU enter Sleep mode	1.20/1.26	Only CPU clock is disabled.
Fast Wakeup Power-down mode (FWPD)	CPU enters Deep Sleep mode	1.20/1.26	Most clocks are disabled except LIRC/LXT, and only RTC/WDT/Timer/UART peripheral clocks still enable if their clock sources are selected as LIRC/LXT.
Normal Power-down mode (NPD)	CPU enters Deep Sleep mode	1.20/1.26	Most clocks are disabled except LIRC/LXT, and only RTC/WDT/Timer/UART peripheral clocks still enable if their clock sources are selected as LIRC/LXT.
Low leakage Power-down mode (LLPD)	CPU enters Deep Sleep mode	0.9	Most clocks are disabled except LIRC/LXT, and only RTC/WDT/Timer/UART peripheral clocks still enable if their clock sources are selected as LIRC/LXT.
Standby Power-down mode 0 (SPD0) ^[1]	Power off	Floating	Only LIRC/LXT still enable for RTC function and wake-up timer usage
Standby Power-down mode 1 (SPD1) ^[1]	Power off	Floating	Only LIRC/LXT still enable for RTC function and wake-up timer usage
Deep Power-down mode (DPD)	Power off	Floating	Only LIRC still enable for wake-up timer usage

Table 6.2-2 Power Mode Table

Note:^[1]

User must turn on LIRC before entering SPD0/1 mode.

There are different power mode entry settings. Each power mode has different entry setting and leaving condition. Table 6.2-3 shows the entry setting for each power mode. When chip power-on, chip is running as normal mode. User can enter each mode by setting SLEEPDEEP (SCR[2]), PDEN (CLK_PWRCTL[7]) and PDMSEL (CLK_PMUCTL[2:0]) and execute WFI instruction.

Register/Instruction Mode	SLEEPDEEP (SCR[2])	PDEN (CLK_PWRCTL[7])	PDMSEL (CLK_PMUCTL[2:0])	CPU Run WFI Instruction
Normal mode	0	0	0	NO
Idle mode	0	0	0	YES
Fast Wakeup Power-down mode	1	1	2	YES
Normal Power-down mode	1	1	0	YES
Low leakage Power-down mode	1	1	1	YES

Standby Power-down mode 0	1	1	4	YES
Standby Power-down mode 1	1	1	5	YES
Deep Power-down mode	1	1	6	YES

Table 6.2-3 Power Mode Difference Table

There are several wake-up sources in Idle mode and Power-down mode. Table 6.2-4 lists the available clocks for each power mode.

Power Mode	Normal Mode	Idle Mode	Power-Down Mode
Definition	CPU is in active state	CPU is in sleep state	CPU is in sleep state and all clocks stop except LXT and LIRC. SRAM content retained.
Entry Condition	Chip is in normal mode after system reset released	CPU executes WFI instruction.	CPU sets sleep mode enable and power down enable and executes WFI instruction.
Wake-up Sources	N/A	All interrupts	RTC, WDT, I ² C, Timer, UART, BOD, GPIO, EINT, USCI, USBD, ACMP and BOD.
Available Clocks	All	All except CPU clock	LXT and LIRC
After Wake-up	N/A	CPU back to normal mode	CPU back to normal mode

Table 6.2-4 Power Mode Definition Table

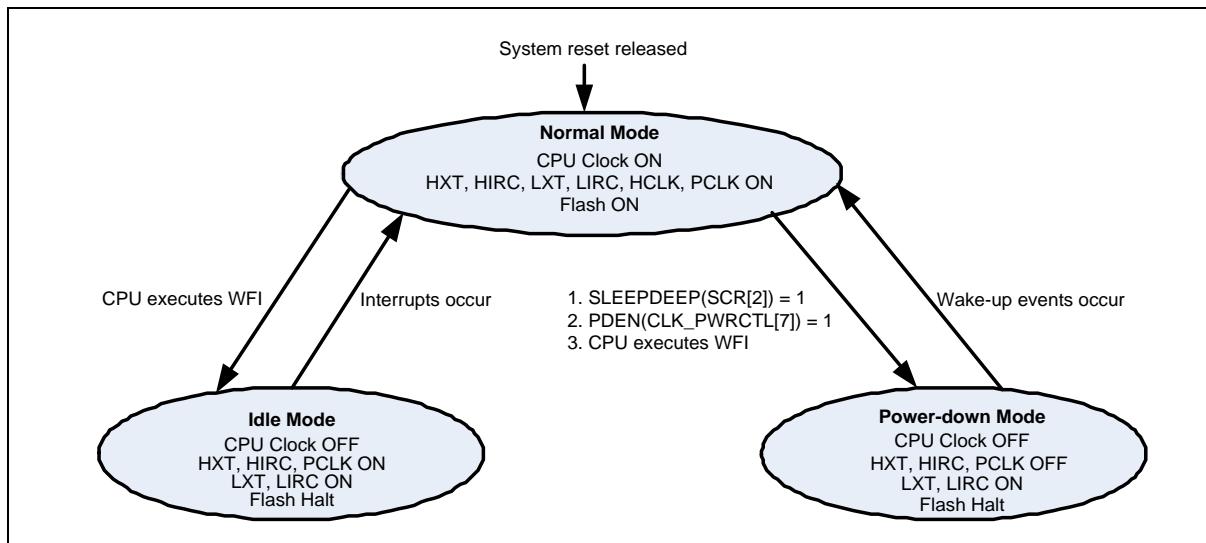

Figure 6.2-7 Power Mode State Machine

	Idle Mode	NPD, LLPD, FWPD	SPD0, SPD1,	DPD
HXT	ON	Halt	Halt	Halt
HIRC	ON	Halt	Halt	Halt
LXT	ON	ON/OFF ^[1]	ON/OFF ^[1]	Halt
LIRC	ON	ON/OFF ^[2]	ON/OFF ^[2]	ON/OFF ^[2]

PLL	ON	Halt	Halt	Halt
HCLK/PCLK	ON	Halt	Halt	Halt
CPU	Halt	Halt	Halt	Halt
SRAM retention	ON	ON	Halt	Halt
FLASH	Halt	Halt	Halt	Halt
TIMER	ON	ON/OFF ^[3]	ON/OFF ^[3]	Halt
WDT	ON	ON/OFF ^[4]	Halt	Halt
RTC	ON	ON/OFF ^[5]	ON/OFF ^[5]	Halt
UART	ON	ON/OFF ^[6]	Halt	Halt
Others	ON	Halt	Halt	Halt

Table 6.2-5 Clocks in Power Modes

Note:

1. LXT ON or OFF depends on SW setting in normal mode.
2. LIRC ON or OFF depends on S/W setting in normal mode.
3. If TIMER clock source is selected as LIRC/LXT and LIRC/LXT is on.
4. If WDT clock source is selected as LIRC and LIRC is on.
5. If RTC clock source is selected as LXT and LXT is on.
6. If UART clock source is selected as LXT and LXT is on.

Wake-up sources in Normal Power-down mode (NPD):

RTC, WDT, I²C, Timer, UART, USCI, BOD, EBOD, GPIO, USBD, and ACMP.

After chip enters power down, the following wake-up sources can wake chip up to normal mode. Table 6.2-6 lists the condition about how to enter Power-down mode again for each peripheral.

User needs to wait this condition before setting PDEN(CLK_PWRCTL[7]) and execute WFI to enter Power-down mode.

Wake-Up Source	Wake-Up Condition	Power-Down Mode			Re-Entering Power-Down Mode Condition
		NPD/ FWPD/ LLPD	SPD0/1	DPD	
BOD	Brown-Out Detector Reset / Interrupt	V	-	-	After software writes 1 to clear BODIF (SYS_BODCTL[4]).
	Brown-Out Detector Reset	-	V	-	After software writes 1 to clear BODWK (CLK_PMUSTS[13]) when SPD mode is entered.
LVR	LVR Reset	V	-	-	After software writes 1 to clear LVRF (SYS_RSTSTS[3])
		-	V	-	After software writes 1 to clear LVRWK (CLK_PMUSTS[12]) when SPD mode is entered.
POR	POR Reset	V	V	-	After software writes 1 to clear PORF (SYS_RSTSTS[0])

INT	External Interrupt	V	-	-	After software write 1 to clear the Px_INTSRC[n] bit.
GPIO	GPIO Interrupt	V	-	-	After software write 1 to clear the Px_INTSRC[n] bit.
GPIO(PA~PD) Wake-up pin	rising or falling edge event, 64-pin	-	V	-	After software writes 1 to clear GPxWK (CLK_PMUSTS[11:8]) when SPD mode is entered.
GPIO(PC.0) Wake-up pin	rising or falling edge event , 1-pin	-	-	V	After software writes 1 to clear PINWK (CLK_PMUSTS[1]) when DPD mode is entered.
TIMER	Timer Interrupt	V	-	-	After software writes 1 to clear TWKF (TIMERx_INTSTS[1]) and TIF (TIMERx_INTSTS[0]).
Wakeup timer	Wakeup by wake-up timer time-out	-	V	V	After software writes 1 to clear TMRWK (CLK_PMUSTS[1]) when SPD or DPD mode is entered.
WDT	WDT Interrupt	V	-	-	After software writes 1 to clear WKF (WDT_CTL[5]) (Write Protect).
RTC	Alarm Interrupt	V	-	-	After software writes 1 to clear ALMIF (RTC_INTSTS[0]).
	Time Tick Interrupt	V	-	-	After software writes 1 to clear TICKIF (RTC_INTSTS[1]).
	Wakeup by RTC alarm	-	V	-	After software writes 1 to clear RTCWK (CLK_PMUSTS[2]) when SPD mode is entered.
	Wakeup by RTC tick time	-	V	-	After software writes 1 to clear RTCWK (CLK_PMUSTS[2]) when SPD mode is entered.
	Wakeup by tamper event	-	V	-	After software writes 1 to clear RTCWK (CLK_PMUSTS[2]) when SPD mode is entered.
UART	nCTS wake-up	V	-	-	After software writes 1 to clear CTSWKF (UARTx_WKSTS[0]).
	RX Data wake-up	V	-	-	After software writes 1 to clear DATWKF (UARTx_WKSTS[1]).
	Received FIFO Threshold Wake-up	V	-	-	After software writes 1 to clear RFRTWKF (UARTx_WKSTS[2]).
	RS-485 AAD Mode Wake-up	V	-	-	After software writes 1 to clear RS485WKF (UARTx_WKSTS[3]).
	Received FIFO Threshold Time-out Wake-up	V	-	-	After software writes 1 to clear TOUTWKF (UARTx_WKSTS[4]).
USCI UART	CTS Toggle	V	-	-	After software writes 1 to clear WKF (UUART_WKSTS[0]).
	Data Toggle	V	-	-	After software writes 1 to clear WKF (UUART_WKSTS[0]).
USCI I2C	Data toggle	V	-	-	After software writes 1 to clear WKF (UI2C_WKSTS[0]).
	Address match	V	-	-	After software writes 1 to clear WKAKDONE (UI2C_PROTSTS[16], then writes 1 to clear WKF (UI2C_WKSTS[0]).
USCI SPI	SS Toggle	V	-	-	After software writes 1 to clear WKF (USPI_WKSTS[0]).
I ² C	Address match wake-up	V	-	-	After software writes 1 to clear WKAKDONE (I2C_WKSTS[1]). Then software writes 1 to clear WKIF(I2C_WKSTS[0]).

USBD	Remote Wake-up	V	-	-	After software writes 1 to clear BUSIF (USBD_INTSTS[0]).
ACMP	Comparator Power-Down Wake-Up Interrupt	V	-	-	After software writes 1 to clear WKIF0 (ACMP_STATUS[8]) and WKIF1 (ACMP_STATUS[9]).
ACMP	ACMPO status change	-	V	-	After software writes 1 to clear ACMPWK (CLK_PMUSTS[14]) when SPD mode is entered.

Table 6.2-6 Re-Entering Power-down Mode Condition

6.2.5 Power Modes and Power Level Transition

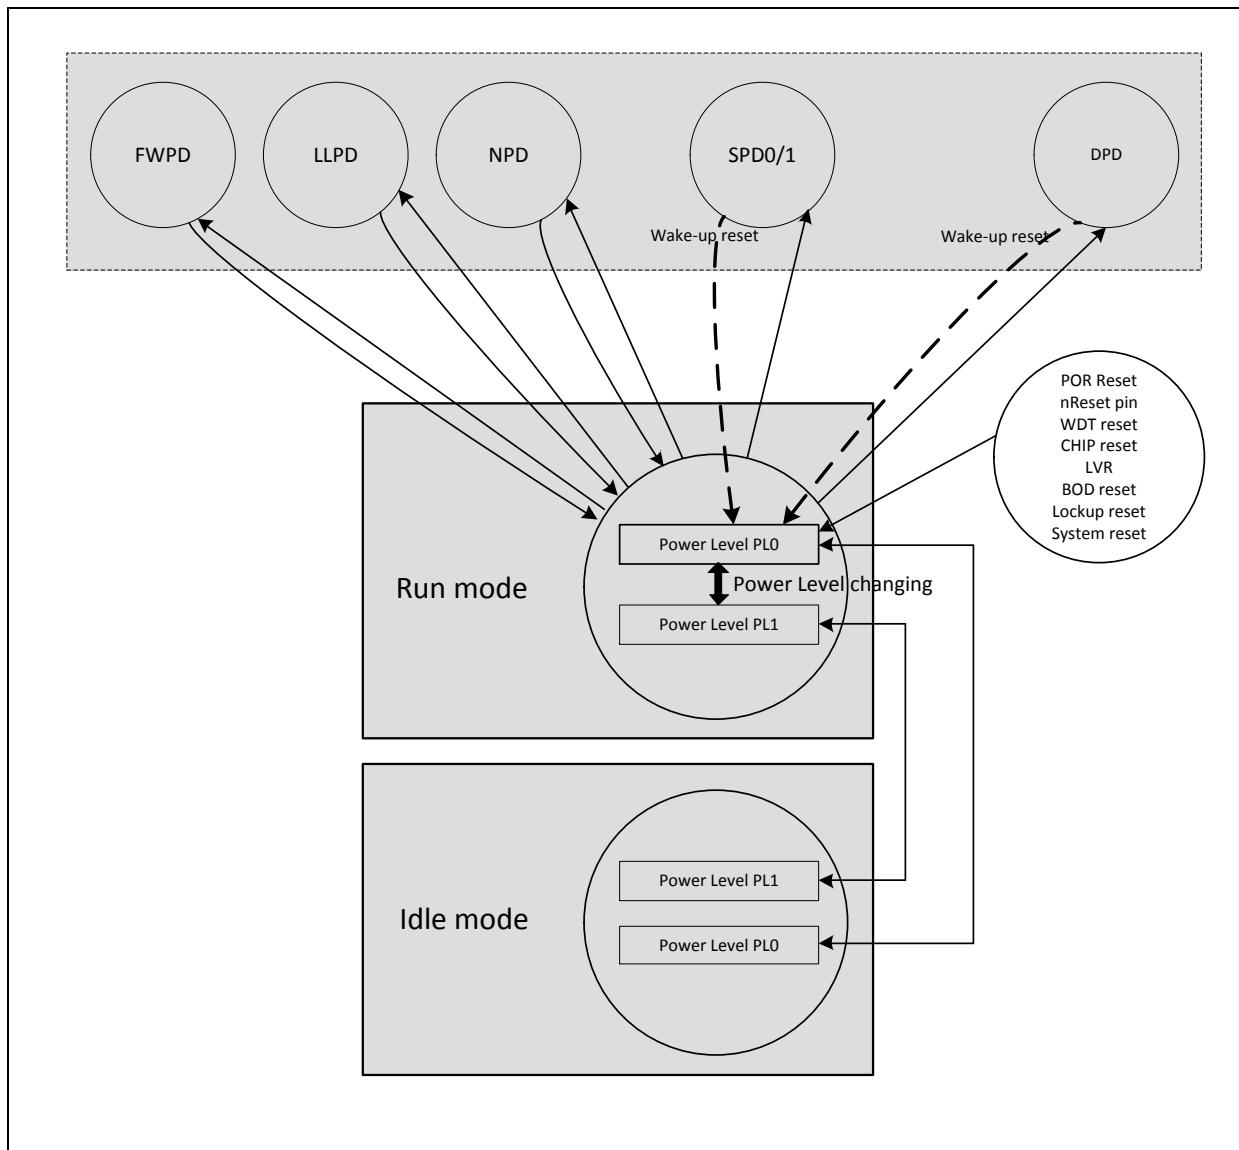

Figure 6.2-8 NuMicro® M480 Power Distribution Diagram

6.2.6 System Memory Map

The NuMicro® M480 series provides 4G-byte addressing space. The memory locations assigned to each on-chip controllers are shown in Table 6.2-7. The detailed register definition, memory space, and programming will be described in the following sections for each on-chip peripheral. The NuMicro®

M480 series only supports little-endian data format.

Address Space	Token	Controllers
Flash and SRAM Memory Space		
0x0000_0000 – 0x0003_FFFF	FLASH_BA	FLASH Memory Space (256KB)
0x0000_0000 – 0x0007_FFFF	FLASH_BA	FLASH Memory Space (512KB)
0x0800_0000 – 0x09FF_FFFF	SPIM_BA	SPIM Memory Space (32MB)
0x2000_0000 – 0x2000_7FFF	SRAM0_BA	SRAM Memory Space (32KB)
0x2000_8000 – 0x2001_FFFF	SRAM1_BA	SRAM Memory Space (96KB)
0x2002_0000 – 0x2002_7FFF	SRAM2_BA	SRAM Memory Space (32KB) for CPU only and share with SPIM cache
0x6000_0000 – 0x6FFF_FFFF	EXTMEM_BA	External Memory Space (256MB)
Peripheral Controllers Space (0x4000_0000 – 0x400F_FFFF)		
0x4000_0000 – 0x4000_01FF	SYS_BA	System Control Registers
0x4000_0200 – 0x4000_02FF	CLK_BA	Clock Control Registers
0x4000_0300 – 0x4000_03FF	NMI_BA	NMI Control Registers
0x4000_4000 – 0x4000_4FFF	GPIO_BA	GPIO Control Registers
0x4000_7000 – 0x4000_7FFF	SPIM_BA	SPIM Control Registers
0x4000_8000 – 0x4000_8FFF	PDMA_BA	Peripheral DMA Control Registers
0x4000_9000 – 0x4000_9FFF	USBH_BA	USB Host Control Registers
0x4000_B000 – 0x4000_BFFF	EMAC_BA	Ethernet MAC Control Registers
0x4000_C000 – 0x4000_CFFF	FMC_BA	Flash Memory Control Registers
0x4000_D000 – 0x4000_DFFF	SDH0_BA	SDHOST0 Control Registers
0x4000_E000 – 0x4000_EFFF	SDH1_BA	SDHOST1 Control Registers
0x4001_0000 – 0x4001_0FFF	EBI_BA	External Bus Interface Control Registers
0x4001_9000 – 0x4001_9FFF	HSUSBD_BA	HSUSBD Control Registers
0x4001_A000 – 0x4001_AFFF	HSUSBH_BA	HSUSBH Host Control Registers
0x4003_1000 – 0x4003_1FFF	CRC_BA	CRC Generator Registers
0x4003_E000 – 0x4003_EFFF	SWDC_BA	SWD Control Registers
0x4003_F000 – 0x4003_FFFF	ETMC_BA	ETM Control Registers
0x5008_0000 – 0x5008_0FFF	CRYP_BA	Cryptographic Accelerator Registers
APB Controllers Space (0x4000_0000 ~ 0x400F_FFFF)		
0x4004_0000 – 0x4004_0FFF	WDT_BA	Watchdog Timer Control Registers
0x4004_1000 – 0x4004_1FFF	RTC_BA	Real Time Clock (RTC) Control Register

Table 6.2-7 Address Space Assignments for On-Chip Controllers

6.2.7 SRAM Memory Organization

The M480 series supports embedded SRAM with total 160 Kbytes size and the SRAM organization is separated to three banks: SRAM bank0 and SRAM bank1 and SRAM bank2. The first bank has 32 Kbytes address space, the second bank has 96 Kbytes address space and the third bank has 32Kbytes. These three banks address space can be accessed simultaneously. The SRAM bank0 supports parity error check to make sure chip operating more stable. The SRAM bank2 is shared with SPIM cache, and it can switch to external SPI Flash cache memory. Note that SRAM bank2 has additional two wait cycles when reading data.

- Supports total 160 Kbytes SRAM
- Supports byte / half word / word write
- Supports fixed 32 Kbytes SRAM bank0 for independent access
- Supports parity error check function for SRAM bank0
- Supports oversize response error
- Supports remap address to 0x1000_0000

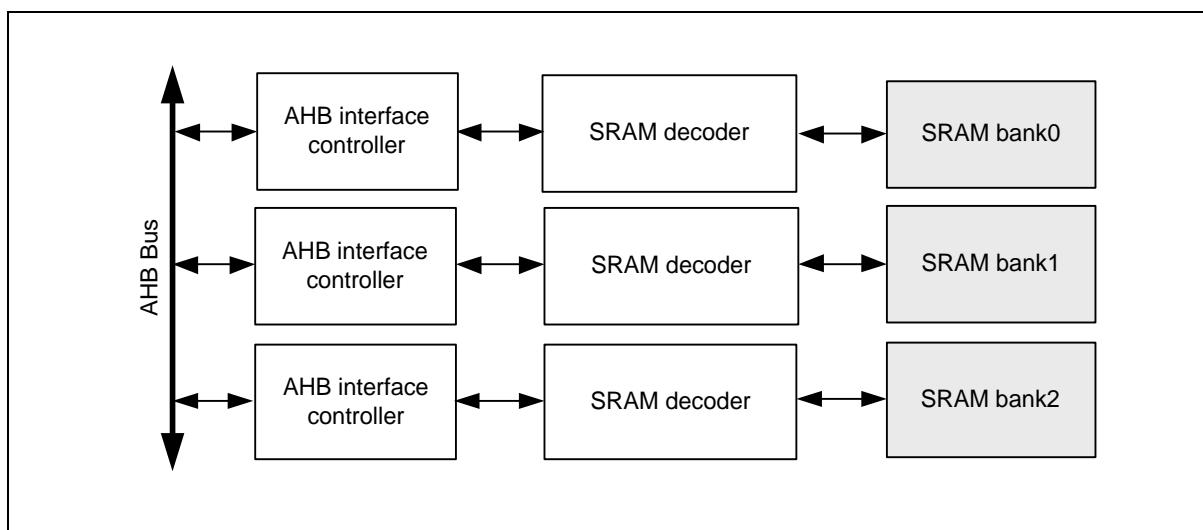

Figure 6.2-9 SRAM Block Diagram

Figure 6.2-9 shows the SRAM organization of M480. There are three SRAM banks in M480. The bank0 is addressed to 32 Kbytes, the bank1 is addressed to 96 Kbytes and the bank2 is addressed to 32 Kbyte. The bank0 address space is from 0x2000_0000 to 0x2000_7FFF. The bank1 address space is from 0x2000_8000 to 0x2001_FFFF. The bank2 address space is from 0x2002_0000 to 0x2002_7FFF. The address between 0x2002_8000 to 0x3FFF_FFFF is illegal memory space and chip will enter hardfault if CPU accesses these illegal memory addresses.

	160 KB Device	96KB Device	Read access
SRAM bank0	0x2000_0000 ~ 0x2000_7FFF or 0x1000_0000 ~ 0x1000_7FFF	0x2000_0000 ~ 0x2000_7FFF or 0x1000_0000 ~ 0x1000_7FFF	Zero wait cycle for continuous access
SRAM bank1	0x2000_8000 ~ 0x2001_FFFF or 0x1000_8000 ~ 0x1001_FFFF	0x2000_8000 ~ 0x2000_FFFF or 0x1000_8000 ~ 0x1000_FFFF	Zero wait cycle for continuous access
SRAM bank2	0x2002_0000 ~ 0x2002_7FFF or 0x1002_0000 ~ 0x1002_7FFF	0x2001_0000 ~ 0x2001_7FFF or 0x1001_0000 ~ 0x1001_7FFF	Two wait cycles

Table 6.2-8 SRAM Organization

The address of each bank is remapping from 0x2000_0000 to 0x1000_0000. CPU can access SRAM bank0 through 0x2000_0000 to 0x2000_7FFF or 0x1000_0000 to 0x1000_7FFF, and access SRAM bank1 through 0x2000_8000 to 0x2001_FFFF or 0x1000_8000 to 0x1001_FFFF, and access SRAM bank2 through 0x2002_0000 to 0x2002_7FFF or 0x1002_0000 to 0x1002_7FFF.

When setting the control register CCMEN(SPI_M_CTL1[2]) to 0, SRAM bank2 is switched to external SPI Flash cache memory. In this case, the SRAM bank2 can't be accessed as gernal SRAM. If user access SRAM bank2 by AHB bus master, the SPI flash controller will send error response via HRESP AHB bus signal to bus master.

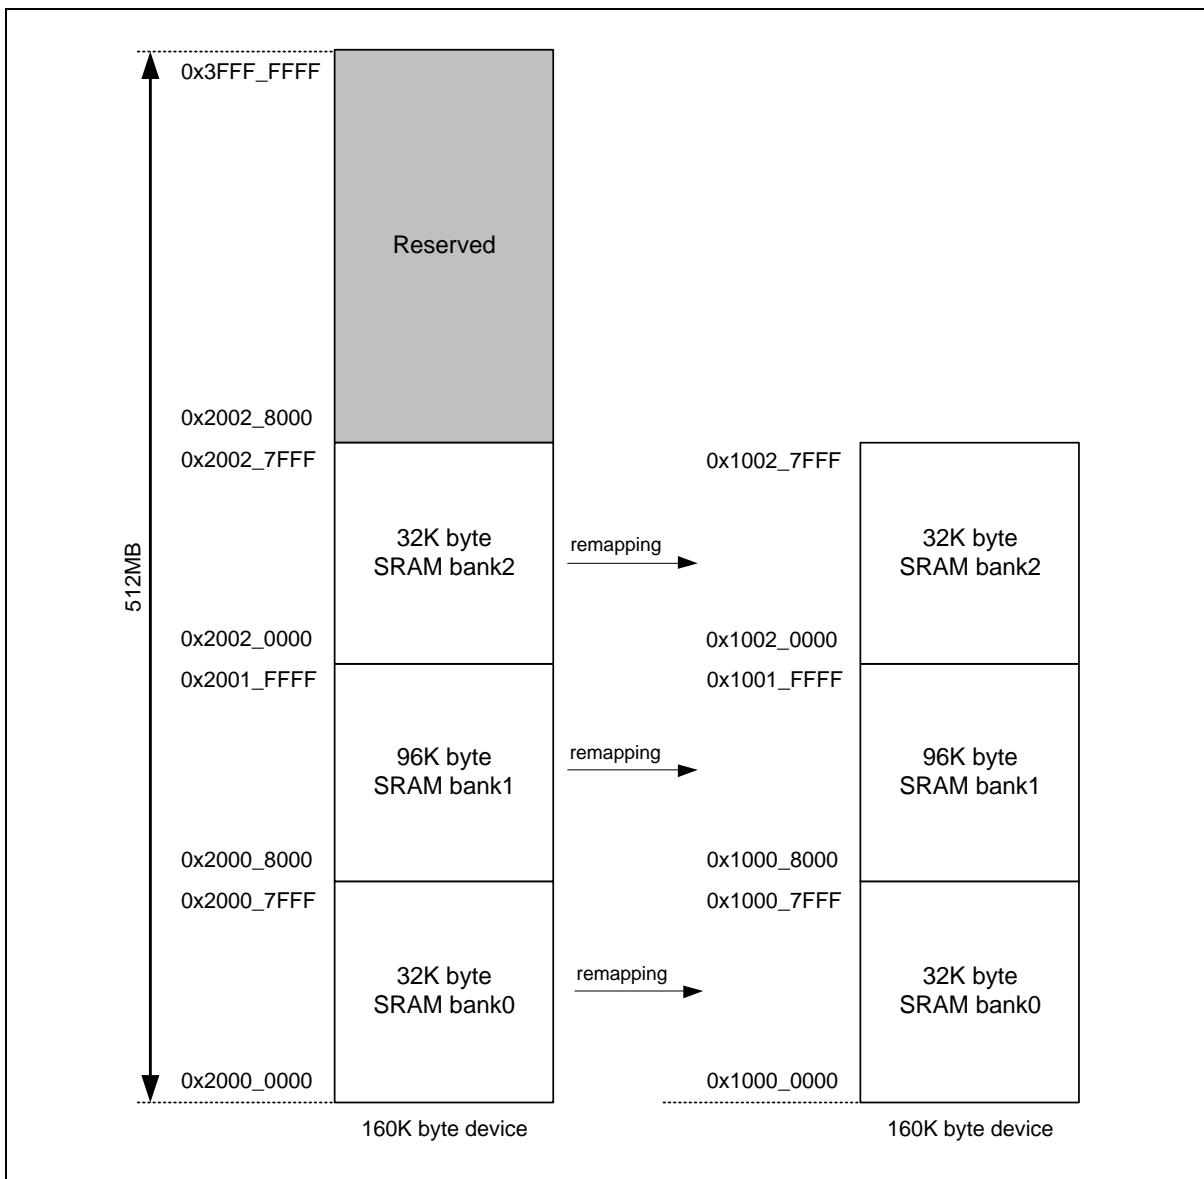

Figure 6.2-10 SRAM Memory Organization

SRAM bank0 has byte parity error check function. When CPU is accessing SRAM bank0, the parity error checking mechanism is dynamic operating. As parity error occurred, the PERRIF (SYS_SRAM_STATUS[0]) will be asserted to 1 and the SYS_SRAM_ERRADDR register will recode the address with parity error. Chip will enter interrupt when SRAM parity error occurred if PERRIEN (SYS_SRAM_INTCTL[0]) is set to 1. When SRAM parity error occurred, chip will stop detecting SRAM parity error until user writes 1 to clear the PERRIF(SYS_SRAM_STATUS[0]) bit.

6.2.8 Bus Matrix

The M480 series supports Bus Matrix to manage the access arbitration between masters. The access arbitration can be selected by INTACTEN (SYS_AHBMCTL[0]) to use round-robin algorithm or set Cortex®-M4 CPU as the highest bus priority.

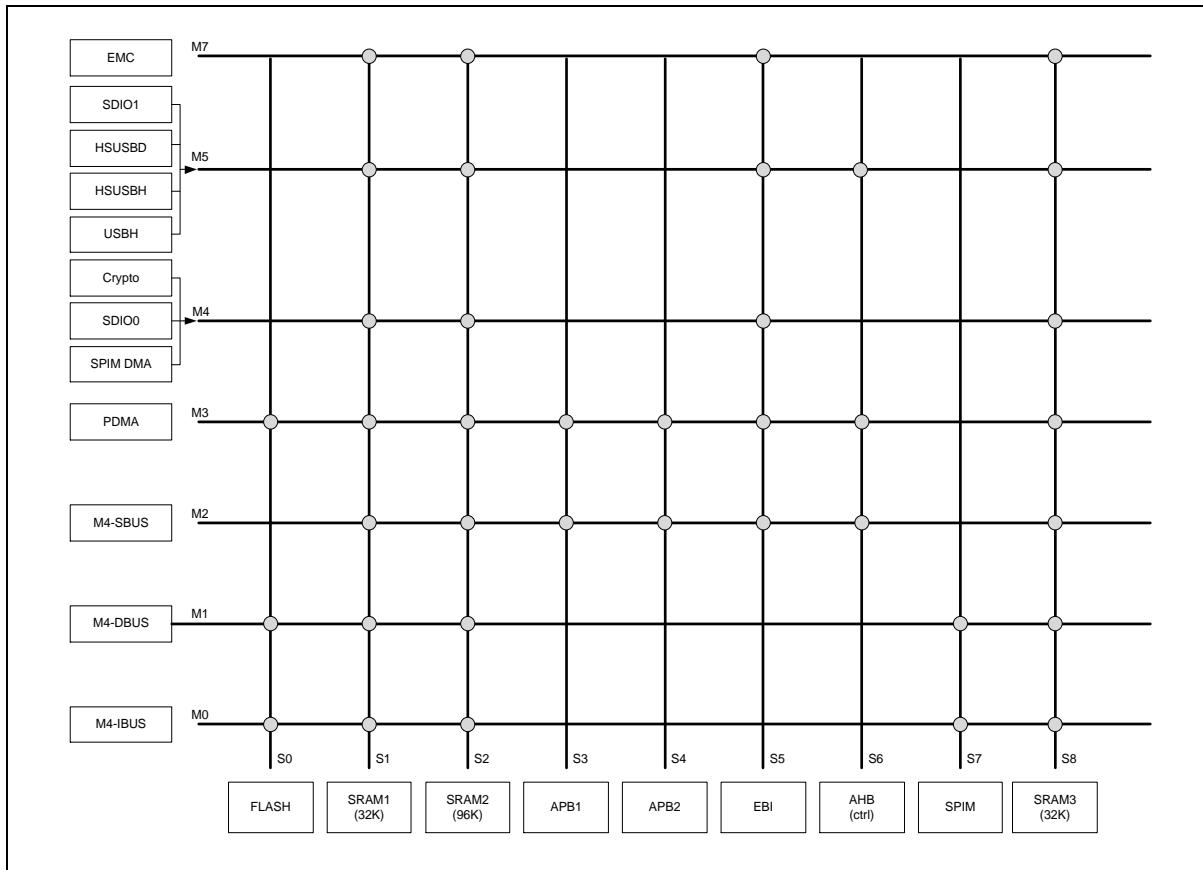

Figure 6.2-11 NuMicro® M480 Bus Matrix Diagram

6.2.9 HIRC Auto Trim

This chip supports auto-trim function: the HIRC trim (48 MHz RC oscillator), according to the accurate external 32.768 kHz crystal oscillator or internal USB synchronous mode, automatically gets accurate HIRC output frequency, 0.25 % deviation within all temperature ranges.

For instance, the system needs an accurate 12 MHz clock. In such case, if neither using PLL as the system clock source nor soldering 32.768 kHz crystal in system, user has to set REFCKSEL (SYS_IRCTCTL[10] reference clock selection) to “1”, set FREQSEL (SYS_IRCTCTL[1:0] trim frequency selection) to “01”, and the auto-trim function will be enabled. Interrupt status bit FREQLOCK (SYS_IRCTISTS[8] HIRC frequency lock status) “1” indicates the HIRC output frequency is accurate within 0.25% deviation.

6.2.10 Register Lock Control

Some of the system control registers need to be protected to avoid inadvertent write and disturb the chip operation. These system control registers are protected after the power-on reset till user to disable register protection. For user to program these protected registers, a register protection disable sequence needs to be followed by a special programming. The register protection disable sequence is writing the data “59h”, “16h” “88h” to the register SYS_REGLCTL address at 0x4000_0100 continuously. Any different data value, different sequence or any other write to other address during these three data writing will abort the whole sequence.

SYS_IPRST0	Address 0x4000_0008

6.2.12 Register Description

Part Device Identification Number Register (SYS_PDID)

Register	Offset	R/W	Description				Reset Value
SYS_PDID	SYS_BA+0x00	R	Part Device Identification Number Register				0x0045_1A93 ^[1]

[1] Every part number has a unique default reset value.

Bits	Description	
[31:0]	PDID	Part Device Identification Number (Read Only) This register reflects device part number code. Software can read this register to identify which device is used.

System Reset Status Register (SYS_RSTSTS)

This register provides specific information for software to identify this chip's reset source from last operation.

Register	Offset	R/W	Description				Reset Value
SYS_RSTSTS	SYS_BA+0x04	R/W	System Reset Status Register				0x0000_0043

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							CPULKRF
7	6	5	4	3	2	1	0
CPURF	Reserved	SYSRF	BODRF	LVRF	WDTRF	PINRF	PORF

Bits	Description	
[31:9]	Reserved	Reserved.
[8]	CPULKRF	CPU Lockup Reset Flag 0 = No reset from CPU lockup happened. 1 = The Cortex®-M4 lockup happened and chip is reset. Note1: Write 1 to clear this bit to 0. Note2: When CPU lockup happened under ICE is connected, This flag will set to 1 but chip will not reset.
[7]	CPURF	CPU Reset Flag The CPU reset flag is set by hardware if software writes CPURST (SYS_IPRST0[1]) 1 to reset Cortex®-M4 Core and Flash Memory Controller (FMC). 0 = No reset from CPU. 1 = The Cortex®-M4 Core and FMC are reset by software setting CPURST to 1. Note: Write 1 to clean this bit to 0.
[6]	Reserved	Reserved.
[5]	SYSRF	System Reset Flag The system reset flag is set by the "Reset Signal" from the Cortex®-M4 Core to indicate the previous reset source. 0 = No reset from Cortex®-M4. 1 = The Cortex®-M4 had issued the reset signal to reset the system by writing 1 to the bit SYSRESETREQ(AIRCR[2], Application Interrupt and Reset Control Register, address = 0xE000ED0C) in system control registers of Cortex®-M4 core. Note: Write 1 to clear this bit to 0.

Bits	Description	
[4]	BODRF	<p>BOD Reset Flag</p> <p>The BOD reset flag is set by the “Reset Signal” from the Brown-Out Detector to indicate the previous reset source.</p> <p>0 = No reset from BOD.</p> <p>1 = The BOD had issued the reset signal to reset the system.</p> <p>Note: Write 1 to clear this bit to 0.</p>
[3]	LVRF	<p>LVR Reset Flag</p> <p>The LVR reset flag is set by the “Reset Signal” from the Low Voltage Reset Controller to indicate the previous reset source.</p> <p>0 = No reset from LVR.</p> <p>1 = LVR controller had issued the reset signal to reset the system.</p> <p>Note: Write 1 to clear this bit to 0.</p>
[2]	WDTRF	<p>WDT Reset Flag</p> <p>The WDT reset flag is set by the “Reset Signal” from the Watchdog Timer or Window Watchdog Timer to indicate the previous reset source.</p> <p>0 = No reset from watchdog timer or window watchdog timer.</p> <p>1 = The watchdog timer or window watchdog timer had issued the reset signal to reset the system.</p> <p>Note1: Write 1 to clear this bit to 0.</p> <p>Note2: Watchdog Timer register RSTF(WDT_CTL[2]) bit is set if the system has been reset by WDT time-out reset. Window Watchdog Timer register WWDTRF(WWDT_STATUS[1]) bit is set if the system has been reset by WWDT time-out reset.</p>
[1]	PINRF	<p>NRESET Pin Reset Flag</p> <p>The nRESET pin reset flag is set by the “Reset Signal” from the nRESET Pin to indicate the previous reset source.</p> <p>0 = No reset from nRESET pin.</p> <p>1 = Pin nRESET had issued the reset signal to reset the system.</p> <p>Note: Write 1 to clear this bit to 0.</p>
[0]	PORF	<p>POR Reset Flag</p> <p>The POR reset flag is set by the “Reset Signal” from the Power-on Reset (POR) Controller or bit CHIPRST (SYS_IPRST0[0]) to indicate the previous reset source.</p> <p>0 = No reset from POR or CHIPRST.</p> <p>1 = Power-on Reset (POR) or CHIPRST had issued the reset signal to reset the system.</p> <p>Note: Write 1 to clear this bit to 0.</p>

Peripheral Reset Control Register 0 (SYS_IPRST0)

Register	Offset	R/W	Description				Reset Value
SYS_IPRST0	SYS_BA+0x08	R/W	Peripheral Reset Control Register 0				0x0000_0000

31	30	29	28	27	26	25	24

CRCRST	SDH0RST	EMACRST	Reserved	EBIRST	PDMARST	CPURST	CHIPRST

Bits	Description	
[31]	ETMCRST	ETM Controller Reset Setting this bit to 1 will generate a reset signal to the ETM controller. User needs to set this bit to 0 to release from the reset state. 0 = ETM controller normal operation. 1 = ETM controller reset.
[30]	SWDCRST	SWD Controller Reset Setting this bit to 1 will generate a reset signal to the SWD controller. User needs to set this bit to 0 to release from the reset state. 0 = SWD controller normal operation. 1 = SWD controller reset.
[29:18]	Reserved	Reserved.
[17]	SDH1RST	SDHOST1 Controller Reset (Write Protect) Setting this bit to 1 will generate a reset signal to the SDHOST1 controller. User needs to set this bit to 0 to release from the reset state. 0 = SDHOST1 controller normal operation. 1 = SDHOST1 controller reset. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[16]	HSUSBHRST	HSUSBH Controller Reset (Write Protect) Set this bit to 1 will generate a reset signal to the HSUSBH controller. User needs to set this bit to 0 to release from the reset state. 0 = HSUSBH controller normal operation. 1 = HSUSBH controller reset. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[15]	Reserved	Reserved.
[14]	SPIMRST	SPIM Controller Reset Setting this bit to 1 will generate a reset signal to the SPIM controller. User needs to set this bit to 0 to release from the reset state. 0 = SPIM controller normal operation.

		1 = SPIM controller reset.
[13]	Reserved	Reserved.
[12]	CRPTRST	<p>CRYPTO Controller Reset (Write Protect)</p> <p>Setting this bit to 1 will generate a reset signal to the CRYPTO controller. User needs to set this bit to 0 to release from the reset state.</p> <p>0 = CRYPTO controller normal operation. 1 = CRYPTO controller reset.</p> <p>Note: This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[11]	Reserved	Reserved.
[10]	HSUSBDRST	<p>HSUSBD Controller Reset (Write Protect)</p> <p>Setting this bit to 1 will generate a reset signal to the HSUSBD controller. User needs to set this bit to 0 to release from the reset state.</p> <p>0 = HSUSBD controller normal operation. 1 = HSUSBD controller reset.</p>
[9:8]	Reserved	Reserved.
[7]	CRCRST	<p>CRC Calculation Controller Reset (Write Protect)</p> <p>Set this bit to 1 will generate a reset signal to the CRC calculation controller. User needs to set this bit to 0 to release from the reset state.</p> <p>0 = CRC calculation controller normal operation. 1 = CRC calculation controller reset.</p> <p>Note: This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[6]	SDH0RST	<p>SDHOST0 Controller Reset (Write Protect)</p> <p>Setting this bit to 1 will generate a reset signal to the SDHOST0 controller. User needs to set this bit to 0 to release from the reset state.</p> <p>0 = SDHOST0 controller normal operation. 1 = SDHOST0 controller reset.</p> <p>Note: This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[5]	EMACRST	<p>EMAC Controller Reset (Write Protect)</p> <p>Setting this bit to 1 will generate a reset signal to the EMAC controller. User needs to set this bit to 0 to release from the reset state.</p> <p>0 = EMAC controller normal operation. 1 = EMAC controller reset.</p> <p>Note: This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[4]	Reserved	Reserved.
[3]	EBIRST	<p>EBI Controller Reset (Write Protect)</p> <p>Set this bit to 1 will generate a reset signal to the EBI. User needs to set this bit to 0 to release from the reset state.</p> <p>0 = EBI controller normal operation. 1 = EBI controller reset.</p> <p>Note: This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[2]	PDMARST	<p>PDMA Controller Reset (Write Protect)</p> <p>Setting this bit to 1 will generate a reset signal to the PDMA. User needs to set this bit to 0 to release from reset state.</p> <p>0 = PDMA controller normal operation. 1 = PDMA controller reset.</p> <p>Note: This bit is write protected. Refer to the SYS_REGLCTL register</p>
[1]	CPURST	Processor Core One-shot Reset (Write Protect)

		<p>Setting this bit will only reset the processor core and Flash Memory Controller(FMC), and this bit will automatically return to 0 after the 2 clock cycles.</p> <p>0 = Processor core normal operation.</p> <p>1 = Processor core one-shot reset.</p> <p>Note: This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[0]	CHIPRST	<p>Chip One-shot Reset (Write Protect)</p> <p>Setting this bit will reset the whole chip, including Processor core and all peripherals, and this bit will automatically return to 0 after the 2 clock cycles.</p> <p>The CHIPRST is same as the POR reset, all the chip controllers are reset and the chip setting from flash are also reload.</p> <p>About the difference between CHIPRST and SYSRESETREQ(AIRCR[2]), please refer to section 7.2.2</p> <p>0 = Chip normal operation.</p> <p>1 = Chip one-shot reset.</p> <p>Note: This bit is write protected. Refer to the SYS_REGLCTL register.</p>

Peripheral Reset Control Register 1 (SYS_IPRST1)

Setting these bits 1 will generate asynchronous reset signals to the corresponding module controller. Users need to set these bits to 0 to release corresponding module controller from reset state.

7	6	5	4	3	2	1	0
LVREN	BODOUT	BODLPM	BODIF	BODRSTEN	Reserved		BODEN

Bits	Description	
[31:19]	Reserved	Reserved.
[18:16]	BODVL	<p>Brown-out Detector Threshold Voltage Selection (Write Protect) The default value is set by flash controller user configuration register CBOV (CONFIG0 [23:21]).</p> <p>000 = Brown-Out Detector threshold voltage is 1.6V. 001 = Brown-Out Detector threshold voltage is 1.8V. 010 = Brown-Out Detector threshold voltage is 2.0V. 011 = Brown-Out Detector threshold voltage is 2.2V. 100 = Brown-Out Detector threshold voltage is 2.4V. 101 = Brown-Out Detector threshold voltage is 2.6V. 110 = Brown-Out Detector threshold voltage is 2.8V. 111 = Brown-Out Detector threshold voltage is 3.0V.</p> <p>Note: This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[15]	Reserved	Reserved.
[14:12]	LVRDGSEL	<p>LVR Output De-glitch Time Select (Write Protect) 000 = Without de-glitch function. 001 = 4 system clock (HCLK). 010 = 8 system clock (HCLK). 011 = 16 system clock (HCLK). 100 = 32 system clock (HCLK). 101 = 64 system clock (HCLK). 110 = 128 system clock (HCLK). 111 = 256 system clock (HCLK).</p> <p>Note: These bits are write protected. Refer to the SYS_REGLCTL register.</p>
[11]	Reserved	Reserved.

Bits	Description
[10:8]	<p>BODDGSEL</p> <p>Brown-out Detector Output De-glitch Time Select (Write Protect)</p> <p>000 = BOD output is sampled by RC10K clock. 001 = 4 system clock (HCLK). 010 = 8 system clock (HCLK). 011 = 16 system clock (HCLK). 100 = 32 system clock (HCLK). 101 = 64 system clock (HCLK). 110 = 128 system clock (HCLK). 111 = 256 system clock (HCLK).</p> <p>Note: These bits are write protected. Refer to the SYS_REGLCTL register.</p>
[7]	<p>LVREN</p> <p>Low Voltage Reset Enable Bit (Write Protect)</p> <p>The LVR function resets the chip when the input power voltage is lower than LVR circuit setting. LVR function is enabled by default.</p> <p>0 = Low Voltage Reset function Disabled. 1 = Low Voltage Reset function Enabled.</p> <p>Note1: After enabling the bit, the LVR function will be active with 100us delay for LVR output stable (default).</p> <p>Note2: This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[6]	<p>BODOUT</p> <p>Brown-out Detector Output Status</p> <p>0 = Brown-out Detector output status is 0. It means the detected voltage is higher than BODVL setting or BODEN is 0. 1 = Brown-out Detector output status is 1. It means the detected voltage is lower than BODVL setting. If the BODEN is 0, BOD function disabled , this bit always responds 0000.</p>
[5]	<p>BODLPM</p> <p>Brown-out Detector Low Power Mode (Write Protect)</p> <p>0 = BOD operate in normal mode (default). 1 = BOD Low Power mode Enabled.</p> <p>Note1: The BOD consumes about 100uA in normal mode, the low power mode can reduce the current to about 1/10 but slow the BOD response.</p> <p>Note2: This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[4]	<p>BODIF</p> <p>Brown-out Detector Interrupt Flag</p> <p>0 = Brown-out Detector does not detect any voltage draft at V_{DD} down through or up through the voltage of BODVL setting. 1 = When Brown-out Detector detects the V_{DD} is dropped down through the voltage of BODVL setting or the V_{DD} is raised up through the voltage of BODVL setting, this bit is set to 1 and the brown-out interrupt is requested if brown-out interrupt is enabled.</p> <p>Note: Write 1 to clear this bit to 0.</p>

Bits	Description	
[3]	BODRSTEN	<p>Brown-out Reset Enable Bit (Write Protect)</p> <p>The default value is set by flash controller user configuration register CBORST(CONFIG0[20]) bit .</p> <p>0 = Brown-out “INTERRUPT” function Enabled. 1 = Brown-out “RESET” function Enabled.</p> <p>Note1:</p> <p>While the Brown-out Detector function is enabled (BODEN high) and BOD reset function is enabled (BODRSTEN high), BOD will assert a signal to reset chip when the detected voltage is lower than the threshold (BODOUT high).</p> <p>While the BOD function is enabled (BODEN high) and BOD interrupt function is enabled (BODRSTEN low), BOD will assert an interrupt if BODOUT is high. BOD interrupt will keep till to the BODEN set to 0. BOD interrupt can be blocked by disabling the NVIC BOD interrupt or disabling BOD function (set BODEN low).</p> <p>Note2: This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[2:1]	Reserved	Reserved.
[0]	BODEN	<p>Brown-out Detector Enable Bit (Write Protect)</p> <p>The default value is set by flash controller user configuration register CBODEN (CONFIG0 [19]).</p> <p>0 = Brown-out Detector function Disabled. 1 = Brown-out Detector function Enabled.</p> <p>Note: This bit is write protected. Refer to the SYS_REGLCTL register.</p> <p>Note: When VDD lower than BOD detect voltage level, chip will not run into BOD interrupt vector and cannot enter power-down mode if BOD enabled (SYS_BODCTL[0]) set to 1 but correlated NVIC interrupt enable bit (NVIC_ISER0[0]) set to 0.</p>

Internal Voltage Source Control Register (SYS_IVSCTL)

Bits	Description	
[31:28]	PA7MFP	PA.7 Multi-function Pin Selection
[27:24]	PA6MFP	PA.6 Multi-function Pin Selection
[23:20]	PA5MFP	PA.5 Multi-function Pin Selection
[19:16]	PA4MFP	PA.4 Multi-function Pin Selection
[15:12]	PA3MFP	PA.3 Multi-function Pin Selection
[11:8]	PA2MFP	PA.2 Multi-function Pin Selection
[7:4]	PA1MFP	PA.1 Multi-function Pin Selection
[3:0]	PA0MFP	PA.0 Multi-function Pin Selection

GPIOA High Byte Multiple Function Control Register (SYS_GPA_MFPH)

Register	Offset	R/W	Description				Reset Value
SYS_GPA_MFPH	SYS_BA+0x34	R/W	GPIOA High Byte Multiple Function Control Register				0x0000_0000

31	30	29	28	27	26	25	24
PA15MFP				PA14MFP			
23	22	21	20	19	18	17	16
PA13MFP				PA12MFP			
15	14	13	12	11	10	9	8
PA11MFP				PA10MFP			
7	6	5	4	3	2	1	0
PA9MFP				PA8MFP			

Bits	Description	
[31:28]	PA15MFP	PA.15 Multi-function Pin Selection
[27:24]	PA14MFP	PA.14 Multi-function Pin Selection
[23:20]	PA13MFP	PA.13 Multi-function Pin Selection
[19:16]	PA12MFP	PA.12 Multi-function Pin Selection
[15:12]	PA11MFP	PA.11 Multi-function Pin Selection
[11:8]	PA10MFP	PA.10 Multi-function Pin Selection
[7:4]	PA9MFP	PA.9 Multi-function Pin Selection
[3:0]	PA8MFP	PA.8 Multi-function Pin Selection

GPIOB Low Byte Multiple Function Control Register (SYS_GPB_MFPL)

Register	Offset	R/W	Description				Reset Value
SYS_GPB_MFPL	SYS_BA+0x38	R/W	GPIOB Low Byte Multiple Function Control Register				0x0000_0000

31	30	29	28	27	26	25	24
PB7MFP				PB6MFP

7	6	5	4	3	2	1	0
RETRYCNT		LOOPSEL		Reserved		FREQSEL	

Bits	Description	
[31:11]	Reserved	Reserved.
[10]	REFCKSEL	Reference Clock Selection 0 = HIRC trim reference from external 32.768 kHz crystal oscillator. 1 = HIRC trim reference from internal USB synchronous mode. Note: HIRC trim reference clock is 20Khz in test mode.
[9]	Reserved	Reserved.
[8]	CESTOPEN	Clock Error Stop Enable Bit 0 = The trim operation is keep going if clock is inaccuracy. 1 = The trim operation is stopped if clock is inaccuracy.
[7:6]	RETRYCNT	Trim Value Update Limitation Count This field defines that how many times the auto trim circuit will try to update the HIRC trim value before the frequency of HIRC locked. Once the HIRC locked, the internal trim value update counter will be reset. If the trim value update counter reached this limitation value and frequency of HIRC still doesn't lock, the auto trim operation will be disabled and FREQSEL will be cleared to 00. 00 = Trim retry count limitation is 64 loops. 01 = Trim retry count limitation is 128 loops. 10 = Trim retry count limitation is 256 loops. 11 = Trim retry count limitation is 512 loops.
[5:4]	LOOPSEL	Trim Calculation Loop Selection This field defines that trim value calculation is based on how many reference clocks. 00 = Trim value calculation is based on average difference in 4 clocks of reference clock. 01 = Trim value calculation is based on average difference in 8 clocks of reference clock. 10 = Trim value calculation is based on average difference in 16 clocks of reference clock. 11 = Trim value calculation is based on average difference in 32 clocks of reference clock. Note: For example, if LOOPSEL is set as 00, auto trim circuit will calculate trim value based on the average frequency difference in 4 clocks of reference clock.

[3:2]	Reserved	Reserved.
[1:0]	FREQSEL	<p>Trim Frequency Selection</p> <p>This field indicates the target frequency of 12 MHz internal high speed RC oscillator (HIRC) auto trim.</p> <p>During auto trim operation, if clock error detected with CESTOPEN is set to 1 or trim retry limitation count reached, this field will be cleared to 00 automatically.</p> <p>00 = Disable HIRC auto trim function. 01 = Enable HIRC auto trim function and trim HIRC to 12 MHz. 10 = Reserved. 11 = Reserved.</p>

[2]	CLKERRIF	<p>Clock Error Interrupt Status</p> <p>When the frequency of 32.768 kHz external low speed crystal oscillator (LXT) or 12MHz internal high speed RC oscillator (HIRC) is shift larger to unreasonable value, this bit will be set and to be an indicate that clock frequency is inaccuracy</p> <p>Once this bit is set to 1, the auto trim operation stopped and FREQSEL(SYS_IRCTCTL[1:0]) will be cleared to 00 by hardware automatically if CESTOPEN(SYS_IRCTCTL[8]) is set to 1.</p> <p>If this bit is set and CLKEIEN(SYS_IRCTIEN[2]) is high, an interrupt will be triggered to notify the clock frequency is inaccuracy. Write 1 to clear this to 0.</p> <p>0 = Clock frequency is accuracy. 1 = Clock frequency is inaccuracy.</p>
[1]	TFAILIF	<p>Trim Failure Interrupt Status</p> <p>This bit indicates that HIRC trim value update limitation count reached and the HIRC clock frequency still doesn't be locked. Once this bit is set, the auto trim operation stopped and FREQSEL(SYS_IRCTCTL[1:0]) will be cleared to 00 by hardware automatically.</p> <p>If this bit is set and TFAILIEN(SYS_IRCTIEN[1]) is high, an interrupt will be triggered to notify that HIRC trim value update limitation count was reached. Write 1 to clear this to 0.</p> <p>0 = Trim value update limitation count does not reach. 1 = Trim value update limitation count reached and HIRC frequency still not locked.</p>
[0]	FREQLOCK	<p>HIRC Frequency Lock Status</p> <p>This bit indicates the HIRC frequency is locked.</p> <p>This is a status bit and doesn't trigger any interrupt</p> <p>Write 1 to clear this to 0. This bit will be set automatically, if the frequency is lock and the RC_TRIM is enabled.</p> <p>0 = The internal high-speed oscillator frequency doesn't lock at 12 MHz yet. 1 = The internal high-speed oscillator frequency locked at 12 MHz.</p>

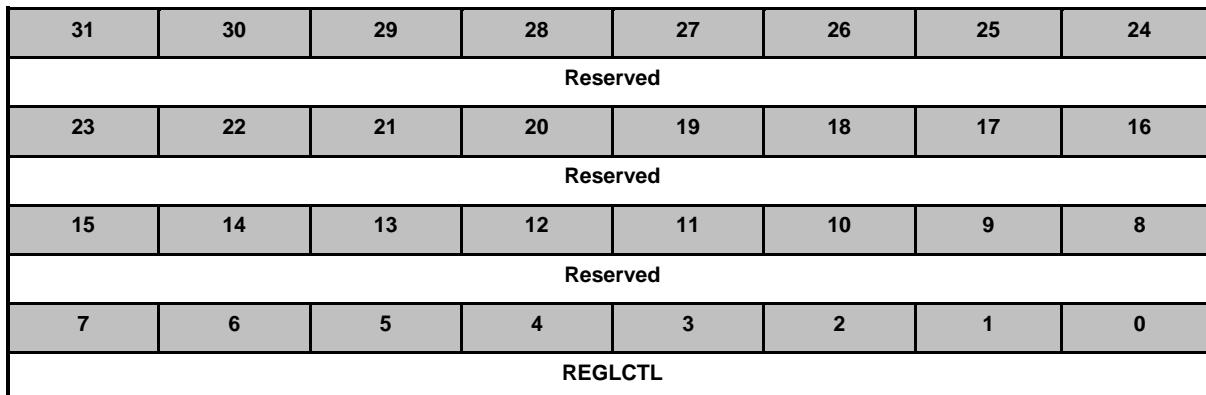

Register Lock Control Register (SYS_REGLCTL)

Some of the system control registers need to be protected to avoid inadvertent write and disturb the chip operation. These system control registers are protected after the power-on reset till user to disable register protection. For user to program these protected registers, a register protection disable sequence needs to be followed by a special programming. The register protection disable sequence is writing the data “59h”, “16h” “88h” to the register SYS_REGLCTL address at 0x4000_0100 continuously. Any different data value, different sequence or any other write to other address during these three data writing will abort the whole sequence.

After the protection is disabled, user can check the protection disable bit at address 0x4000_0100 bit0, 1 is protection disable, and 0 is protection enable. Then user can update the target protected register value and then write any data to the address “0x4000_0100” to enable register protection.

This register is written to disable/enable register protection and read for the REGLCTL status.

Register	Offset	R/W	Description					Reset Value
SYS_REGLCTL	SYS_BA+0x100	R/W	Register Lock Control Register					0x0000_0000

Bits	Description	
[31:8]	Reserved	Reserved.
[7:0]	REGLCTL	<p>Register Lock Control Code (Write Only)</p> <p>Some registers have write-protection function. Writing these registers have to disable the protected function by writing the sequence value “59h”, “16h”, “88h” to this field. After this sequence is completed, the REGLCTL bit will be set to 1 and write-protection registers can be normal write.</p> <p>REGLCTL[0]</p> <p>Register Lock Control Disable Index (Read Only)</p> <p>0 = Write-protection Enabled for writing protected registers. Any write to the protected register is ignored.</p> <p>1 = Write-protection Disabled for writing protected registers.</p>

Refer to the SYS_REGLCTL register.</p>

6.2.13 System Timer (SysTick)

The Cortex®-M4 includes an integrated system timer, SysTick, which provides a simple, 24-bit clear-on-write, decrementing, wrap-on-zero counter with a flexible control mechanism. The counter can be used as a Real Time Operating System (RTOS) tick timer or as a simple counter.

When system timer is enabled, it will count down from the value in the SysTick Current Value Register (SYST_VAL) to zero, and reload (wrap) to the value in the SysTick Reload Value Register (SYST_LOAD) on the next clock cycle, and then decrement on subsequent clocks. When the counter transitions to zero, the COUNTFLAG status bit is set. The COUNTFLAG bit clears on reads.

The SYST_VAL value is UNKNOWN on reset. Software should write to the register to clear it to zero before enabling the feature. This ensures the timer will count from the SYST_LOAD value rather than an arbitrary value when it is enabled.

If the SYST_LOAD is zero, the timer will be maintained with a current value of zero after it is reloaded with this value. This mechanism can be used to disable the feature independently from the timer enable bit.

For more detailed information, please refer to the “ARM® Cortex®-M4 Technical Reference Manual” and “ARM® v6-M Architecture Reference Manual”.

6.2.14 System Timer Control Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
SYST Base Address:				
SCS_BA = 0xE000_E000				
SYST_CTRL	SCS_BA+0x10	R/W	SysTick Control and Status Register	0x0000_0000
SYST_LOAD	SCS_BA+0x14	R/W	SysTick Reload Value Register	0xFFFF_FFFF
SYST_VAL	SCS_BA+0x18	R/W	SysTick Current Value Register	0xFFFF_FFFF

6.2.14.1 System Timer Control Register Description

SysTick Control and Status Register (SYST_CTRL)

Register	Offset	R/W	Description					Reset Value
SYST_CTRL	SCS_BA+0x10	R/W	SysTick Control and Status Register					0x0000_0000

31	30	29	28	27	26	25	24

Reserved								
7	6	5	4	3	2	1	0	
Reserved					CLKSRC	TICKINT	ENABLE	

Bits	Description	
[31:17]	Reserved	Reserved.
[16]	COUNTFLAG	System Tick Counter Flag Returns 1 if timer counted to 0 since last time this register was read. COUNTFLAG is set by a count transition from 1 to 0. COUNTFLAG is cleared on read or by a write to the Current Value register.
[15:3]	Reserved	Reserved.
[2]	CLKSRC	System Tick Clock Source Selection 0 = Clock source is the (optional) external reference clock. 1 = Core clock used for SysTick.
[1]	TICKINT	System Tick Interrupt Enabled 0 = Counting down to 0 does not cause the SysTick exception to be pended. Software can use COUNTFLAG to determine if a count to zero has occurred. 1 = Counting down to 0 will cause the SysTick exception to be pended. Clearing the SysTick current value register by a register write in software will not cause SysTick to be pended.
[0]	ENABLE	System Tick Counter Enabled 0 = Counter Disabled. 1 = Counter will operate in a multi-shot manner.

SysTick Reload Value Register (SYST_LOAD)

Register	Offset	R/W	Description					Reset Value
SYST_LOAD	SCS_BA+0x14	R/W	SysTick Reload Value Register					0xXXXX_XXXX

CURRENT							
7	6	5	4	3	2	1	0
CURRENT							

Bits	Description	
[31:24]	Reserved	Reserved.
[23:0]	CURRENT	System Tick Current Value Current counter value. This is the value of the counter at the time it is sampled. The counter does not provide read-modify-write protection. The register is write-clear. A software write of any value will clear the register to 0.

6.2.15 Nested Vectored Interrupt Controller (NVIC)

The NVIC and the processor core interface are closely coupled to enable low latency interrupt processing and efficient processing of late arriving interrupts. The NVIC maintains knowledge of the stacked, or nested, interrupts to enable tail-chaining of interrupts. You can only fully access the NVIC from privileged mode, but you can cause interrupts to enter a pending state in user mode if you enable the Configuration and Control Register. Any other user mode access causes a bus fault. You can access all NVIC registers using byte, halfword, and word accesses unless otherwise stated. NVIC registers are located within the SCS (System Control Space). All NVIC registers and system debug registers are little-endian regardless of the endianness state of the processor.

The NVIC supports:

- An implementation-defined number of interrupts, in the range 1-240 interrupts.
- A programmable priority level of 0-16 for each interrupt; a higher level corresponds to a lower priority, so level 0 is the highest interrupt priority.
- Level and pulse detection of interrupt signals.
- Dynamic reprioritization of interrupts.
- Grouping of priority values into group priority and subpriority fields.
- Interrupt tail-chaining.
- An external Non Maskable Interrupt (NMI)
- WIC with Ultra-low Power Sleep mode support

The processor automatically stacks its state on exception entry and unstacks this state on exception exit, with no instruction overhead. This provides low latency exception handling.

6.2.15.1 Exception Model and System Interrupt Map

Table 6.2-9 lists the exception model supported by M480 Series. Software can set 16 levels of priority on some of these exceptions as well as on all interrupts. The highest user-configurable priority is denoted as “0x00” and the lowest priority is denoted as “0xF0” (The 4-LSB always 0). The default priority of all the user-configurable interrupts is “0x00”. Note that priority “0” is treated as the fourth priority on the system, after three system exceptions “Reset”, “NMI” and “Hard Fault”.

When any interrupts is accepted, the processor will automatically fetch the starting address of the interrupt service routine (ISR) from a vector table in memory. On system reset, the vector table is fixed at address 0x00000000. Privileged software can write to the VTOR to relocate the vector table start address to a different memory location, in the range 0x00000080 to 0x3FFFFF80,

The vector table contains the initialization value for the stack pointer on reset, and the entry point addresses for all exception handlers. The vector number on previous page defines the order of entries in the vector table associated with exception handler entry as illustrated in previous section.

Exception Type	Vector Number	Vector Address	Priority
Reset	1	0x00000004	-3
NMI	2	0x00000008	-2
Hard Fault	3	0x0000000C	-1
Memory Manager Fault	4	0x00000010	Configurable
Bus Fault	5	0x00000014	Configurable
Usage Fault	6	0x00000018	Configurable
Reserved	7 ~ 10		Reserved

SVCall	11	0x0000002C	Configurable
Debug Monitor	12	0x00000030	Configurable
Reserved	13		Reserved
PendSV	14	0x00000038	Configurable
SysTick	15	0x0000003C	Configurable
Interrupt (IRQ0 ~ IRQ)	16 ~ 111	0x00000000 + (Vector Number)*4	Configurable

Table 6.2-9 Exception Model

Vector Number	Interrupt Number (Bit In Interrupt Registers)	Interrupt Name	Interrupt Description
0 ~ 15	-	-	System exceptions
16	0	BODOUT	Brown-Out low voltage detected interrupt
17	1	IRC_INT	IRC TRIM interrupt
18	2	PWRWU_INT	Clock controller interrupt for chip wake-up from power-down state
19	3	SRAM_PERR	SRAM parity check error interrupt
20	4	CLKFAIL	Clock fail detected interrupt
21	5	Reserved	Reserved
22	6	RTC_INT	Real time clock interrupt
23	7	TAMPER_INT	Backup register tamper interrupt
24	8	WDT_INT	Watchdog Timer interrupt
25	9	WWDT_INT	Window Watchdog Timer interrupt
26	10	EINT0	External interrupt from PA.0, PD.2 or PE.4 pins
27	11	EINT1	External interrupt from PB.0, PD.3 or PE.5 pins
28	12	EINT2	External interrupt from PC.0 pin
29	13	EINT3	External interrupt from PD.0 pin
30	14	EINT4	External interrupt from PE.0 pin
31	15	EINT5	External interrupt from PF.0 pin
32	16	GPA_INT	External interrupt from PA[15:0] pin
33	17	GPB_INT	External interrupt from PB[15:0] pin
34	18	GPC_INT	External interrupt from PC[15:0] pin
35	19	GPD_INT	External interrupt from PD[15:0] pin
36	20	GPE_INT	External interrupt from PE[15:0] pin
37	21	GPF_INT	External interrupt from PF[15:0] pin
38	22	QSPI0_INT	QSPI0 interrupt

39	23	SPI0_INT	SPI0 interrupt
40	24	BRAKE0_INT	EPWM0 brake interrupt
41	25	EPWM0_P0_INT	EPWM0 pair 0 interrupt
42	26	EPWM0_P1_INT	EPWM0 pair 1 interrupt
43	27	EPWM0_P2_INT	EPWM0 pair 2 interrupt
44	28	BRAKE1_INT	EPWM1 brake interrupt
45	29	EPWM1_P0_INT	EPWM1 pair 0 interrupt
46	30	EPWM1_P1_INT	EPWM1 pair 1 interrupt
47	31	EPWM1_P2_INT	EPWM1 pair 2 interrupt
48	32	TMR0_INT	Timer 0 interrupt
49	33	TMR1_INT	Timer 1 interrupt
50	34	TMR2_INT	Timer 2 interrupt
51	35	TMR3_INT	Timer 3 interrupt
52	36	UART0_INT	UART0 interrupt
53	37	UART1_INT	UART1 interrupt
54	38	I2C0_INT	I2C0 interrupt
55	39	I2C1_INT	I2C1 interrupt
56	40	PDMA_INT	PDMA interrupt
57	41	DAC_INT	DAC interrupt
58	42	EADC0_INT	EADC interrupt source 0
59	43	EADC1_INT	EADC interrupt source 1
60	44	ACMP01_INT	ACMP0 and ACMP1 interrupt
61	45	Reserved	Reserved
62	46	EADC2_INT	EADC interrupt source 2
63	47	EADC3_INT	EADC interrupt source 3
64	48	UART2_INT	UART2 interrupt
65	49	UART3_INT	UART3 interrupt
66	50	Reserved	Reserved
67	51	SPI1_INT	SPI1 interrupt
68	52	SPI2_INT	SPI2 interrupt
69	53	USBD_INT	USB device interrupt
70	54	USBH_INT	USB host interrupt
71	55	USBOTG_INT	USB OTG interrupt
72	56	CAN0_INT	CAN0 interrupt
73	57	CAN1_INT	CAN1 interrupt

74	58	SC0_INT	Smart card host 0 interrupt
75	59	SC1_INT	Smart card host 1 interrupt
76	60	SC2_INT	Smart card host 2 interrupt
77	61	SC3_INT	Smart card host 3 interrupt
78	62	SPI3_INT	SPI3 interrupt
80	64	SDHOST0_INT	SD host 0 interrupt
81	65	HSUSBD_INT	HSUSBD interrupt
82	66	EMAC_TX	Ethernet MAC transmit interrupt
83	67	EMAC_RX	Ethernet MAC receive interrupt
84	68	I2S0_INT	I2S0 interrupt
85	69	Reserved	Reserved
86	70	OPA0_INT	Analog OP0 interrupt
87	71	CRYPTO	Crypto interrupt
88	72	GPG_INT	External interrupt from PG[15:0] pin
89	73	EINT6	External interrupt from PG.0 pin
90	74	UART4_INT	UART4 interrupt
91	75	UART5_INT	UART5 interrupt
92	76	USCI0_INT	USCI0 interrupt
93	77	USCI1_INT	USCI1 interrupt
94	78	BPWM0_INT	BPWM0 interrupt
95	79	BPWM1_INT	BPWM1 interrupt
96	80	SPIM_INT	SPI Master interrupt
97	81	Reserved	Reserved
98	82	I2C2_INT	I2C2 interrupt
99	83	Reserved	Reserved
100	84	QEI0_INT	QEI0 interrupt
101	85	QEI1_INT	QEI1 interrupt
102	86	ECAP0_INT	ECAP0 interrupt
103	87	ECAP1_INT	ECAP1 interrupt
105	88	GPH_INT	External interrupt from PH[?:0] pin
105	89	EINT7	External interrupt from PH.? pin
106	90	SDHOST1_INT	SD host 1 interrupt
107	91	Reserved	Reserved
108	92	HSUSBH_INT	HSUSBH interrupt
109	93	HSOTG_INT	HSOTG interrupt

Table 6.2-10 Interrupt Number Table

6.2.15.2 Operation Description

NVIC interrupts can be enabled and disabled by writing to their corresponding Interrupt Set-Enable or Interrupt Clear-Enable register bit-field. The registers use a write-1-to-enable and write-1-to-clear policy, both registers reading back the current enabled state of the corresponding interrupts. When an interrupt is disabled, interrupt assertion will cause the interrupt to become Pending, however, the interrupt will not activate. If an interrupt is Active when it is disabled, it remains in its Active state until cleared by reset or an exception return. Clearing the enable bit prevents new activations of the associated interrupt.

NVIC interrupts can be pended/un-pended using a complementary pair of registers to those used to enable/disable the interrupts, named the Set-Pending Register and Clear-Pending Register respectively. The registers use a write-1-to-enable and write-1-to-clear policy, both registers reading back the current pended state of the corresponding interrupts. The Clear-Pending Register has no effect on the execution status of an Active interrupt.

NVIC interrupts are prioritized by updating an 8-bit field within a 32-bit register (each register supporting four interrupts).

The general registers associated with the NVIC are all accessible from a block of memory in the System Control Space and will be described in next section.

6.2.15.3 NVIC Control Registers

R: read only, **W:** write only, **R/W:** both read and write

Register	Offset	R/W	Description	Reset Value
NVIC Base Address:				
NVIC_BA = 0xE000_E100				
NVIC_ISER0	NVIC_BA+0x00	R/W	IRQ0 ~ IRQ71 Set-Enable Control Register	0x0000_0000

6.2.16 System Control Register

The Cortex®-M4 status and operation mode control are managed by System Control Registers. Including CPUID, Cortex®-M4 interrupt priority and Cortex®-M4 power management can be controlled through these system control registers.

For more detailed information, please refer to the “ARM® Cortex™-M4 Technical Reference Manual” and “ARM® v6-M Architecture Reference Manual”.

6.3 Clock Controller

6.3.1 Overview

The clock controller generates clocks for the whole chip, including system clocks and all peripheral clocks. The clock controller also implements the power control function with the individually clock ON/OFF control, clock source selection and a clock divider. The chip will not enter Power-down mode until CPU sets the Power-down enable bit PDEN(CLK_PWRCTL[7]) and Cortex®-M4 core executes the WFI instruction. After that, chip enters Power-down mode and wait for wake-up interrupt source triggered to leave Power-down mode. In Power-down mode, the clock controller turns off the 4~24 MHz external high speed crystal (HXT) and 12 MHz internal high speed RC oscillator (HIRC) to reduce the overall system power consumption. Figure 6.3-1 shows the clock generator and the overview of the clock source control.

Note: For USB High-speed application, HXT should be 12 MHz.

Figure 6.3-1 Clock Generator Global View Diagram

6.3.2 Clock Generator

The clock generator consists of 5 clock sources, which are listed below:

- 32.768 kHz external low speed crystal oscillator (LXT)
- 4~24 MHz external high speed crystal oscillator (HXT)
- Programmable PLL output clock frequency (PLLFOU), PLL source can be selected from external 4~24 MHz external high speed crystal (HXT) or 12 MHz internal high speed oscillator (HIRC)
- 12 MHz internal high speed RC oscillator (HIRC)
- 10 kHz internal low speed RC oscillator (LIRC)

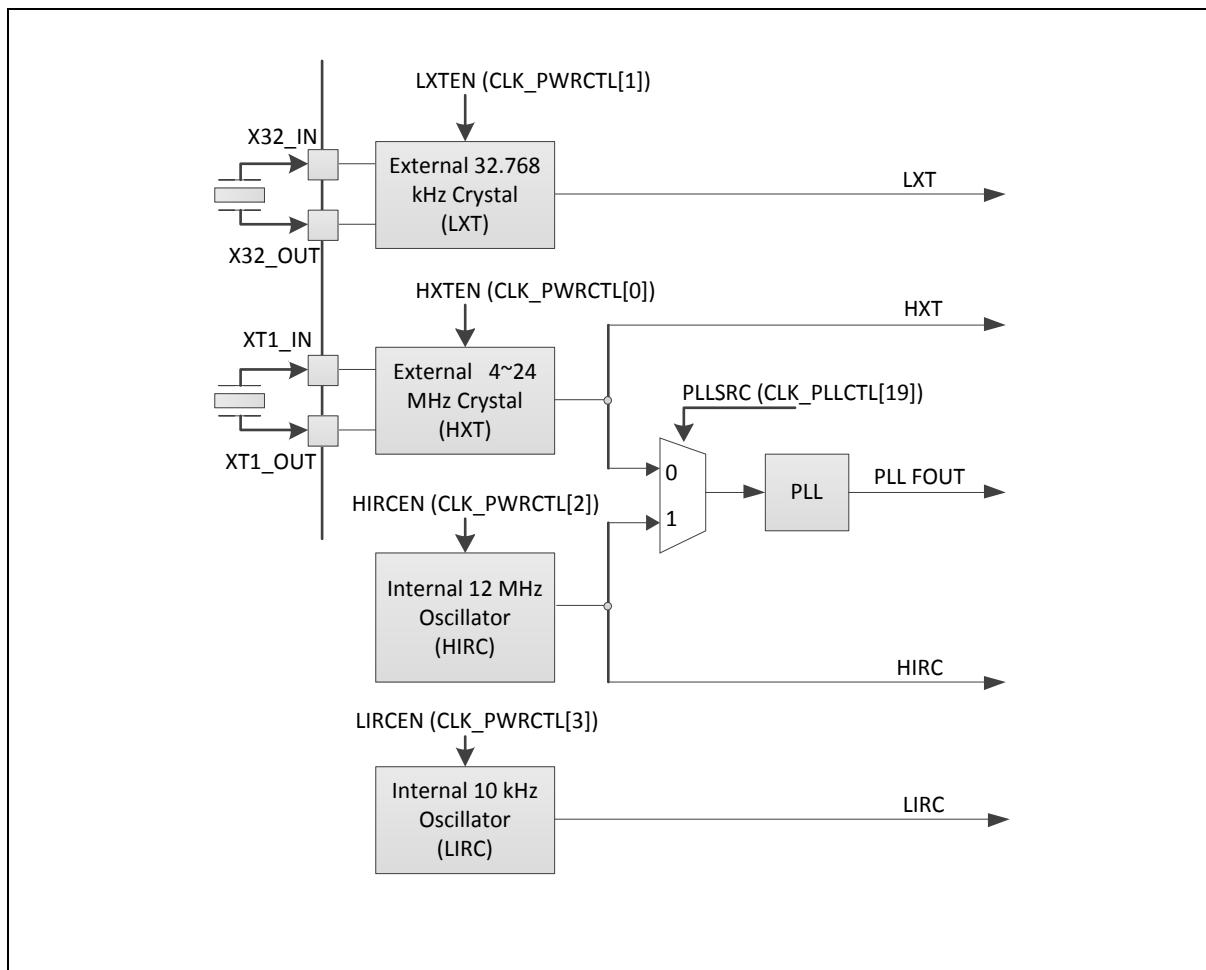

Figure 6.3-2 Clock Generator Block Diagram

6.3.3 System Clock and SysTick Clock

The system clock has 5 clock sources, which were generated from clock generator block. The clock source switch depends on the register HCLKSEL (CLK_CLKSEL0[2:0]). The block diagram is shown in Figure 6.3-3.

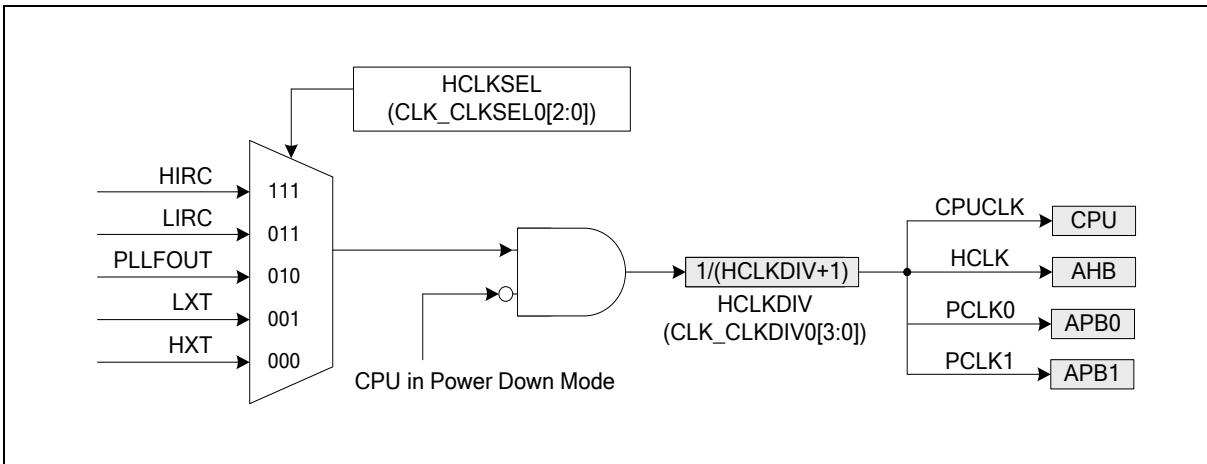

Figure 6.3-3 System Clock Block Diagrams

There are two clock fail detectors to observe HXT and LXT clock source and they have individual enable and interrupt control. When HXT detector is enabled, the HIRC clock is enabled automatically. When LXT detector is enabled, the LIRC clock is enabled automatically.

When HXT clock detector is enabled, the system clock will auto switch to HIRC if HXT clock stop being detected on the following condition: system clock source comes from HXT or system clock source comes from PLL with HXT as the input of PLL. If HXT clock stop condition is detected, the HXTFIF (CLK_CLKDSTS[0]) is set to 1 and chip will enter interrupt if HXTFIE (CLK_CLKDCTL[5]) is set to 1. User can trying to recover HXT by disable HXT and enable HXT again to check if the clock stable bit is set to 1 or not. If HXT clock stable bit is set to 1, it means HXT is recover to oscillate after re-enable action and user can switch system clock to HXT again.

Figure 6.3-4 shows The HXT clock stops detection and system clock switches to HIRC procedure

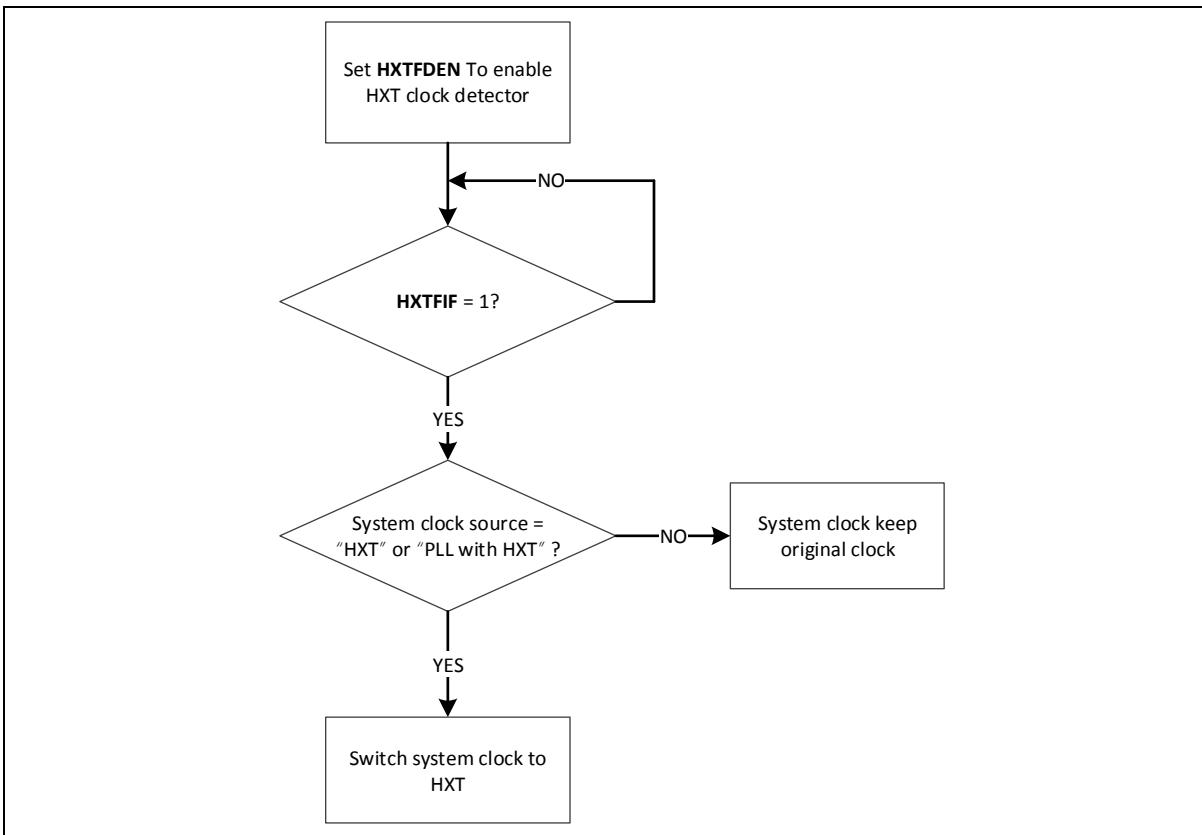

Figure 6.3-4 HXT Stop Protect Procedure

The clock source of SysTick in Cortex®-M4 core can use CPU clock or external clock (SYST_CTRL[2]). If using external clock, the SysTick clock (STCLK) has 5 clock sources. The clock source switch depends on the setting of the register STCLKSEL (CLK_CLKSEL0[5:3]). The block diagram is shown in Figure 6.3-5.

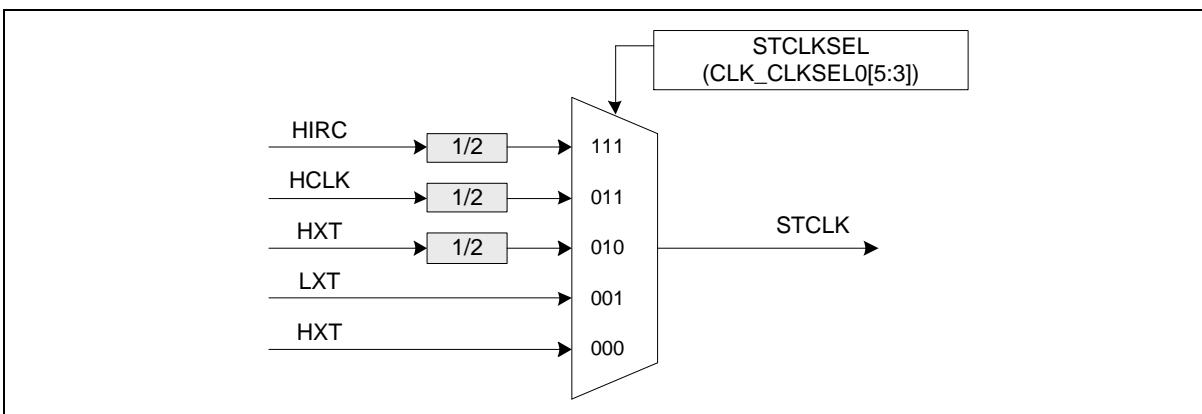

Figure 6.3-5 SysTick Clock Control Block Diagram

6.3.4 Peripherals Clock

Each peripheral clock has its own clock source selection. Refer to the CLK_CLKSEL1, CLK_CLKSEL2 and CLK_CLKSEL3 register.

6.3.5 Power-down Mode Clock

When entering Power-down mode, system clocks, some clock sources and some peripheral clocks are disabled. Some clock sources and peripherals clock are still active in Power-down mode.

For these clocks, which still keep active, are listed below:

- Clock Generator
 - 10 kHz internal low speed RC oscillator (LIRC) clock
 - 32.768 kHz external low speed crystal oscillator (LXT) clock
- Peripherals Clock (When the modules adopt LXT or LIRC as clock source)

6.3.6 Clock Output

This device is equipped with a power-of-2 frequency divider which is composed of 16 chained divide-by-2 shift registers. One of the 16 shift register outputs selected by a sixteen to one multiplexer is reflected to CLKO function pin. Therefore there are 16 options of power-of-2 divided clocks with the frequency from $F_{in}/2^1$ to $F_{in}/2^{16}$ where F_{in} is input clock frequency to the clock divider.

The output formula is $F_{out} = F_{in}/2^{(N+1)}$, where F_{in} is the input clock frequency, F_{out} is the clock divider output frequency and N is the 4-bit value in FREQSEL (CLK_CLKOCTL[3:0]).

When writing 1 to CLKOEN (CLK_CLKOCTL[4]), the chained counter starts to count. When writing 0 to CLKOEN (CLK_CLKOCTL[4]), the chained counter continuously runs till divided clock reaches low state and stays in low state.

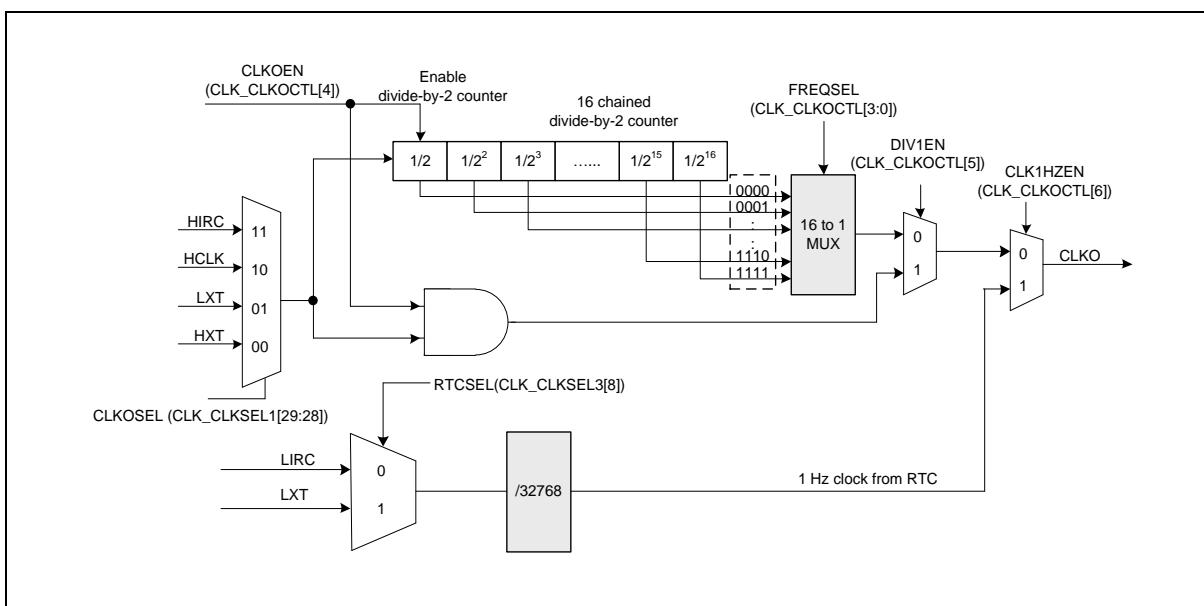

Figure 6.3-6 Clock Output Block Diagram

6.3.7 USB Clock Source

The clock sources of USB 1.0 and 2.0 systems are generated from USB2.0 PHY clock or programmable PLL output. The generated clocks are shown in Figure 6.3-7.

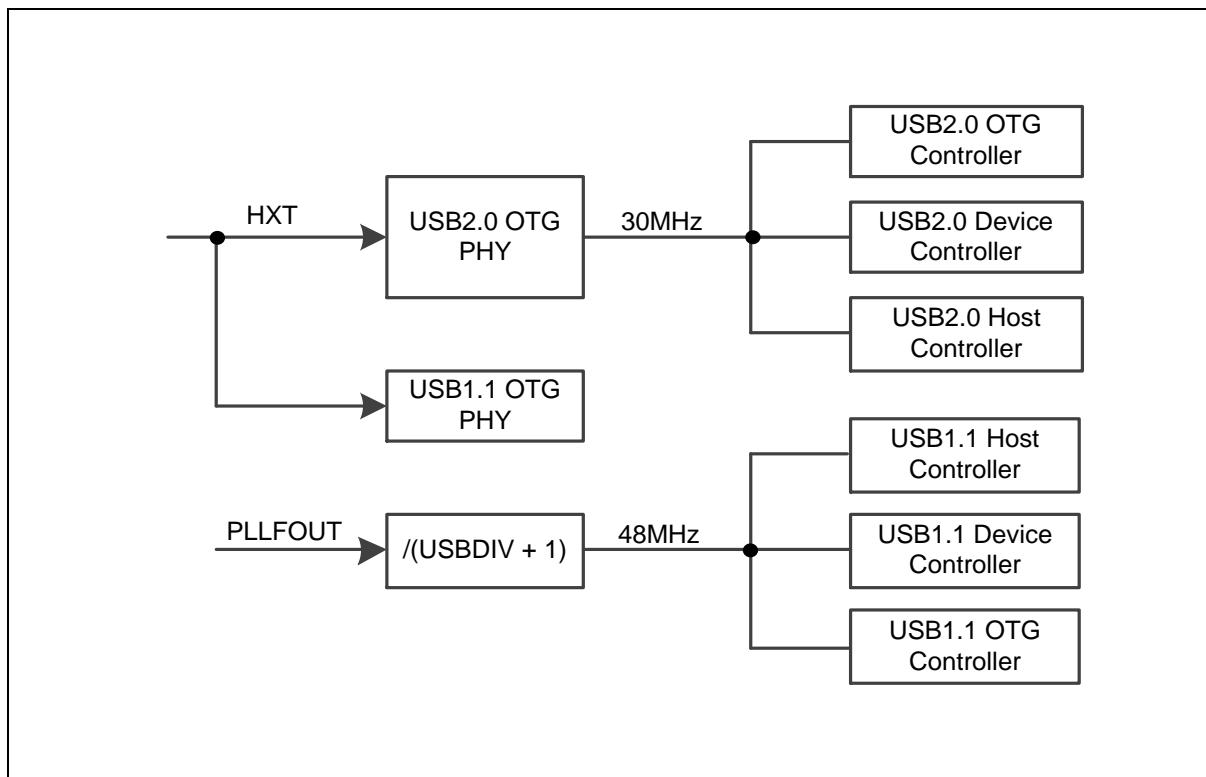

Figure 6.3-7 USB Clock Source

6.3.8 HXT clock

The High Speed Crystal (HXT) can be generated from two possible clock sources:

- HXT external crystal oscillator
- HXT user external clock

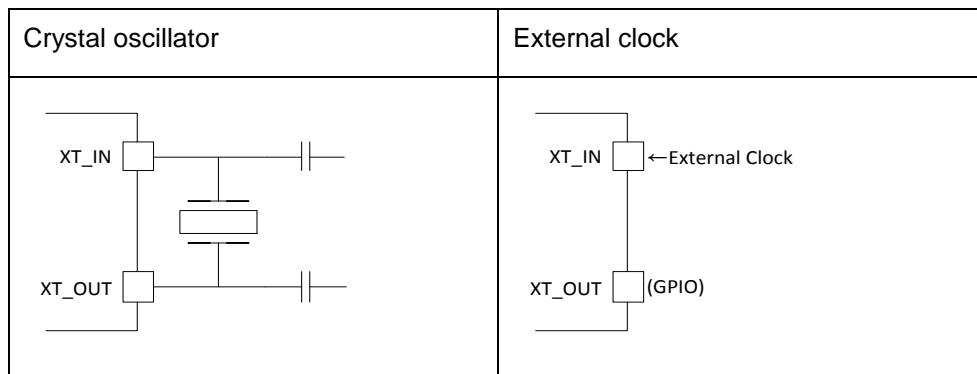

Figure 6.3-8 HXT Clock Sources

External source (HXT OSC Mode)

The clock sources can be input from the external pin (PF.3).

When writing 1 to CFGXT1(CONFIG0[27]), HXT work as crystal mode. PF.2 and PF.3 are configured as external high speed crystal (HXT) pins. When writing 0 to CFGXT1 (CONFIG0[27]), HXT work as external clock mode. PF.3 is configured as external clock input pin. PF.3 MFP should be setting as GPIO mode. The DC characteristic of XT1_IN is the same as GPIO.

6.3.9 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
CLK Base Address:

7	6	5	4	3	2	1	0
PDEN	PDWKIF	PDWKIEN	PDWKDLY	LIRCEN	HIRCEN	LXTEN	HXTEN

Bits	Description	
[31:18]	Reserved	Reserved.
[17:16]	HIRCSTBS	HIRC Stable Count Select (Write Protect) 00 = HIRC stable count = 64 clocks. 01 = HIRC stable count = 24 clocks. Others: Reserved
[15:14]	Reserved	Reserved.
[13]	HXTTBEN	HXT Crystal TURBO Mode (Write Protect) This is a protected register. Please refer to open lock sequence to program it. 0 = HXT Crystal TURBO mode Disabled. 1 = HXT Crystal TURBO mode Enabled.
[12]	HXTSELTYP	HXT Crystal Type Select Bit (Write Protect) This is a protected register. Please refer to open lock sequence to program it. 0 = Select INV type. 1 = Select GM type. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[11:10]	HXTGAIN	HXT Gain Control Bit (Write Protect) This is a protected register. Please refer to open lock sequence to program it. Gain control is used to enlarge the gain of crystal to make sure crystal work normally. If gain control is enabled, crystal will consume more power than gain control off. 00 = HXT frequency is lower than from 8 MHz. 01 = HXT frequency is from 8 MHz to 12 MHz. 10 = HXT frequency is from 12 MHz to 16 MHz. 11 = HXT frequency is higher than 16 MHz. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[9:8]	Reserved	Reserved.

[7]	PDEN	System Power-down Enable (Write Protect) When this bit is set to 1, Power-down mode is enabled and chip keeps active till the CPU sleep mode is also active and then the chip enters Power-down mode. When chip wakes up from Power-down mode, this bit is auto cleared. Users need to set this bit again for next Power-down. In Power-down mode, HXT and the HIRC will be disabled in this mode, but LXT and LIRC are not controlled by Power-down mode. In Power-down mode, the PLL and system clock are disabled, and ignored the clock source selection. The clocks of peripheral are not controlled by Power-down mode, if the peripheral clock source is from LXT or LIRC. 0 = Chip will not enter Power-down mode after CPU sleep command WFI. 1 = Chip enters Power-down mode after CPU sleep command WFI. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[6]	PDWKIF	Power-down Mode Wake-up Interrupt Status Set by “Power-down wake-up event”, it indicates that resume from Power-down mode” The flag is set if any wake-up source is occurred. Refer Power Modes and Wake-up Sources chapter. Note1: Write 1 to clear the bit to 0. Note2: This bit works only if PDWKIEN (CLK_PWRCTL[5]) set to 1.
[5]	PDWKIEN	Power-down Mode Wake-up Interrupt Enable Bit (Write Protect) 0 = Power-down mode wake-up interrupt Disabled. 1 = Power-down mode wake-up interrupt Enabled. Note1: The interrupt will occur when both PDWKIF and PDWKIEN are high. Note2: This bit is write protected. Refer to the SYS_REGLCTL register.
[4]	PDWKDLY	Enable the Wake-up Delay Counter (Write Protect) When the chip wakes up from Power-down mode, the clock control will delay certain clock cycles to wait system clock stable. The delayed clock cycle is 4096 clock cycles when chip works at 4~24 MHz external high speed crystal oscillator (HXT), and 256 clock cycles when chip works at 12 MHz internal high speed RC oscillator (HIRC). 0 = Clock cycles delay Disabled. 1 = Clock cycles delay Enabled. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[3]	LIRCEN	LIRC Enable Bit (Write Protect) 0 = 10 kHz internal low speed RC oscillator (LIRC) Disabled. 1 = 10 kHz internal low speed RC oscillator (LIRC) Enabled. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[2]	HIRCEN	HIRC Enable Bit (Write Protect) 0 = 12 MHz internal high speed RC oscillator (HIRC) Disabled. 1 = 12 MHz internal high speed RC oscillator (HIRC) Enabled. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[1]	LXTEN	LXT Enable Bit (Write Protect) 0 = 32.768 kHz external low speed crystal (LXT) Disabled. 1 = 32.768 kHz external low speed crystal (LXT) Enabled. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[0]	HXTEN	HXT Enable Bit (Write Protect) The bit default value is set by flash controller user configuration register CONFIG0 [26:24]. When the default clock source is from HXT, this bit is set to 1 automatically. 0 = 4~24 MHz external high speed crystal (HXT) Disabled.

		1 = 4~24 MHz external high speed crystal (HXT) Enabled.
--	--	---

Note: This bit is write protected. Refer to the SYS_REGLCTL register.

AHB Devices Clock Enable Control Register (CLK_AHBCLK)

The bits in this register are used to enable/disable clock for system clock, AHB bus devices clock.

15	14	13	12	11	10	9	8
OUTDIV		INDIV				FBDIV	
7	6	5	4	3	2	1	0
FBDIV							

Bits	Description	
[31:29]	Reserved	Reserved.
[28]	BANDSEL	PLL Stable Counter Selection (Write Protect) 0 = PLL low band frequency select. (FVCO range is 200 MHz ~ 400 MHz) 1 = PLL high band frequency select. (FVCO range is 400 MHz ~ 500 MHz) Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[23]	STBSEL	PLL Stable Counter Selection (Write Protect) 0 = PLL stable time is 6144 PLL source clock (suitable for source clock is equal to or less than 12 MHz). 1 = PLL stable time is 12288 PLL source clock (suitable for source clock is larger than 12 MHz). Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[22:20]	Reserved	Reserved.
[19]	PLLSRC	PLL Source Clock Selection (Write Protect) 0 = PLL source clock from 4~24 MHz external high-speed crystal oscillator (HXT). 1 = PLL source clock from 12 MHz internal high-speed oscillator (HIRC). Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[18]	OE	PLL OE (FOUT Enable) Pin Control (Write Protect) 0 = PLL FOUT Enabled. 1 = PLL FOUT is fixed low. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[17]	BP	PLL Bypass Control (Write Protect) 0 = PLL is in normal mode (default). 1 = PLL clock output is same as PLL input clock FIN. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[16]	PD	Power-down Mode (Write Protect) If set the PDEN bit to 1 in CLK_PWRCTL register, the PLL will enter Power-down mode,

		too. 0 = PLL is in normal mode. 1 = PLL is in Power-down mode (default). Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[15:14]	OUTDIV	PLL Output Divider Control (Write Protect) Refer to the formulas below the table. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[13:9]	INDIV	PLL Input Divider Control (Write Protect) Refer to the formulas below the table. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[8:0]	FBDIV	PLL Feedback Divider Control (Write Protect) Refer to the formulas below the table. Note: This bit is write protected. Refer to the SYS_REGLCTL register.

Output Clock Frequency formula:

$$FREF = FIN \times \frac{1}{NR}$$

$$FVCO = FIN \times \frac{2 * NF}{NR}$$

$$FOUT = FIN \times \frac{2 * NF}{NR} \times \frac{1}{NO}$$

where FREF is the comparison frequency for the PFD (phase frequency detector).

For proper operation in normal mode, the following constraints must be satisfied:

$$4 \text{ MHz} \leq FREF \leq 8 \text{ MHz}$$

$$200 \text{ MHz} \leq FVCO \leq 500 \text{ MHz}$$

$$50 \text{ MHz} \leq FOOUT \leq 500 \text{ MHz}$$

Symbol	Description					
FOUT	Output Clock Frequency					
FIN	Input (Reference) Clock Frequency					
NR	Input Divider (INDIV + 1)					
NF	Feedback Divider (FBDIV + 2)					
NO	OUTDIV = "00"	:	NO	=	1	
	OUTDIV = "01"	:	NO	=	2	
	OUTDIV = "10"	:	NO	=	2	
	OUTDIV = "11": NO = 4					

Table 6.3-1 Symbol definition of PLL Output Frequency formula

Clock Status Monitor Register (CLK_STATUS)

The bits in this register are used to monitor if the chip clock source is stable or not, and whether the clock switch is failed.

Register	Offset	R/W	Description				Reset Value
CLK_STATUS	CLK_BA+0x50	R	Clock Status Monitor Register				0x0000_00XX

31	30	29	28	27	26	25	24

CLKSFAIL	Reserved		HIRCSTB	LIRCSTB	PLLSTB	LXTSTB	HXTSTB

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	CLKSFAIL	Clock Switching Fail Flag (Read Only) This bit is updated when software switches system clock source. If switch target clock is stable, this bit will be set to 0. If switch target clock is not stable, this bit will be set to 1. 0 = Clock switching success. 1 = Clock switching failure. Note: Write 1 to clear the bit to 0.
[6:5]	Reserved	Reserved.
[4]	HIRCSTB	HIRC Clock Source Stable Flag (Read Only) 0 = 12 MHz internal high speed RC oscillator (HIRC) clock is not stable or disabled. 1 = 12 MHz internal high speed RC oscillator (HIRC) clock is stable and enabled.
[3]	LIRCSTB	LIRC Clock Source Stable Flag (Read Only) 0 = 10 kHz internal low speed RC oscillator (LIRC) clock is not stable or disabled. 1 = 10 kHz internal low speed RC oscillator (LIRC) clock is stable and enabled.
[2]	PLLSTB	Internal PLL Clock Source Stable Flag (Read Only) 0 = Internal PLL clock is not stable or disabled. 1 = Internal PLL clock is stable and enabled.
[1]	LXTSTB	LXT Clock Source Stable Flag (Read Only) 0 = 32.768 kHz external low speed crystal oscillator (LXT) clock is not stable or disabled. 1 = 32.768 kHz external low speed crystal oscillator (LXT) clock is stabled and enabled.
[0]	HXTSTB	HXT Clock Source Stable Flag (Read Only) 0 = 4~24 MHz external high speed crystal oscillator (HXT) clock is not stable or disabled. 1 = 4~24 MHz external high speed crystal oscillator (HXT) clock is stable and enabled.

Clock Output Control Register (CLK_CLKOCTL)

Register	Offset	R/W	Description				Reset Value
CLK_CLKOCTL	CLK_BA+0x60	R/W	Clock Output Control Register				0x0000_0000

6.4 Flash Memory Controller (FMC)

6.4.1 Overview

The FMC is equipped with dual-bank on-chip embedded Flash (BANK0 and BANK1) for application and configurable Data Flash to store some application dependent data. Both BANK0 and BANK1 have 64/128/256 Kbytes space. Thus, the total size of application rom (APROM) is 128K/256K/512K. A User Configuration block provides for system initiation in BANK0. A 4 Kbytes loader ROM (LDROM) is used for In-System-Programming (ISP) function in BANK0. A 4 Kbytes security protection ROM (SPROM) can conceal user program. A 2 Kbytes one-time-program ROM (OTP) is used for recording one-time-program data in BANK1. A 32K Boot Loader consists of native ISP functions. A 4KB cache with zero wait cycle is used to improve Flash access performance. This chip also supports In-Application-Programming (IAP) function. User switches the code executing without chip reset after the embedded Flash is updated.

6.4.2 Features

- Supports dual-bank Flash macro for safe firmware upgrade
- Supports 128/256/512 Kbytes application ROM (APROM)
- Supports 4 Kbytes loader ROM (LDROM)
- Supports 4 Kbytes security protection ROM (SPROM) to conceal user program
- Supports mirror SPROM in dual-bank Flash macro to read SPROM code while writing other ROM
- Supports Data Flash with configurable memory size
- Supports 16 bytes User Configuration block to control system initiation
- Supports 2 Kbytes one-time-program ROM (OTP)
- Supports 4 Kbytes page erase for all embedded Flash
- Supports Boot Loader with native In-System-Programming (ISP) functions
- Supports Secure Boot function for code integrity and authenticity
- Supports Security Key protection function for APROM, LDROM, SPROM, User Configuration block and KPROM protection
- Supports 32-bit/64-bit and multi-word Flash programming function
- Supports fast Flash programming verification function
- Supports CRC32 checksum calculation function
- Supports Flash all one verification function
- Supports In-System-Programming (ISP) / In-Application-Programming (IAP) to update embedded Flash memory
- Supports cache memory to improve Flash access performance and reduce power consumption

6.4.3 Block Diagram

The Flash memory controller (FMC) consists of AHB slave interface, cache memory controller, Flash control registers, Flash initialization controller, Flash operation control and embedded Flash memory. The block diagram of Flash memory controller is shown as follows.

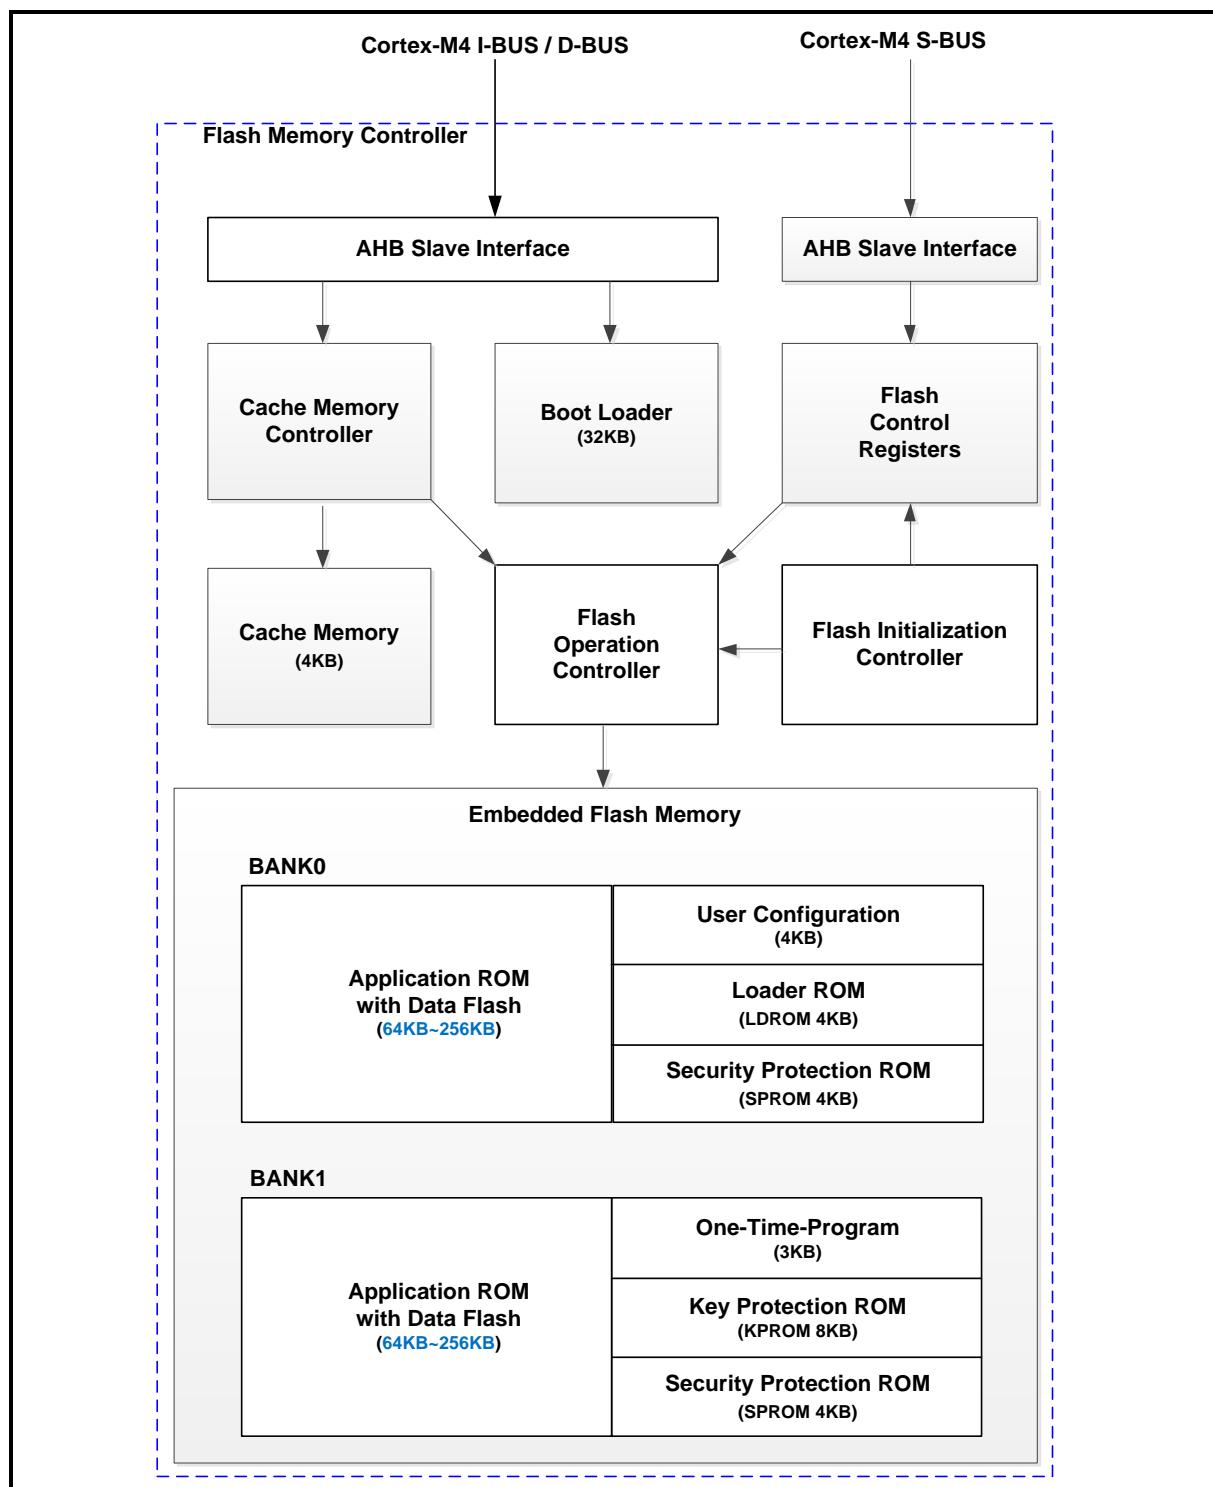

Figure 6.4-1 Flash Memory Controller Block Diagram

AHB Slave Interface

There are two AHB slave interfaces in Flash memory controller, one is from both Cortex®-M4 I-Bus and D-Bus for the instruction and data fetch; the other is from Cortex®-M4 S-Bus for Flash control registers access including ISP registers.

Cache Memory Controller

A 4 KB cache with zero wait cycle is implemented between Cortex®-M4 CPU and embedded Flash memory. This cache memory controller improves the Flash access performance and reduces power consumption of the embedded Flash memory.

Boot Loader

The Boot Loader is 32KB, and consists of native ISP functions to update embedded Flash memory. The Boot Loader content is read only, but not programmable.

Flash Control Registers

All of ISP control and status registers are in the Flash control registers. The detail registers description is in the Register Description section

Flash Initialization Controller

When chip is powered on or active from reset, the Flash initialization controller will start to access Flash automatically and check the Flash stability, and also reload User Configuration content to the Flash control registers for system initiation.

Flash Operation Controller

The Flash operations, such as Flash erase, Flash program, and Flash read operation, have specific control timing for embedded Flash memory. The Flash operation controller generates those control timing by requested from the cache memory controller, the Flash control registers and the Flash initialization controller.

Embedded Flash Memory

The embedded Flash memory is the main memory for user application code and parameters. It consists of the user configuration block, 4KB LDROM, two 4KB SPROM, 2KB OTP, 8KB KPROM and 128KB/256KB/512KB APROM with Data Flash. The page erase Flash size is 4KB, and minimum program bit size is 32 bits.

6.4.4 Functional Description

FMC functions include the memory organization, boot selection, secure boot, IAP, ISP, the embedded Flash programming, and checksum calculation. The Flash memory map and system memory map are also introduced in the memory organization.

6.4.4.1 Memory Organization

The FMC memory consists of the dual-bank embedded Flash memory and boot loader. The dual-bank embedded Flash memory is programmable, and includes APROM, LDROM, SPROM, Data Flash, the User Configuration block, OTP and KPROM. Boot Loader is a Mask ROM with ISP boot codes to support firmware download, boot control, security control and firmware execution. The address map includes Flash memory map and five system address maps: LDROM with IAP, LDROM without IAP, APROM with IAP, APROM without IAP, and Boot Loader with IAP functions..

BANK	Flash Memory Block	Address Range
0	APROM with 512KB	0x00_0000 ~ 0x03_ffff
	APROM with 256KB	0x00_0000 ~ 0x01_ffff
	APROM with 128KB	0x00_0000 ~ 0x00_ffff
	User Configuration	0x30_0000 ~ 0x30_000f
	LDROM	0x10_0000 ~ 0x10_0fff
	SPROM	0x20_0000 ~ 0x20_0fff
1	APROM with 512KB	0x04_0000 ~ 0x07_ffff
	APROM with 256KB	0x02_0000 ~ 0x03_ffff
	APROM with 128KB	0x01_0000 ~ 0x01_ffff
	OTP	0x31_0000 ~ 0x31_0bff
	KPROM-KEY	0x30_1000 ~ 0x30_11ff
	KPROM - KPCNTROM	0x30_1200 ~ 0x30_1fff

Table 6.4-1 Dual-Bank Block Address Range

6.4.4.2 LDROM APROM and Data Flash

LDROM is designed for a loader to implement In-System-Programming (ISP) function by user. LDROM is a 4KB embedded Flash memory, the Flash address range is from 0x0010_0000 to 0x0010_0FFF. APROM is main memory for user applications. APROM size is 128KB/256KB/512KB. Data Flash is used to store application parameters (not instruction). Data Flash is shared with APROM and size is configurable. The base address of Data Flash is determined by DFBA (CONFIG1[19:0]). All of the embedded Flash memory is 4KB page erased.

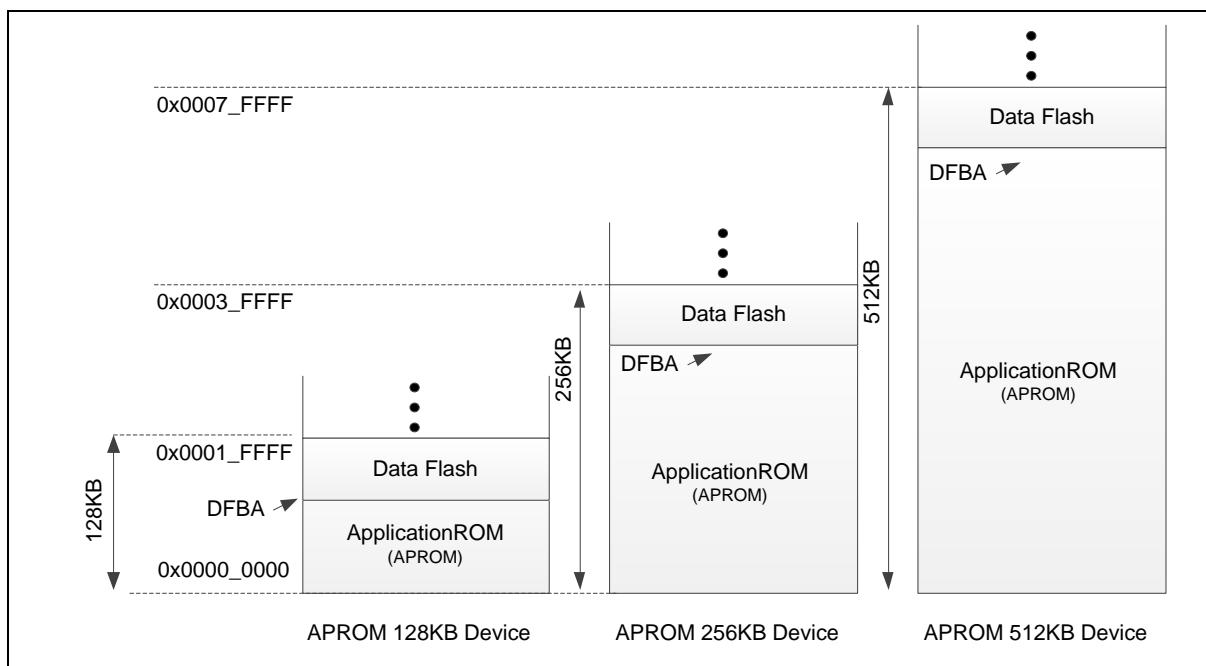

Figure 6.4-2 Data Flash Shared with APROM Examples (128/256/512 KB)

6.4.4.3 User Configuration Block

User Configuration block is internal programmable configuration area for boot options, such as Flash security lock, boot select, brown-out voltage level, and Data Flash base address. It works like a fuse for power on setting. It is loaded from Flash memory to its corresponding control registers during chip power on. User can set these bits according to different application requests. User Configuration block can be updated by ISP function and located at 0x0030_0000 with four 32 bits words (CONFIG0, CONFIG1, CONFIG2 and CONFIG3). Any change on User Configuration block will take effect after system reboot.

Bits	Descriptions	
[31]	CWDTEN[2]	<p>Watchdog Timer Hardware Enable Bit When watchdog timer hardware enable function is enabled, the watchdog enable bit WDTEN (WDT_CTL[7]) and watchdog reset enable bit RSTEN (WDT_CTL[1]) is set to 1 automatically after power on. The clock source of watchdog timer is force at LIRC and LIRC can't be disabled.</p> <p>CWDTEN[2:0] is CONFIG0[31][4][3],</p> <p>011 = WDT hardware enable function is active. WDT clock is always on except chip enters Power-down mode. When chip enter Power-down mode, WDT clock is always on if CWDTPDEN is 0 or WDT clock is controlled by LIRCEN (CLK_PWRCTL[3]) if CWDTPDEN is 1. Please refer to bit field description of CWDTPDEN.</p> <p>111 = WDT hardware enable function is inactive.</p> <p>Others = WDT hardware enable function is active. WDT clock is always on.</p>
[30]	CWDTPDEN	<p>Watchdog Clock Power-down Enable Bit 0 = Watchdog Timer clock kept enabled when chip enters Power-down. 1 = Watchdog Timer clock is controlled by LIRCEN (CLK_PWRCTL[3]) when chip enters Power-down.</p> <p>Note: This bit only works if CWDTEN[2:0] is set to 011</p>
[29:28]	Reserved	Reserved.
[27]	CFGXT1	<p>HXT Mode selection 0 = HXT work as external clock mode. PF.3 is configured as external clock input pin. 1 = HXT work as crystal mode. PF.2 and PF.3 are configured as external high speed crystal (HXT) pins.</p> <p>Note: When CFGXT1 = 0, PF.3 MFP should be setting as GPIO mode. The DC characteristic of XT1_IN is the same as GPIO.</p>
[25:24]	Reserved	Reserved.
[23:21]	CBOV	<p>Brown-Out Voltage Selection 000 = Brown-out voltage is 1.6V. 001 = Brown-out voltage is 1.8V. 010 = Brown-out voltage is 2.0V. 011 = Brown-out voltage is 2.2V. 100 = Brown-out voltage is 2.4V. 101 = Brown-out voltage is 2.6V. 110 = Brown-out voltage is 2.8V. 111 = Brown-out voltage is 3.0V.</p>

[20]	CBORST	Brown-Out Reset Enable Bit 0 = Brown-out reset Enabled after powered on. 1 = Brown-out reset Disabled after powered on.
[19]	CBODEN	Brown-Out Detector Enable Bit 0= Brown-out detect Enabled after powered on. 1= Brown-out detect Disabled after powered on.
[18:13]	Reserved	Reserved.
[12]	SPLCAEN	SPROM Lock Cacheable Enable Bit 0 =The content of SPROM is not cacheable. 1 = The content of SPROM is cacheable.
[11]	ICELOCK	ICE Lock Bit This bit only used to disable ICE function. User may use it with LOCK (CONFIG0[1]) bit or ALOCK (CONFIG2[7:0]) bits to increase security level. 0 = ICE function Disabled. 1 = ICE function Enabled.
[10]	CIOINI	I/O Initial State Selection 0 = All GPIO set as Quasi-bidirectional mode after chip powered on. 1 = All GPIO set as input tri-state mode after powered on.
[9:8]	Reserved	Reserved.
[7:6]	CBS	Chip Booting Selection When CBS[0] = 0, the LDROM base address is mapping to 0x100000 and APROM base address is mapping to 0x0. User could access both APROM and LDROM without boot switching. In other words, if IAP mode is supported, the code in LDROM and APROM can be called by each other. CBS[0] value will be assigned to 0 when MBS =0. 00 = Boot from LDROM with IAP mode. 01 = Boot from LDROM without IAP mode. 10 = Boot from APROM with IAP mode. 11 = Boot from APROM without IAP mode. Note: BS (FMC_ISPCTL[1]) is only be used to control boot switching when CBS[0] = 1 and MBS = 1. VECMAP (FMC_ISPSTS[23:9]) is only be used to remap 0x0~0x1ff when CBS[0] = 0 or MBS = 0.
[5]	MBS	Boot Loader Booting Selection 0 = Booting from Boot Loader, and ignored CBS setting. 1 = Booting from APROM or LDROM, depended on CBS value. Note: BS (FMC_ISPCTL[1]) is only be used to control boot switching when CBS[0] = 1 and MBS = 1. VECMAP (FMC_ISPSTS[23:9]) is only be used to remap 0x0~0x1ff when CBS[0] = 0 or MBS = 0.

[4:3]	CWDTEN	Watchdog Timer Hardware Enable Bit When watchdog timer hardware enable function is enabled, the watchdog enable bit WDTEN (WDT_CTL[7]) and watchdog reset enable bit RSTEN (WDT_CTL[1]) is set to 1 automatically after power on. The clock source of watchdog timer is force at LIRC and LIRC can't be disable. CWDTEN[2:0] is CONFIG0[31][4][3], 011 = WDT hardware enable function is active. WDT clock is always on except chip enter Power-down mode. When chip enter Power-down mode, WDT clock is always on if CWDTPDEN is 0 or WDT clock is controlled by LIRCEN (CLK_PWRCTL[3]) if CWDTPDEN is 1. Please refer to bit field description of CWDTPDEN. 111 = WDT hardware enable function is inactive. Others = WDT hardware enable function is active. WDT clock is always on.
[2]	Reserved	Reserved.
[1]	LOCK	Security Lock Control 0 = Flash memory content is locked. 1 = Flash memory content is not locked if ALOCK(CONFIG2[7:0]) is 0x5A. When Flash data is locked key LOCK,user can look the lock effect of FMC up in lock effect tables.
[0]	DFEN	Data Flash Enable Bit The Data Flash is shared with APROM, and the base address of Data Flash is decided by DFBA (CONFIG1[19:0]) when DFEN is 0. 0 = Data Flash Enabled. 1 = Data Flash Disabled.

Note: The config bits should be 1 if reserved.

Note: The config bits should be 1 if reserved.

6.4.4.4 Security Protection Memory (SPROM)

The security protection memory (SPROM) is used to store instructions for security application. The SPROM is 4 Kbytes with location address 0x20_0000 ~ 0x20_0FFF. SPROM is only erased by “page erase command”. The last byte of SPROM (address: 0x0020_0FFF) is used to identify the SPROM code is secured or non-secured as show in Figure 6.4-3. SPROM has three modes, (1) SPROM non-secured mode (the last byte is 0xFF), (2)SPROM debug mode (the last byte is 0xAA), (3) SPROM secured mode (the last byte is not 0xFF or 0xAA).

In order to conceal SPROM code in secured mode, CPU only can perform instruction fetch to SPROM and then get the SPROM data; any CPU data access to SPROM directly without perform instruction fetch to SPROM, CPU will get all one (0xffff_ffff). When Cortex®-M4 ICE (In-Circuit-Emulator) debugging in SPROM secured code, any ICE breakpoint setting on SPROM program and dumping SPROM secured code out by ICE and PDMA are illegal for security protection issue; but user can debug SPROM program with ICE port connection in SPROM debug mode.

The SPROM secured flag is shown at SCODE (FMC_ISPSTS[31]), which is cleared after the SPROM page erase operation complete, and set at Flash initiation if the last byte of SPROM is not 0xFF. In addition, users can also set the SCODE by programming 1 in the register FMC_ISPSTS[31]. Before executing the SPROM page erase operation, SPUEN (FMC_ISPCTL[2]) must be set to 1 and ISPDAT[31:0] register must be set to 0x0055AA03 in SPROM secured mode.

To implement “safe firmware upgrade”, allocate one SPROM page with the same content of security application in each bank to make sure that the security application can be performed in any bank. When upgrading firmware code and accessing SPROM at the same time, FMC will return the instructions of SPROM in any idle bank. Please note that all SPROM will be erased or programmed automatically when executing ISP CMDs Flash page erase function or Flash data program function on any SPROM.

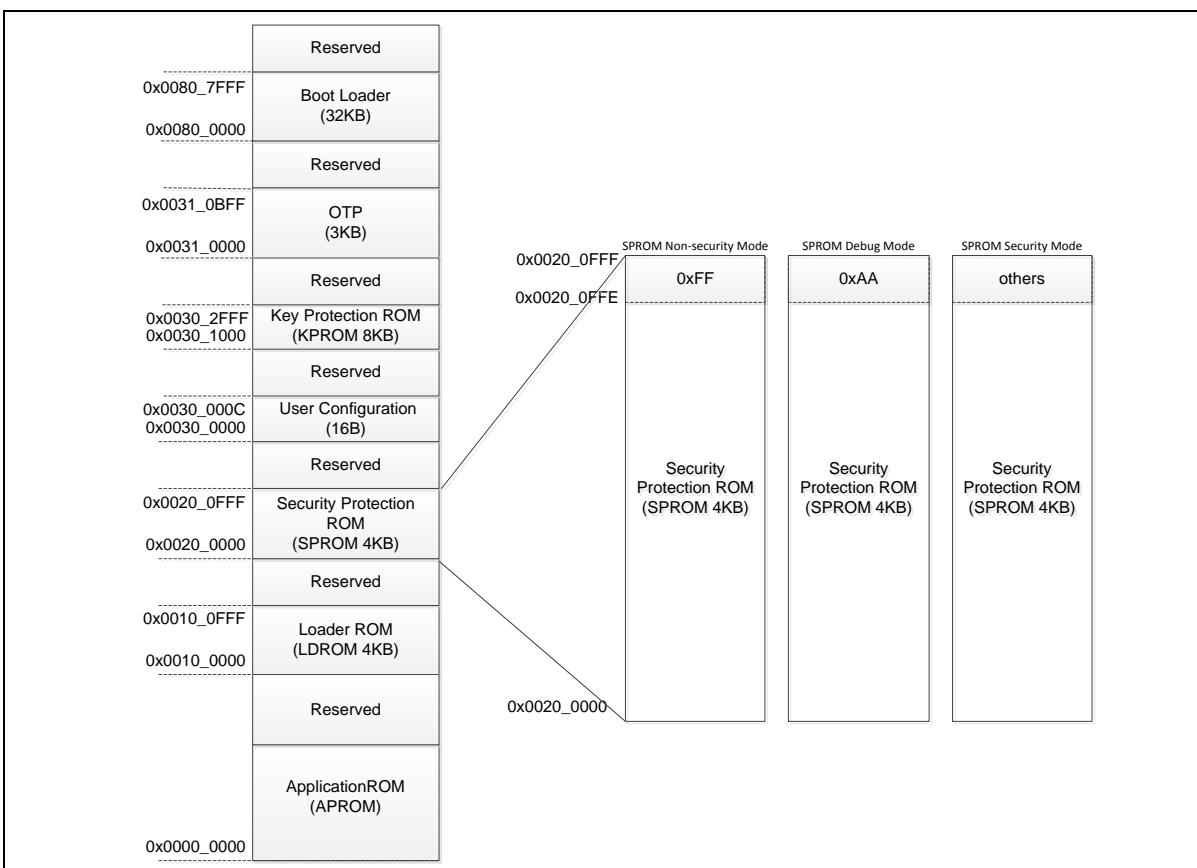

Figure 6.4-3 SPROM Security Mode

6.4.4.5 One Time Program Memory (OTP)

The One time program memory (OTP) is used to store the important information that are not allowed user to modify them twice. The OTP is 3 Kbytes with location address 0x31_0000 ~ 0x31_0BFF. The maximum size of OTP data are 2Kbytes from 0x31_0000 ~ 0x31_07FF. Every 64 bits of OTP data has one 32 bits “LOCK BIT” from 0x31_0800 to 0x31_0BFF, as shown in Figure 6.4-4.

The purpose of “LOCK BIT” is for recording if the programmed address had been locked (LOCK BIT≠0xFFFF_FFFF) or not (LOCK BIT= 0xFFFF_FFFF) in OTP. For examples, when LOCK BIT0 is not “0xFFFFFFFF”, OTP0 cannot be programmed again, regardless its content is all 1 or not. The “Flash page erase /mass erase command/ FLASH 64-bit Program/ FLASH Multi-Word Program” are never allowed to be executed in OTP. Before updating the content of OTP from 0x31_0000 to 0x31_07FF, user must check their “LOCK BIT” firstly. After finishing programming OTP data, user must write a non-0xFFFF_FFFF in the “LOCK BIT” of the above programmed data to make sure that no one can modify them. OTP is only readable by ISP command and un-readable by CPU read directly.

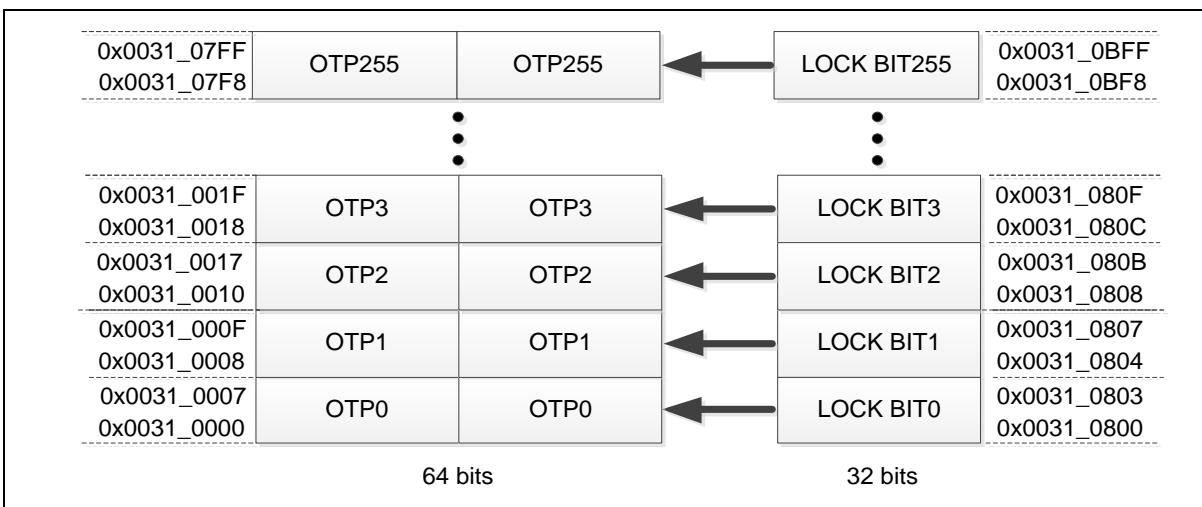

Figure 6.4-4 OTP Memory Map

6.4.4.6 Key Protection Memory (KPROM)

The Key Protection Memory (KPROM) is used to store 96-bit security key content and the entry limitations of key mismatch. KPROM costs 28 bytes at address 0x30_1000 ~ 0x30_1017 in the first page and at address 0x30_1200 ~ 0x30_1203 in the second page. All above two pages can be programmed or page-erased while KEYLOCK (FMC_KPKEYSTS [1]) is inactive. KPROM cannot be read directly through ISP/ICE/ICP /Writer interface and commands. If Users want to check the data of KPROM, the only way is verifying the data of security key (KPKEY0ROM, KPKEY1ROM, and KPKEY2ROM) by executing the Key Comparison operation. The memory map of KPROM is shown in Figure 6.4-5.

6.4.4.7 Flash Memory Map

The Flash memory map is different from system memory map. The system memory map is used by CPU fetch code or data from FMC memory. The Flash memory map is used for ISP function to read, program or erase FMC memory. The Flash memory map is as Figure 6.4-6.

6.4.4.8 System Memory Map with IAP Mode

The system memory map is used by CPU to fetch code or data from FMC memory. Boot Loader(0x0080_0000~0x0080_7FFF), SPROM(0x0020_0000~0x0020_0FFF) and LDROM(0x0010_0000~0x0010_0FFF) address map are the same as in the Flash memory map. The Data Flash is shared with APROM and the Data Flash base address is defined by CONFIG1. The content of CONFIG1 is loaded into DFBA (Data Flash Base Address Register) at the Flash initiation.

The DFBA-(0x0000_FFFF/0x0001_FFFF/0x0003_FFFF/ 0x0005_FFFF/0x0007_FFFF) is the Data Flash region for Cortex®-M4 data access, and 0x0000_0200~(DFBA-1) is APROM region for Cortex®-M4 instruction access when APROM size is 64KB/128KB/256KB/384KB/512KB, respectively.

The address from 0x0000_0000 to 0x0000_01FF is called system memory vector.

Figure 6.4-7 shows the system memory map with IAP mode.

APROM and LDROM can map to the system memory vector for CPU start up. There are three kinds of system memory map with IAP mode when chip booting: (1) LDROM with IAP and (2) APROM with IAP, and (3) Boot Loader with IAP.

0x0080_7FFF	Reserved
0x0080_0000	Boot Loader (32KB)

0x0020_0000	Security Protection ROM (SPROM 4KB)
0x0010_0FFF	Reserved
0x0010_0000	Loader ROM (LDROM 4KB)
0x0007_FFFF	Reserved
DFBA	Data Flash
0x0000_0200	ApplicationROM (APROM)
0x0000_01FF	System Memory Vector
0x0000_0000	

Figure 6.4-7 System Memory Map with IAP Mode

In LDROM with IAP mode, the LDROM (0x0010_0000~0x0010_01FF) is mapping to the system memory vector for Cortex®-M4 instruction or data access. Figure 6.4-8 shows the memory map of LDROM with IAP mode.

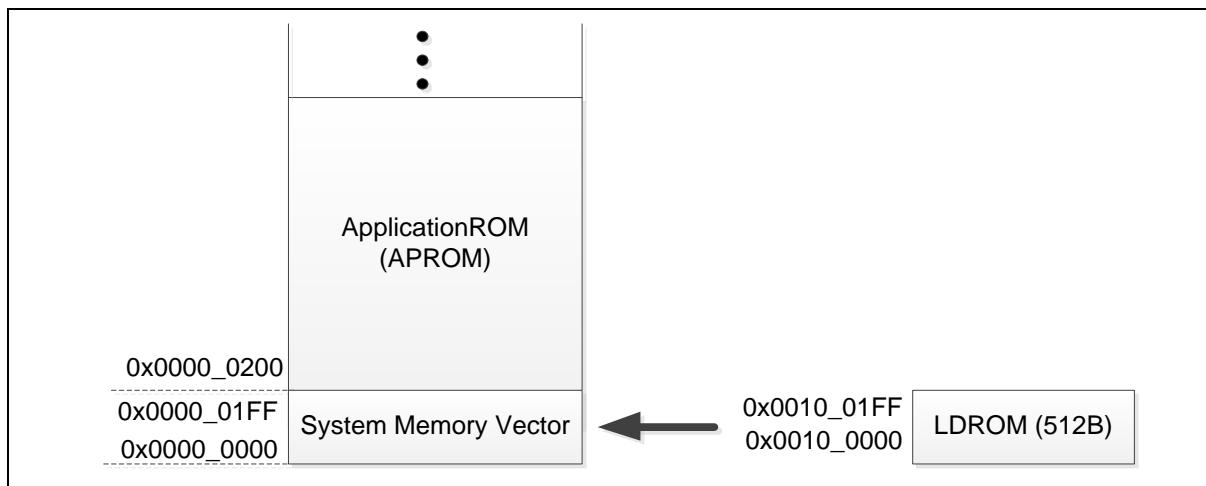

Figure 6.4-8 LDROM with IAP Mode

In APROM with IAP mode, the APROM (0x0000_0000~0x0000_01FF) is mapping to the system memory vector for Cortex®-M4 instruction or data access. Figure 6.4-9 shows the memory map of APROM with IAP mode.

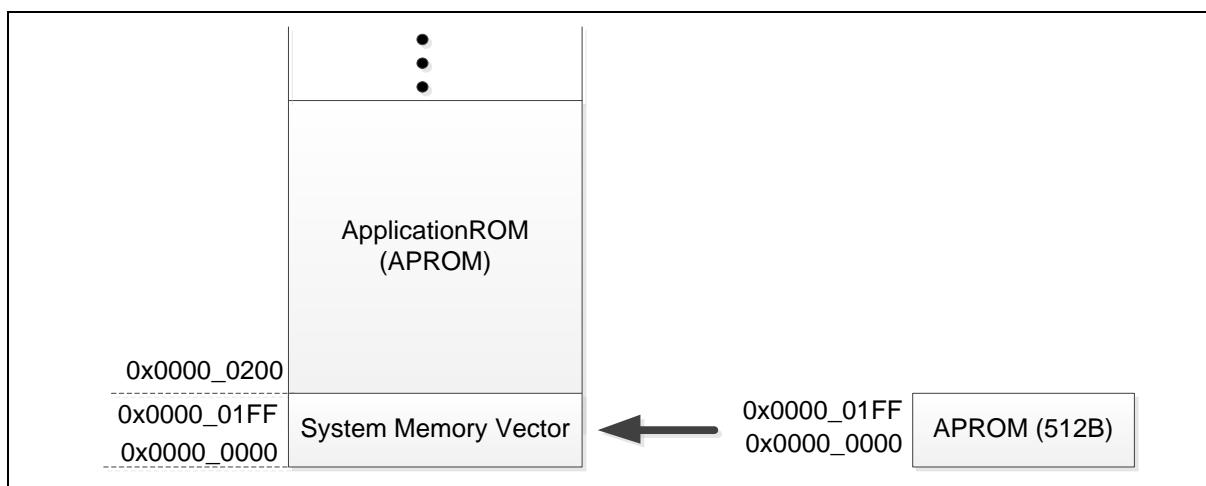

Figure 6.4-9 APROM with IAP Mode

In Boot Loader with IAP mode, the Boot Loader (0x0080_0000~0x0080_01FF) is mapping to the system memory vector for Cortex®-M4 instruction or data access. Figure 6.4-10 shows the memory map of Boot Loader with IAP mode.

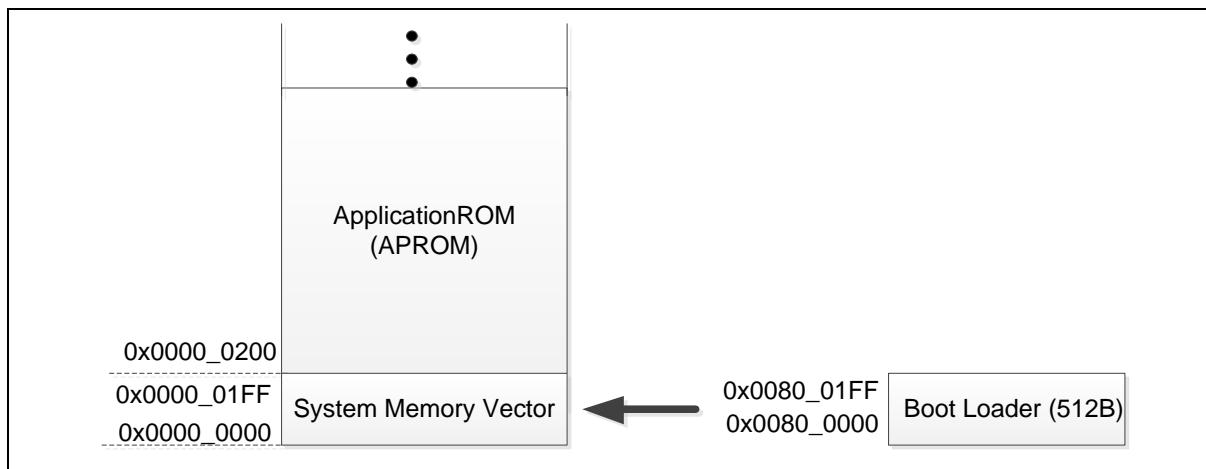

Figure 6.4-10 Boot Loader with IAP Mode

In system memory map with IAP mode, APROM, LDROM and APROM can remap to the system memory vector when CPU running. User can write the target remap address to FMC_ISPADDR register and then trigger ISP procedure with the “Vector Remap” command (0x2E). In VECMAP (FMC_ISPSTS[23:9]), shows the final system memory vector mapping address.

6.4.4.9 System Memory Map Without IAP Mode

In system memory map without IAP mode, CPU still can access Boot Loader(0x0080_0000~0x0080_7FFF) and SPROM(0x0020_0000~0x0020_0FFF), but the system memory vector mapping is not supported. There are two kinds of system memory map without IAP mode when chip booting: (1) LDROM without IAP, (2) APROM without IAP. In LDROM without IAP mode, LDROM base is mapping to 0x0000_0000. CPU program cannot run to access APROM. In APROM without IAP mode, APROM base is mapping to 0x0000_0000. CPU program cannot run to access LDROM. The Data Flash is shared with APROM and the Data Flash base address is defined by CONFIG1. The content of CONFIG1 is loaded into DFBA (Data Flash Base Address Register) at the Flash initiation. The DFBA~(0x0000_FFFF/0x0001_FFFF/0x0003_FFFF/0x0005_FFFF /0x0007_FFFF) is the Data Flash region for Cortex®-M4 data access, and 0x0000_0000~(DFBA-1) is APROM region for Cortex®-M4 instruction access when APROM size is 64KB/128KB/256KB/384KB/512KB, respectively. Figure 6.4-11 shows the system memory map without IAP mode.

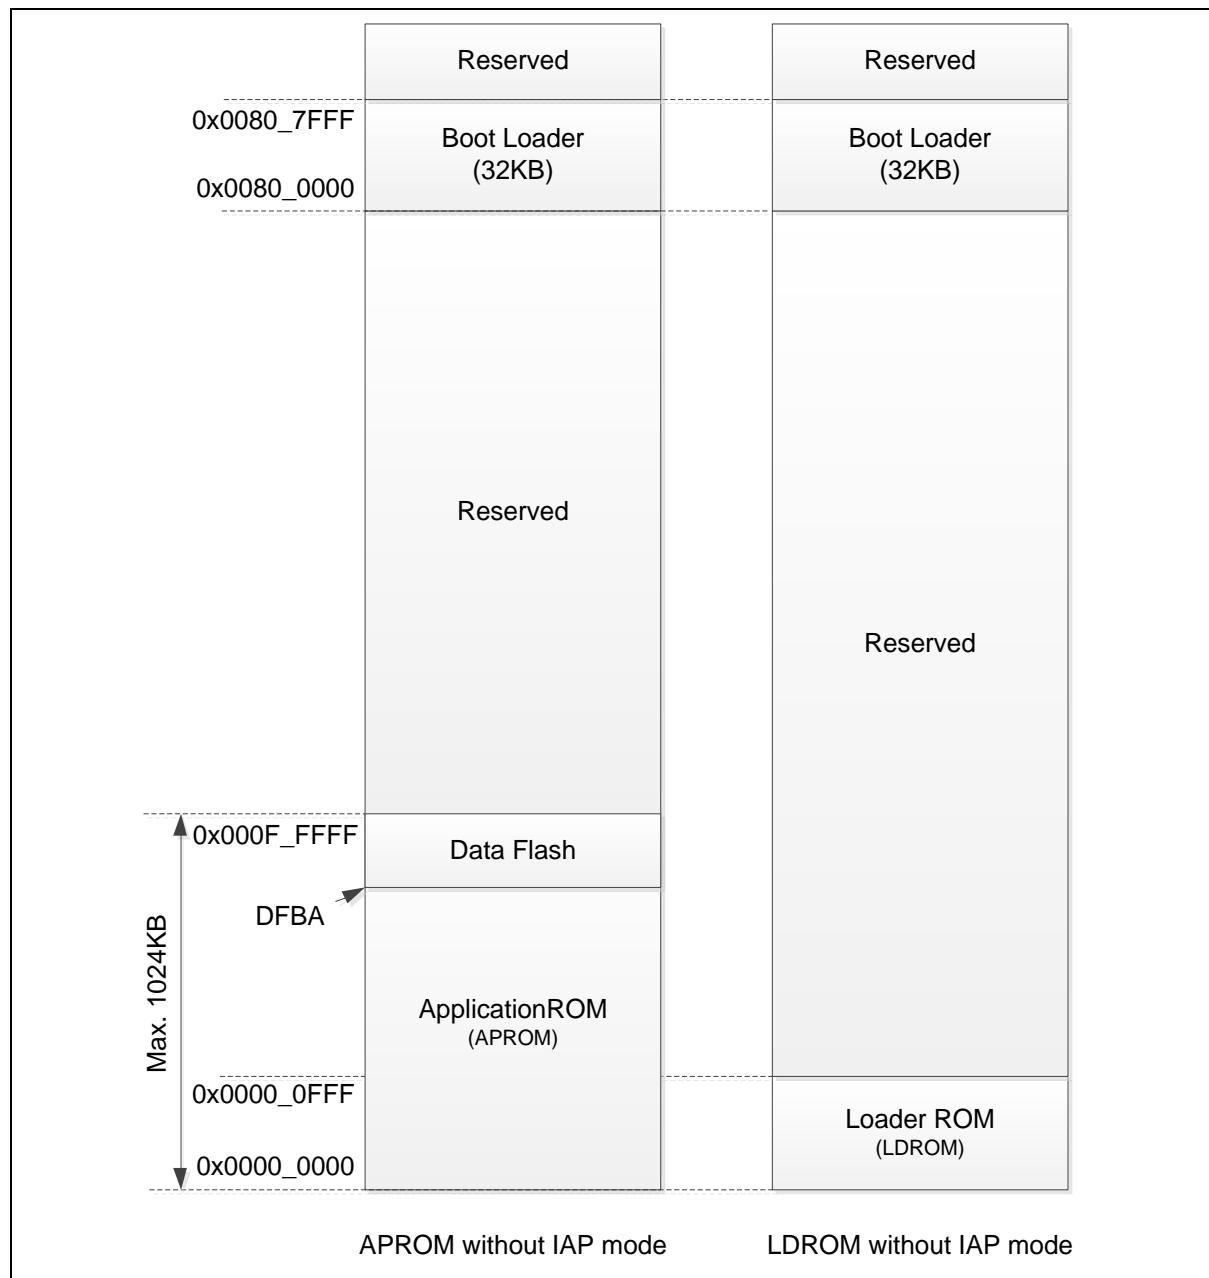

Figure 6.4-11 System Memory Map without IAP Mode

6.4.4.10 Boot Selection

The M480 series provides five booting sources for user to select, including LDROM with IAP, LDROM without IAP, APROM with IAP, APROM without IAP, and Boot Loader with IAP. To make CPU fetches code from Boot Loader, user can use the following two methods: MBS (CONFIG0[5]) is low or SBLOCK (CONFIG2[15:8]) is not 0x5A. In other cases, the booting source and system memory map are setting by CBS (CONFIG0[7:6]) and MBS (CONFIG0[5]).

The boot source selection diagram is shown in Figure 6.4-12 and each boot selection support vector mapping is shown in Table 6.4-2.

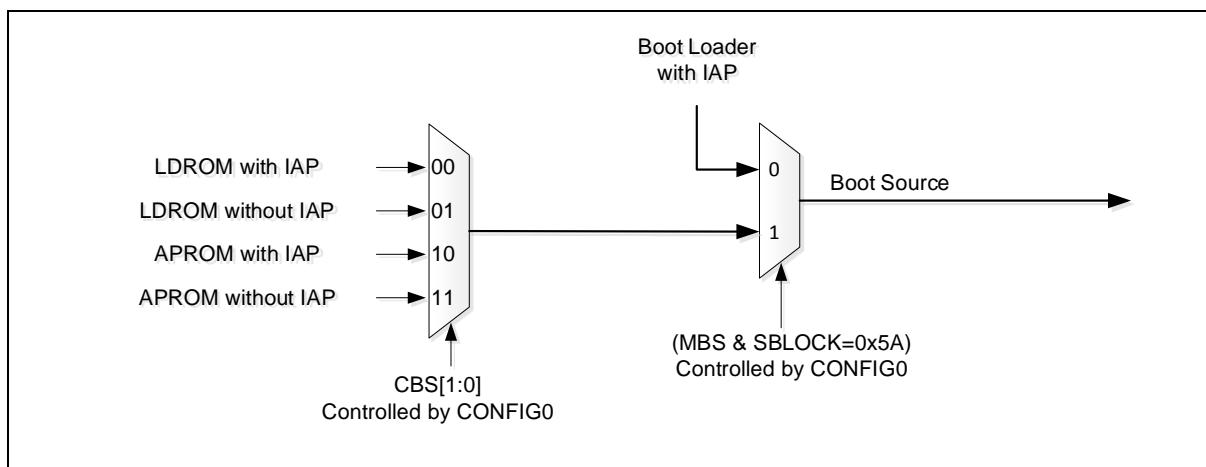

Figure 6.4-12 Boot Source Selection

MBS	CBS[1:0]	Boot Selection/System Memory Map	Vector Mapping Support
1	00	LDROM with IAP	✓
1	01	LDROM without IAP	-
1	10	APROM with IAP	✓
1	11	APROM without IAP	-
0	XX	Boot Loader with IAP	✓

Table 6.4-2 Vector Mapping Support

6.4.4.11 In-Application-Programming (IAP)

The M480 series provides In-Application-Programming (IAP) function for user to switch the system memory vector code executing between APROM, LDROM and Boot Loader. User can enable the IAP function by booting chip and setting the chip boot selection bits in CBS (CONFIG0[7:6]) as 10 or 00, in MBS (CONFIG0[5]) as 0, or in SBLOCK (CONFIG2[15:8]) as a non-0x5A value. (If MSB(CONFIG0[5]) bit is set as 0 or perform secure boot, the CBS[0] (FMC_ISPSTS[1]) registers will show 0 and ignore CONFIG0[6] setting).

When chip boots with IAP function is enabled, any executable code (align to 512 bytes) is allowed to map to the system memory vector any time. User can change the remap address to FMC_ISPADDR and then trigger ISP procedure with the “Vector Remap” command.

6.4.4.12 In-System-Programming (ISP)

The M480 series supports In-System-Programming (ISP) function allowing the embedded Flash memory to be reprogrammed under software control. ISP is performed without removing the microcontroller from the system through the firmware and on-chip connectivity interface, such as UART, USB, I²C, SPI, and CAN (depended on chip feature). The target Flash memory space that ISP function operates cannot be across banks. Table 6.4-3 lists all ISP commands.

The ISP provides the following functions for embedded Flash memory.

- Supports Flash page erase function
- Supports Flash data program function

- Supports Flash data read function
- Supports company ID read function
- Supports device ID read function
- Supports unique ID read function
- Supports memory CRC32 checksum calculation function
- Supports Flash all one verification function
- Supports system memory vector remap function

ISP Commands

ISP Command	FMC_ISPCMD	FMC_ISPADDR	FMC_ISPDAT FMC_MPDATA0~FMC_MPDATA3
Flash Page Erase	0x22	Valid address of Flash memory organization. It must be page (4 Kbytes) alignment. Note that FMC_ISPADDR[11:0] will be ignored.	N/A
Flash Bank Erase	0x23	Valid address of APROM of the target bank. Note that FMC_ISPADDR[15:0] will be ignored.	N/A
Flash Block Erase	0x25	Valid address of APROM. It must be 4 pages (16 Kbytes) alignment. Note that FMC_ISPADDR[13:0] will be ignored.	N/A
Flash Mass Erase (This command is only valid while MERASE(CONFIG0[13]) bit = 0.)	0x26	0x0000_0000	N/A
Flash 32-bit Program	0x21	Valid address of Flash memory organization	FMC_ISPDAT :Programming Data
Flash 64-bit Program	0x61	Valid address of Flash memory organization	FMC_MPDATA0: LSB Programming Data FMC_MPDATA1: MSB Programming Data
Flash Multi-Word Program	0x27	Valid address of Flash memory organization in APROM, LDROM and SPROM	FMC_MPDATA0: 1'st Programming Data FMC_MPDATA1: 2'nd Programming Data FMC_MPDATA2: 3'rd Programming Data FMC_MPDATA3: 4'th Programming Data
Flash Read	0x00	Valid address of Flash memory organization	FMC_ISPDAT: Return Data
Flash 64-bit Read	0x40	Valid address of Flash memory organization	FMC_ISPDAT: Return Data in FMC_ISPADDR FMC_MPDATA0: Return Data in FMC_ISPADDR FMC_MPDATA1: Return Data in FMC_ISPADDR+4
Read Company ID	0x0B	0x0000_0000	FMC_ISPDAT: 0x0000_00DA

Read Device ID	0x0C	0x0000_0000	FMC_ISPDAT: Return Device ID
Read CRC32 Checksum	0x0D	0x0000_0000	FMC_ISPDAT: Return Checksum
Run CRC32 Checksum Calculation	0x2D	Valid start address of memory organization It must be 4 Kbytes page alignment	FMC_ISPDAT: Size It must be 4 Kbytes alignment
Read Flash All One Result	0x08	Keep address of "Run Flash All One Verification"	FMC_ISPDAT: Return Result 0xA110_0000 : Flash is not all one 0xA11F_FFFF: Flash is all one.
Run Flash All One Verification	0x28	Valid start address of memory organization It must be 4 Kbytes page alignment	FMC_ISPDAT: Size It must be 4 Kbytes alignment
Read Unique ID	0x04	0x0000_0000	FMC_ISPDAT: Unique ID Word 0
		0x0000_0004	FMC_ISPDAT: Unique ID Word 1
		0x0000_0008	FMC_ISPDAT: Unique ID Word 2
Vector Remap	0x2E	Valid address in APROM, LDROM or boot loader It must be 512 bytes alignment	N/A

Table 6.4-3 ISP Command List

ISP Procedure

The FMC controller provides embedded Flash memory read, erase and program operation. Several control bits of FMC control register are write-protected, thus it is necessary to unlock before setting.

After unlocking the protected register bits, user needs to set the FMC_ISPCTL control register to decide to update LDROM, APROM, SPROM or user configuration block, and then set ISPEN (FMC_ISPCTL[0]) to enable ISP function.

Once the FMC_ISPCTL register is set properly, user can set FMC_ISPCMD (refer to Table 6.4-3 ISP command list) for specify operation. Set FMC_ISPADDR for target Flash memory based on Flash memory organization. FMC_ISPDAT can be used to set the data to program or used to return the read data according to FMC_ISPCMD. The ISP procedure flow is shown in Figure 6.4-13.

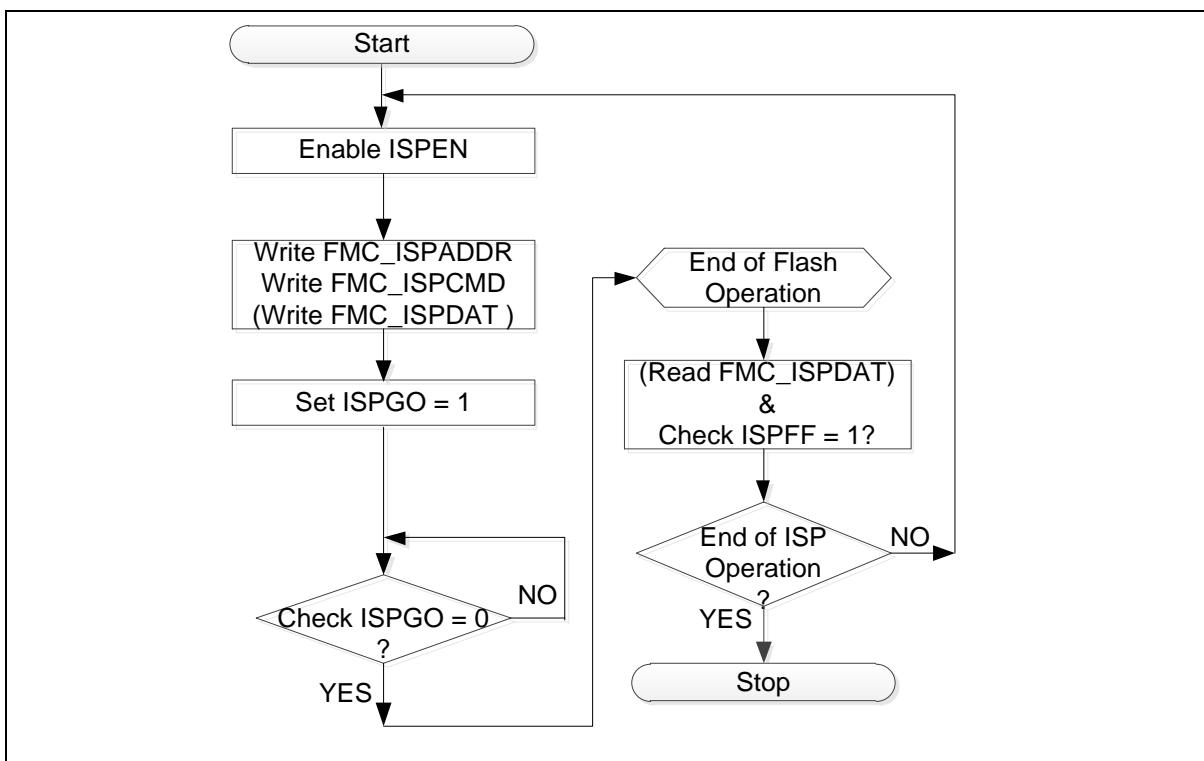

Figure 6.4-13 ISP Procedure Example

Finally, set the ISPGO (FMC_ISPTRG[0]) register to perform the relative ISP function. When ISP function is active, the ISPBUSY(FMC_ISPSTS[0]) and MPBUSY(FMC_MPSTS[0]) be set to 1. The ISPGO(FMC_ISPTRG[0]), ISPBUSY(FMC_ISPSTS[0]) and MPBUSY(FMC_MPSTS[0]) are self-cleared when ISP function has been done.

Several error conditions will be checked after ISP is completed. If an error condition occurs, ISP operation is not started and the ISP fail flag will be set instead. ISPFF(FMC_ISPSTS[6]) flag can only be cleared by software. The next ISP procedure can be started even ISPFF(FMC_ISPSTS[6]) bit is kept as 1. Therefore, it is recommended to check the ISPFF(FMC_ISPSTS[6]) bit and clear it after each ISP operation if it is set to 1.

When the ISPGO(FMC_ISPTRG[0]) bit is set and then CPU access the same bank, CPU will wait for ISP operation to finish during this period; the peripheral still keeps working as usual. If any interrupt request occurs, CPU will not service it till ISP operation is finished. When ISP operation is finished, the ISPGO bit will be cleared by hardware automatically. User can check whether ISP operation is finished or not by the ISPGO(FMC_ISPTRG[0]) bit.

When CPU access operation and ISP command are executed in different bank, CPU and ISP command can operate in parallel.

6.4.4.13 Embedded Flash Memory Programming

The M480 series provides 32-bit, 64-bit and multi-word Flash memory programming function to speed up Flash updated procedure. Table 6.4-4 lists required FMC control registers in each embedded Flash programming function.

Register	Description	32-Bit Programming	64-Bit Programming	Multi-Word Programming
FMC_ISPCTL	ISP Control Register	✓	✓	✓
FMC_ISPADDR	ISP Address Register	✓	✓	✓

FMC_ISPDAT	ISP Data Register	✓	N/A	N/A
FMC_ISPCMD	ISP Command Register	0x21	0x61	0x27
FMC_ISPTRG	ISP Trigger Register	✓	✓	✓
FMC_ISPSTS	ISP Status Register	✓	✓	N/A
FMC_MPDATA0	ISP Data0 Register	N/A	✓	✓
FMC_MPDATA1	ISP Data1 Register	N/A	✓	✓
FMC_MPDATA2	ISP Data2 Register	N/A	N/A	✓
FMC_MPDATA3	ISP Data3 Register	N/A	N/A	✓
FMC_MPSTA	ISP Multi-Program status	N/A	N/A	✓
FMC_MPADDR	ISP Multi-Program Address	N/A	N/A	✓

Table 6.4-4 FMC Control Registers for Flash Programming

64-bit Programming

The M480 series 64-bit programming function is faster than 32-bit programming. FMC_ISPDAT is used for 32-bit programming data register. In 64-bit programming, there are two programming data registers, one is FMC_MPDATA0 for LSB word, and the other is FMC_MPDATA1 for MSB word, and ISP command is 0x61, the other registers are the same as 32-bit programming. Figure 6.4-14 and Figure 6.4-15 are the ISP 32-bit / 64-bit programming procedure flow.

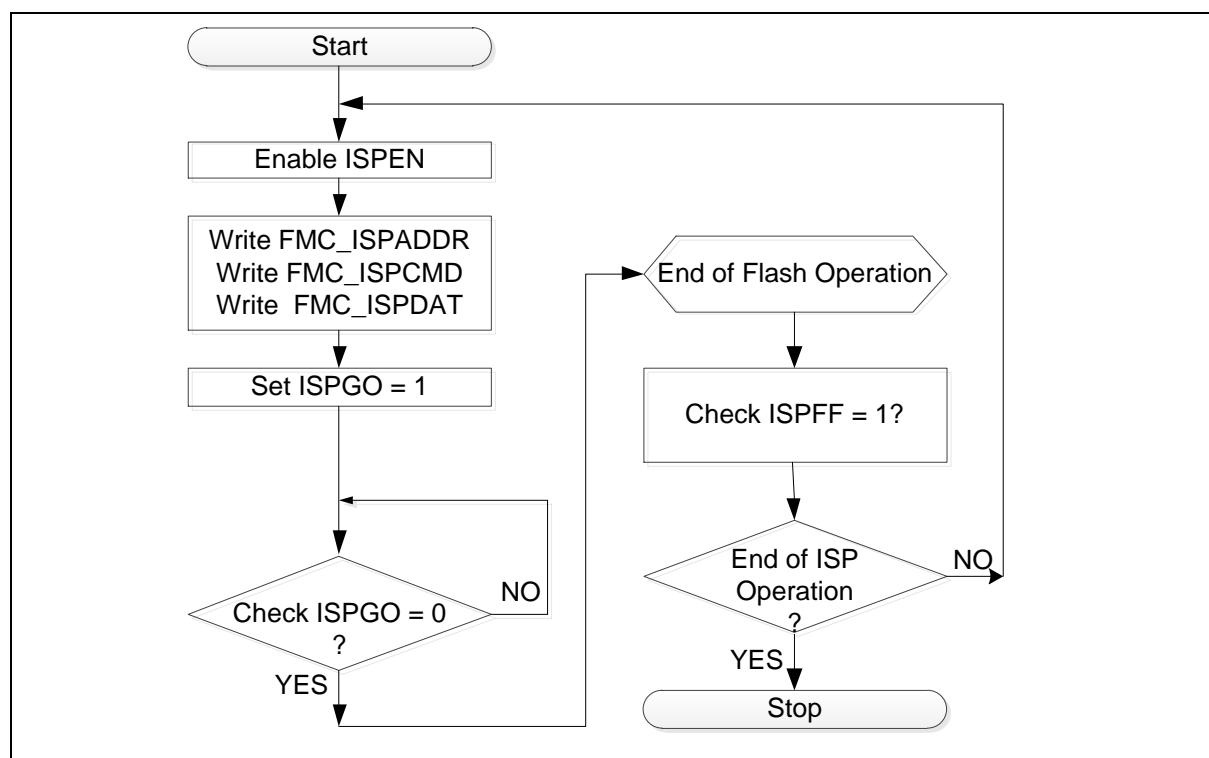

Figure 6.4-14 ISP 32-bit Programming Procedure

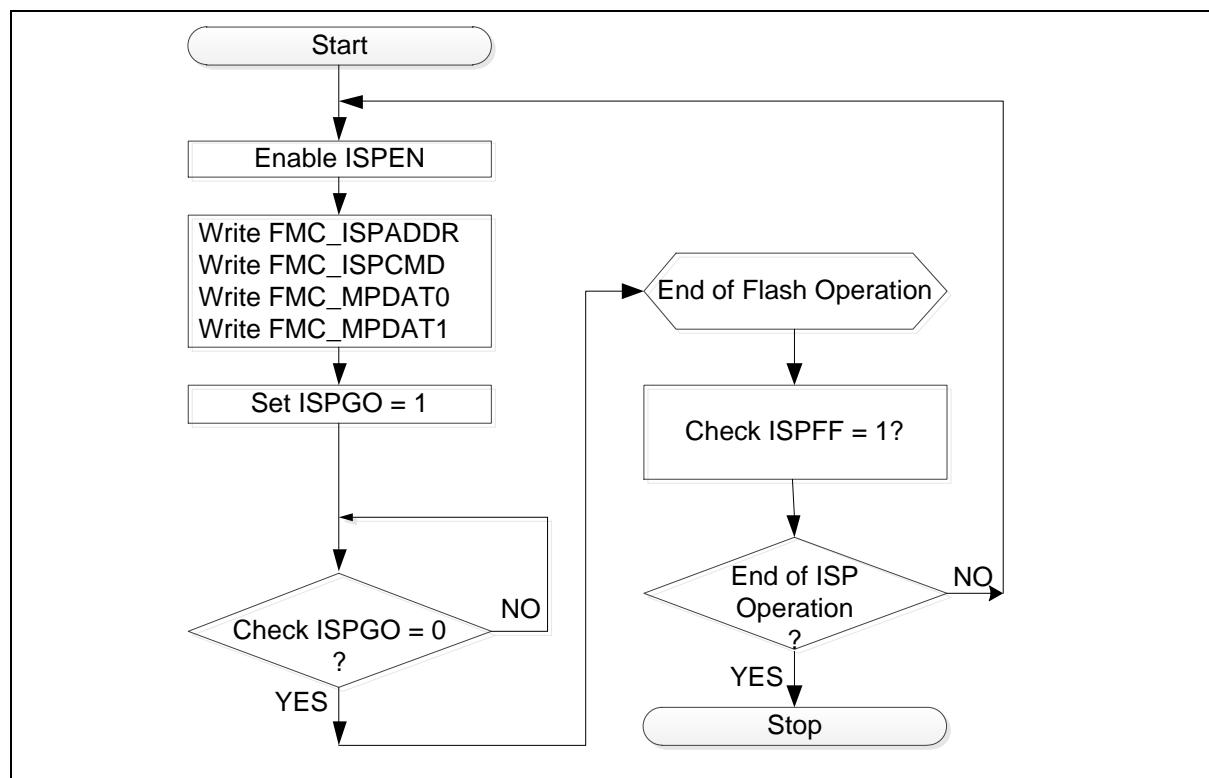

Figure 6.4-15 ISP 64-bit Programming Procedure

Multi-word Programming

The M480 series supports multi-word programming function to speed up Flash updated procedure. The maximum programming length is up to 512 bytes, and the minimum programming length is 8 bytes (2 words). The multi-word programming is the fastest programming function if the programming words more than 8 bytes, because only one set of Flash setup time and hold time needed for one time operation. Figure 6.4-16 compares each programming time.

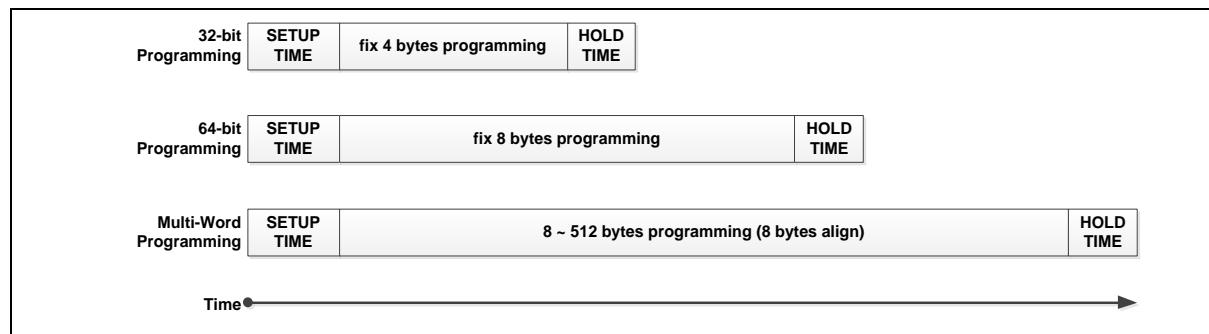

Figure 6.4-16 Multi-word Programming Time

In multi-word programming operation, Cortex®-M4 CPU has to monitor the empty status of the programming buffer. CPU has to prepare the next data for programming continuity. The multi-program firmware should not be located in APROM or LDROM, or SPROM, because CPU instruction fetch cannot be hold. The firmware has to be located in Boot loader or embedded SRAM of chip to avoid CPU hold.

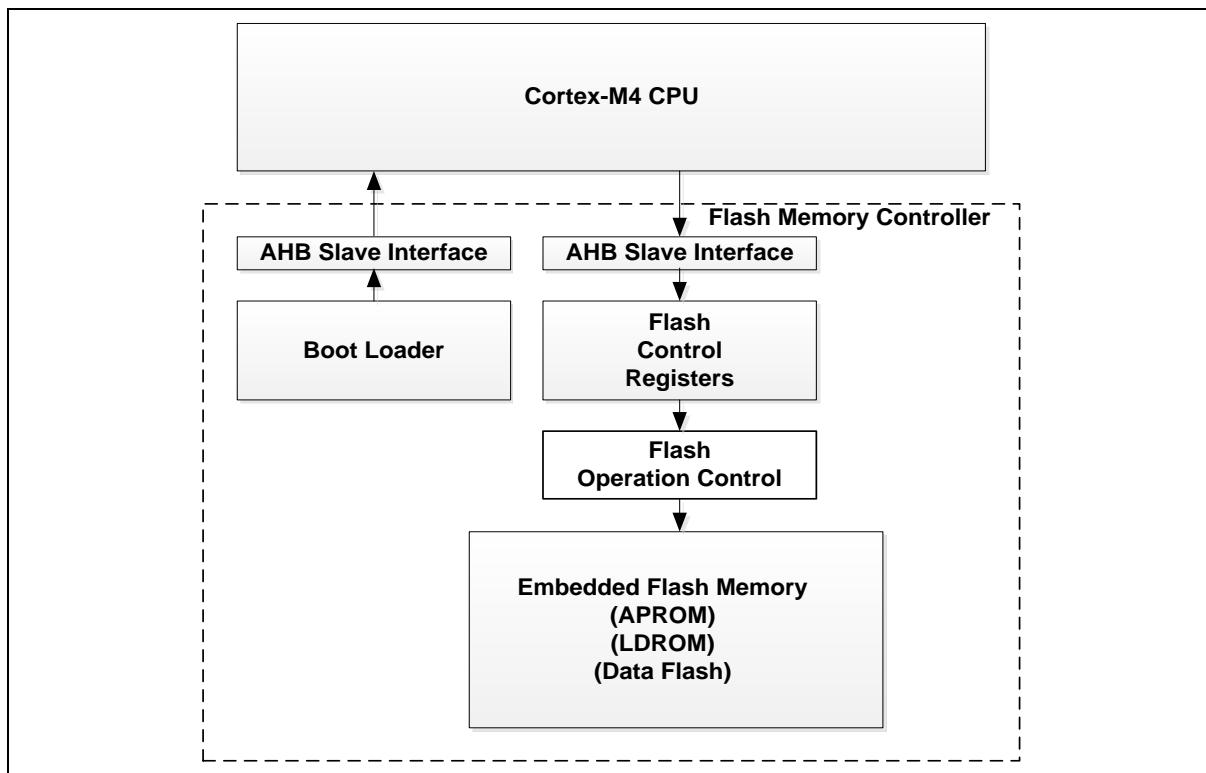

Figure 6.4-17 Firmware in Boot Loader for Multi-word Programming

The multi-word programming flow is shown in Figure 6.4-18. The starting ISP address (FMC_ISPADDR) has to be 8-byte align, FMC_ISPADDR[2:0] should be 0. ISPDAT0(FMC_MPDAT0) is the data word of the offset 0x0, ISPDAT1(FMC_MPDAT1) is the second word (offset 0x4), ISPDAT2(FMC_MPDAT2) is the third word (offset 0x8), and ISPDAT3(FMC_MPDAT3) is forth word (offset 0xC). If the starting ISP address FMC_ISPADDR [3] is 0, the 1st data word should put on ISPDAT0, and 2nd word is ISPDAT1, 3rd word is ISPDAT2, and 4th word is ISPDAT3. If the starting ISP address FMC_ISPADDR [3] is 1, the 1st data word should put on ISPDAT2, and 2nd word is ISPDAT3, 3rd word is ISPDAT0, and 4th word is ISPDAT1. The maximum programming size is 512 bytes and align to 512-byte address. While FMC controller performs multi-word programming operation, CPU needs to monitor the buffer status D3~D0(FMC_MPSTS[7:4]) and MPBUSY (FMC_MPSTS[0]) to wait the buffer empty ((D1,D0)=00, or (D3,D2)=00), and then CPU needs to update the next programming data (ISPDAT0, ISPDAT1, ISPDAT2 and ISPDAT3) in time. Otherwise, FMC controller will exit multi-word programming operation (MPBUSY (FMC_MPSTS[0]) = 0). If CPU cannot update the data in time (MPBUSY (FMC_MPSTS[0]) =0), CPU needs restart a new multi-word programming procedure to continue, FMC_MPADDR provides the last program address information. At the end of operation, CPU has to check ISPFF (FMC_MPSTS[2]) to confirm the multi-word operation successful complete.

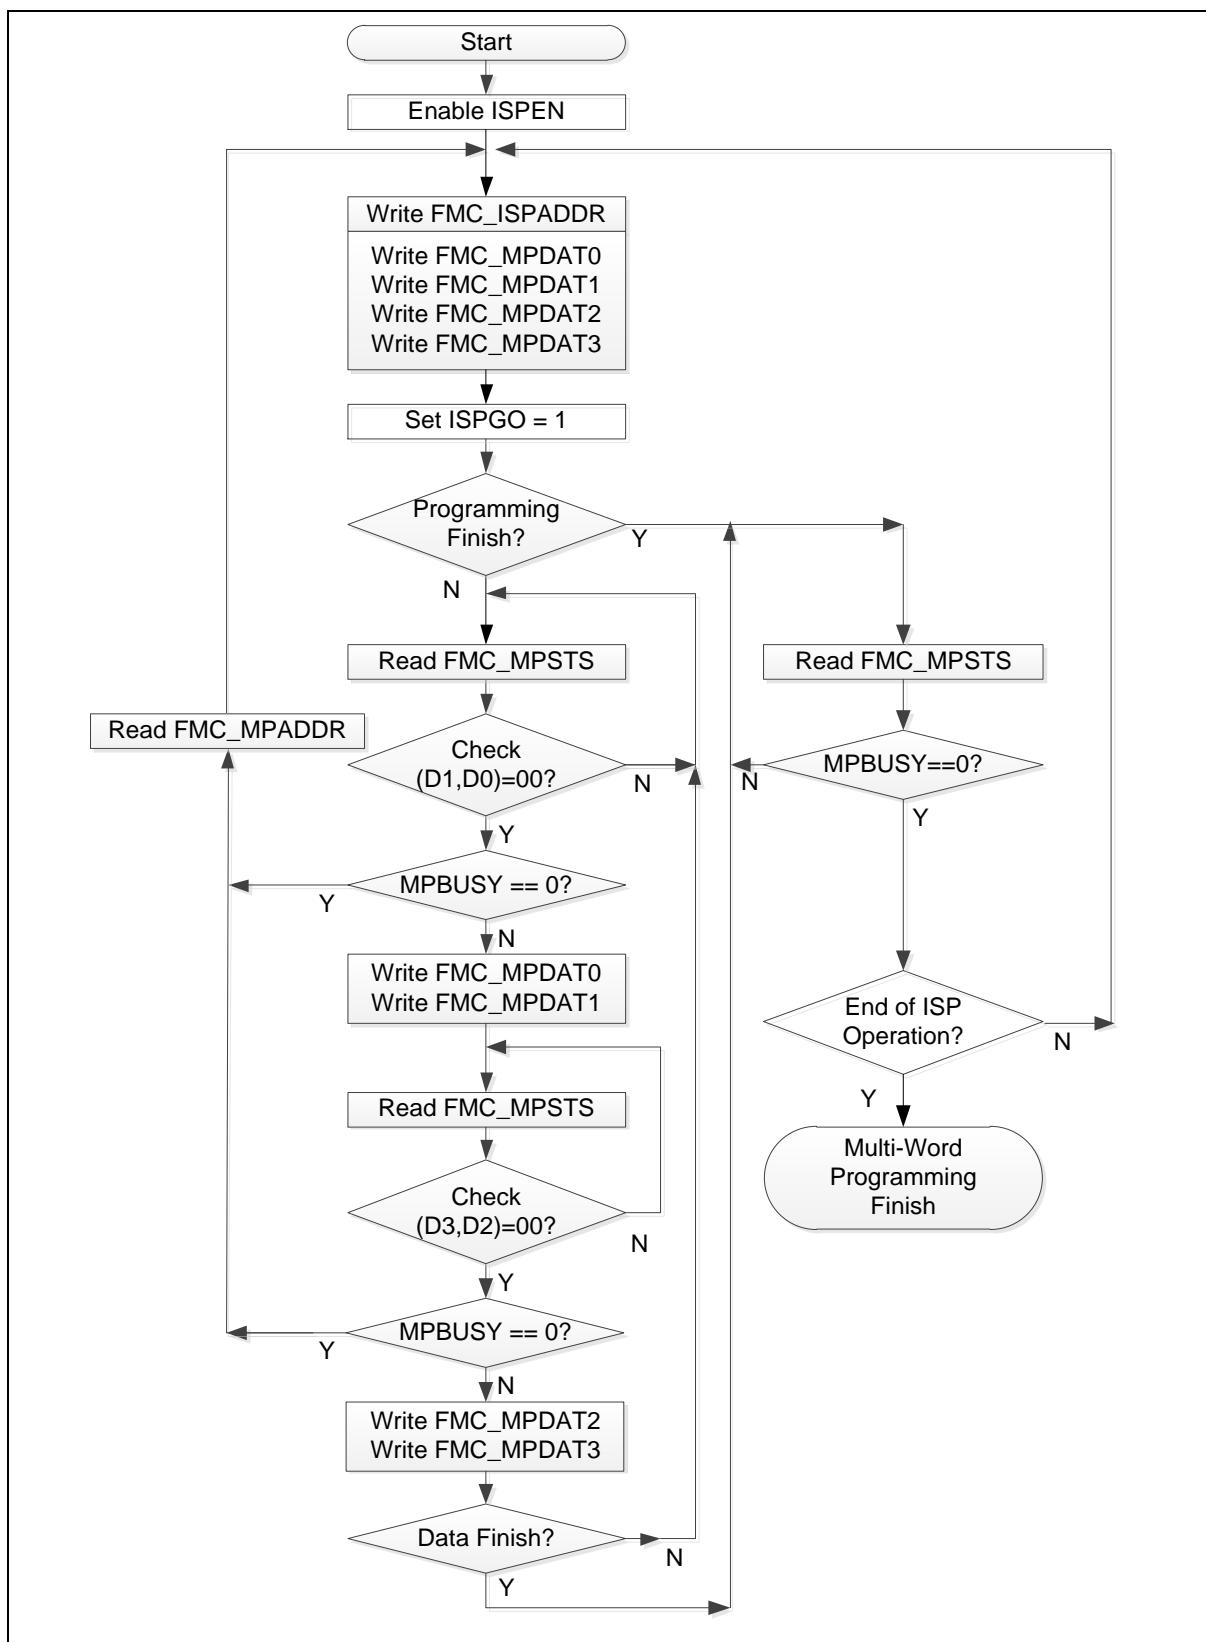

Figure 6.4-18 Multi-word Programming Flow

6.4.4.14 Fast Flash Programming Verification

In traditional Flash programming operation, the controller receives the programming trigger event then control the timing to perform the programming embedded Flash memory as show in Figure 6.4-19.

The M480 series supports the fast Flash programming verification function, which provides hardware verification for Flash programming to save time of the CPU read back and comparison. When data is programmed to the embedded Flash memory, the controller asserts the Flash read operation to read data out, and performs data comparison with data in. Finally, the comparison result is saved in PGFF (FMC_ISPSTS[5]). The PGFF is set to 1 if output data is not the same as the input programming data. The flag is kept until clear by software or a new erase operation. The fast Flash programming verification flow is shown in Figure 6.4-19.

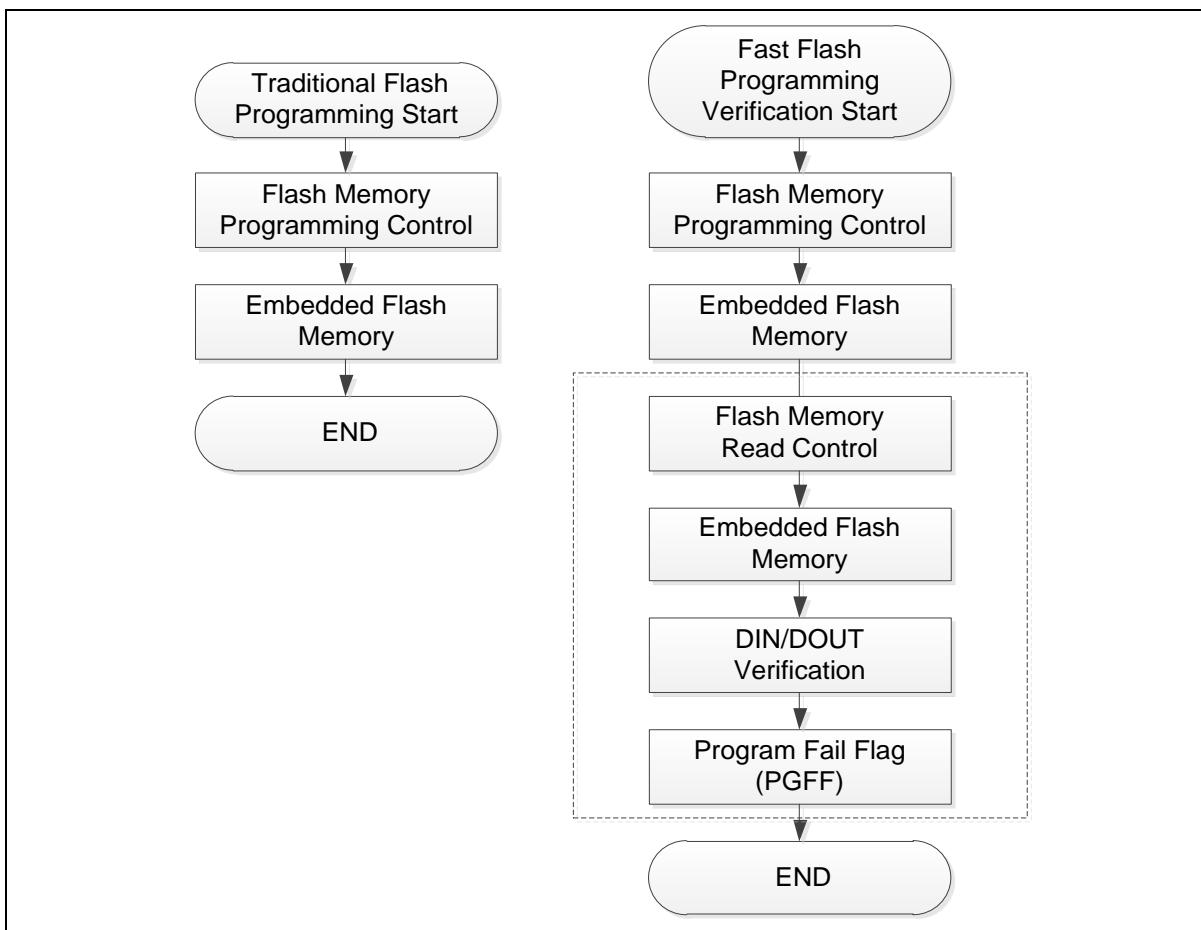

Figure 6.4-19 Fast Flash Programming Verification Flow

In traditional Flash updated operation, the Flash memory has to perform three steps to complete the Flash memory updated procedure, (1) Flash ERASE (2) Flash PROGRAM (3) Flash READ back all of data to check the correction. In the M480 series, it only reads FMC_ISPSTS to check PGFF flag in Step (3) without reading data back to confirm. Figure 6.4-20 compares traditional programming verification flow and fast programming verification flow.

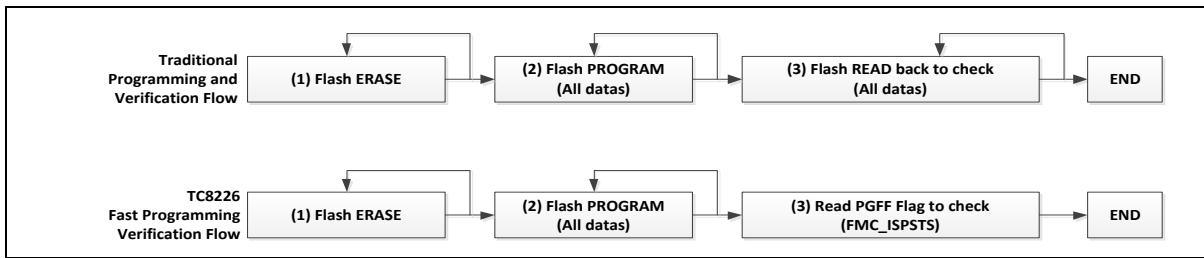

Figure 6.4-20 Verification Flow

The fast Flash programming verification function is released for 32-bit programming and 64-bit programming operation, but multi-word programming operation is not suitable due to the embedded Flash HV (High Voltage) of continue programming.

6.4.4.15 CRC32 Checksum Calculation

The M480 series supports the CRC32 checksum calculation function to help user quickly check the memory content includes APROM, LDROM and SPROM. The CRC32 polynomial is

$$\text{CRC-32: } X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$$

With seed = 0xFFFF_FFFF

The CRC32 checksum calculation flow is shown in Figure 6.4-21.

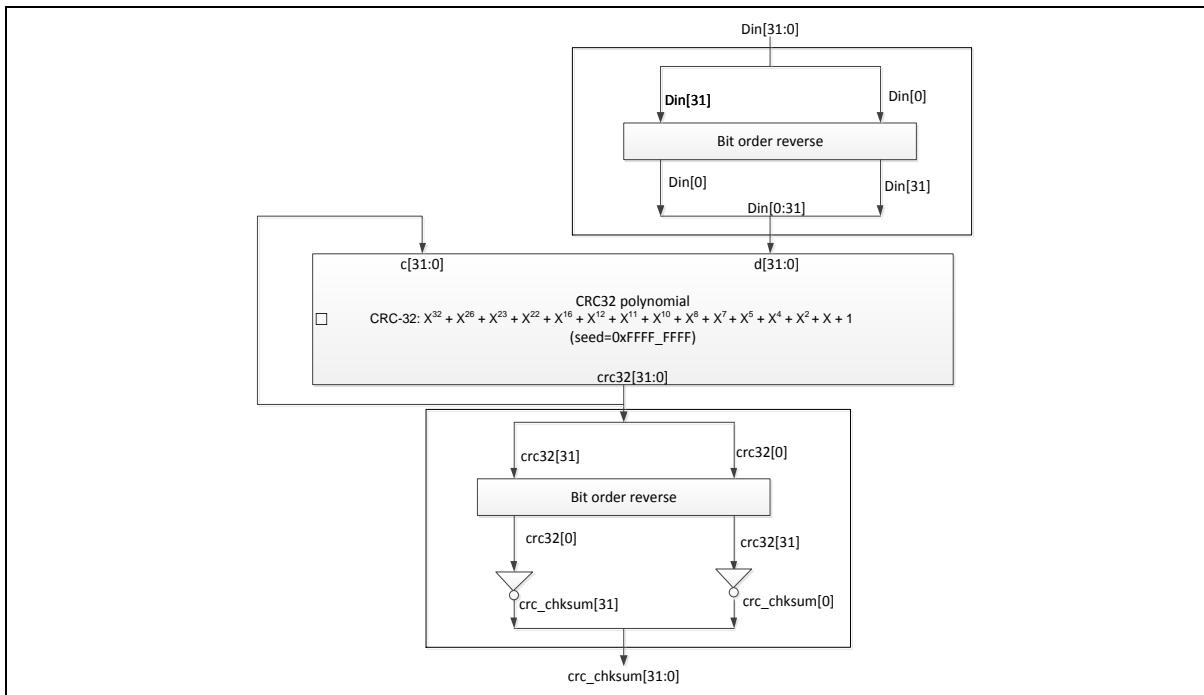

Figure 6.4-21 Flash CRC32 Checksum Calculation

Three steps complete this CRC32 checksum calculation.

1. Step 1.Perform ISP “Run Memory CRC32 Checksum” operation
2. Step 2.Perform ISP “Read Memory CRC32 Checksum” operation
3. Step 3..Read FMC_ISPDAT to get checksum.

In Step 1, user has to set the memory starting address (FMC_ISPADDR) and size (FMC_ISPDAT) to

calculate. Both address and size have to be 4 Kbytes alignment, the size should be \geq 4 Kbytes and the starting address includes APROM, LDROM, SPROM and Boot Loader.

In Step 2, the FMC_ISPADDR should be kept as the same as Step 1.

In Step 3, the checksum is read from FMC_ISPDAT. If the checksum is 0x0000_0000, there is one of two conditions (1) Checksum calculation is in-progress, (2) Address and size is over device limitation

When SPROM is locked to be security code, user cannot read the SPROM content directly; user can use this CRC32 checksum function to check SPROM content correction.

Note that the range of CRC32 checksum cannot cross bank in one operation.

6.4.4.16 Flash All One Verification

The M480 series supports the Flash all one verification function to help user quickly check a memory block content blanking for APROM, LDROM, and SPROM after Flash erase operation.

Two or Three steps complete this Flash all one verification.

Two-step flow:

1. Step 1.Perform ISP “Run Flash All One Verification” operation
2. Step 2..Read ALLONE(FMC_ISPSTA[7])bit to get the verification result
 - ALLONE : 1, all of Flash bits are 1 in verification block memory.
 - ALLONE : 0, Flash bits are not all 1 in verification block memory.

Three-step flow:

3. Step 1.Perform ISP “Run Flash All One Verification” operation
4. Step 2.Perform ISP “Read Flash All One Result” operation
5. Step 3..Read FMC_ISPDAT to get the verification result.

FMC_ISPDAT : 0xA11F_FFFF, all of Flash bits are 1 in verification block memory.

FMC_ISPDAT : 0xA110_0000, Flash bits are not all 1 in verification block memory

In Step 1, user has to set the memory starting address (FMC_ISPADDR) and size (FMC_ISPDAT) to verify. Both address and size have to be 4 Kbytes alignment, the size should be \geq 4 Kbytes and the starting address includes APROM, LDROM and SPROM.

In Step 2, the FMC_ISPADDR should be kept as the same as Step 1.

Note that the range of “Run All One Verification” cannot cross bank in one operation.

6.4.4.17 Security Key Protection

The M480 series supports the Security Key protection function to protect data of APROM, LDROM, SPROM, CONFIG and KPROM for program and erase command. While KEYLOCK (FMC_KPKEYSTS [1]) is active, KPROM, LDROM and APROM (except Data Flash) are at write-protected state. SPROM and CONFIG are optional for write protected based on value of KPKEYENROM[1:0], any programming and page erasing operation are illegal except whole chip mass erase operation. If the data of APROM, LDROM, SPROM, CONFIG and KPROM need to be modified, the correct Key Comparison operation must be executed in advance to clear KEYLOCK (FMC_KPKEYSTS [1]) status. When Flash data is locked by KEYLOCK, user can look the lock effect of FMC up in lock effect tables.

Security Key Setup Flow

The Security Key setup flow is shown in Figure 6.4-22. All of security key information is stored in KPROM. Firstly, the KPROM (8KB) has to perform erase operation to disable security key and then program three security keys in KPKEY0ROM, KPKEY1ROM and KPKEY2ROM. Continuously program KPMAXROM and KPKEMAXROM to define retry limitation of the security key comparison. KPMAXROM is used to limit the number of power-on if the security key comparison is unmatched. KPKEMAXROM is used to limit the number of key unmatched operation in each power-on. Finally, program a non-0xFF value into KPKEYENROM to enable security key protection function. KPROM data is unreadable, data cannot read back to check. The only way to check the security key is to execute the Key Comparison operation.

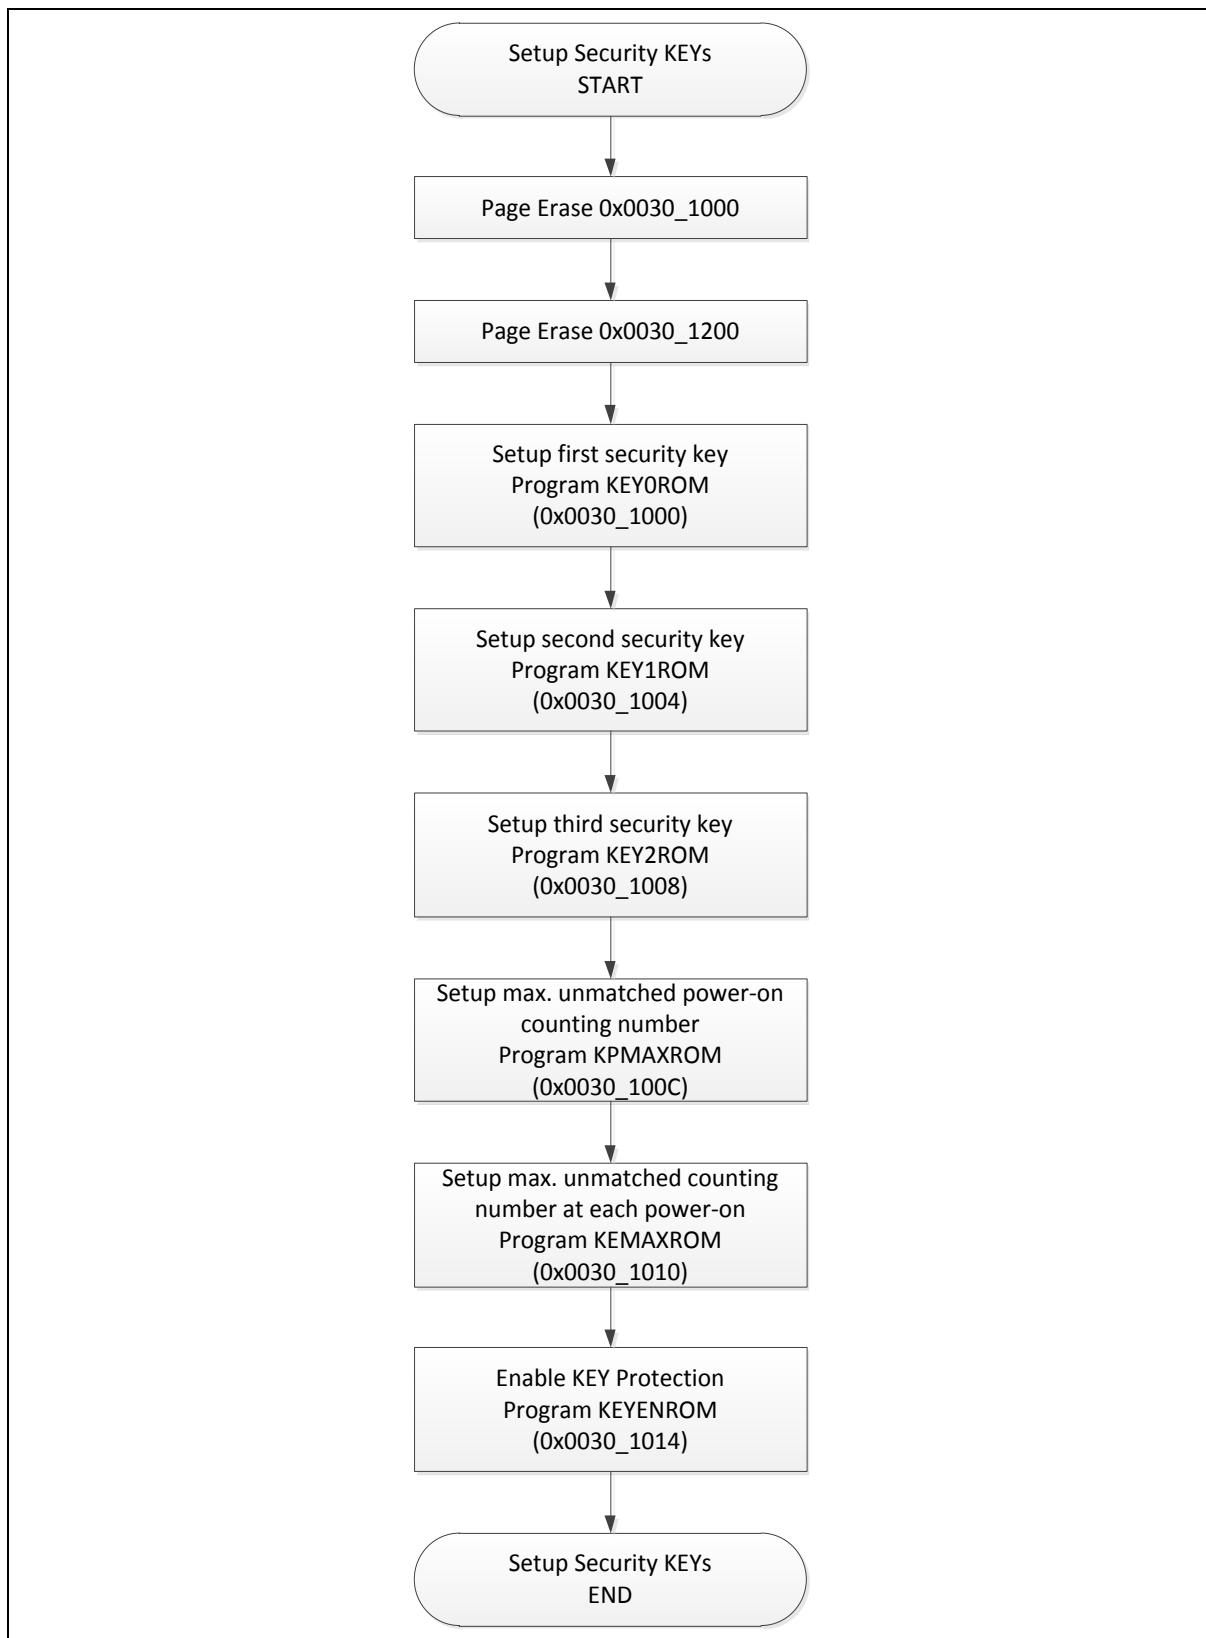

Figure 6.4-22 Flash Security Key Setup Flow

Key Comparison Operation Flow

The Key Comparison function checks the user keys and the security keys in KPROM. The operation flow is shown in Figure 6.4-23.

1. Step 1. Write the user keys into FMC_KPKEY0/FMC_KPKEY1/FMC_KPKEY2 registers
2. Step 2. Set 1 to KPKEYGO (FMC_KPKEYTRG [0]) to start the comparison operation.
3. Step 3. FMC controller reads the security keys in KPROM and compares user keys.

If the comparison is matched, the unmatched counting register (FMC_KPKECNT) will be cleared to 0 and the KPCNTROM page in KPROM will be erased. If the comparison is unmatched, the unmatched counting register (FMC_KPKECNT and FMC_KPCNT) is increased, and program 0 to KPCNTROM in KPROM.

4. Step 4. Hardware updates the status flag and compared result to FMC_KPKEYSTS for user read.

If the KEYS are matched, KEYMATCH (FMC_KPKEYSTS [2]) will be set to 1, and clear KEYLOCK (FMC_KPKEYSTS [1]) to 0. KEYLOCK will keep 0 about 10~30 minutes, and then return to 1 automatically while KEYFLAG (FMC_KPKEYSTS [4]) is active.

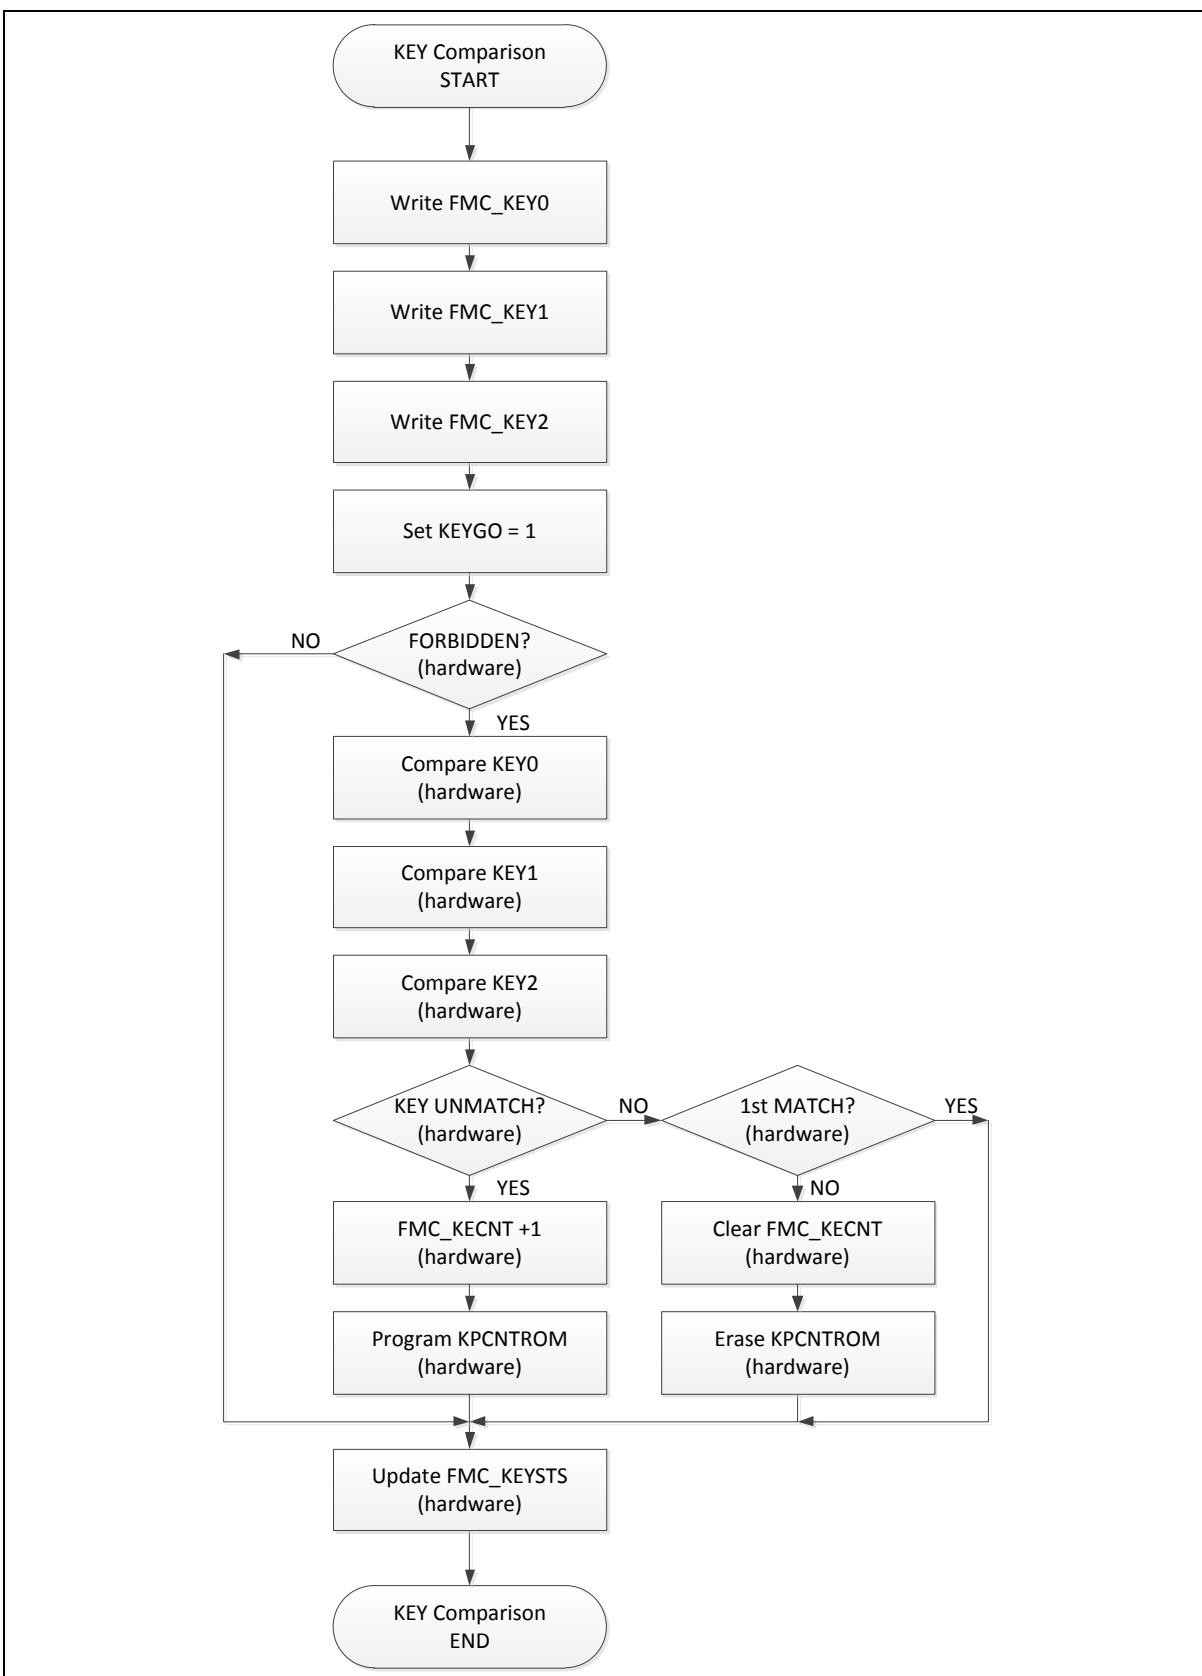

Figure 6.4-23 Key Comparison Flow

6.4.4.18 Lock Effect Tables

The M480 series supports four kinds of protections include the Security Lock Control (i.e., LOCK in CONFIG0[1] and ALOCK in CONFIG2[7:0]), Security Key protection function (i.e., KPROM and abbreviated to KEYLOCK), Secure boot (i.e., SBLOCK in CONFIG2[15:8]) and Security Protection Memory (i.e., SPROM and abbreviated to SPLOCK). In this section, M480 prepares some lock effect tables for user to understand the lock effects on APROM, LDROM, SPROM CONFIG and others with above four protections for CPU, ICE and ICP/Writer. Table 6.4-5 and Table 6.4-6 are the lock effect table for CPU and for ICE, ICP and Writer

LOCK/ALOCK	OFF		ON		OFF		OFF		OFF					
KEYLOCK	OFF		OFF		OFF		OFF		ON					
KPKEYENROM[1:0]	X		X		X		X		00	01	10			
SBLOCK	OFF		OFF		ON		OFF		OFF

KPROM	-	W	-	-	-	-	-	W	-	-	-	-	-	-
DID/UID/Checksum	R	-	R	-	R	-	R	-	R	-	R	-	R	-

Table 6.4-6 Lock Effect Table with Four Protections for ICE/ ICP/Writer

Note:

1. The symbol "R" means readable and the symbol "W" means writable.
2. The symbol "X" means no matter what value is.
3. The symbol " R_1 " means SPROM readable for CPU instruction, but unreadable for CPU data or ISP command. The symbol " W_1 " means SPROM cannot Program, but can PageErase. The symbol "D" means SPROM can be in debug mode for ICE (unreadable, return 0x0000_0000).
4. The symbol " W_2 " means OTP is writable only when the corresponding "LOCK BIT" is 0xFFFF_FFFF.
5. SBLOCK = LOCK/ALOCK for CPU and ICP/Writer.
6. All operations (except for MassErase) are invalid for ICE when SBLOCK is not 0x5A.
7. MassErase (i.e. whole chip erase) can be executed any time and any address, except for SPROM.
8. When any protection conflicts with another, FMC will adopt the most stringent one. For example, APROM is readable for ICE when KEYLOCK is on. Once both KEYLOCK and LOCK are on, APROM will be un-readable for ICE.
9. KPROM and secure boot key are un-readable for CPU, ICE and ICP/Writer.
10. Boot loader is un-readable for ICE and ICP/Writer.

6.4.5 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

Reserved							
7	6	5	4	3	2	1	0
Reserved	SPFLAG	CFGFLAG	KEYFLAG	FORBID	KEYMATCH	KEYLOCK	KEYBUSY

Bits	Description	
[31:7]	Reserved	Reserved.
[6]	SPFLAG	SPROM Write-protection Enable Flag (Read Only) This bit is set while the KEYENROM [1] is 0 at power-on or reset. This bit is cleared to 0 by hardware while KPROM is erased. This bit is set to 1 by hardware while KEYENROM[1] is programmed to 0. 0 = SPROM write-protection Disabled. 1 = SPROM write-protection Enabled.
[5]	CFGFLAG	CONFIG Write-protection Enable Flag (Read Only) This bit is set while the KEYENROM [0] is 0 at power-on or reset. This bit is cleared to 0 by hardware while KPROM is erased. This bit is set to 1 by hardware while KEYENROM[0] is programmed to 0. 0 = CONFIG write-protection Disabled. 1 = CONFIG write-protection Enabled.
[4]	KEYFLAG	KEY Protection Enable Flag (Read Only) This bit is set while the KEYENROM [7:0] is not 0xFF at power-on or reset. This bit is cleared to 0 by hardware while KPROM is erased. This bit is set to 1 by hardware while KEYENROM is programmed to a non-0xFF value. 0 = Security Key protection Disabled. 1 = Security Key protection Enabled.
[3]	FORBID	KEY Comparison Forbidden Flag (Read Only) This bit is set to 1 when KPKECNT(FMC_KPKEY0[4:0]) is more than KPKEMAX (FMC_KPKEY0[12:8]) or KPCNT (FMC_KPCNT [2:0]) is more than KPMAX (FMC_KPCNT [10:8]). 0 = KEY comparison is not forbidden. 1 = KEY comparison is forbidden, KEYGO (FMC_KEYTRG [0]) cannot trigger.

[2]	KEYMATCH	KEY Match Flag (Read Only) This bit is set to 1 after KEY comparison complete if the KEY0, KEY1 and KEY2 are matched with the 96-bit security keys in KPROM; and cleared to 0 if KEYs are unmatched. This bit is also cleared to 0 while <ul style="list-style-type: none">● CPU writing 1 to KEYLOCK(FMC_KPKEYSTS[1]) or● Timeout event or● KPROM is erased or● KEYENROM is programmed to a non-0xFF value.● Chip is in Power-down mode. 0 = KEY0, KEY1, and KEY2 are unmatched with the KPROM setting. 1 = KEY0, KEY1, and KEY2 are matched with the KPROM setting.
[1]	KEYLOCK	KEY LOCK Flag This bit is set to 1 if KEYMATCH (FMC_KPKEYSTS [2]) is 0 and cleared to 0 if KEYMATCH is 1 in Security Key protection. After Mass Erase operation, users must reset or power on /off to clear this bit to 0. This bit also can be set to 1 while: <ul style="list-style-type: none">● CPU write 1 to KEYLOCK(FMC_KPKEYSTS[1]) or● KEYFLAG(FMC_KPKEYSTS[4]) is 1 at power-on or reset or● KEYENROM is programmed a non-0xFF value or● Timeout event or● FORBID(FMC_KPKEYSTS[3]) is 1 0 = KPROM, LDROM and APROM (not include Data Flash) is not in write protection. 1 = KPROM, LDROM and APROM (not include Data Flash) is in write protection. SPROM write protect is depended on SPFLAG. CONFIG write protect is depended on CFGFLAG
[0]	KEYBUSY	KEY Comparison Busy (Read Only) 0 = KEY comparison is finished. 1 = KEY comparison is busy.

KPROM KEY-unmatched Counting Register (FMC_KPKEYCNT)

Register	Offset	R/W	Description				Reset Value
FMC_KPKEYCNT	FMC_BA+0x64	R	KPROM KEY-Unmatched Counting Register				0x0000_XX00

23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
D3	D2	D1	D0	Reserved	ISPFF	PPGO	MPBUSY

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	D3	ISP DATA 3 Flag (Read Only) This bit is set when FMC_MPDAT3 is written and auto-clear to 0 when the FMC_MPDAT3 data is programmed to Flash complete. 0 = FMC_MPDAT3 register is empty, or program to Flash complete. 1 = FMC_MPDAT3 register has been written, and not program to Flash complete.
[6]	D2	ISP DATA 2 Flag (Read Only) This bit is set when FMC_MPDAT2 is written and auto-clear to 0 when the FMC_MPDAT2 data is programmed to Flash complete. 0 = FMC_MPDAT2 register is empty, or program to Flash complete. 1 = FMC_MPDAT2 register has been written, and not program to Flash complete.
[5]	D1	ISP DATA 1 Flag (Read Only) This bit is set when FMC_MPDAT1 is written and auto-clear to 0 when the FMC_MPDAT1 data is programmed to Flash complete. 0 = FMC_MPDAT1 register is empty, or program to Flash complete. 1 = FMC_MPDAT1 register has been written, and not program to Flash complete.
[4]	D0	ISP DATA 0 Flag (Read Only) This bit is set when FMC_MPDAT0 is written and auto-clear to 0 when the FMC_MPDAT0 data is programmed to Flash complete. 0 = FMC_MPDAT0 register is empty, or program to Flash complete. 1 = FMC_MPDAT0 register has been written, and not program to Flash complete.
[3]	Reserved	Reserved.

[2]	ISPFF	ISP Fail Flag (Read Only) This bit is the mirror of ISPFF (FMC_ISPCTL[6]), it needs to be cleared by writing 1 to FMC_ISPCTL[6] or FMC_ISPSTS[6]. This bit is set by hardware when a triggered ISP meets any of the following conditions: (1) APROM writes to itself if APUEN is set to 0. (2) LDROM writes to itself if LDUEN is set to 0. (3) CONFIG is erased/programmed if CFGUEN is set to 0. (4) SPROM is erased/programmed if SPUEN is set to 0 (5) SPROM is programmed at SPROM secured mode. (6) Page Erase command at LOCK mode with ICE connection (7) Erase or Program command at brown-out detected (8) Destination address is illegal, such as over an available range. (9) Invalid ISP commands (10) Vector address is mapping to SPROM region.
[1]	PPGO	ISP Multi-program Status (Read Only) 0 = ISP multi-word program operation is not active. 1 = ISP multi-word program operation is in progress.
[0]	MPBUSY	ISP Multi-word Program Busy Flag (Read Only) Write 1 to start ISP Multi-Word program operation and this bit will be cleared to 0 by hardware automatically when ISP Multi-Word program operation is finished. This bit is the mirror of ISPGO(FMC_ISPTRG[0]). 0 = ISP Multi-Word program operation is finished. 1 = ISP Multi-Word program operation is progressed.

ISP Multi-word Program Address Register (FMC_MPADDR)

Register	Offset	R/W	Description				Reset Value
FMC_MPADDR	FMC_BA+0xC4	R	ISP Multi-Program Address Register				0x0000_0000

31	30	29	28	27	26	25	24
MPADDR							
23	22	21	20	19	18	17	16
MPADDR							
15	14	13	12	11	10	9	8
MPADDR							
7	6	5	4	3	2	1	0
MPADDR							

Bits	Description	
[31:0]	MPADDR	ISP Multi-word Program Address MPADDR is the address of ISP multi-word program operation when ISPGO flag is 1. MPADDR will keep the final ISP address when ISP multi-word program is complete.

6.5 General Purpose I/O (GPIO)

6.5.1 Overview

This chip has up to 118 General Purpose I/O pins to be shared with other function pins depending on the chip configuration. These 118 pins are arranged in 8 ports named as PA, PB, PC, PD, PE, PF, PG and PH. PA, PB, PE and PG has 16 pins on port. PC, PD has 15 pins on port. PF, PH has 12 pins on port. Each of the 118 pins is independent and has the corresponding register bits to control the pin mode function and data.

The I/O type of each of I/O pins can be configured by software individually as Input, Push-pull output, Open-drain output or Quasi-bidirectional mode. After the chip is reset, the I/O mode of all pins are depending on CIOINI (CONFIG0[10]).

6.5.2 Features

- Four I/O modes:
 - Quasi-bidirectional mode
 - Push-Pull Output mode
 - Open-Drain Output mode
 - Input only with high impedance mode
- TTL/Schmitt trigger input selectable
- I/O pin can be configured as interrupt source with edge/level setting
- Supports High Drive and High Slew Rate I/O mode
- Configurable default I/O mode of all pins after reset by CIOINI (CONFIG0[10]) setting
 - CIOINI = 0, all GPIO pins in Quasi-bidirectional mode after chip reset
 - CIOINI = 1, all GPIO pins in input mode after chip reset
- I/O pin internal pull-up resistor enabled only in Quasi-bidirectional I/O mode
- Enabling the pin interrupt function will also enable the wake-up function

6.5.3 Block Diagram

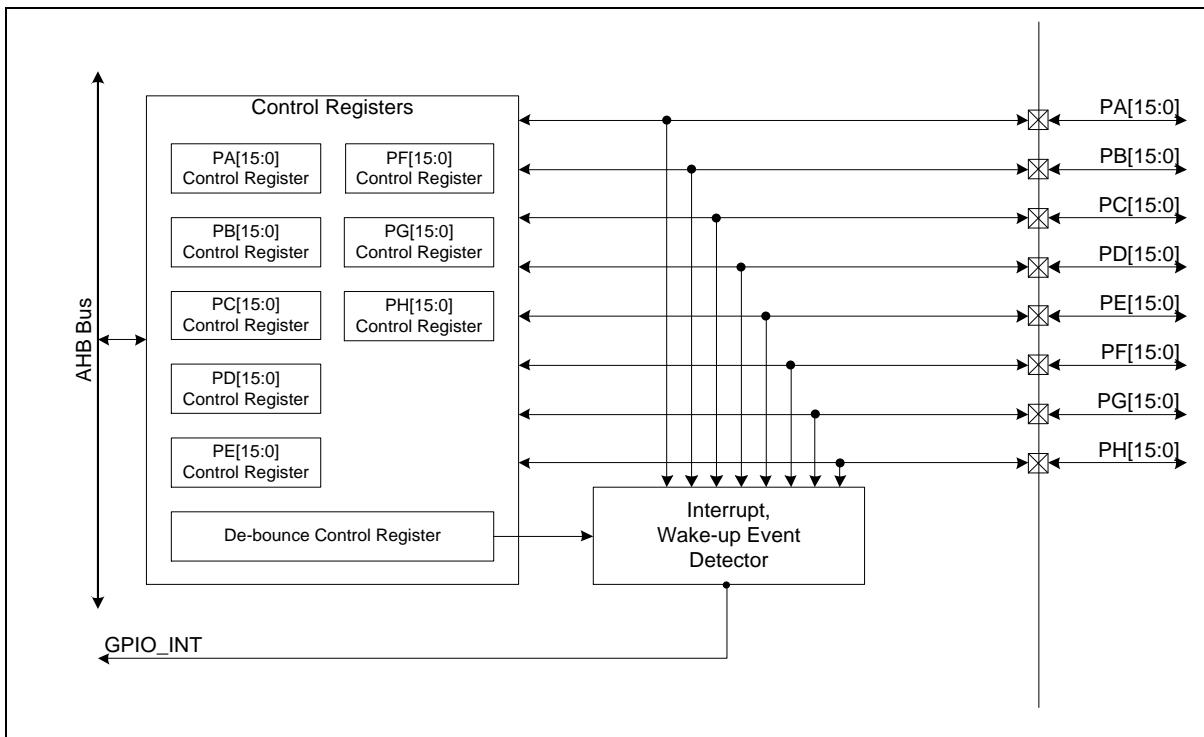

Figure 6.5-1 GPIO Controller Block Diagram

Note: The PC.15/PD.15/PF.12/PF.13/PF.14/PF.15/PH.12/PH.13/PH.14/PH.15 pins are not available.

6.5.4 Basic Configuration

- Reset configuration
 - Reset GPIO in GPIO_RST SYS_IPRST1[1]
- Pin configuration

Group	Pin Name	GPIO	MFP
INT0	INT0	PA.6, PB.5	MFP15
INT1	INT1	PA.7, PB.4	MFP15
INT2	INT2	PB.3, PC.6	MFP15
INT3	INT3	PB.2, PC.7	MFP15
INT4	INT4	PB.6	MFP13
		PA.8	MFP15
INT5	INT5	PB.7	MFP13
		PD.12	MFP15
INT6	INT6	PB.8	MFP13
		PD.11	MFP15
INT7	INT7	PB.9	MFP13
		PD.10	MFP15

6.5.5 Functional Description

6.5.5.1 Input Mode

Set MODEn (Px_MODE[2n+1:2n]) to 00 as the Px.n pin is in Input mode and the I/O pin is in tri-state (high impedance) without output drive capability. The PIN (Px_PIN[n]) value reflects the status of the corresponding port pins.

6.5.5.2 Push-pull Output Mode

Figure 6.5-2 shows the diagram of Push-pull Output Mode. Set MODEn (Px_MODE[2n+1:2n]) to 01 as Px.n pin is in Push-pull Output mode and the I/O pin supports digital output function with source/sink current capability. The bit value in the corresponding DOUT (Px_DOUT[n]) is driven on the pin.

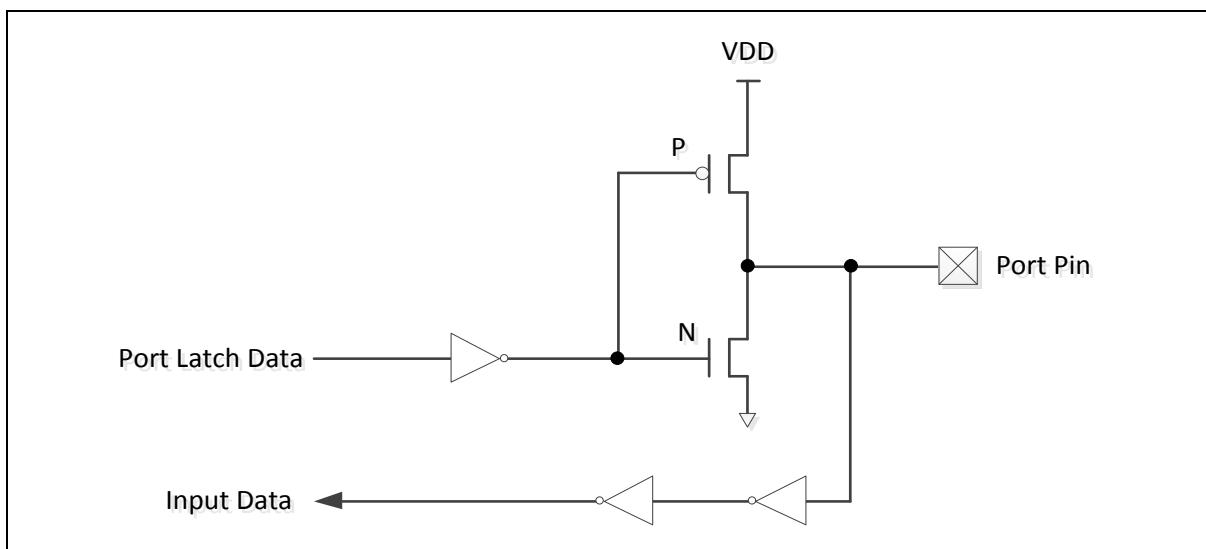

Figure 6.5-2 Push-Pull Output

6.5.5.3 Open-drain Mode

Figure 6.5-3 shows the diagram of Open-drain Mode. Set MODEn (Px_MODE[2n+1:2n]) to 10 the Px.n pin is in Open-drain mode and the digital output function of I/O pin supports only sink current capability, an external pull-up register is needed for driving high state. If the bit value in the corresponding DOUT (Px_DOUT[n]) bit is 0, the pin drive a low output on the pin. If the bit value in the corresponding DOUT (Px_DOUT[n]) bit is 1, the pin output drives high that is controlled by external pull high resistor.

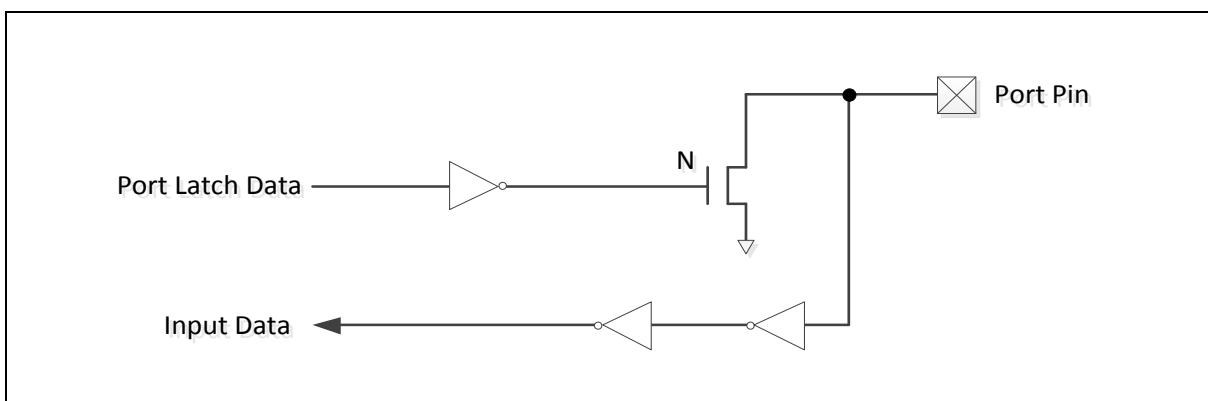

Figure 6.5-3 Open-Drain Output

6.5.5.4 Quasi-bidirectional Mode

Figure 6.5-4 shows the diagram of Quasi-bidirectional Mode. Set MODEn (Px_MODE[2n+1:2n]) to 11 as the Px.n pin is in Quasi-bidirectional mode and the I/O pin supports digital output and input function at the same time but the source current is only up to hundreds uA. Before the digital input function is performed the corresponding DOUT (Px_DOUT[n]) bit must be set to 1. The quasi-bidirectional output is common on the 80C51 and most of its derivatives. If the bit value in the corresponding DOUT (Px_DOUT[n]) bit is 0, the pin drive a low output on the pin. If the bit value in the corresponding DOUT (Px_DOUT[n]) bit is 1, the pin will check the pin value. If pin value is high, no action takes. If pin state is low, the pin will drive strong high with 2 clock cycles on the pin and then disable the strong output drive. Meanwhile, the pin status is controlled by internal pull-up resistor. Note that the source current capability in quasi-bidirectional mode is only about 200 uA to 30 uA for V_{DD} is from 5.0 V to 2.5 V.

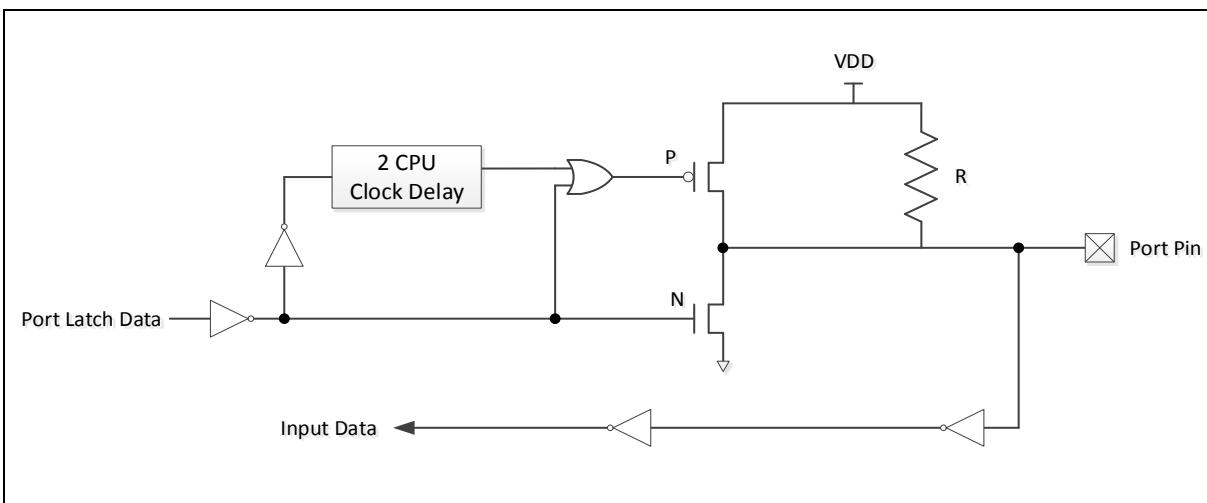

Figure 6.5-4 Quasi-Bidirectional I/O Mode

Note: When GPIO is configured as Quasi mode, it consumes 65uA fixedly as long as the potential is LOW.

6.5.5.5 GPIO Interrupt and Wake-up Function

Each GPIO pin can be set as chip interrupt source by setting correlative RHIEN (Px_INTEN[n+16])/FLIEN (Px_INTEN[n]) bit and TYPE (Px_INTTYPE[n]). There are five types of interrupt condition can be selected: low level trigger, high level trigger, falling edge trigger, rising edge trigger and both rising and falling edge trigger. The GPIO can also be the chip wake-up source when chip enters Idle/Power-down mode. The setting of wake-up trigger condition is the same as GPIO interrupt trigger.

6.5.5.6 GPIO De-bounce Function

GPIO de-bounce function can be used to sample interrupt input for each GPIO pin and prevent unexpected interrupt happened which caused by noise. GPIO de-bounce function only support edge detection trigger type and are not supported in power down mode. For edge trigger condition, there are three types of interrupt condition can be selected for de-bounce function: falling edge trigger, rising edge trigger and both rising and falling edge trigger by setting correlative RHIEN (Px_INTEN[n+16])/FLIEN (Px_INTEN[n]) bit and TYPE (Px_INTTYPE[n]). If user wants to use de-bounce function, de-bounce enable control register Px_DBEN must be set for corresponding GPIO pin. The de-bounce clock source can be HCLK or LIRC (10kHz) by setting DBCLKSRC (Px_DBCTL[4]) register. And DBCLKSEL (Px_DBCTL[3:0]) register can control sampling cycle period.

Figure 6.5-5 shows GPIO rising edge trigger interrupt. The interval of time between the two valid sample signal is determined by DBCLKSRC (Px_DBCTL[4]) and DBCLKSEL (Px_DBCTL[3:0]). Each valid data from GPIO pin need to be sample twice. For rising edge setting, if pin status is low before setting DBEN (Px_DBEN), interrupt will happen when generating a pin high valid data. But, if pin

status is high before setting DBEN (Px_DBEN), interrupt will happen when generating a pin low valid data first, and then generating a pin high valid data. For falling edge trigger, Figure 6.5-6 shows the situation is opposite to rising edge trigger.

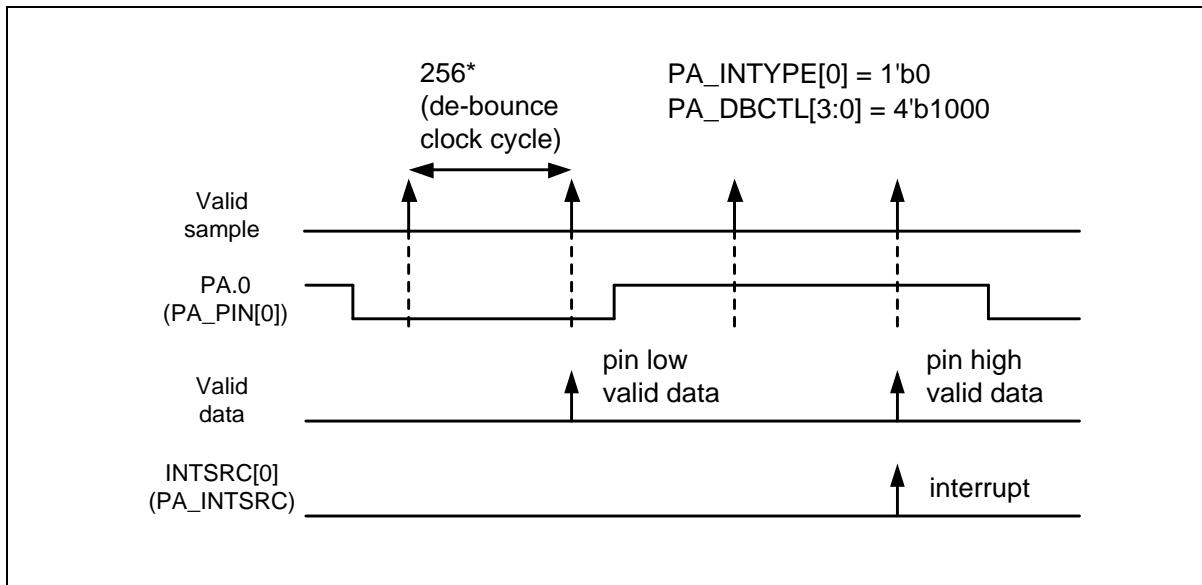

Figure 6.5-5 GPIO Rising Edge Trigger Interrupt

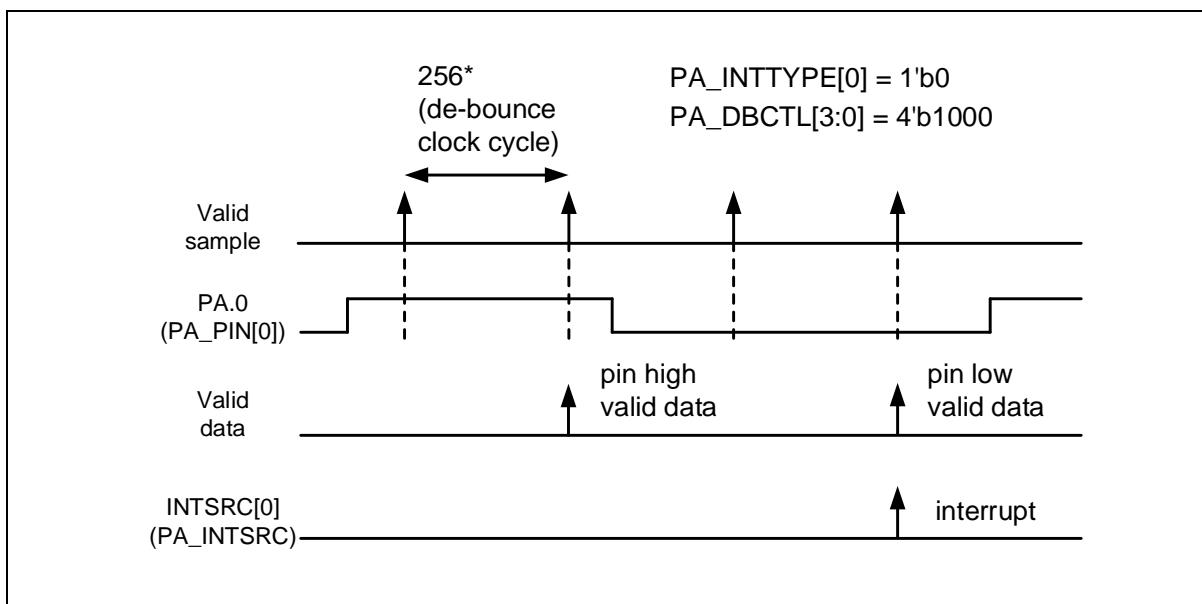

Figure 6.5-6 GPIO Falling Edge Trigger Interrupt

6.5.6 Register Map

R: read only, W: write only, R/W: both read and write

6.6 PDMA Controller (PDMA)

6.6.1 Overview

The peripheral direct memory access (PDMA) controller is used to provide high-speed data transfer. The PDMA controller can transfer data from one address to another without CPU intervention. This has the benefit of reducing the workload of CPU and keeps CPU resources free for other applications. The PDMA controller has a total of 16 channels and each channel can perform transfer between memory and peripherals or between memory and memory.

6.6.2 Features

- Supports 16 independently configurable channels
- Selectable 2 level of priority (fixed priority or round-robin priority)
- Supports transfer data width of 8, 16, and 32 bits
- Supports source and destination address increment size can be byte, half-word, word or no increment
- Supports software and SPI, UART, DAC, ADC and PWM request
- Supports Scatter-Gather mode to perform sophisticated transfer through the use of the descriptor link list table
- Supports single and burst transfer type
- Supports time-out function on channel 0 and channel1
- Supports stride function from channel 0 to channel 5

6.6.3 Block Diagram

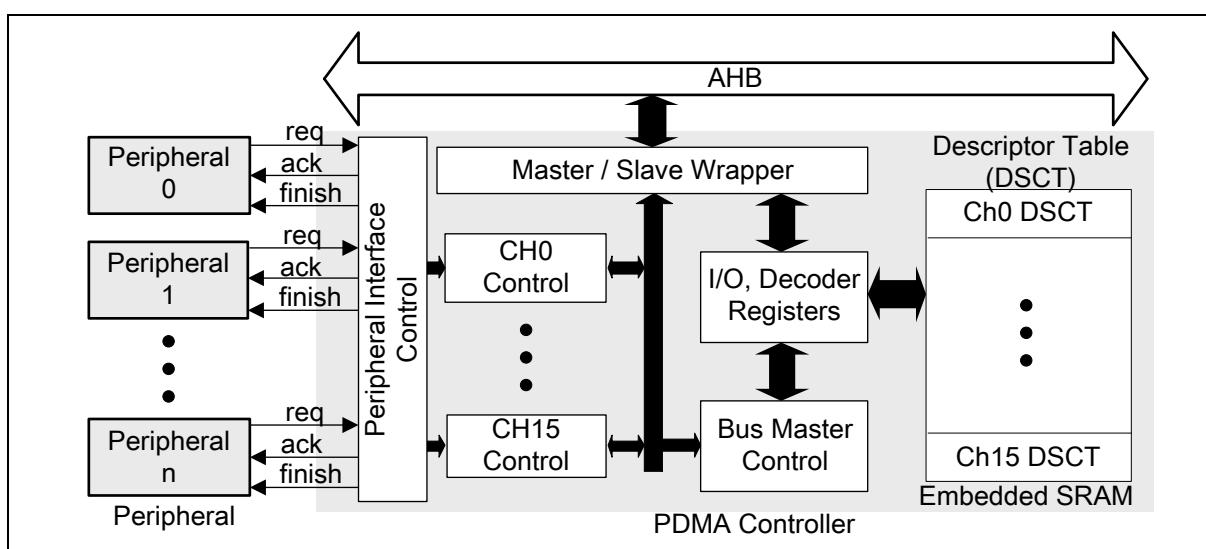

Figure 6.6-1 PDMA Controller Block Diagram

6.6.4 Basic Configuration

- Clock Source Configuration
 - Enable PDMA controller clock in PDMACKEN (CLK_AHBCLOCK [1]).

- Reset Configuration
 - Reset PDMA controller in PDMARST (SYS_IPRST0[2]).

6.6.5 Functional Description

The PDMA controller transfers data from one address to another without CPU intervention. The PDMA controller supports 16 independent channels and serves only one channel at one time, as the result, PDMA controller supports two level channel priorities: fixed and round-robin priority, PDMA controller serves channel in order from highest to lowest priority channel. The PDMA controller supports two operation modes: Basic mode and Scatter-gather mode. Basic mode is used to perform one descriptor table transfer. Scatter-gather mode has more entries for each PDMA channel, and thus the PDMA controller supports sophisticated transfer through the entries. The descriptor table entry data structure contains many transfer information including the transfer source address, transfer destination address, transfer count, burst size, transfer type and operation mode. Figure 6.6-2 shows the diagram of descriptor table (DSCT) data structure.

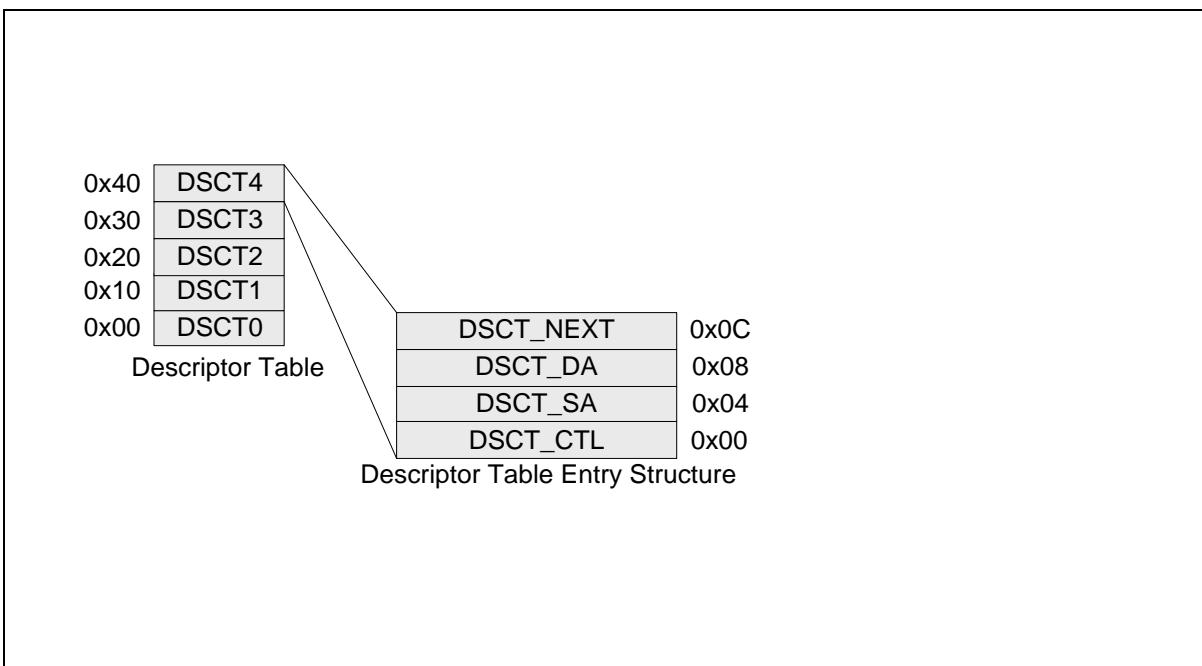

Figure 6.6-2 Descriptor Table Entry Structure

The PDMA controller also supports single and burst transfer type and the request source can be from software or peripheral request, transfer between memory to memory using software request. A single transfer means that software or peripheral is ready to transfer one data (every data needs one request), and the burst transfer means that software or peripherals will transfer multiple data (multiple data only need one request).

6.6.5.1 Channel Priority

The PDMA controller supports two level channel priorities including fixed and round-robin priority. The fixed priority channel has higher priority than round-robin priority channel. If multiple channels are set as fixed or round-robin priority, the higher channel will have higher priority. The priority order is listed in Table 6.6-1.

PDMA_PRISET	Channel Number	Priority Setting	Arbitration Priority In Descending Order
1	15	Channel15, Fixed Priority	Highest

1	14	Channel14, Fixed Priority	---
---	---	---	---
1	0	Channel0, Fixed Priority	---
0	15	Channel15, Round-Robin Priority	---
0	14	Channel14, Round-Robin Priority	---
---	---	---	---
0	0	Channel0, Round-Robin Priority	Lowest

Table 6.6-1 Channel Priority Table

6.6.5.2 PDMA Operation Mode

The PDMA controller supports two operation modes including Basic mode and Scatter-Gather mode.

Basic Mode

Basic mode is used to perform one descriptor table transfer mode. This mode can be used to transfer data between memory and memory, peripherals and memory or memory and peripherals, but if user want to transfer data between peripherals and peripherals, one thing must be sure is that the request from peripherals knows that the data is ready for transfer or not. PDMA controller operation mode can be set from OPMODE (PDMA_DSCTn_CTL[1:0], n denotes PDMA channel), the default setting is in idle state (OPMODE (PDMA_DSCTn_CTL[1:0]) = 0x0) and recommend user configure the descriptor table in idle state. If operation mode is not in idle state, user re-configure channel setting may make some operation error.

User must fill the transfer count TXCNT (PDMA_DSCTn_CTL[31:16]) register and select transfer width TXWIDTH (PDMA_DSCTn_CTL[13:12]), destination address increment size DAINC (PDMA_DSCTn_CTL[11:10]), source address increment size SAINC (PDMA_DSCTn_CTL[9:8]), burst size BURSIZE (PDMA_DSCTn_CTL[6:4]) and transfer type TXTYPE (PDMA_DSCTn_CTL[2]), then the PDMA controller will perform transfer operation in transfer state after receiving request signal. Finishing this task will generate an interrupt to CPU if corresponding PDMA interrupt bit INTENn (PDMA_INTEN[15:0]) is enabled and the operation mode will be updated to idle state as shown in Figure 6.6-3. If software configures the operation mode to idle state, the PDMA controller will not perform any transfer and then clear this operation request. Finishing this task will also generate an interrupt to CPU if corresponding PDMA interrupt bit is enabled.

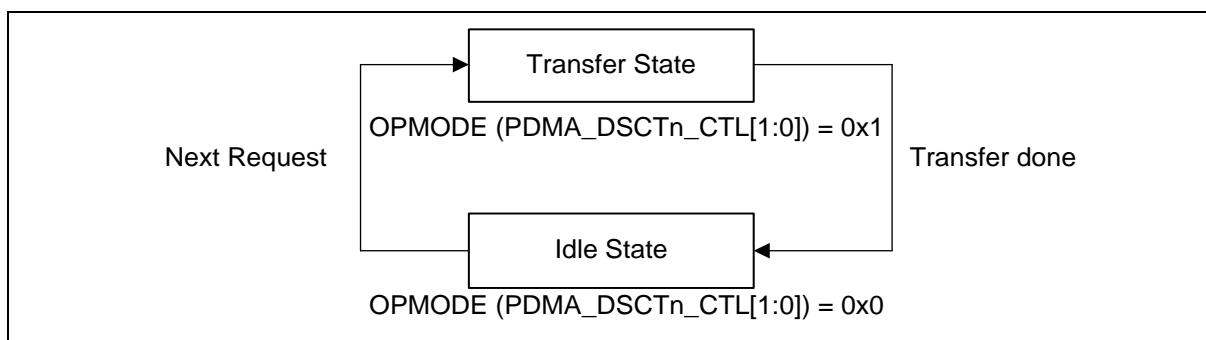

Figure 6.6-3 Basic Mode Finite State Machine

Scatter-Gather Mode

Scatter-Gather mode is a complex mode and can perform sophisticated transfer through the use of the description link list table as shown in Figure 6.6-4. Through operation mode user can perform peripheral wrapper-around, and multiple PDMA task can be used for data transfer between varied locations in system memory instead of a set of contiguous locations. Scatter-gather mode only needs a request to finish all table entries task till the last task with OPMODE (PDMA_DSCTn_CTL[1:0]) is

idle state without ack. It also means scatter-gather mode can be used to transfer data between memory to memory without handshaking.

In Scatter-Gather mode, the table is just used for jumping to the next table entry. The first task will not perform any operation transfer. Finishing each task will generate an interrupt to CPU if corresponding PDMA interrupt bit is enabled and TBINTDIS (PDMA_DSCTn_CTL[7]) bit is “0” (when finishing task and TBINTDIS bit is “0”, corresponding TDIFn (PDMA_TDSTS[15:0]) flag will be asserted and if this bit is “1” TDIFn will not be active).

If channel 15 has been triggered, and the operation mode is in Scatter-Gather mode (OPMODE (PDMA_DSCTn_CTL[1:0]) = 0x2), the hardware will load the real PDMA information task from the address generated by adding PDMA_DSCTn_NEXT (link address) and PDMA_SCATBA (base address) registers. For example, base address is 0x2000_0000 (only MSB 16 bits valid in PDMA_SCATBA), the current link address is 0x0000_0100 (only LSB 16bits without last two bits [1:0] valid in PDMA_DSCTn_NEXT), and then the next DSCT entry start address is 0x2000_0100.

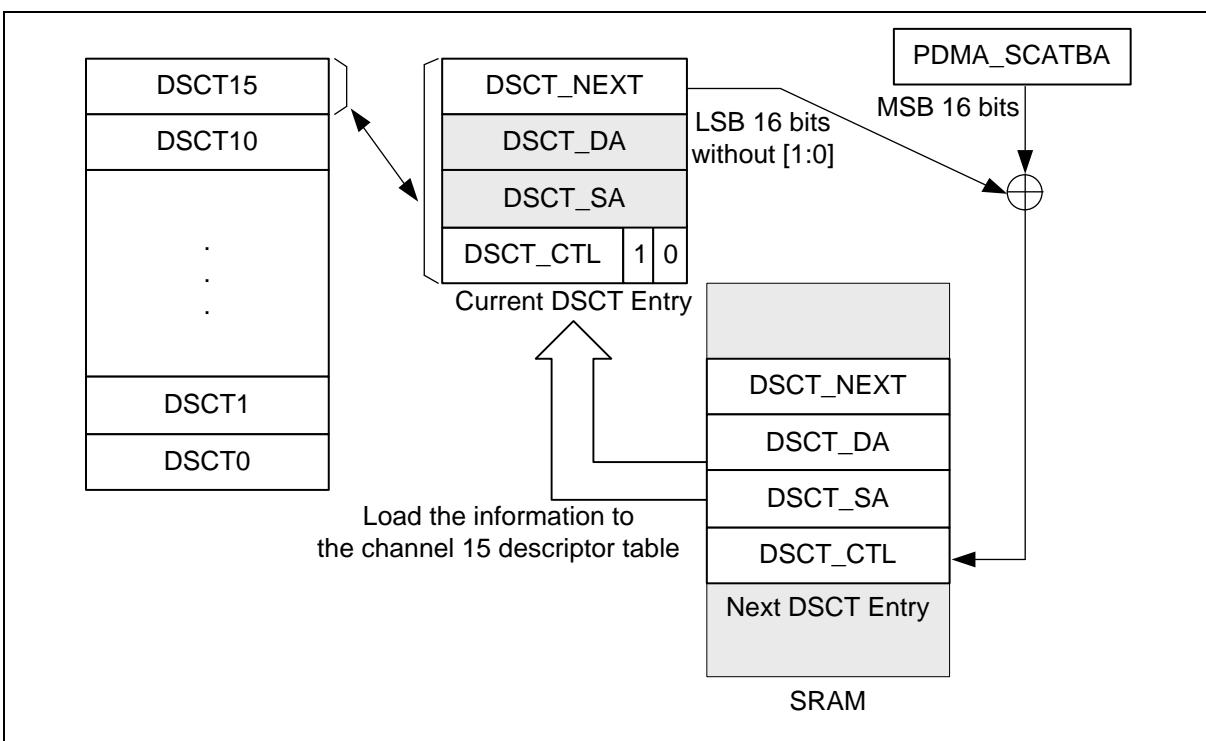

Figure 6.6-4 Descriptor Table Link List Structure

The above link list table operation is DSCT state in Scatter-Gather Mode as shown in Figure 6.6-5. When loading the information is finished, it will go to transfer state and start transfer by this information automatically. However, if the next PDMA information is also set to Scatter-Gather mode, the hardware will catch the next PDMA information block when the current task is finished. The Scatter-Gather mode switches to basic mode when doing the next task. Then, the basic mode switches to Idle state when the last task is finished.

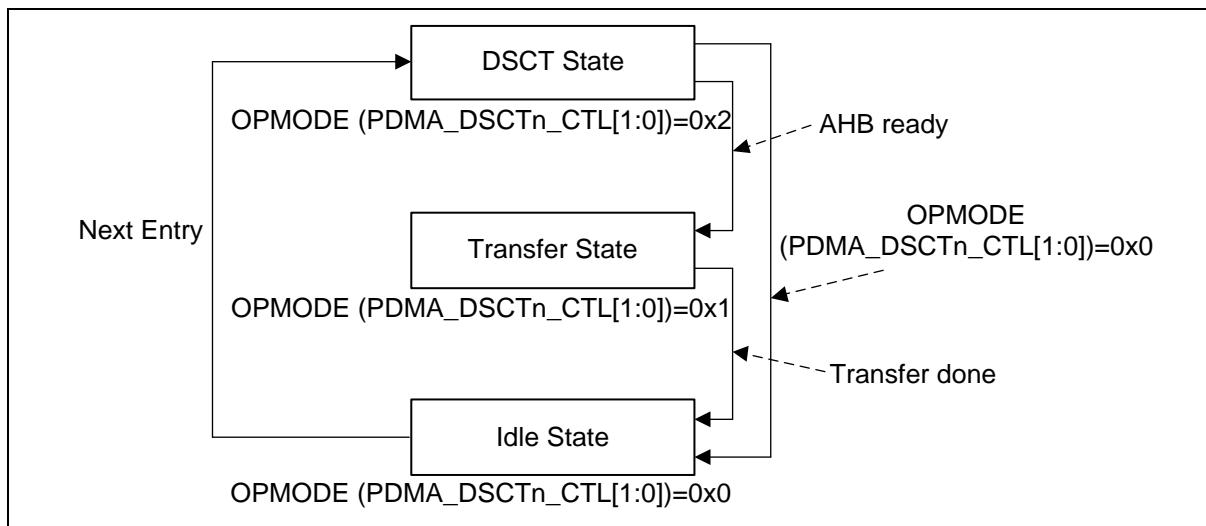

Figure 6.6-5 Scatter-Gather Mode Finite State Machine

6.6.5.3 Transfer Type

The PDMA controller supports two transfer types: single transfer type and burst transfer type, configure by setting TXTYPE (PDMA_DSCTn_CTL[2]).

When the PDMA controller is operated in single transfer type, each transfer data needs one request signal for one transfer, after transferred data, TXCNT (PDMA_DSCTn_CTL[31:16]) will decrease 1. Transfer will be finished after the TXCNT (PDMA_DSCTn_CTL[31:16]) decreases to 0. In this mode, the BURSIZE (PDMA_DSCTn_CTL[6:4]) is not useful to control the transfer size. The BURSIZE (PDMA_DSCTn_CTL[6:4]) will be fixed as one.

For the burst transfer type, the PDMA controller transfers TXCNT (PDMA_DSCTn_CTL[31:16]) of data and need only one request signal. After transferred BURSIZE (PDMA_DSCTn_CTL[6:4]) of data, TXCNT (PDMA_DSCTn_CTL[31:16]) will decrease BURSIZE number. Transfer will be done after the transfer count TXCNT (PDMA_DSCTn_CTL[31:16]) decreases to 0. Note that burst transfer type can only be used for PDMA controller to do burst transfer between memory and memory. User must use single request type for memory-to-peripheral and peripheral-to-memory transfers. Please note that, PDMA transfer data between flash and memory should finish before MCU enter idle mode or power done mode to prevent access wrong data

Figure 6.6-6 shows an example about single and burst transfer type in basic mode. In this example, channel 1 uses single transfer type and TXCNT (PDMA_DSCTn_CTL[31:16]) = 127. Channel 0 uses burst transfer type, BURSIZE (PDMA_DSCTn_CTL[6:4]) = 128 and TXCNT (PDMA_DSCTn_CTL[31:16]) = 255. The operation sequence is described below:

1. Channel 0 and channel 1 get the trigger signal at the same time.
2. Channel 1 has higher priority than channel 0 by default; the PDMA controller will load the channel 1 descriptor table first and executing. But channel 1 is single transfer type, and thus the PDMA controller will only transfer one transfer data.
3. Then, the PDMA controller turns to the channel 0 and loads channel 0's descriptor table. The channel 0 is burst transfer type and the burst size selected to 128. Therefore, the PDMA controller will transfer 128 transfer data.
4. When channel 0 transfers 128 data, channel 1 gets another request signal, then after channel 0 finishes 128 transfer data, the PDMA controller will turn to channel 1 and transfer next one data.
5. After channel 1 transfers data, the PDMA controller switches to low priority channel 0 to continuous next 128 data transfer. If no channel 1 request receives, PDMA will start next channel 0, 128 data transfer.

6. The PDMA controller will complete transfer when channel 0 finishes data transfer 256 times, and channel 1 finishes transferring 128 times.

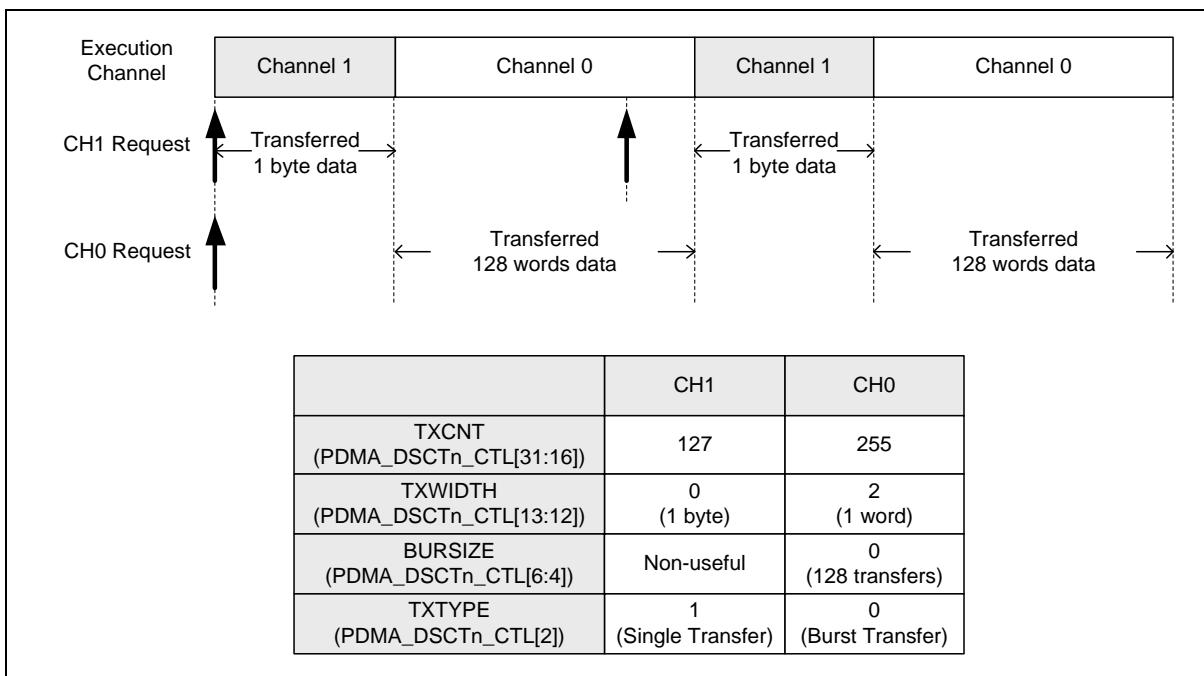

Figure 6.6-6 Example of Single Transfer Type and Burst Transfer Type in Basic Mode

6.6.5.4 Channel Time-out

Only PDMA channel 0 and channel 1 support time-out function. When the transfer channel is enabled and selected to the peripheral, corresponding channel time-out TOUTENn (PDMA_TOUTEN [n], n=0,1) is enabled, then channel's corresponding time-out counter will start count up from 0 while the channel has received trigger signal from the peripheral.

The time-out counter is based on output of HCLK prescaler, which is setting by corresponding channel's TOUTPSCn (PDMA_TOUTPSC [2+4n:4n], n=0,1). If time-out counter counts up from 0 to corresponding channel's TOCn (PDMA_TOCO_1 [16(n+1)-1:16n], n=0,1), the PDMA controller will generate interrupt signal when corresponding TOUTIENn (PDMA_TOUTIEN [n], n=0,1) is enabled. When time-out occurred, corresponding channel's REQTOFn (PDMA_INTSTS [n+8], n=0,1) will be set to indicate channel time-out is happened.

Time-out counter resets to 0 while counter count to TOCn (PDMA_TOCO_1 [16(n+1)-1:16n], n=0,1), received trigger signal, time-out function is disabled or chip enters Power-down mode.

Figure 6.6-7 shows an example about time-out counter operation. The operation sequence is described below:

1. The channel 0 time-out counter is not counting when time-out function is enabled by setting TOUTEN0(PDMA_TOUTEN[0]) bit to 1.
2. Time-out counter starts counting from 0 to the value of TOC0(PDMA_TOCO_1[15:0]) bits when receiving the first peripheral request.
3. Time-out counter is reset to 0 by received second peripheral request.
4. Channel 0 request time-out flag(REQTOF0(PDMA_INTSTS[8])) is set to high when time-out counter counts to 5. The counter will keep counting from 0 to 5, and user can clear REQTOF0 flag and then poll REQTOF0 flag to check the next time-out occurred.

5. Time-out counter is reset to 0 when time-out function is disabled.

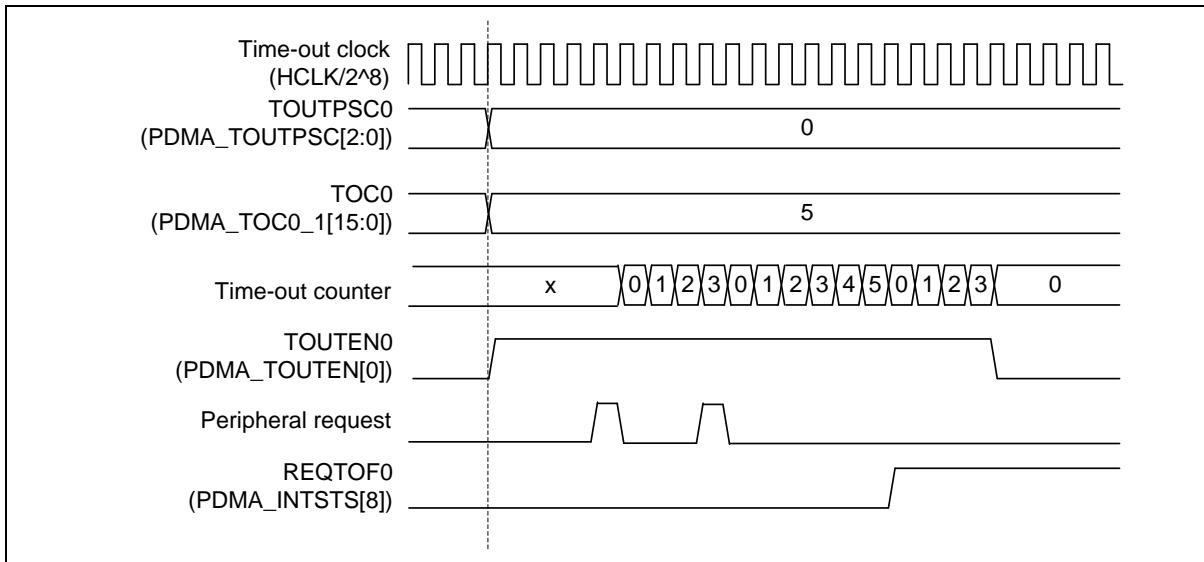

Figure 6.6-7 Example of PDMA Channel 0 Time-out Counter Operation

6.6.5.5 Stride Function

The PDMA supports channel 0 to channel 5 six channels with stride function. The stride function can transfer data from one address to another address and support block transfer with stride. When operating with stride function, the transfer address can be fixed or incremented successively.

Set STRIDEEN (PDMA_DSCTn_CTL[15]) to enable the stride function, and then write a valid source address to the PDMA_DSCTn_SA register and a source address offset count to SASOL (PDMA_ASOCRn[15:0]) register, a destination address to the PDMA_DSCTn_DA register and a destination address offset count to DASOL (PDMA_ASOCRn[31:16]), and a transfer count to the TXCNT (PDMA_DSCTn_CTL) register and a stride transfer count to STC (PDMA_STCn[15:0]). Next, trigger the SWREQn (PDMA_SWREQ[5:0]). The PDMA will start and then stop the transfer after TXCNT (PDMA_DSCTn_CTL) counts down to 0. Figure 6.6-8 shows the block transfer relationship between source memory and destination memory. The stride function also supports peripheral to memory or memory to peripheral transfer.

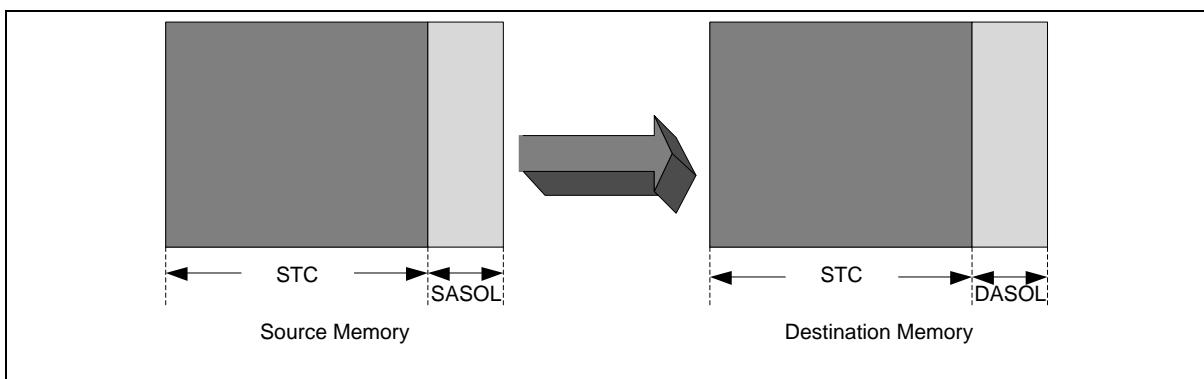

Figure 6.6-8 Stride Function Block Transfer

[31:16]	EXENEXT	PDMA Execution Next Descriptor Table Offset This field indicates the offset of next descriptor table address of current execution descriptor table in system memory. Note: write operation is useless in this field.
[15:0]	NEXT	PDMA Next Descriptor Table Offset This field indicates the offset of the next descriptor table address in system memory. Write Operation: If the system memory based address is 0x2000_0000 (PDMA_SCATBA), and the next descriptor table is start from 0x2000_0100, then this field must fill in 0x0100. Read Operation: When operating in scatter-gather mode, the last two bits NEXT[1:0] will become reserved, and indicate the first next address of system memory. Note1: The descriptor table address must be word boundary. Note2: Before filled transfer task in the descriptor table, user must check if the descriptor table is complete.

Current Scatter-gather Descriptor Table Address (PDMA_CURSCATn)

Register	Offset	R/W	Description				Reset Value
PDMA_CURSCATn	CURSCAT_BA + 0x004 * n	R	Current Scatter-Gather Descriptor Table Address of PDMA Channel n				0xFFFF_FFFF

Bits	Description	
[31:0]	CURADDR	<p>PDMA Current Description Address (Read Only)</p> <p>This field indicates a 32-bit current external description address of PDMA controller.</p> <p>Note: This field is read only and used for Scatter-Gather mode only to indicate the current external description address.</p>

Channel Control Register (PDMA_CHCTL)

Register	Offset	R/W	Description			Reset Value
PDMA_CHCTL	PDMA_BA + 0x400	R/W	PDMA Channel Control Register			0x0000_0000

6.7 Timer Controller (TMR)

6.7.1 Overview

The timer controller includes four 32-bit timers, Timer0 ~ Timer3, allowing user to easily implement a timer control for applications. The timer can perform functions, such as frequency measurement, delay timing, clock generation, and event counting by external input pins, and interval measurement by external capture pins.

The timer controller also provides four PWM generators. Each PWM generator supports two PWM output channels in independent mode and complementary mode. The output state of PWM output pin can be controlled by pin mask, polarity and break control, and dead-time generator.

6.7.2 Features

6.7.2.1 Timer Function Features

- Four sets of 32-bit timers, each timer having one 24-bit up counter and one 8-bit prescale counter
- Independent clock source for each timer
- Provides one-shot, periodic, toggle-output and continuous counting operation modes
- 24-bit up counter value is readable through CNT (TIMERx_CNT[23:0])
- Supports event counting function
- 24-bit capture value is readable through CAPDAT (TIMERx_CAP[23:0])
- Supports external capture pin event for interval measurement
- Supports external capture pin event to reset 24-bit up counter
- Supports chip wake-up from Idle/Power-down mode if a timer interrupt signal is generated
- Supports Timer0 ~ Timer3 time-out interrupt signal or capture interrupt signal to trigger EPWM, EADC, DAC and PDMA function
- Supports internal capture triggered while internal ACMP output signal transition
- Supports Inter-Timer trigger mode
- Supports event counting source from internal USB SOF signal

6.7.2.2 PWM Function Features

- Supports maximum clock frequency up to maximum PCLK
- Supports independent mode for PWM generator with two output channels
- Supports complementary mode for PWM generator with paired PWM output channel
 - 12-bit dead-time insertion with 12-bit prescale
- Supports 12-bit prescale from 1 to 4096
- Supports 16-bit PWM counter
 - Up, down and up-down count operation type
 - One-shot or auto-reload counter operation mode
- Supports mask function and tri-state enable for each PWM output pin
- Supports brake function
 - Brake source from pin, analog comparator and system safety events (clock failed,

- Brown-out detection, SRAM parity error and CPU lockup)
- Brake pin noise filter control for brake source
- Edge detect brake source to control brake state until brake status cleared
- Level detect brake source to auto recover function after brake condition removed
- Supports interrupt on the following events:
 - PWM zero point, period point, up-count compared or down-count compared point events
 - Brake condition happened
- Supports trigger EADC on the following events:
 - PWM zero point, period, zero or period point, up-count compared or down-count compared point events

6.7.3 Block Diagram

The timer controller block diagram and clock control are shown as follows.

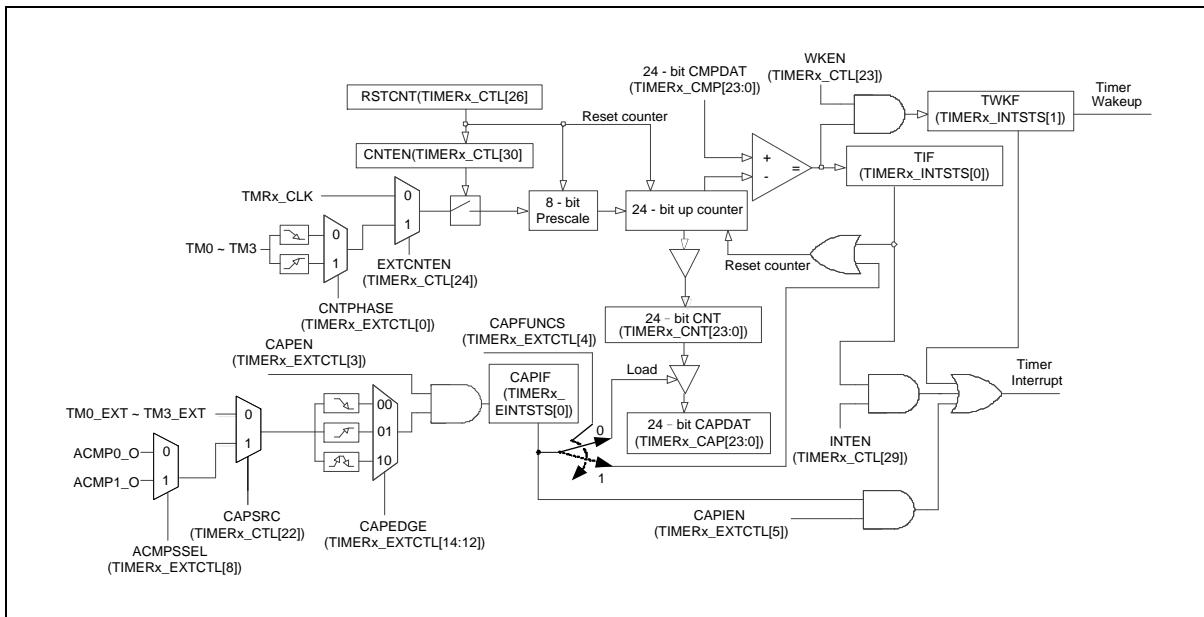

Figure 6.7-1 Timer Controller Block Diagram

Set FUNMODE (TIMERx_ALTCTL[0]) 0 to enable timer mode. The clock source of Timer0 ~ Timer3 in timer mode can be enabled in TMRxCKEN (CLK_APBCLK0[5:2]) and selected as different frequency in TMR0SEL (CLK_CLKSEL1[10:8]) for Timer0, TMR1SEL (CLK_CLKSEL1[14:12]) for Timer1, TMR2SEL (CLK_CLKSEL1[18:16]) for Timer2 and TMR3SEL (CLK_CLKSEL1[22:20]) for Timer3 as Figure 6.7-2.

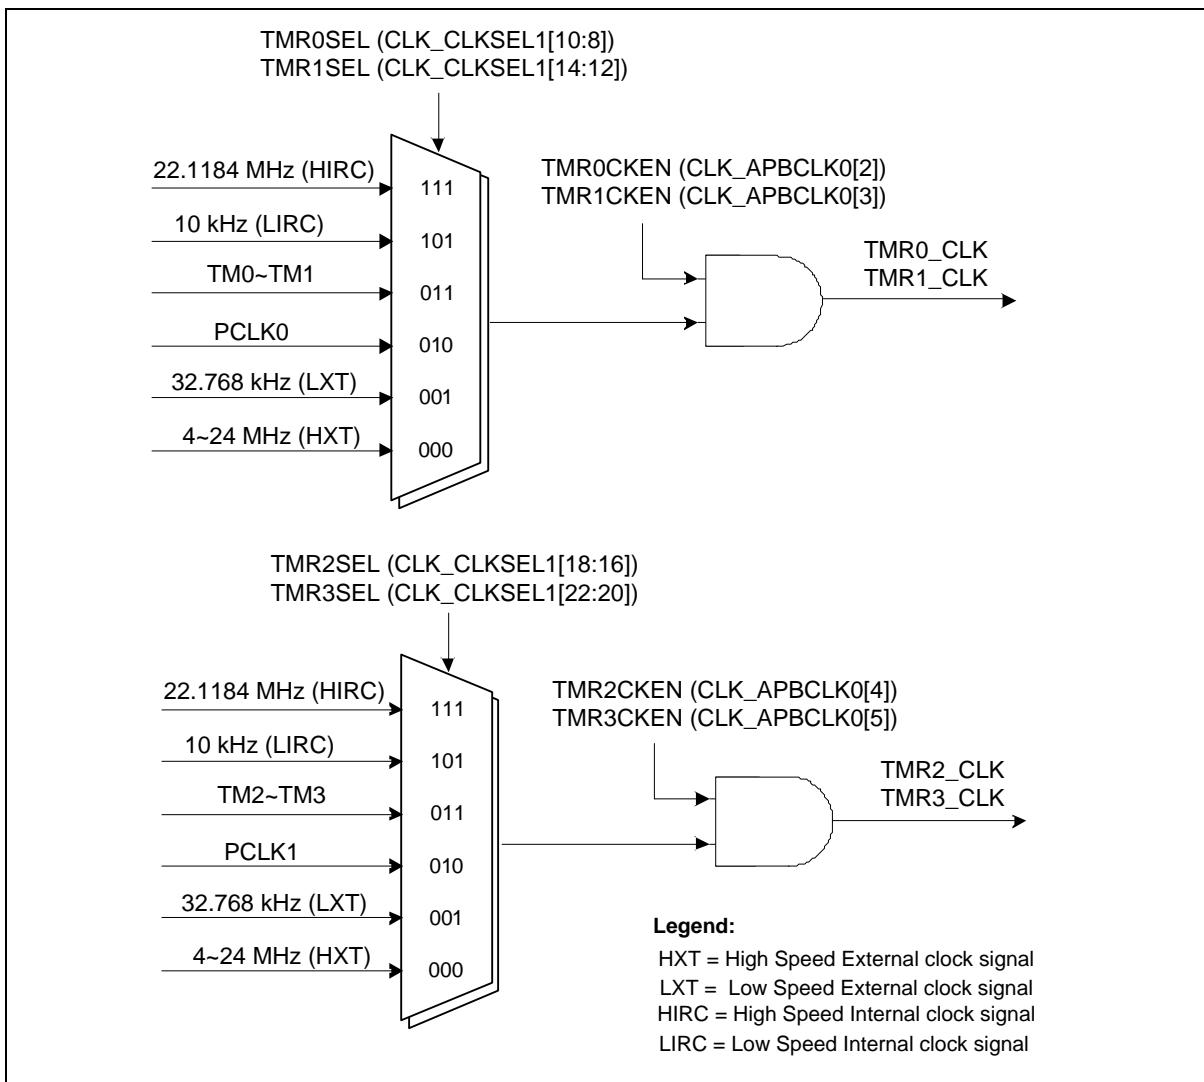

Figure 6.7-2 Clock Source of Timer Controller

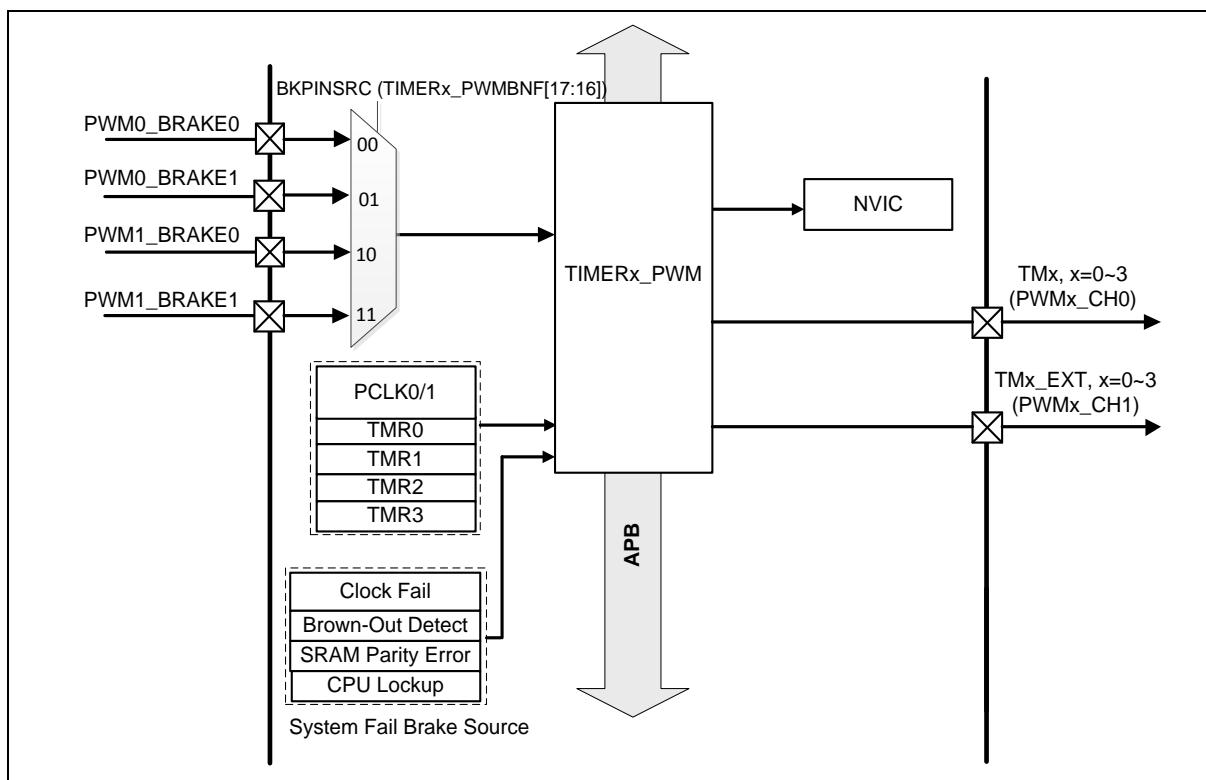

Figure 6.7-3 PWM Generator Overview Block Diagram

Set FUNMODE (TIMERx_ALTCTL[0]) 1 to enable PWM mode. The clock source of Timer0 ~ Timer3 in PWM mode can be enabled in TMRxCKEN (CLK_APBCLK0[5:2]). TMR0_CLK and TMR1_CLK clock sources are fixed to PCLK0. TMR2_CLK and TMR3_CLK clock sources are fixed to PCLK1. PWM system clock frequency will be PCLKx frequency as Figure 6.7-4 .

The clock source of PWM counter (TIMERx_PWMCLK) can be selected from PWM system clock (TMRx_CLK) or Timer interrupt events (TMRx_INT) as Figure 6.7-5.

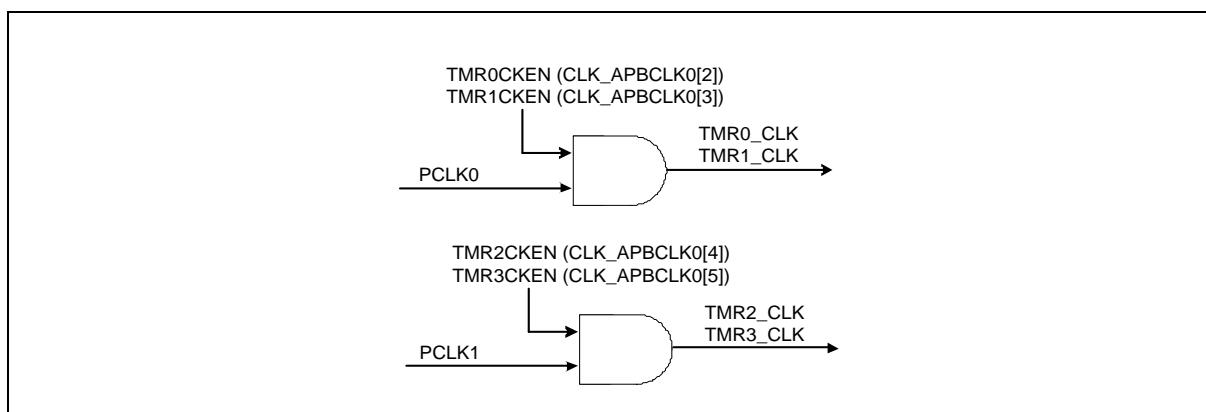

Figure 6.7-4 PWM System Clock Source Control

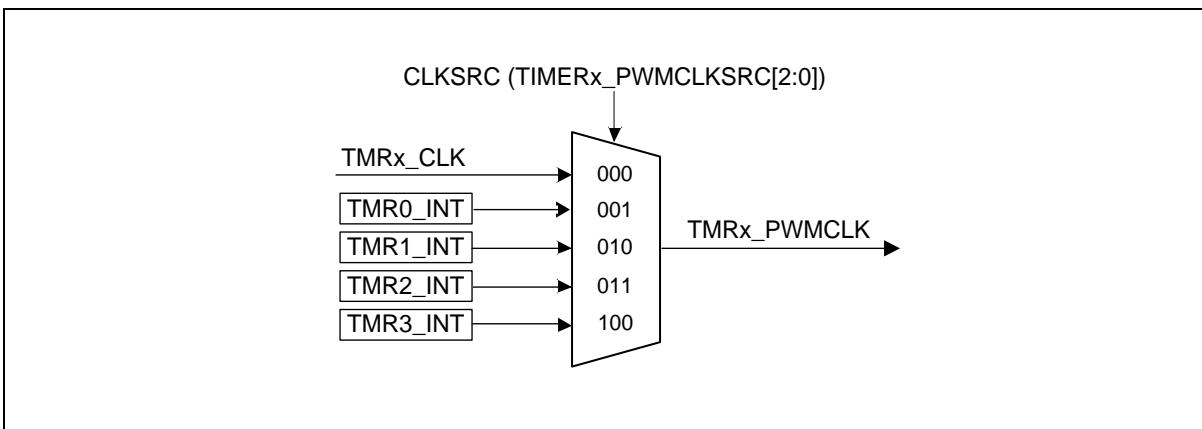

Figure 6.7-5 PWM Counter Clock Source Control

Figure 6.7-6 and Figure 6.7-7 illustrate the architecture of PWM independent mode and complementary mode. Both independent mode and complementary mode supports PWM_x_CH0 and PWM_x_CH1 output channels in each PWM generator.

When counter counts to 0, PERIOD (TIMER_x_PWMPERIOD[15:0]) or equal to CMP (TIMER_x_PWMCMPDAT[15:0]), relative events will be generated. These events are passed to corresponding generators to generate PWM pulse (Pulse Generator), interrupt signal (Interrupt Generator) and trigger signal (Trigger Generator) for ADC to start conversion. Output Control block is used to decide PWM pulse output; brake function in Output Control block also generates interrupt events. And Dead-Time Control is available only in PWM complementary mode.

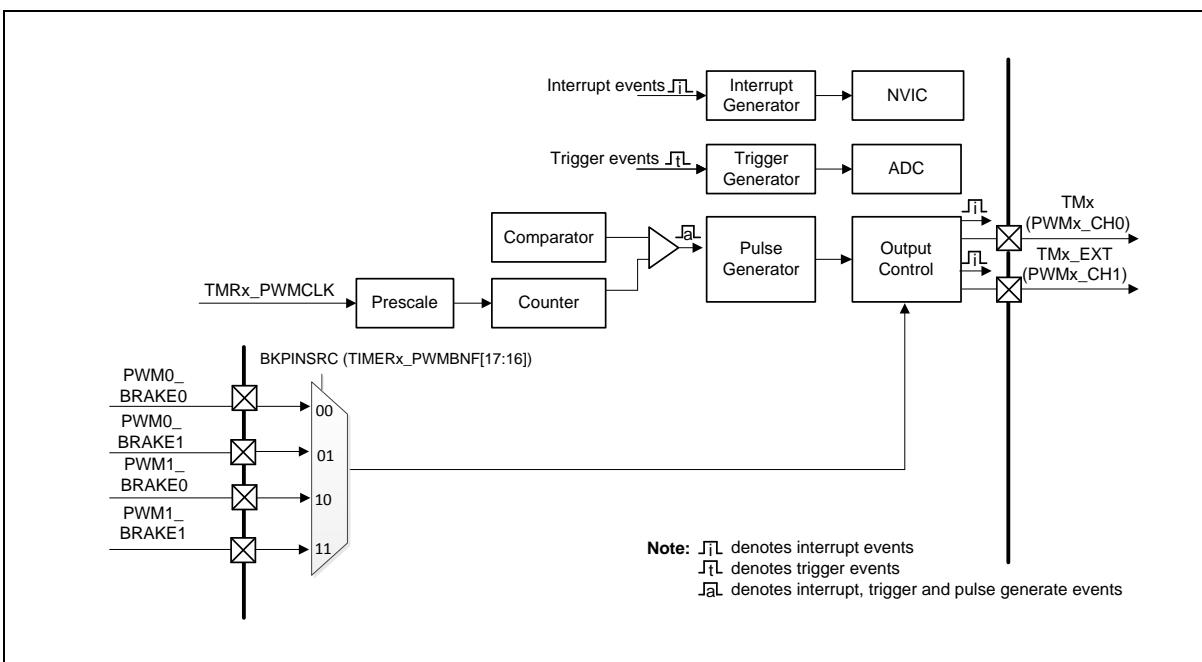

Figure 6.7-6 PWM Independent Mode Architecture Diagram

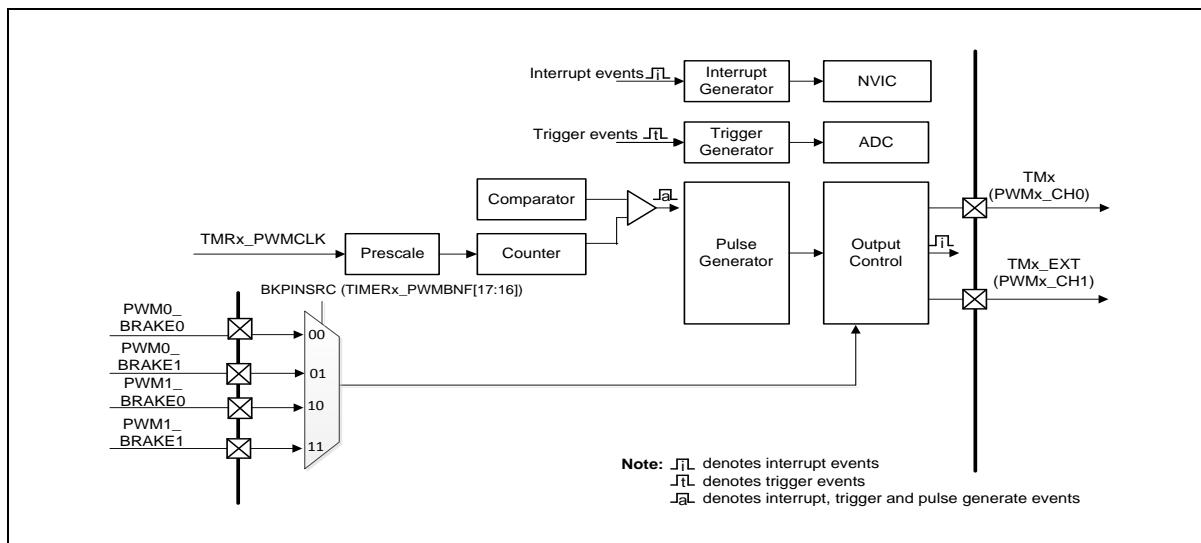

Figure 6.7-7 PWM Complementary Mode Architecture Diagram

6.7.4 Basic Configuration

Set FUNMODE (TMRx_ALTCTL[0]) 0 to enable timer mode. The clock source of Timer0 ~ Timer3 in timer mode can be enabled in TMRxCKEN (CLK_APBCLK0[5:2]) and selected as different frequency in TMR0SEL (CLK_CLKSEL1[10:8]) for Timer0, TMR1SEL (CLK_CLKSEL1[14:12]) for Timer1, TMR2SEL (CLK_CLKSEL1[18:16]) for Timer2 and TMR3SEL (CLK_CLKSEL1[22:20]) for Timer3.

Set FUNMODE (TMRx_ALTCTL[0]) 1 to enable PWM mode. The clock source of Timer0 ~ Timer3 in PWM mode can be enabled in TMRxCKEN (CLK_APBCLK0[5:2]). TMR0_CLK and TMR1_CLK clock sources are fixed to PCLK0. TMR2_CLK and TMR3_CLK clock sources are fixed to PCLK1.

6.7.4.1 TIMER01 basic configurations

- Clock source Configuration
 - Enable TIMER0 peripheral clock in TMR0CKEN (CLK_APBCLK0[2]).
 - Enable TIMER1 peripheral clock in TMR1CKEN (CLK_APBCLK0[3]).
- Reset Configuration
 - Reset TIMER0 controller in TMR0RST (SYS_IPRST2[2]).
 - Reset TIMER0 controller in TMR1RST (SYS_IPRST2[3]).
- Pin configuration

Group	Pin Name	GPIO	MFP
TM0	TM0	PG.2	MFP13

	TM3_EXT	PA.8, PB.12, PH.3	MFP13

Table 6.7-2 TIMER23 Pin Configuration

6.7.5 Timer Functional Description

6.7.5.1 Timer Interrupt Flag

The timer controller supports the following interrupt flags; one is TIF (TIMERx_INTSTS[0]) and its set while timer counter value CNT (TIMERx_CNT[23:0]) matches the timer compared value CMPDAT (TIMERx_CMP[23:0]), and CAPIF (TIMERx_EINTSTS[0]) is set means when the transition on the TMx_EXT pin associated CAPEdge (TIMERx_EXTCTL[14:12]) setting. The TWKF (TIMERx_INTSTS[1]) bit indicates the interrupt wake-up flag status of timer. Set WKEN (TIMERx_CTL[23] to 1 can use wake-up function.

6.7.5.2 Timer Counting Mode

The timer controller provides four timer counting modes: one-shot, periodic, toggle-output and continuous counting operation modes:

6.7.5.3 One-shot Mode

If the timer controller is configured at one-shot mode (TIMERx_CTL[28:27] is 00) and CNTEN (TIMERx_CTL[30]) is set, the timer counter starts up counting. Once the CNT (TIMERx_CNT[23:0]) value reaches CMPDAT (TIMERx_CMP[23:0]) value, the TIF (TIMERx_INTSTS[0]) will be set to 1, CNT value and CNTEN bit is cleared automatically by timer controller then timer counting operation stops. In the meantime, if the INTEN (TIMERx_CTL[29]) is enabled, the timer interrupt signal is generated and sent to NVIC to inform CPU also.

User can monitor the counter reset operation active by RSTACT (TIMERx_CNT[31]). And set ICEDEBUG (TIMERx_CTL[31]) to 1 that disable ICE debug mode acknowledgement effects TIMER counting.

6.7.5.4 Periodic Mode

If the timer controller is configured at periodic mode (TIMERx_CTL[28:27] is 01) and CNTEN (TIMERx_CTL[30]) is set, the timer counter starts up counting. Once the CNT (TIMERx_CNT[23:0]) value reaches CMPDAT (TIMERx_CMP[23:0]) value, the TIF (TIMERx_INTSTS[0]) will be set to 1, CNT value will be cleared automatically by timer controller and timer counter operates counting again.

In the meantime, if the INTEN (TIMERx_CTL[29]) bit is enabled, the timer interrupt signal is generated and sent to NVIC to inform CPU also. In this mode, the timer controller operates counting and compares with CMPDAT value periodically until the CNTEN bit is cleared by user.

User can set PERIOSEL (TIMERx_CTL[20]) to select Timer behavior at periodic mode.

6.7.5.5 Toggle-Output Mode

If the timer controller is configured at toggle-output mode (TIMERx_CTL[28:27] is 10) and CNTEN (TIMERx_CTL[30]) is set, the timer counter starts up counting. The counting operation of toggle-output mode is almost the same as periodic mode, except toggle-output mode has associated TM0 ~ TM3 or TM0_EXT ~ TM3_EXT pin to output signal while specify TIF (TIMERx_INTSTS[0]) is set. User can set TGLPINSEL (TIMERx_CTL[21]) to choose Tx or Tx_EXT as toggle-output pin. Thus, the toggle-output signal on TM0 ~ TM3 pin is high and changing back and forth with 50% duty cycle.

6.7.5.6 Continuous Counting Mode

If the timer controller is configured at continuous counting mode (TIMERx_CTL[28:27] is 11) and CNTEN (TIMERx_CTL[30]) is set, the timer counter starts up counting. Once the CNT (TIMERx_CNT[23:0]) value reaches CMPDAT (TIMERx_CMP[23:0]) value, the TIF (TIMERx_INTSTS[0]) will be set to 1 and CNT value keeps up counting. In the meantime, if the INTEN (TIMERx_CTL[29]) is enabled, the timer interrupt signal is generated and sent to NVIC to inform CPU also. User can change different CMPDAT value immediately without disabling timer counting and restarting timer counting in this mode.

For example, CMPDAT value is set as 80, first. The TIF will set to 1 when CNT value is equal to 80, timer counter is kept counting and CNT value will not goes back to 0, it continues to count 81, 82, 83, ... to 224 -1, 0, 1, 2, 3, ... to 224 -1 again and again. Next, if user programs CMPDAT value as 200 and clears TIF, the TIF will set to 1 again when CNT value reaches to 200. At last, user programs CMPDAT as 500 and clears TIF, the TIF will set to 1 again when CNT value reaches to 500.

In this mode, the timer counting is continuous. So, this operation mode is called as continuous counting mode.

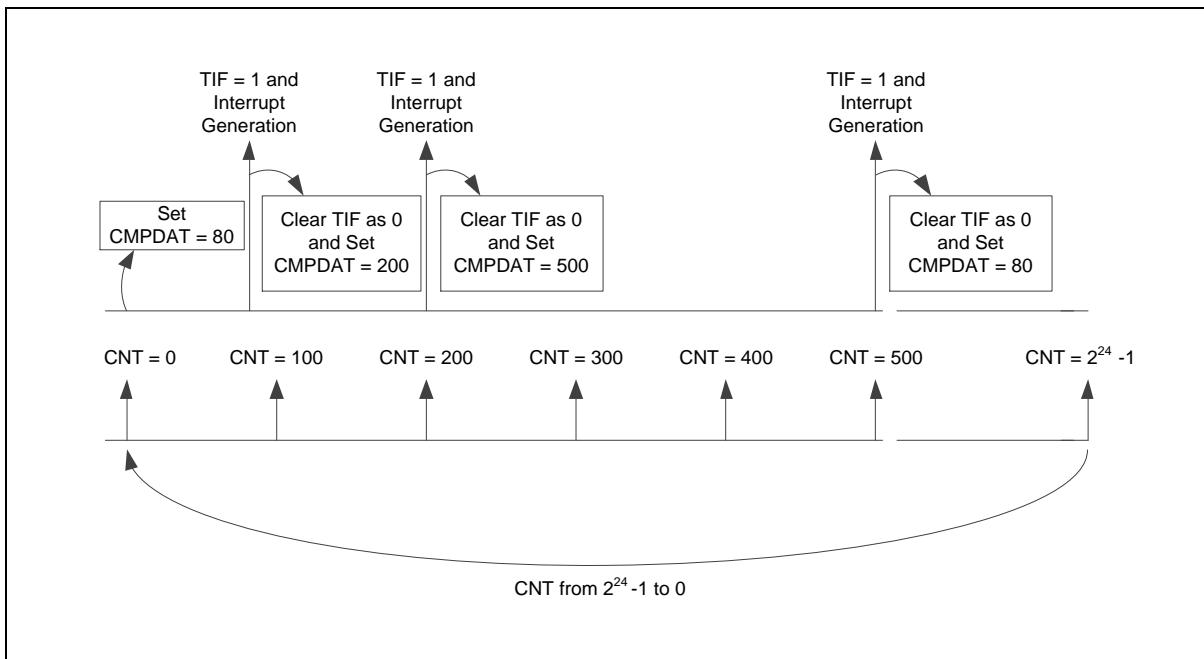

Figure 6.7-8 Continuous Counting Mode

6.7.5.7 Event Counting Mode

The timer controller also provides an application which can count the input event from TMx (x= 0~3)

pin and the number of event will reflect to CNT (TIMERx_CNT[23:0]) value. It is also called as event counting function. In this function, EXTCNTEN (TIMERx_CTL[24]) should be set and the timer peripheral clock source should be set as PCLK.

If ECNTSSEL (TIMERx_EXTCTL[16]) is 0, the event counter source is from external TMx pin. User can enable or disable TMx pin de-bounce circuit by setting CNTDBEN (TIMERx_EXTCTL[7]). The input event frequency should be less than 1/3 PCLK if TMx pin de-bounce disabled or less than 1/8 PCLK if TMx pin de-bounce enabled to assure the returned CNT value is correct, and user can also select edge detection phase of TMx pin by setting CNTPHASE (TIMERx_EXTCTL[0]) bit.

In event counting mode, the timer counting operation mode can be selected as one-shot, periodic and continuous counting mode to counts the counter value CNT (TIMERx_CNT[23:0]) for TMx pin.

If ECNTSSEL (TIMERx_EXTCTL[16]) is 1, the event counter source will generate by USB device detect the start-of-frame (SOF) packet. Please refer USB device specifications.

6.7.5.8 External Capture Mode

The event capture function is used to load CNT (TIMERx_CNT[23:0]) value to CAPDAT (TIMERx_CAP[23:0]) value while edge transition detected on TMx_EXT (x= 0~3) pin. In this mode, CAPFUNCS (TIMERx_EXTCTL[4]) should be as 0 to trigger event capture function and the timer peripheral clock source should be set as PCLK.

If CAPSRC (TIMERx_CTL[22]) is 0, the capture event is triggered by TMx_EXT pin transition. User can enable or disable TMx_EXT pin de-bounce circuit by setting CAPDBEN (TIMERx_EXTCTL[6]). The transition frequency of TMx_EXT pin should be less than 1/3 PCLK if TMx_EXT pin de-bounce disabled or less than 1/8 PCLK if TMx_EXT pin de-bounce enabled to assure the capture function can be work normally, and user can also select edge transition detection of TMx_EXT pin by setting CAPEDGE (TIMERx_EXTCTL[14:12]).

In event capture mode, user does not consider what timer counting operation mode is selected, the capture event occurred only if edge transition on TMx_EXT pin is detected.

Users can enable CAPIEN (TIMERx_EXTCTL[5]) to use capture interrupt fuction. When the TMx_EXT edge transition meets setting, CAPIF is high.

Users must consider the Timer will keep register TIMERx_CAP unchanged and drop the new capture value, if the CPU does not clear the CAPIF status.

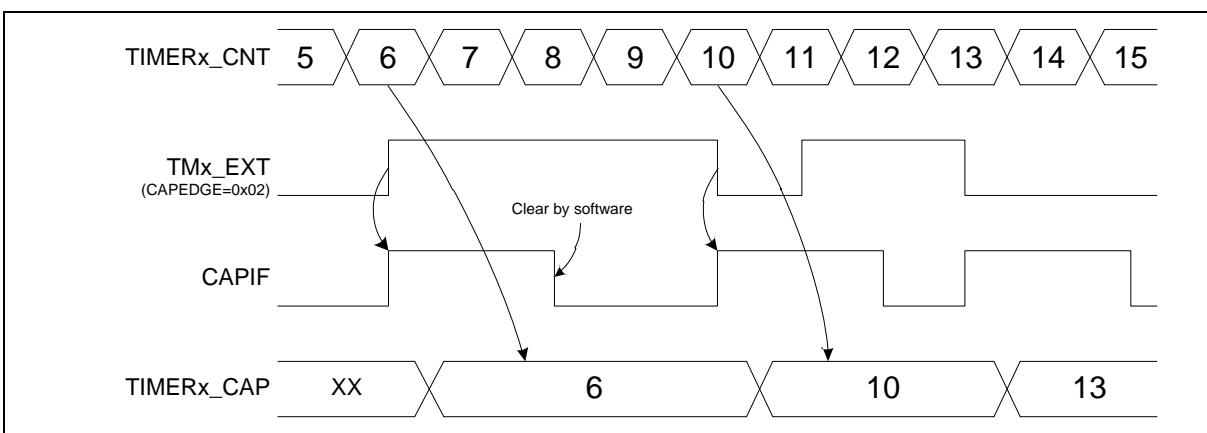

Figure 6.7-9 External Capture Mode

If CAPSRC (TIMERx_CTL[22]) is 1, the capture event can be triggered by internal output signal transition on ACMP0 if ACMPSSEL (TIMERx_EXTCTL[8]) is 0, or ACMP1 if ACMPSSEL (TIMERx_EXTCTL[8]) is 1.

6.7.5.9 External Reset Counter Mode

The timer controller also provides reset counter function to reset CNT (TIMERx_CNT[23:0]) value

while capture event is generated. In this mode, CAPFUNCS (TIMERx_EXTCTL[4]) should be as 1 for select TMx_EXT transition or internal ACMPx output signal to trigger reset counter value.

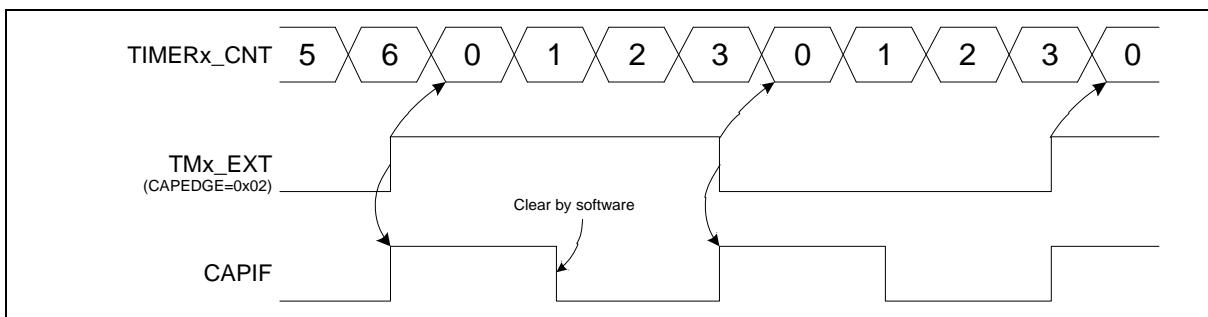

Figure 6.7-10 External Reset Counter Mode

6.7.5.10 Timer Trigger Function

The timer controller provides timer time-out interrupt or capture interrupt to trigger EPWM, ADC, DAC and PDMA. If TRGSSEL (TIMERx_TRGCTL[0]) is 0, time-out interrupt signal is used to trigger EPWM, ADC, DAC and PDMA. If TRGSSEL (TIMERx_TRGCTL[0]) is 1, capture interrupt signal is used to trigger EPWM, ADC, DAC and PDMA.

When the TRGPWM (TIMERx_TRGCTL[1]) is set, if the timer interrupt signal is generated, the timer controller will generate a trigger pulse as EPWM external clock source.

When the TRGADC (TIMERx_TRGCTL[2]) is set, if the timer interrupt signal is generated, the timer controller will trigger ADC to start converter.

When the TRGDAC (TIMERx_TRGCTL[3]) is set, if the timer interrupt signal is generated, the timer controller will trigger DAC to start converter.

When the TRGPDMA (TIMERx_TRGCTL[4]) is set, if the timer interrupt signal is generated, the timer controller will trigger PDMA.

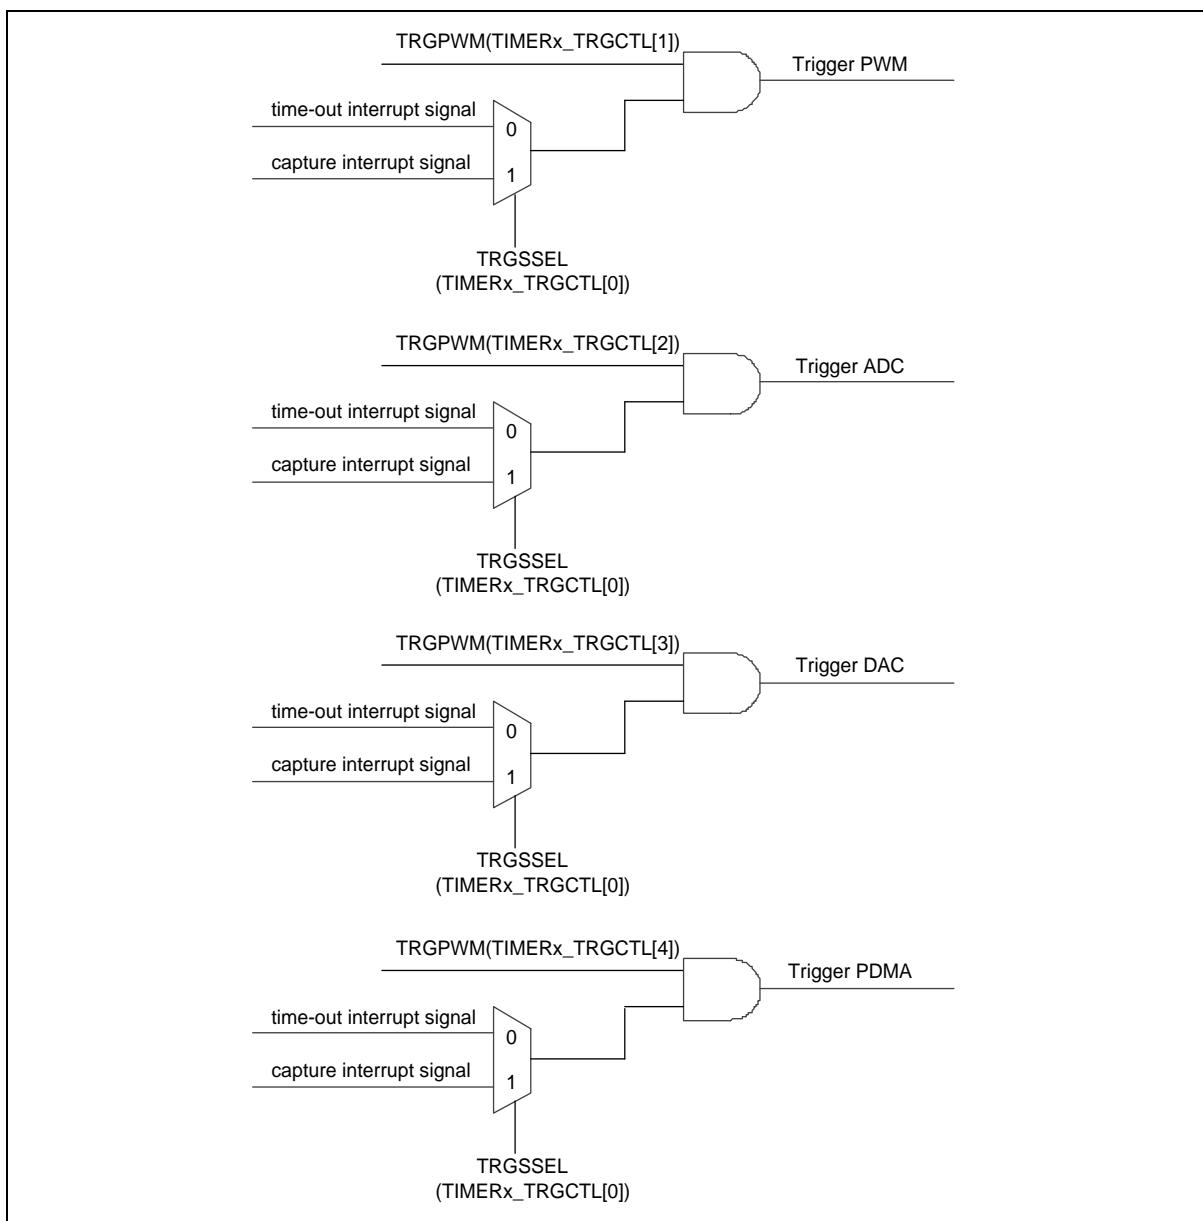

Figure 6.7-11 Internal Timer Trigger

6.7.5.11 Inter-Timer Trigger Capture Mode

In this mode, the Timer0/2 will be forced in event counting mode, counting with external event, and will generate an internal signal (INTR_TMR_TRG) to trigger Timer1/3 start or stop counting. Also, the Timer1/3 will be forced in capture mode and start/stop trigger-counting by Timer0/2 counter status.

Setting Timer0 Inter-timer Trigger Capture enabled, trigger-counting capture function is forced on Timer1. Setting Timer2 Inter-Timer Trigger enabled, trigger-counting capture function is forced on Timer3.

Start Trigger

While INTRGEN (TIMERx_CTL[19]) in Timer0/2 is set, the Timer0/2 will make a rising-edge transition of INTR_TMR_TRG while Timer0/2 24-bit counter value (CNT) is counting from 0x0 to 0x1 and Timer1/3 counter will start counting immediately and automatically.

Stop Trigger

When Timer0/2 CNT reaches the Timer0/2 CMPDAT value, the Timer0/2 will make a falling-edge transition of INTR_TMR_TRG. Then Timer0/2 counter mode function will be disabled and INTRGEN (TIMERx_CTL[19]) will be cleared by hardware then Timer1/3 will stop counting also. At the same time, the Timer1/3 CNT value will be saved into Timer1/3 CAPDAT (TIMERx_CAP[23:0]).

User can use inter-timer trigger mode to measure the period of external event (TMx) more precisely. Figure 6.7-12 shows the sample flow of Inter-Timer Trigger Capture Mode for Timer0 as event counting mode and Timer1 as trigger-counting capture mode.

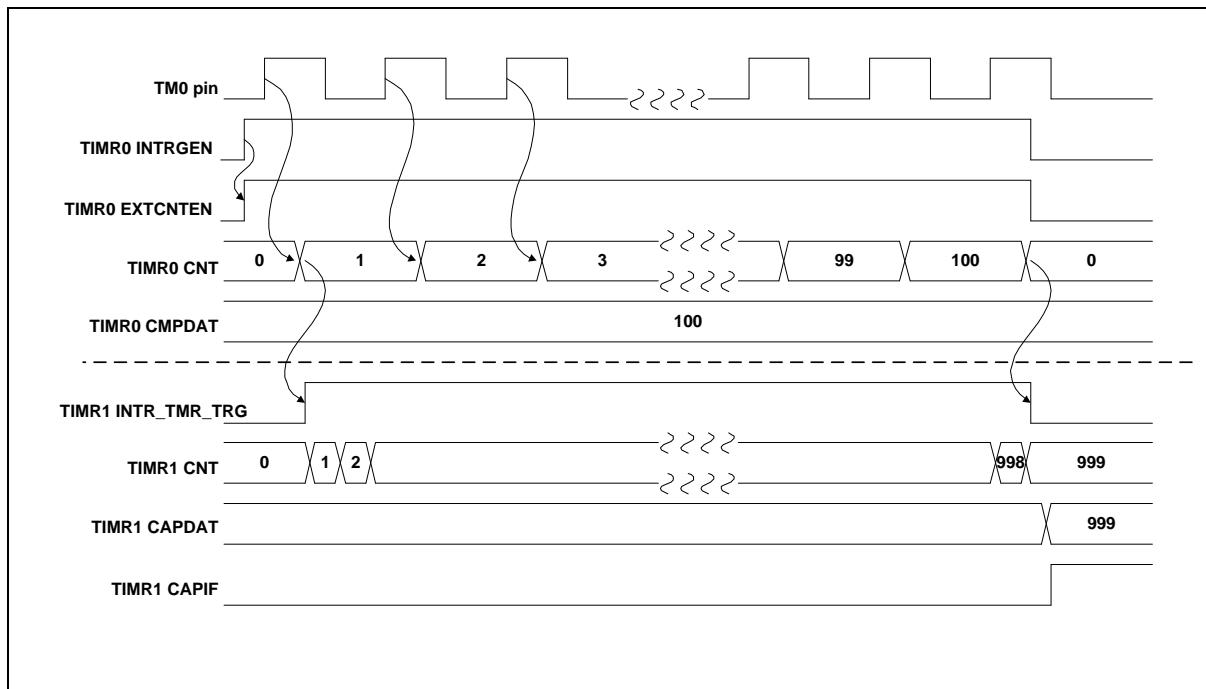

Figure 6.7-12 Inter-Timer Trigger Capture Timing

6.7.6 PWM Functional Description

6.7.6.1 PWM Prescale

The PWM prescale is used to divide clock source, and the clock of PWM counter is divided by (CLKPSC + 1). The prescale is set by CLKPSC (TIMERx_PWMCLKPSC[11:0]). Figure 6.7-13 shows an example of PWM prescale waveform in up count type.

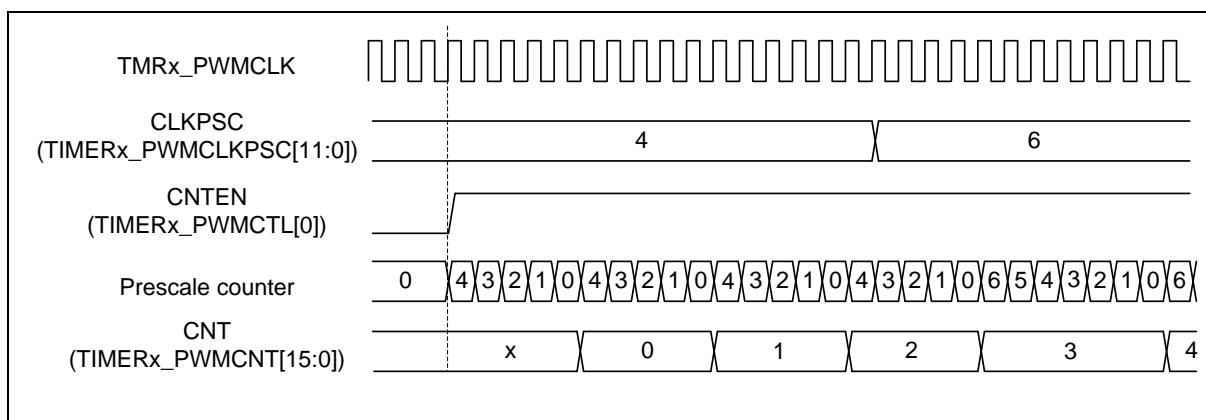

Figure 6.7-13 PWM Prescale Waveform in Up Count Type

6.7.6.2 PWM Counter

The PWM supports three counter types operation: up count, down count and up-down count types.

6.7.6.3 Up Count Type

When PWM counter is set to up count type, CNTTYPE (TIMERx_PWMCTL[2:1]) is 0x0, it starts up-counting from 0 to PERIOD (TIMERx_PWMPERIOD[15:0]). The current counter value can be read from the CNT (TIMERx_PWMCNT[15:0]). PWM generates a zero point event when both counter and prescale counts to 0. PWM generates a period point event when the counter counts to PERIOD and prescale counts to 0. Figure 6.7-14 shows an example of PWM up count type, where PWM period time is (PERIOD+1) * (CLKPSC+1) * TMRx_PWMCLK.

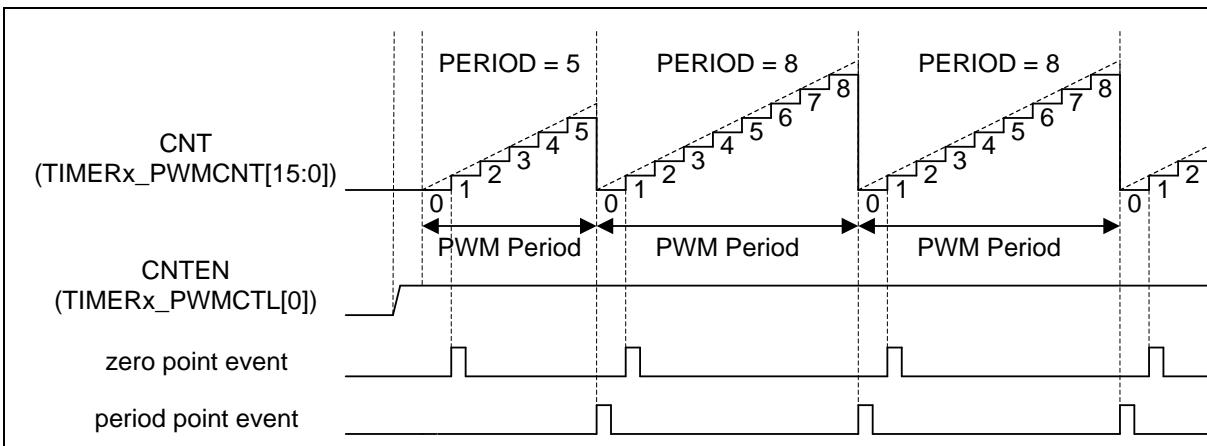

Figure 6.7-14 PWM Up Count Type

6.7.6.4 Down Count Type

When PWM counter is set to down count type, CNTTYPE (TIMERx_PWMCTL[2:1]) is 0x1, it starts down-counting from PERIOD to 0, current counter value can be read from CNT (TIMERx_PWMCNT[15:0]). PWM generates a zero point event when both counter and prescale counts to 0. PWM generates a period point event when the counter counts to PERIOD and prescale counts to 0. Figure 6.7-15 is an example of PWM down count type, where PWM period time is (PERIOD+1) * (CLKPSC+1) * TMRx_PWMCLK.

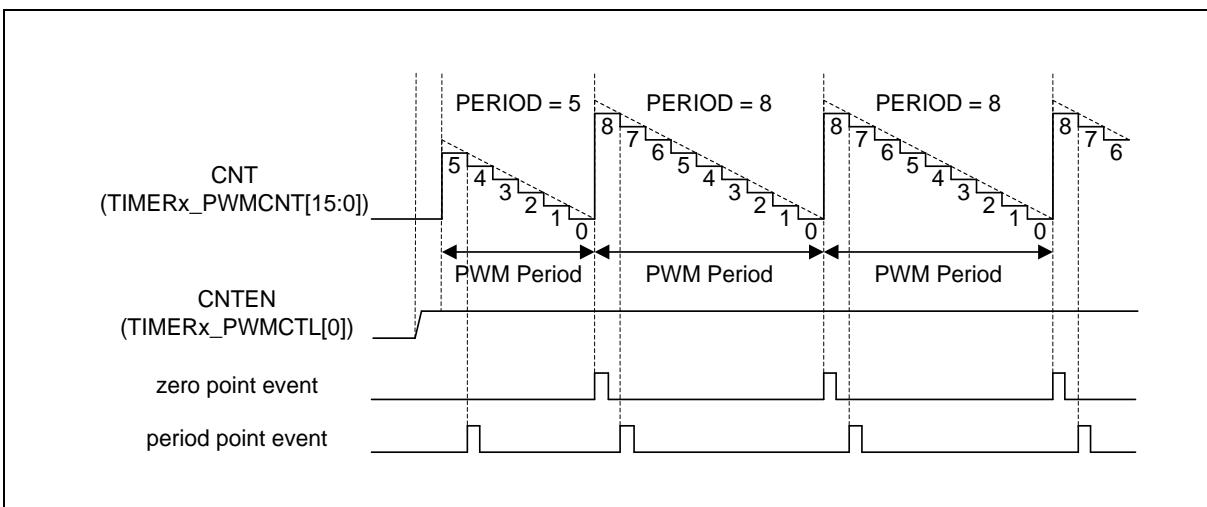

Figure 6.7-15 PWM Down Count Type

6.7.6.5 Up-Down Count Type

When PWM counter is set to up-down count type, CNTTYPE (TIMERx_PWMCTL[2:1]) is 0x2, it starts counting up from 0 to PERIOD and then starts counting down to 0. The current counter value can be read from CNT (TIMERx_PWMCNT[15:0]). PWM generates a zero point event when both counter and prescale counts to 0. PWM generates a center point event when the counter counts to PERIOD and prescale counts to 0. Figure 6.7-16 shows an example of PWM up-down count type, where PWM period time is $(2 * \text{PERIOD}) * (\text{CLKPSC}+1) * \text{TMRx_PWMCLK}$. The DIRF (TIMERx_PWMCNT[16]) is counter direction indicator flag, where 1 is up counting, and 0 is down counting.

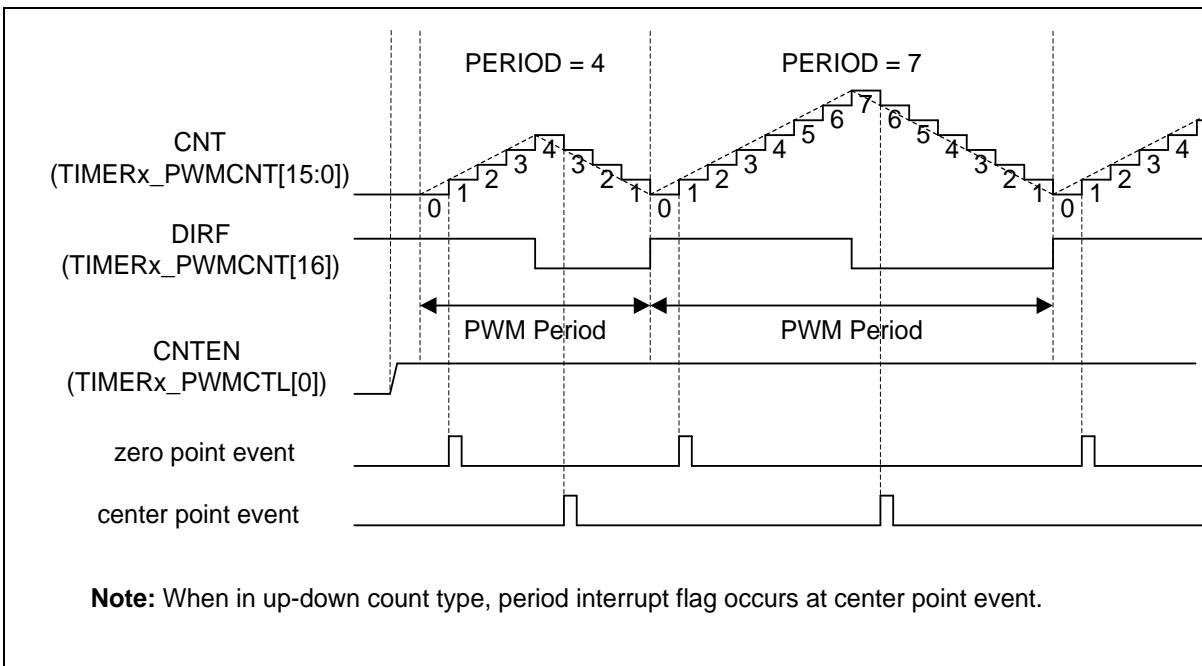

Figure 6.7-16 PWM Up-Down Count Type

6.7.6.6 PWM Counter Operation mode

The PWM counter supports two operation modes: one-shot mode and auto-reload mode. PWM counter will operate in one-shot mode if CNTMODE (TIMERx_PWMCTL[3]) bit is set to 1, and operate in auto-reload mode if CNTMODE bit is set to 0.

In both modes, CMP (TIMERx_PWMCMPPDAT[15:0]) and PERIOD (TIMERx_PWMPPERIOD[15:0]) should be written first and then set CNTEN (TIMERx_PWMCTL[0]) bit to 1 to start counter running.

In one-shot mode, PWM counter value will reload to default value according count type after one PWM period is completed. User can write CMP to continuous one-shot operation to generate next one-shot pulse once no matter current one-shot counter is running or completed.

In auto-reload mode, PWM counter is continuous running with current active PERIOD and CMP. If user sets PERIOD to zero in auto-reload mode, PWM counter value will reload to default value according count type after one PWM period is completed.

6.7.6.7 PWM Comparator

The CMP (TIMERx_PWMCMPPDAT[15:0]) is comparator register of PWM. The CMP value is continuously compared to the corresponding counter value. When the counter is equal to CMP, PWM generates a compared point event. This event will generate PWM output pulse, interrupt signal or trigger ADC start convert. In up-down count type, two events will be generated in a PWM period as shown in Figure 6.7-17. The CMPPU is up count compared point event and CMPPD is down count

compared point event.

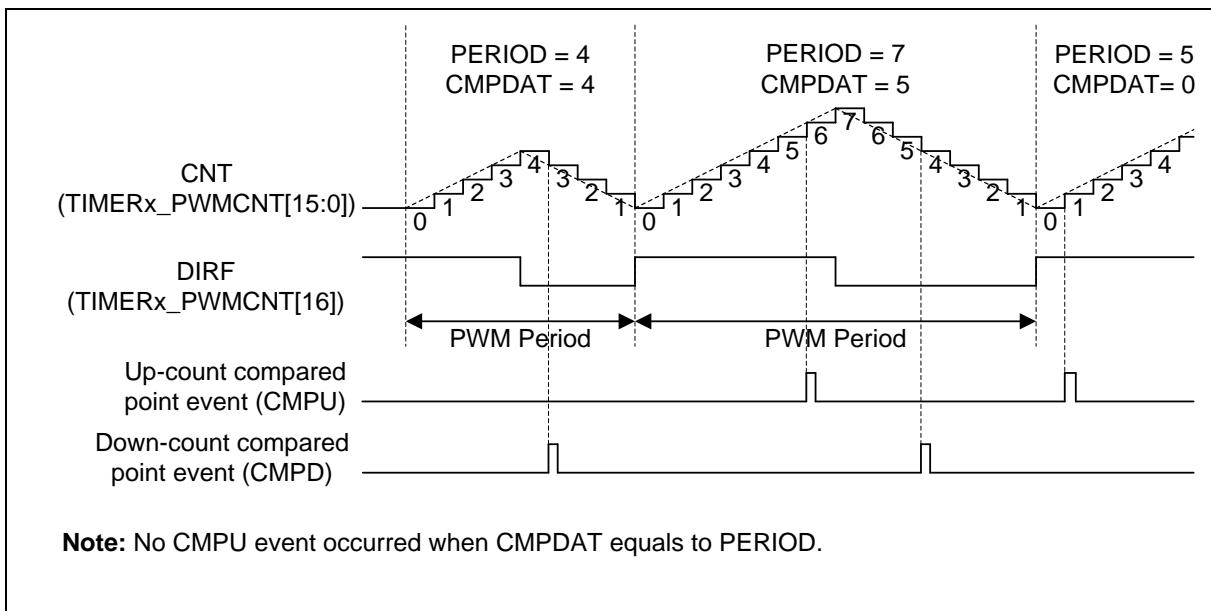

Figure 6.7-17 PWM Comparator Events in Up-Down Count Type

6.7.6.8 Period Loading Mode

When the IMMLDEN (TIMERx_PWMCTL[9]) bit set to 0, PWM operates at period loading mode. The PWM provides PBUF (TIMERx_PWPMPBUF[15:0]) is the active PERIOD buffer register and CMPBUF (TIMERx_PWMCPMBUF[15:0]) is the active CMP buffer register. In period loading mode, both PERIOD (TIMERx_PWMPPERIOD[15:0]) and CMP (TIMERx_PWMCPMDAT[15:0]) will load to their active PBUF and CMPBU register while each PWM period is completed. Figure 6.7-18 shows period loading timing of up count type, where PERIOD DATA0 denotes the initial data of PERIOD, PERIOD DATA1 denotes the first updated PERIOD data by user and so on, CMP also follows this rule. The following steps are the sequence of Figure 6.7-18.

1. User writes CMP DATA1 to CMP at point 1.
2. Period loading CMP DATA1 to CMPBUF at the end of PWM period at point 2.
3. User writes PERIOD DATA1 to PERIOD at point 3.
4. Period loading PERIOD DATA1 to PBUF at the end of PWM period at point 4.
5. User writes PERIOD DATA2 to PERIOD at point 5.
6. Period loading PERIOD DATA2 to PBUF at the end of PWM period at point 6.

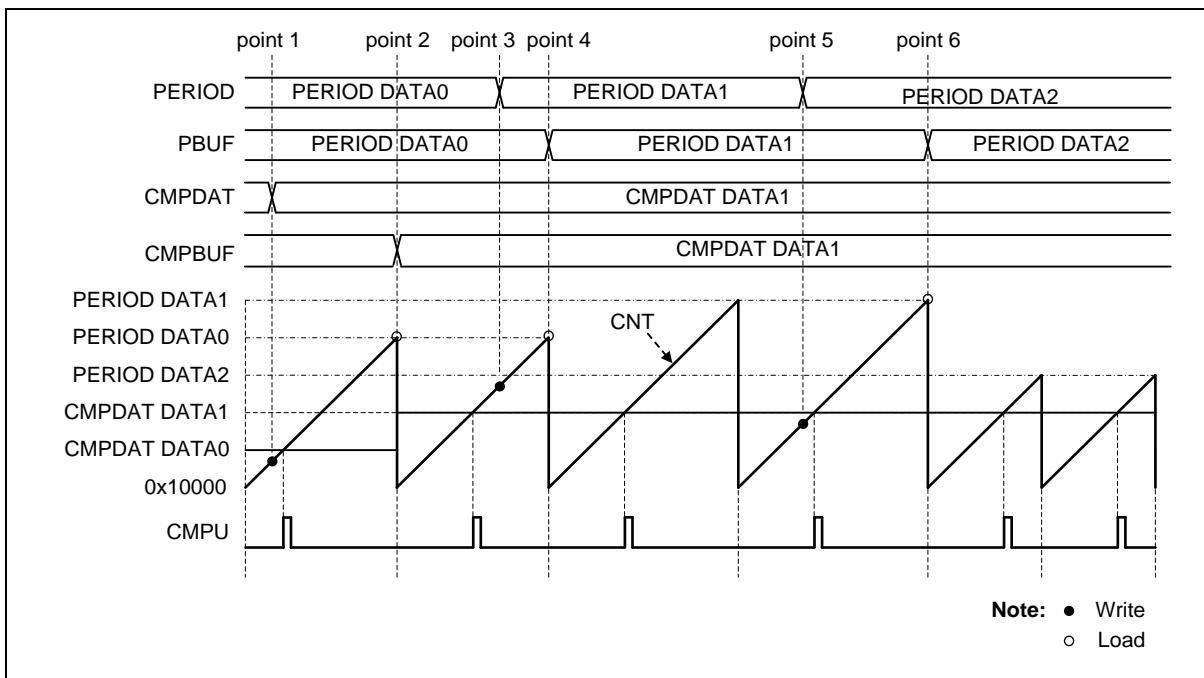

Figure 6.7-18 Period Loading Mode with Up Count Type

6.7.6.9 Immediately Loading Mode

When the IMMLDEN (TIMERx_PWMCTL[9]) bit is set to 1, PWM operates at immediately loading mode. In immediately loading mode, when user update PERIOD (TIMERx_PWMPERIOD[15:0]) or CMP (TIMERx_PWMCMPPDAT[15:0]), PERIOD or CMP will be load to active PBUF (TIMERx_PWMMPBUF[15:0]) or CMPBUF (TIMERx_PWMCMPPBUF[15:0]) after current counter count is completed. If the update PERIOD value is less than current counter value, counter will count wraparound. The following steps are the sequence of Figure 6.7-19.

1. User writes CMP DATA1 at point 1 and hardware will load CMP DATA1 to CMPBUF after current counter count is completed.
2. User writes PERIOD DATA1 at point 2 and PERIOD DATA1 is greater than current counter value, PWM counter will continuously count until equal to PERIOD DATA1 to complete one PWM period.
3. User writes PERIOD DATA2 at point 3 and PERIOD DATA2 is less than the current counter value, PWM counter will continuously count to maximum counter value 0xFFFF and wraparound from 0x10000 to PERIOD DATA2 to complete one PWM period.

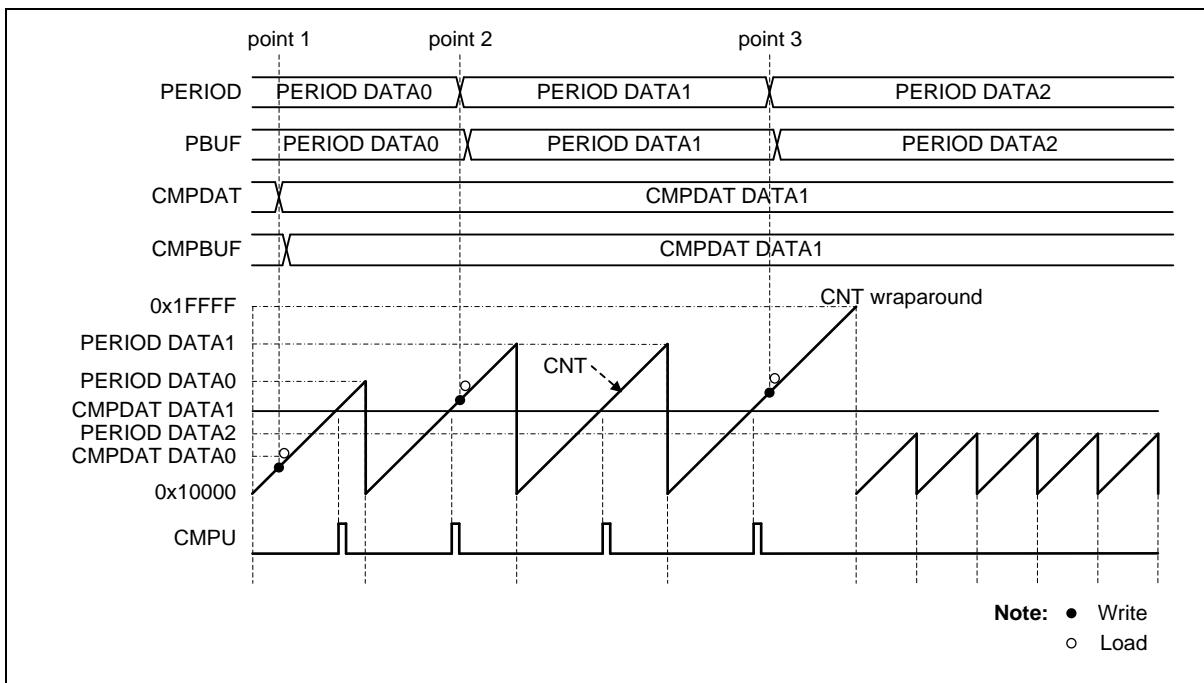

Figure 6.7-19 Immediately Loading Mode with Up Count Type

6.7.6.10 PWM Pulse Generator

PWM pulse generator uses counter and comparator events to generate PWM output pulse. The events are zero point and period point in up count type and down count type, center point in up-down count type and counter equal to comparator point in three count types.

Each event point can generate PWM output waveform in different count type as shown in Figure 6.7-20, Figure 6.7-21 and Figure 6.7-22.

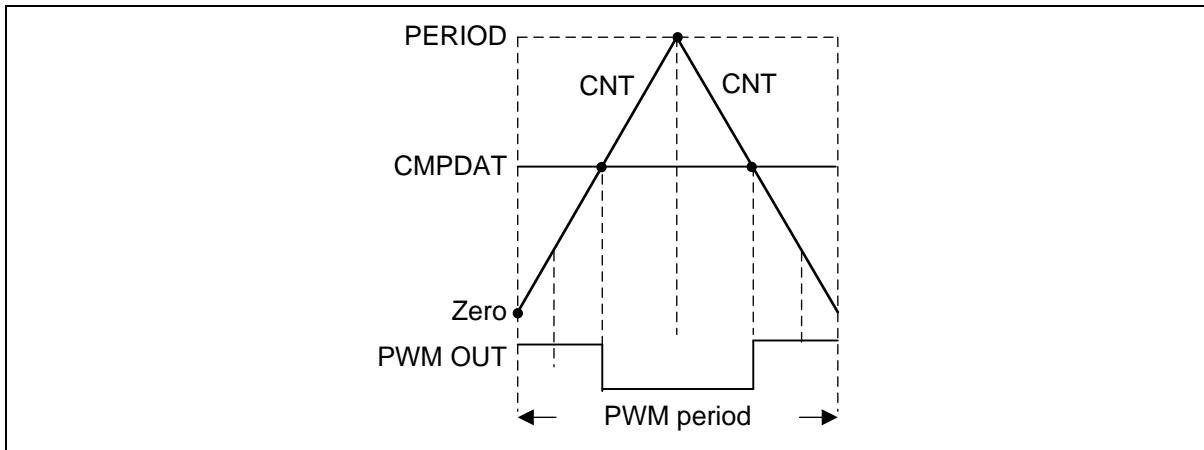

Figure 6.7-20 PWM Pulse Generation in Up-Down Count Type

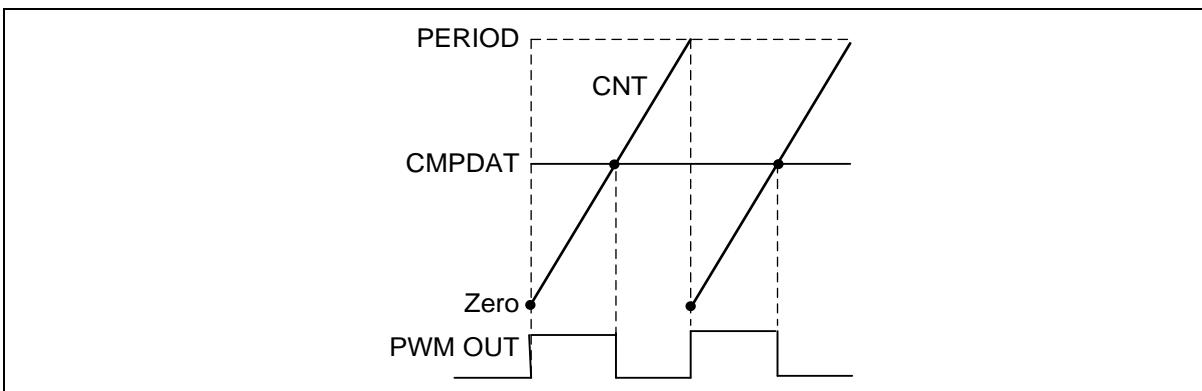

Figure 6.7-21 PWM Pulse Generation in Up Count Type

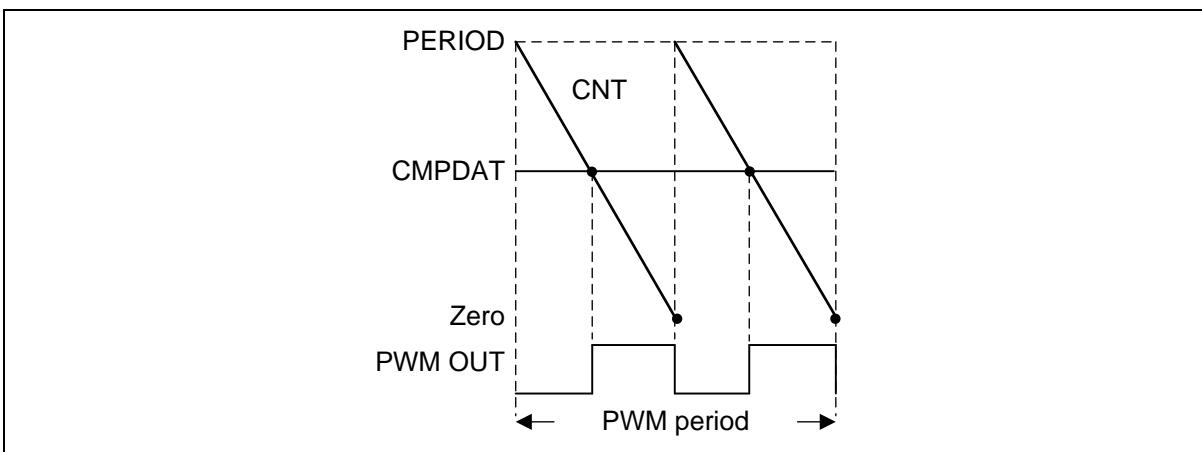

Figure 6.7-22 PWM Pulse Generation in Down Count Type

The PWM generation events may sometimes be generated at the same time, as the reason, events priority between different counter types should be take care are listed in Table 6.7-3, Table 6.7-4 and Table 6.7-5, event priority in up count type, event priority in down count type and event priority in up-down count type.

Priority	Zero And CMPU Point Event ($CMP = 0$)	PWM Output
1 (High)	Compare up event	Low
2 (Low)	Zero event	High

Table 6.7-3 PWM Pulse Generation Event Priority in Up Count Type

Priority	Zero And CMPD Point Event ($CMP = 0$)	PWM Output
1 (High)	Zero event	Low
2 (Low)	Compare down event	High
Priority	Period and CMPD point event ($CMP = PERIOD$)	PWM output

1 (High)	Compare down event	High
2 (Low)	Period event	Low

Table 6.7-4 PWM Pulse Generation Event Priority in Down Count Type

Priority	CMPU And CMPU Point Event (CMP = PERIOD)	PWM Output
1 (High)	Compare down event	High
2 (Low)	Compare up event	Low

Table 6.7-5 PWM Pulse Generation Event Priority in Up-Down Count Type

According to event priority limitation, PWM generator can support 0% and 100% duty cycle PWM output waveform only in up count and up-down count type. Figure 6.7-23 is an example about PWM duty cycle from 0% to 100% in up count type and up-down count type where PERIOD is 4 with different CMP value.

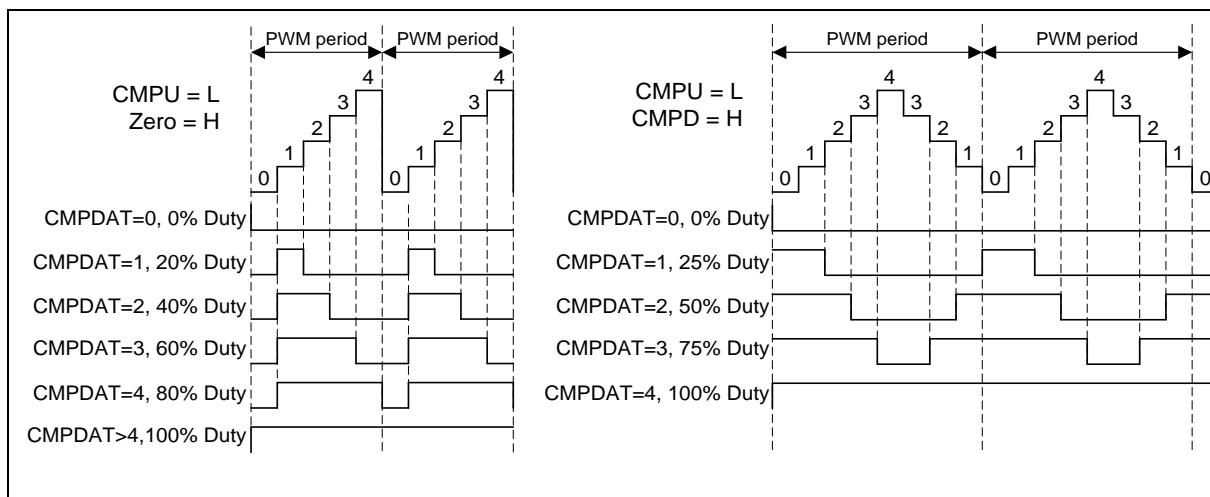

Figure 6.7-23 PWM 0% to 100% Duty Cycle in Up Count Type and Up-Down Count Type

6.7.6.11 PWM Output Mode

The PWM supports two output modes: independent mode which may be applied to DC motor system, complementary mode with dead-time insertion which may be used in the application of AC induction motor and permanent magnet synchronous motor.

6.7.6.12 Independent Mode

When OUTMODE (TIMERx_PWMCTL[16]) bit is set to 0, PWM output operates in independent mode. In this mode, both PWMx_CH0 and PWMx_CH1 can output the same waveform as shown in Figure 6.7-24.

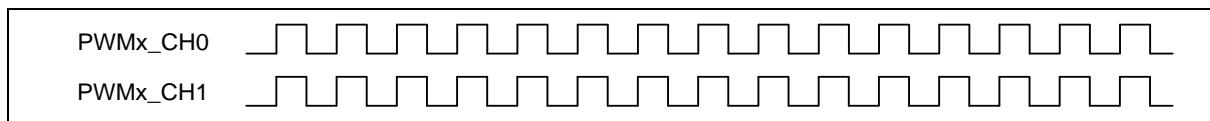

Figure 6.7-24 PWM Independent Mode Output Waveform

6.7.6.13 Complementary Mode

When OUTMODE (TIMERx_PWMCTL[16]) bit is set to 1, PWM output operates in complementary mode. In this mode, both PWMx_CH0 and PWMx_CH1 can output waveform and PWMx_CH1 must always be the complement of PWMx_CH0 as shown in Figure 6.7-25.

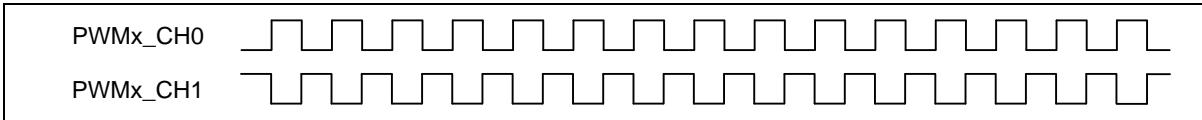

Figure 6.7-25 PWM Complementary Mode Output Waveform

6.7.6.14 PWM Output Control

After PWM pulse generator, there are four steps to control output waveform in independent output mode and five control steps in complementary output mode. User can set POEN0 (TIMERx_PWMPOEN[0]) and POEN1 (TIMERx_PWMPOEN[1]) 1 to enable PWMx_CH0 and PWMx_CH1 output waveform.

In Independent mode, there are mask control, brake control, polarity control and output enable control to control output waveform as shown in Figure 6.7-26.

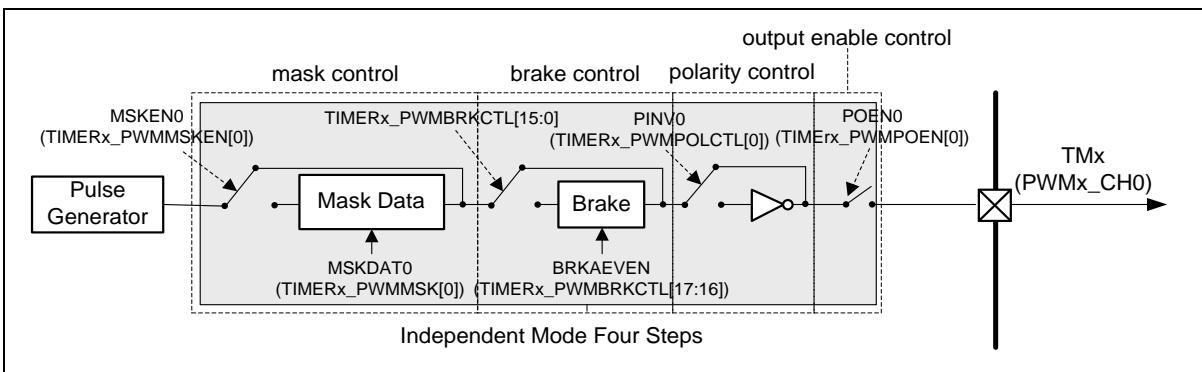

Figure 6.7-26 PWMx_CH0 Output Control in Independent Mode

In complementary mode, there are dead-time insertion control and four control steps the same as independent mode to control PWMx_CH0 and PWMx_CH1 outputs as shown in Figure 6.7-27.

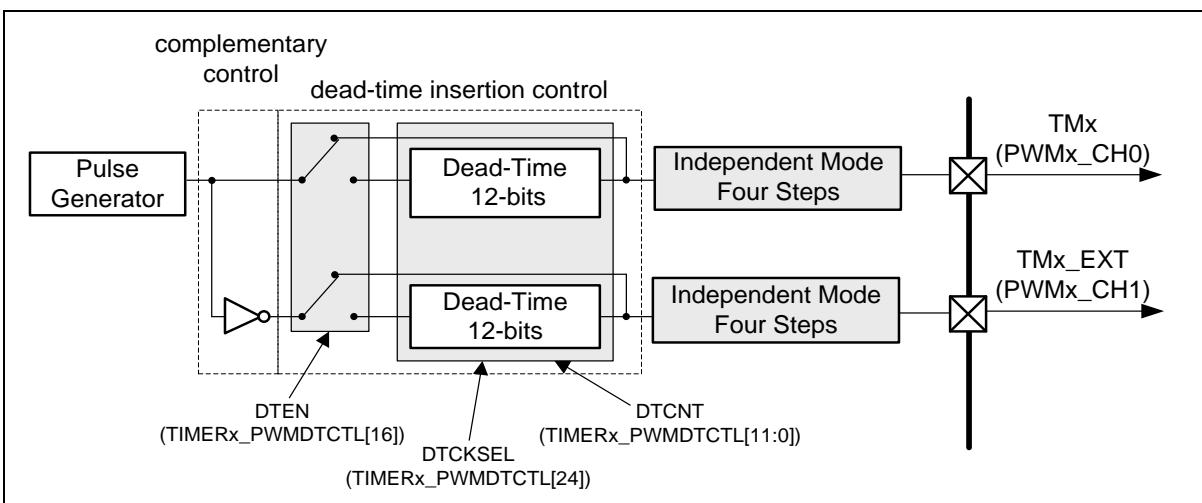

Figure 6.7-27 PWMx_CH0 and PWMx_CH1 Output Control in Complementary Mode

6.7.6.15 Dead-Time Insertion Control

In the complementary application, the complementary channels may drive the external devices like power switches. The dead-time generator inserts a low level interval between complementary outputs PWMx_CH0 and PWMx_CH1 as shown in Figure 6.7-28. User sets DTEN (TIMERx_PWMDTCTL[16]) bit to enable dead-time control function, DTCNT (TIMERx_PWMDTCTL[11:0]) and DTCKSEL (TIMERx_PWMDTCTL[24]) to control dead-time interval. The dead-time interval can be calculated from the following formula:

Dead-time interval = (DTCNT + 1) * TMRx_PWMCLK period, if DTCKSEL is 0

Dead-time interval = (DTCNT + 1) * TMRx_PWMCLK * (CLKPSC + 1) period, if DTCKSEL is 1

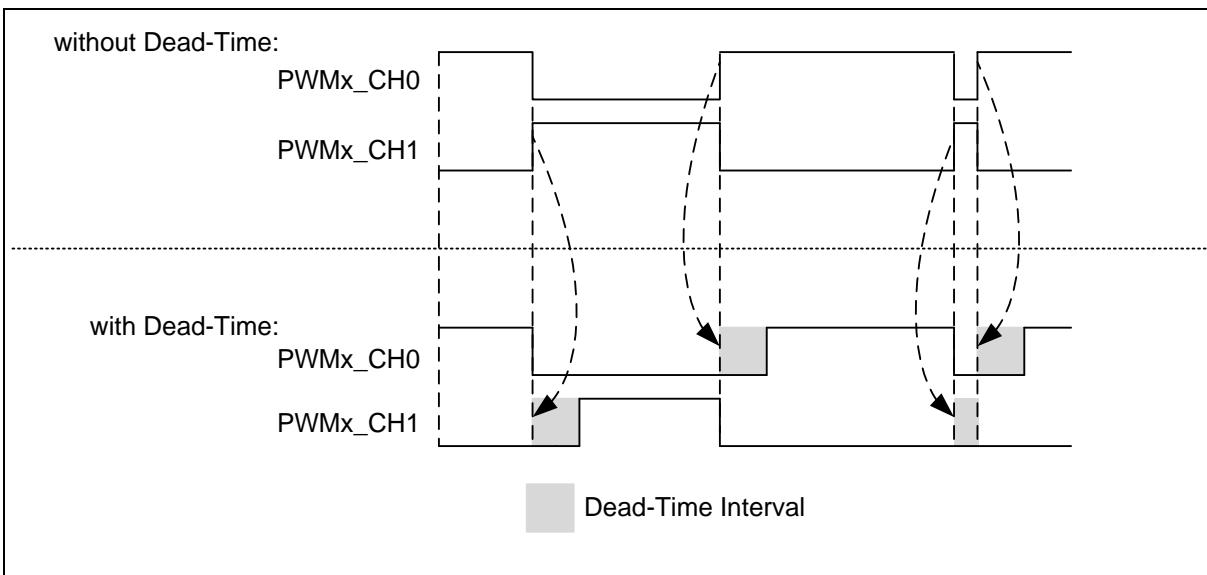

Figure 6.7-28 Dead-Time Insertion

6.7.6.16 PWM Mask Output Control

PWMx_CH0/CH1 output value can be masked to specified logic states by setting MSKEN0/1 (TIMERx_PWMMSKEN[1:0]) and MSKDAT0/1 (TIMERx_PWMMSK[1:0]). The PWM output mask function is useful when controlling various types of Electrically Commutated Motor (ECM) like a BLDC motor. Figure 6.7-29 shows an example of PWM output mask control in PWMx_CH0 and PWMx_CH1.

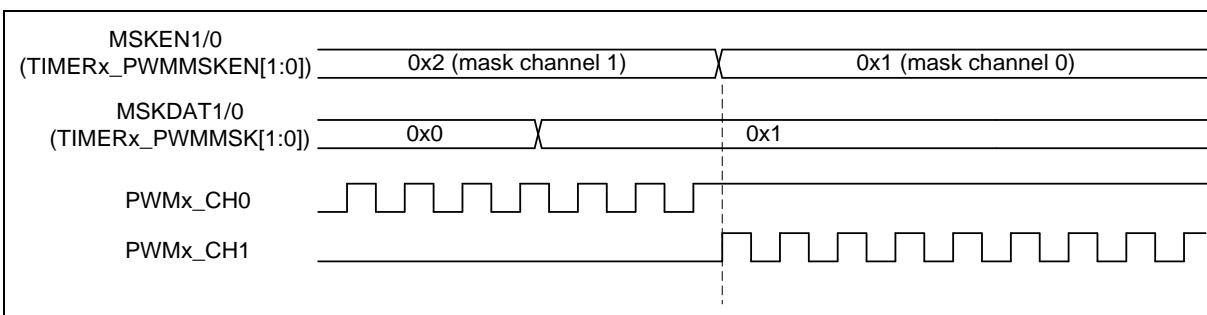

Figure 6.7-29 PWM Output Mask Control Waveform

6.7.6.17 PWM Brake Control

Each PWM generator supports one external input brake pin as PWM brake event source. User can select active brake pin source in BKPINSRC (TIMERx_PWBKF[17:16]), PWMx_BRAKEy (y=0,1 and y=0,1). There is a 3-bit noise filter counter to filter the external brake pin signal. User can enable BRKNFEN (TIMERx_PWBKF[0]) to enable the brake pin noise filter function and the noise filter

sampling clock can be selected by setting BRKNFSEL (TIMERx_PWMBNF[3:1]) to fit different noise properties. Moreover, by setting BRKFCNT (TIMERx_PWMBNF[6:4]), user can define by how many sampling clock cycles a filter will recognize the effective edge of the brake pin signal. In addition, brake pin polar can be inversed by setting BRKPINV (TIMERx_PWMBNF[7]) to realize the polarity setup for the brake control signals. Set BRKPINV to 0, brake event will occurred when PWM_x_BRAKE_x pin status from low to high; set BRKPINV to 1, brake event will occurred when PWM_x_BRAKE_x pin status from high to low.

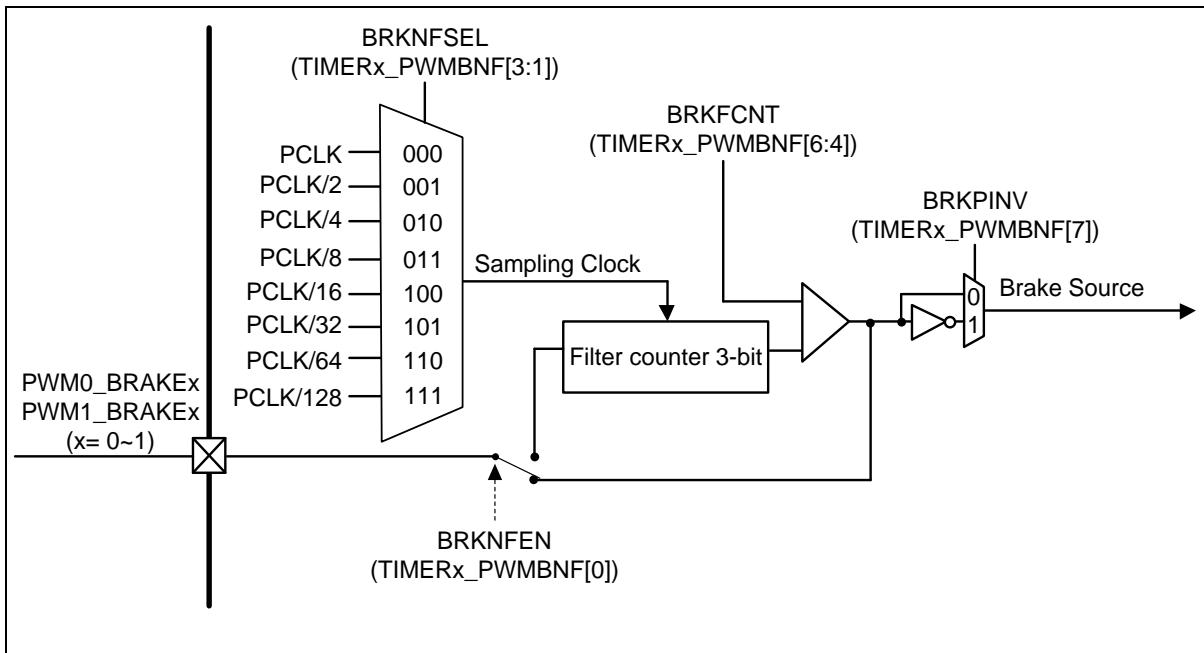

Figure 6.7-30 Brake Pin Noise Filter Block Diagram

User can set BRKAEVEN (TIMERx_PWMRKCTL[17:16]) for PWM_x_CH0 output state and BRKAODD (TIMERx_PWMRKCTL[19:18]) for PWM_x_CH1 output state when PWM brake event happened. There are two brake detector sources, edge detect brake source and level detect brake source when brake event happened. Figure 6.7-31 shows the brake event block diagram for PWM_x_CH0 and PWM_x_CH1.

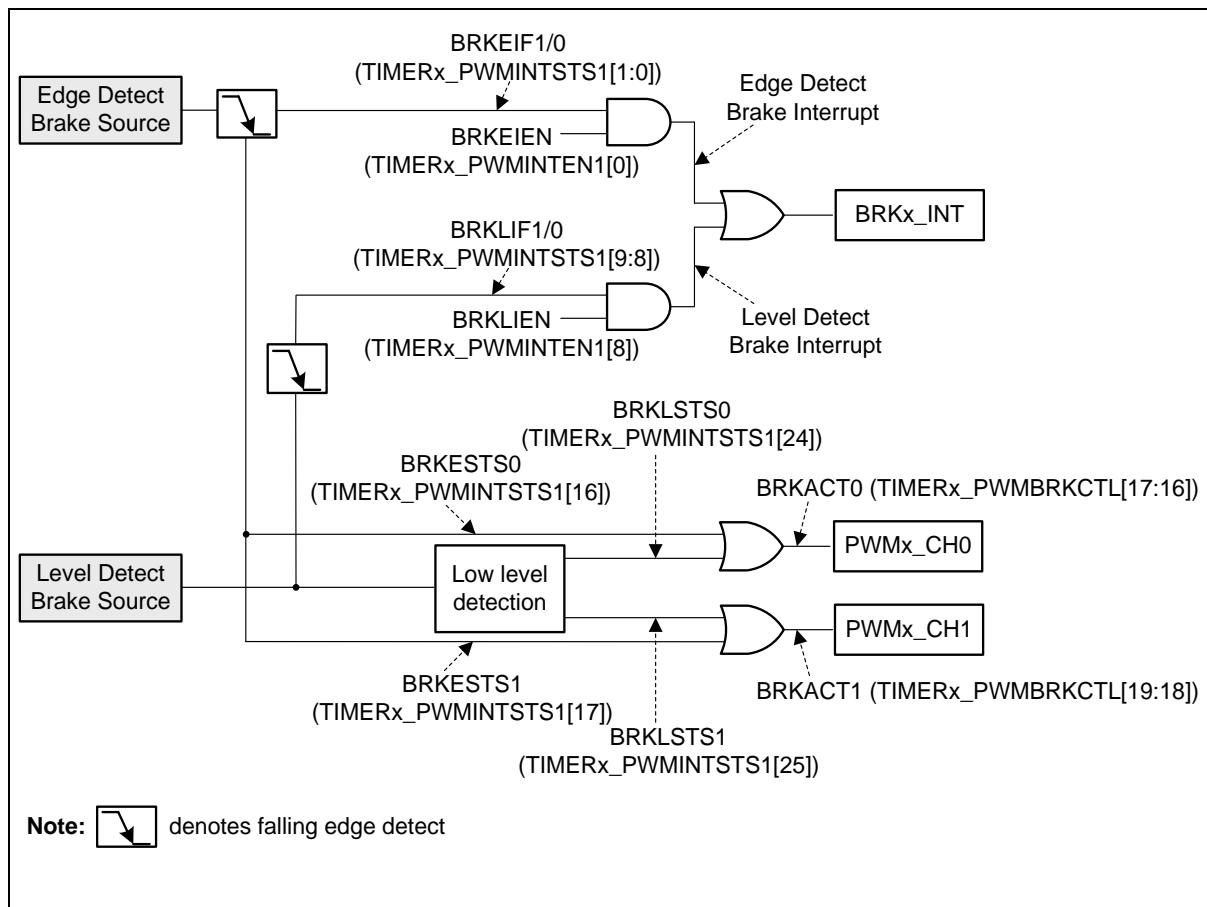

Figure 6.7-31 Brake Event Block Diagram for PWMx_CH0 and PWMx_CH1

When the edge detector detects the brake signal, the brake function generates interrupt status for PWMx_CH1/0 is BRKEIF1/0 (TIMERx_PWMINTSTS1[1:0]) and brake event status for PWMx_CH1/0 is BRKESTS1/0 (TIMERx_PWMINTSTS1[17:16]). The interrupt status BRKEIF1/0 can be cleared by writing 1 to it, and the brake event status BRKESTS1/0 will keep until the next PWM period starts when corresponding BRKEIF1/0 flag has been cleared and PWM generator can resume normal output.

Figure 6.7-32 shows an example of edge detector brake waveform for PWMx_CH0 and PWMx_CH1. In this case, the edge detect brake source has occurred twice for the brake events. When the first brake event occurs, both of the BRKEIF0 and BRKEIF1 flags are set and BRKESTS0 and BRKESTS1 status are also set to indicate brake state of PWMx_CH0 and PWMx_CH1. For the first occurring event, user writes 1 to clear the BRKEIF0. After that, the BRKESTS0 is cleared by hardware at the next start of the PWM period and the PWMx_CH0 outputs the normal waveform even though the edge brake event is still occurring. At the same time, BRKESTS1 keep 1 and PWMx_CH1 keep outputs low in brake state. The second event also triggers the same flags, but at this time, user writes 1 to clear the BRKEIF1. Afterward, PWMx_CH1 outputs normally at the next start of the PWM period.

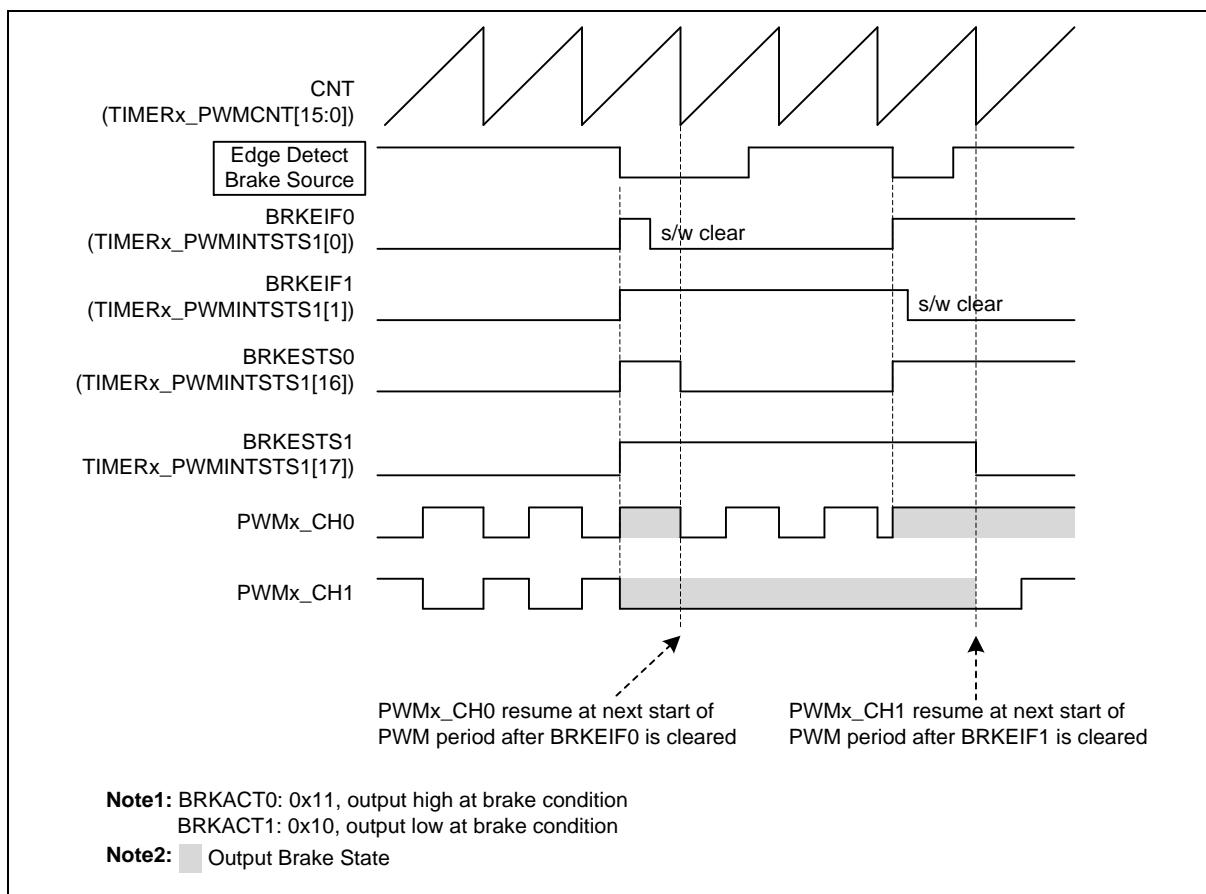

Figure 6.7-32 Edge Detector Brake Waveform for PWMx_CH0 and PWMx_CH1

When the level detector detects the brake signal, the brake function generates interrupt status for PWMx_CH1/0 is BRKLIF1/0 (TIMERx_PWMINTSTS1[9:8]) and brake event status for PWMx_CH1/0 is BRKLSTS1/0 (TIMERx_PWMINTSTS1[25:24]). The interrupt status BRKLIF1/0 can be cleared by writing 1 to it, and the brake event status BRKLSTS1/0 will be cleared only when current period is completed and brake condition removed, then PWM generator can resume normal output when next PWM period starts.

Figure 6.7-33 shows an example of level detector brake waveform for PWMx_CH0 and PWMx_CH1. In this case, the BRKLIF0 and BRKLIF1 can only indicate the brake event has occurred, writes 1 to clear this flags will not affect BRKLSTS0 and BRKLSTS1 brake event status. Both BRKLSTS0 and BRKLSTS1 brake states will automatically cleared at the start of the next PWM period when level brake condition has released no matter BRKLIF0 and BRKLIF1 status.

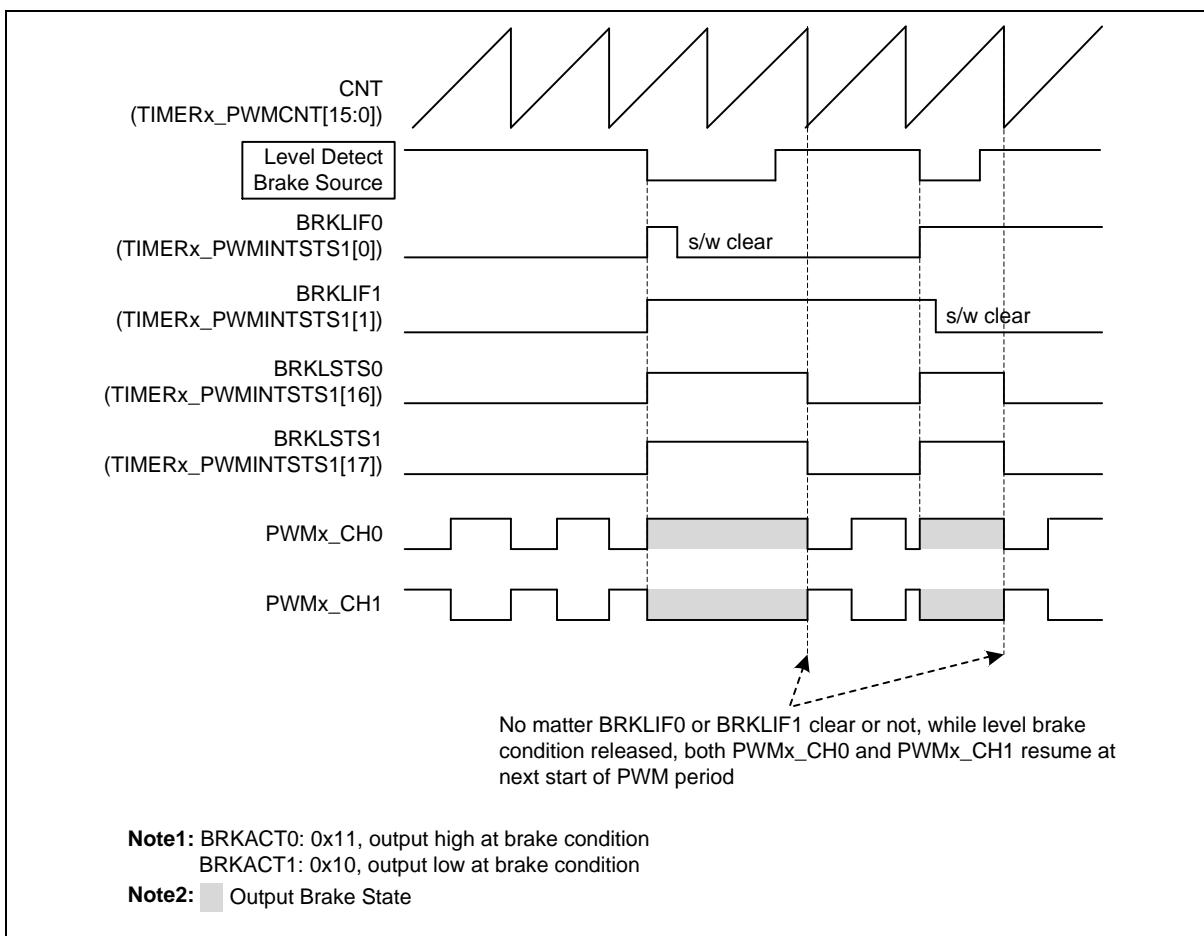

Figure 6.7-33 Level Detector Brake Waveform for PWMx_CH0 and PWMx_CH1

The two kinds of detectors detect the same five brake sources as shown in Figure 6.7-34: one from PWM_x_BRAKEy (x=0,1 and y=0,1) external input signals, two from internal ACMP comparator signals, one from system fail events and one from software trigger brake event. ACMP brake sources will be detected only when internal ACMP0_O or ACMP1_O signal from low to high.

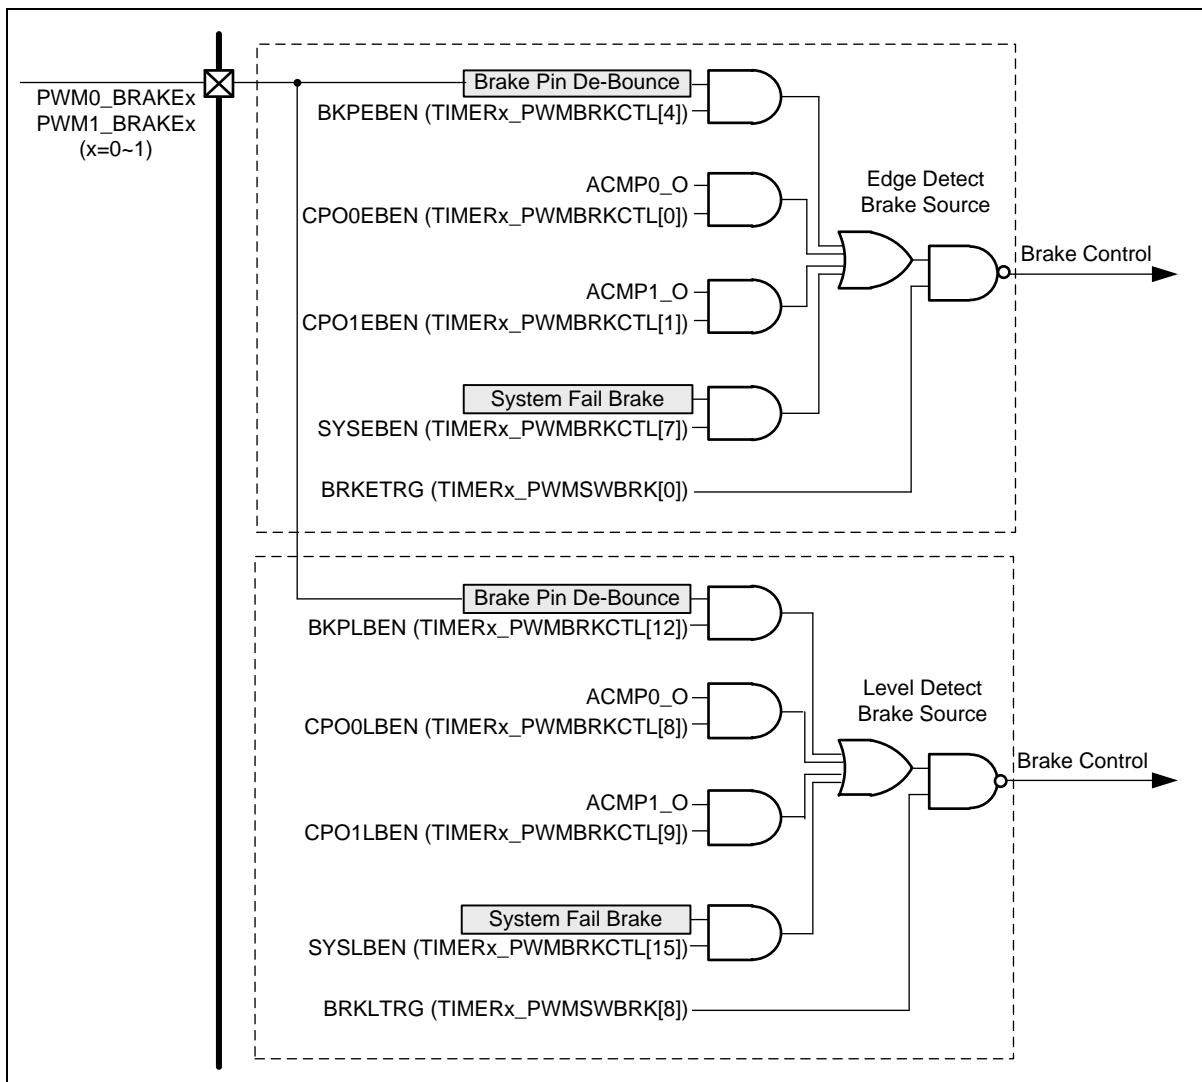

Figure 6.7-34 Brake Source Block Diagram

Among the above described brake sources, the brake source coming from system fail event can be specified to one of the different system fail conditions, these conditions include clock fail, BOD detect, SRAM parity error and CPU lockup as shown in Figure 6.7-35.

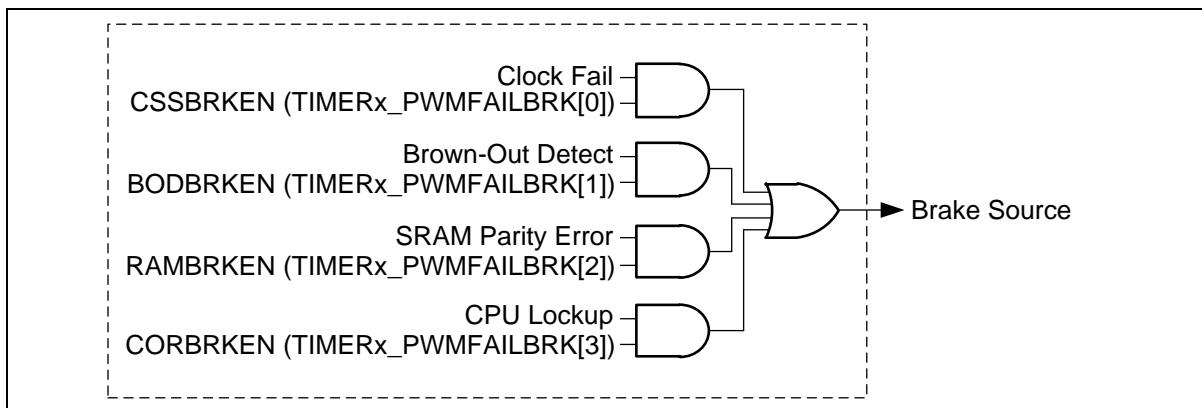

Figure 6.7-35 System Fail Brake Block Diagram

6.7.6.18 Polarity Control

Each PWMx_CH0 and PWMx_CH1 has an independent polarity control to configure the polarity of the active state of PWM output. User can control polarity state of PWMx_CH0 on PINV0 (TIMERx_PWMPOLCTL[0]) and PWMx_CH1 on PINV1 (TIMERx_PWMPOLCTL[1]). Figure 6.7-36 shows the PWMx_CH0 and PWMx_CH1 output with polarity control and dead-time insertion.

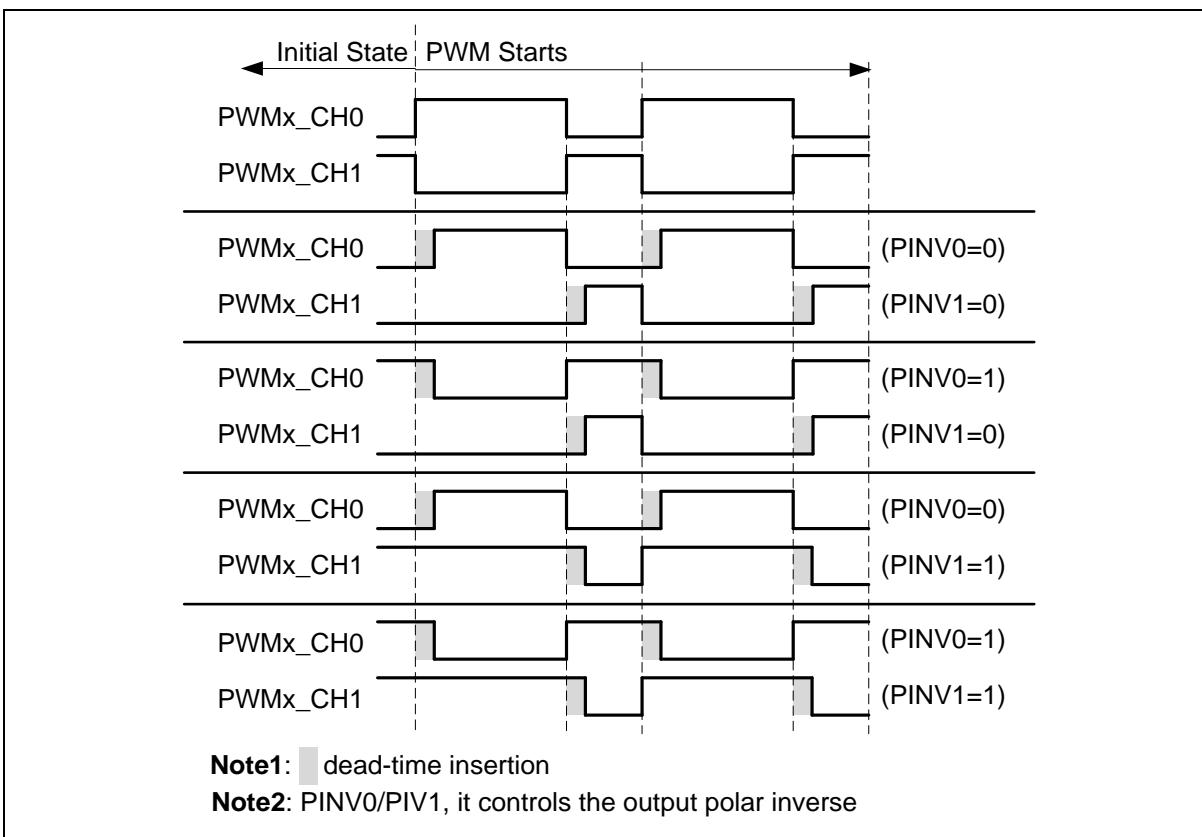

Figure 6.7-36 PWMx_CH0 and PWMx_CH1 Polarity Control with Dead-Time Insertion

6.7.6.19 PWM Interrupt Generator

There are independent interrupts for each PWM as shown in Figure 6.7-37.

The PWM interrupt (PWMx_INT) comes from PWM complementary pair events. The counter can generate the zero point interrupt flag ZIF (TIMERx_PWMINTSTS0[0]) and the period point interrupt flag PIF (TIMERx_PWMINTSTS0[1]). When counter equals to the comparator value stored in CMP (TIMERx_PWMCMPPDAT[15:0]), the different interrupt flags will be triggered depending on the counting direction. If counter and CMP matched occurs at up-count direction, the comparator up interrupt flag CMPIUF (TIMERx_PWMINTSTS0[2]) is set and if matched at down-count direction, the comparator down interrupt flag CMPDIF (TIMERx_PWMINTSTS0[3]) is set. If the corresponding interrupt enable bits are set, the interrupt trigger events will also generates interrupt signals. When PWM brake event occurred, the relatives interrupt event will be triggered according to PWM brake settings.

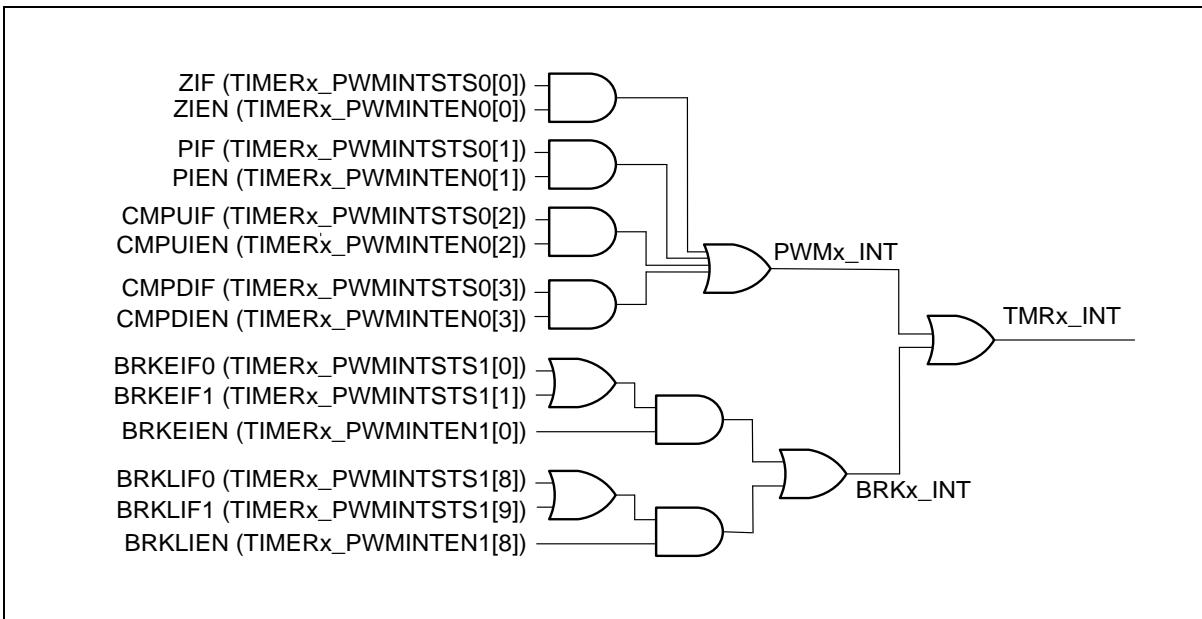

Figure 6.7-37 PWM Interrupt Architecture Diagram

6.7.6.20 PWM Trigger ADC Generator

PWM counter event can be one of the ADC conversion trigger source. User sets **TRGSEL (TIMERx_PWMADCTS[3:0])** to select which PWM counter event can trigger ADC conversion after **TRGEN (TIMERx_PWMADCTS [7])** is enabled.

There are five PWM counter events can be selected as the trigger source to start ADC conversion as shown in Figure 6.7-38.

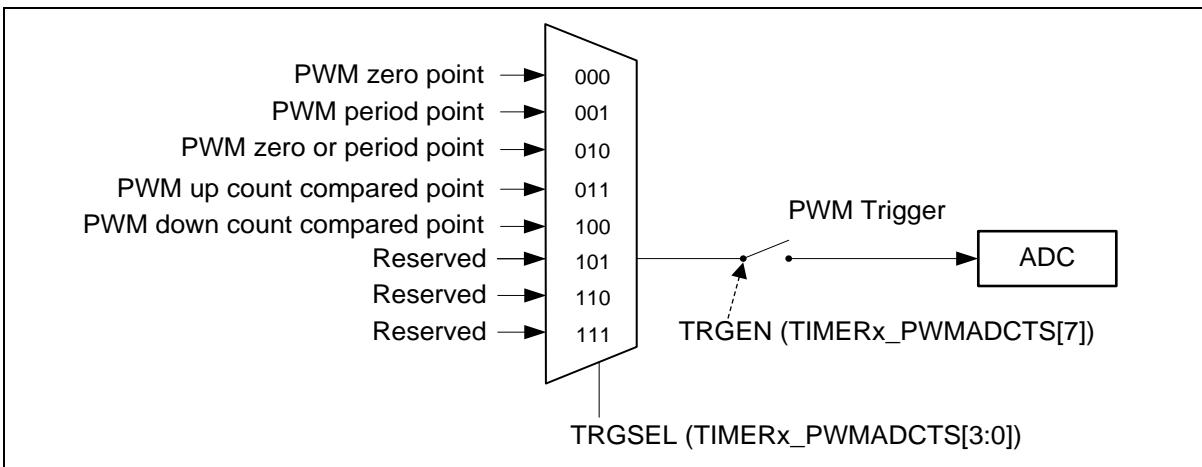

Figure 6.7-38 PWM Trigger ADC Block Diagram

6.7.7 Register Map

R: read only, W: write only, R/W: both read and write

PSC							

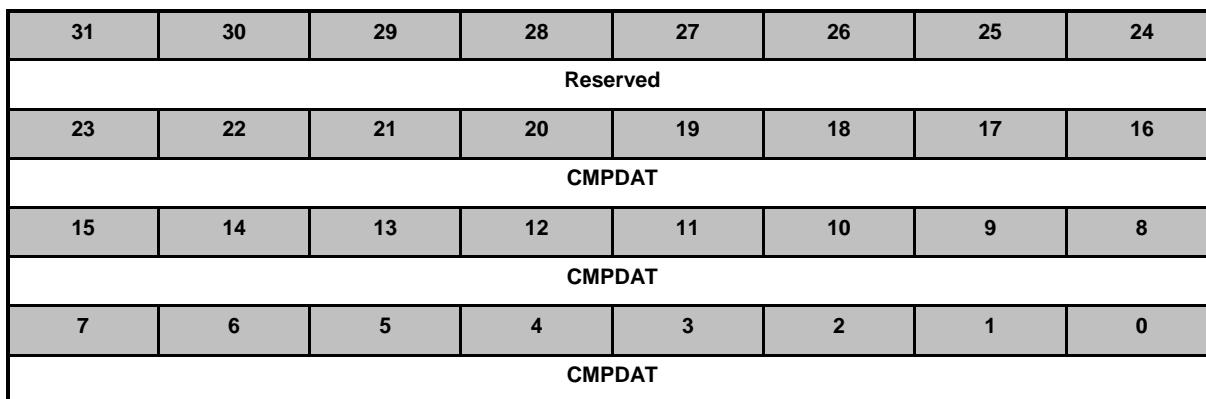

Bits	Description
[31]	ICEDEBUG ICE Debug Mode Acknowledge Disable Bit (Write Protect) 0 = ICE debug mode acknowledgement effects TIMER counting. TIMER counter will be held while CPU is held by ICE. 1 = ICE debug mode acknowledgement Disabled. TIMER counter will keep going no matter CPU is held by ICE or not. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[30]	CNTEN Timer Counting Enable Bit 0 = Stops/Suspends counting. 1 = Starts counting. Note1: In stop status, and then set CNTEN to 1 will enable the 24-bit up counter to keep counting from the last stop counting value. Note2: This bit is auto-cleared by hardware in one-shot mode (TIMER_CTL[28:27] = 00) when the timer time-out interrupt flag TIF (TIMERx_INTSTS[0]) is generated. Note3: Set enable/disable this bit needs 2 * TMR_CLK period to become active, user can read ACTSTS (TIMERx_CTL[25]) to check enable/disable command is completed or not.
[29]	INTEN Timer Interrupt Enable Bit 0 = Timer time-out interrupt Disabled. 1 = Timer time-out interrupt Enabled. Note: If this bit is enabled, when the timer time-out interrupt flag TIF is set to 1, the timer interrupt signal is generated and inform to CPU.
[28:27]	OPMODE Timer Counting Mode Select 00 = The timer controller is operated in One-shot mode.

		01 = The timer controller is operated in Periodic mode. 10 = The timer controller is operated in Toggle-output mode. 11 = The timer controller is operated in Continuous Counting mode.
[26]	Reserved	Reserved.
[25]	ACTSTS	<p>Timer Active Status Bit (Read Only) This bit indicates the 24-bit up counter status. 0 = 24-bit up counter is not active. 1 = 24-bit up counter is active.</p> <p>Note: This bit may active when CNT 0 transition to CNT 1.</p>
[24]	EXTCNTEN	<p>Event Counter Mode Enable Bit This bit is for external counting pin function enabled. 0 = Event counter mode Disabled. 1 = Event counter mode Enabled.</p> <p>Note: When timer is used as an event counter, this bit should be set to 1 and select PCLK as timer clock source.</p>
[23]	WKEN	<p>Wake-up Function Enable Bit If this bit is set to 1, while timer interrupt flag TIF (TIMERx_INTSTS[0]) is 1 and INTEN (TIMERx_CTL[29]) is enabled, the timer interrupt signal will generate a wake-up trigger event to CPU. 0 = Wake-up function Disabled if timer interrupt signal generated. 1 = Wake-up function Enabled if timer interrupt signal generated.</p>
[22]	CAPSRC	<p>Capture Pin Source Selection 0 = Capture Function source is from TMx_EXT (x= 0~3) pin. 1 = Capture Function source is from internal ACMP output signal. User can set ACMPSEL (TIMERx_EXTCTL[8]) to decide which internal ACMP output signal as timer capture source.</p>
[21]	TGLPINSEL	<p>Toggle-output Pin Select 0 = Toggle mode output to TMx (Timer Event Counter Pin). 1 = Toggle mode output to TMx_EXT (Timer External Capture Pin).</p>
[20]	PERIOSEL	<p>Periodic Mode Behavior Selection Enable Bit 0 = The behavior selection in periodic mode is Disabled. When user updates CMPDAT while timer is running in periodic mode, CNT will be reset to default value. 1 = The behavior selection in periodic mode is Enabled. When user update CMPDAT while timer is running in periodic mode, the limitations as bellows list, If updated CMPDAT value > CNT, CMPDAT will be updated and CNT keep running continually. If updated CMPDAT value = CNT, timer time-out interrupt will be asserted immediately. If updated CMPDAT value < CNT, CNT will be reset to default value.</p>
[19]	INTRGEN	<p>Inter-timer Trigger Mode Enable Bit Setting this bit will enable the inter-timer trigger capture function. The Timer0/2 will be in event counter mode and counting with external clock source or event. Also, Timer1/3 will be in trigger-counting mode of capture function. 0 = Inter-Timer Trigger Capture mode Disabled. 1 = Inter-Timer Trigger Capture mode Enabled.</p> <p>Note: For Timer1/3, this bit is ignored and the read back value is always 0</p>

[18:8]	Reserved	Reserved.
[7:0]	PSC	Prescale Counter Timer input clock or event source is divided by (PSC+1) before it is fed to the timer up counter. If this field is 0 (PSC = 0), then there is no scaling. Note: Update prescale counter value will reset internal 8-bit prescale counter and 24-bit up counter value.

Timer Comparator Register (TIMERx_CMP)

Register	Offset	R/W	Description	Reset Value
TIMER0_CMP	TMR01_BA+0x04	R/W	Timer0 Comparator Register	0x0000_0000
TIMER1_CMP	TMR01_BA+0x104	R/W	Timer1 Comparator Register	0x0000_0000
TIMER2_CMP	TMR23_BA+0x04	R/W	Timer2 Comparator Register	0x0000_0000
TIMER3_CMP	TMR23_BA+0x104	R/W	Timer3 Comparator Register	0x0000_0000

Bits	Description	
[31:24]	Reserved	Reserved.
[23:0]	CMPDAT	<p>Timer Comparator Value</p> <p>CMPDAT is a 24-bit compared value register. When the internal 24-bit up counter value is equal to CMPDAT value, the TIF (TIMERx_INTSTS[0] Timer Interrupt Flag) will set to 1.</p> <p>Time-out period = (Period of timer clock input) * (8-bit PSC + 1) * (24-bit CMPDAT).</p> <p>Note1: Never write 0x0 or 0x1 in CMPDAT field, or the core will run into unknown state.</p> <p>Note2: When timer is operating at continuous counting mode, the 24-bit up counter will keep counting continuously even if user writes a new value into CMPDAT field. But if timer is operating at other modes, the 24-bit up counter will restart counting from 0 and using newest CMPDAT value to be the timer compared value while user writes a new value into CMPDAT field.</p>

Timer Interrupt Status Register (TIMERx_INTSTS)

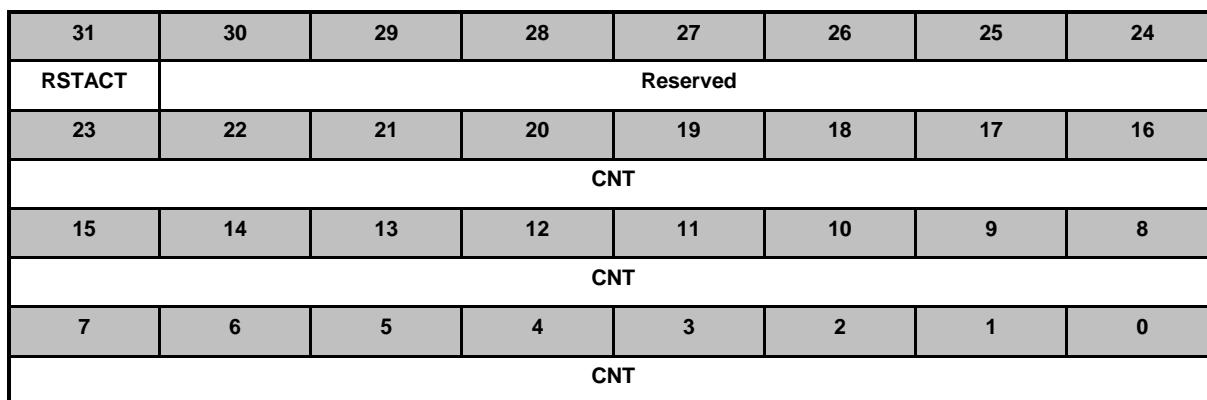

Register	Offset	R/W	Description	Reset Value
TIMER0_INTSTS	TMR01_BA+0x08	R/W	Timer0 Interrupt Status Register	0x0000_0000
TIMER1_INTSTS	TMR01_BA+0x108	R/W	Timer1 Interrupt Status Register	0x0000_0000
TIMER2_INTSTS	TMR23_BA+0x08	R/W	Timer2 Interrupt Status Register	0x0000_0000
TIMER3_INTSTS	TMR23_BA+0x108	R/W	Timer3 Interrupt Status Register	0x0000_0000

Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved						TWKF	TIF

Bits	Description	
[31:2]	Reserved	Reserved.
[1]	TWKF	<p>Timer Wake-up Flag</p> <p>This bit indicates the interrupt wake-up flag status of timer. 0 = Timer does not cause CPU wake-up. 1 = CPU wake-up from Idle or Power-down mode if timer time-out interrupt signal generated.</p> <p>Note: This bit is cleared by writing 1 to it.</p>
[0]	TIF	<p>Timer Interrupt Flag</p> <p>This bit indicates the interrupt flag status of Timer while 24-bit timer up counter CNT (TIMERx_CNT[23:0]) value reaches to CMPDAT (TIMERx_CMP[23:0]) value. 0 = No effect. 1 = CNT value matches the CMPDAT value.</p> <p>Note: This bit is cleared by writing 1 to it.</p>

Timer Data Register (TIMERx_CNT)

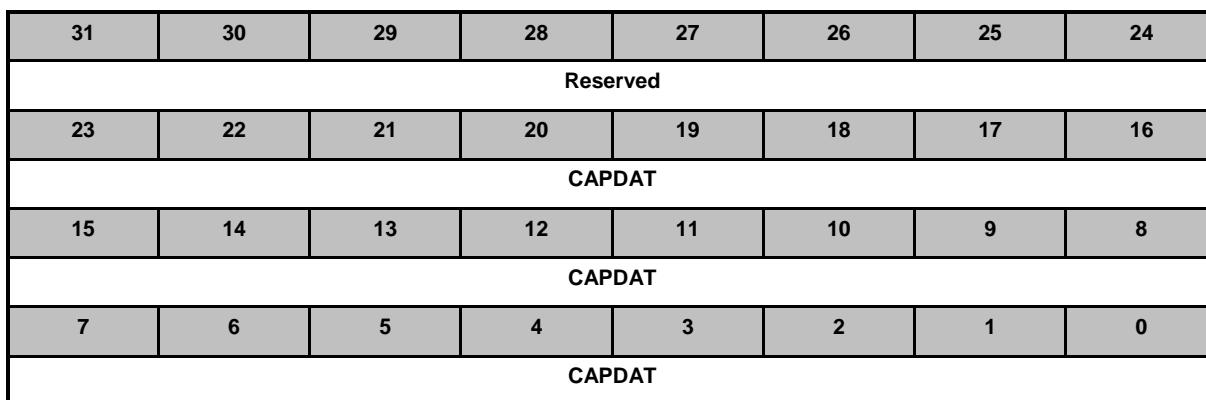

Register	Offset	R/W	Description	Reset Value
TIMER0_CNT	TMR01_BA+0x0C	R/W	Timer0 Data Register	0x0000_0000
TIMER1_CNT	TMR01_BA+0x10C	R/W	Timer1 Data Register	0x0000_0000
TIMER2_CNT	TMR23_BA+0x0C	R/W	Timer2 Data Register	0x0000_0000
TIMER3_CNT	TMR23_BA+0x10C	R/W	Timer3 Data Register	0x0000_0000

Bits	Description	
[31]	RSTACT	Timer Data Register Reset Active (Read Only) This bit indicates if the counter reset operation active. When user writes this CNT register, timer starts to reset its internal 24-bit timer up-counter to 0 and reload 8-bit pre-scale counter. At the same time, timer set this flag to 1 to indicate the counter reset operation is in progress. Once the counter reset operation done, timer clear this bit to 0 automatically. 0 = Reset operation is done. 1 = Reset operation triggered by writing TIMERx_CNT is in progress.
[30:24]	Reserved	Reserved.
[23:0]	CNT	Timer Data Register Read operation. Read this register to get CNT value. For example: If EXTCNTEN (TIMERx_CTL[24]) is 0, user can read CNT value for getting current 24-bit counter value. If EXTCNTEN (TIMERx_CTL[24]) is 1, user can read CNT value for getting current 24-bit event input counter value. Write operation. Writing any value to this register will reset current CNT value to 0 and reload internal 8-bit prescale counter.

Timer Capture Data Register (TIMERx_CAP)

Register	Offset	R/W	Description	Reset Value
TIMER0_CAP	TMR01_BA+0x10	R	Timer0 Capture Data Register	0x0000_0000
TIMER1_CAP	TMR01_BA+0x110	R	Timer1 Capture Data Register	0x0000_0000
TIMER2_CAP	TMR23_BA+0x10	R	Timer2 Capture Data Register	0x0000_0000
TIMER3_CAP	TMR23_BA+0x110	R	Timer3 Capture Data Register	0x0000_0000

Bits	Description	
[31:24]	Reserved	Reserved.
[23:0]	CAPDAT	Timer Capture Data Register When CAPEN (TIMERx_EXTCTL[3]) bit is set, CAPFUNCS (TIMERx_EXTCTL[4]) bit is 0, and a transition on TMx_EXT pin matched the CAPEdge (TIMERx_EXTCTL[14:12]) setting, CAPIF (TIMERx_EINTSTS[0]) will set to 1 and the current timer counter value CNT (TIMERx_CNT[23:0]) will be auto-loaded into this CAPDAT field.

Timer External Control Register (TIMERx_EXTCTL)

Register	Offset	R/W	Description	Reset Value
TIMER0_EXTCTL	TMR01_BA+0x14	R/W	Timer0 External Control Register	0x0000_0000
TIMER1_EXTCTL	TMR01_BA+0x114	R/W	Timer1 External Control Register	0x0000_0000
TIMER2_EXTCTL	TMR23_BA+0x14	R/W	Timer2 External Control Register	0x0000_0000
TIMER3_EXTCTL	TMR23_BA+0x114	R/W	Timer3 External Control Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved	CAPEDGE			Reserved			ACMPSSEL
7	6	5	4	3	2	1	0
CNTDBEN	CAPDBEN	CAPIEN	CAPFUNCS	CAPEN	Reserved		CNTPHASE

Bits	Description	
[31:17]	Reserved	Reserved.
[16]	ECNTSSEL	Event Counter Source Selection to Trigger Event Counter Function 0 = Event Counter input source is from TMx (x= 0~3) pin. 1 = Event Counter input source is from USB internal SOF output signal.
[15]	Reserved	Reserved.
[14:12]	CAPEDGE	Timer External Capture Pin Edge Detect When first capture event is generated, the CNT (TIMERx_CNT[23:0]) will be reset to 0 and first CAPDAT (TIMERx_CAP[23:0]) should be to 0. 000 = Capture event occurred when detect falling edge transfer on TMx_EXT (x= 0~3) pin. 001 = Capture event occurred when detect rising edge transfer on TMx_EXT (x= 0~3) pin. 010 = Capture event occurred when detect both falling and rising edge transfer on TMx_EXT (x= 0~3) pin, and first capture event occurred at falling edge transfer. 011 = Capture event occurred when detect both rising and falling edge transfer on TMx_EXT (x= 0~3) pin, and first capture event occurred at rising edge transfer. 110 = First capture event occurred at falling edge, follows capture events are at rising edge transfer on TMx_EXT (x= 0~3) pin. 111 = First capture event occurred at rising edge, follows capture events are at falling edge transfer on TMx_EXT (x= 0~3) pin. 100, 101 = Reserved.
[11:9]	Reserved	Reserved.
[8]	ACMPSSEL	ACMP Source Selection to Trigger Capture Function

		0 = Capture Function source is from internal ACMP0 output signal. 1 = Capture Function source is from internal ACMP1 output signal. Note: these bits only available when CAPSRC (TIMERx_CTL[22]) is 1.
[7]	CNTDBEN	Timer Counter Pin De-bounce Enable Bit 0 = TMx (x= 0~3) pin de-bounce Disabled. 1 = TMx (x= 0~3) pin de-bounce Enabled. Note: If this bit is enabled, the edge detection of TMx pin is detected with de-bounce circuit.
[6]	CAPDBEN	Timer External Capture Pin De-bounce Enable Bit 0 = TMx_EXT (x= 0~3) pin de-bounce or ACMP output de-bounce Disabled. 1 = TMx_EXT (x= 0~3) pin de-bounce or ACMP output de-bounce Enabled. Note: If this bit is enabled, the edge detection of TMx_EXT pin or ACMP output is detected with de-bounce circuit.
[5]	CAPIEN	Timer External Capture Interrupt Enable Bit 0 = TMx_EXT (x= 0~3) pin detection Interrupt Disabled. 1 = TMx_EXT (x= 0~3) pin detection Interrupt Enabled. Note: CAPIEN is used to enable timer external interrupt. If CAPIEN enabled, timer will rise an interrupt when CAPIF (TIMERx_EINTSTS[0]) is 1. For example, while CAPIEN = 1, CAPEN = 1, and CAPEDGE = 00, a 1 to 0 transition on the TMx_EXT pin will cause the CAPIF to be set then the interrupt signal is generated and sent to NVIC to inform CPU.
[4]	CAPFUNCS	Capture Function Selection 0 = External Capture Mode Enabled. 1 = External Reset Mode Enabled. Note1: When CAPFUNCS is 0, transition on TMx_EXT (x= 0~3) pin is using to save current 24-bit timer counter value (CNT value) to CAPDAT field. Note2: When CAPFUNCS is 1, transition on TMx_EXT (x= 0~3) pin is using to save current 24-bit timer counter value (CNT value) to CAPDAT field then CNT value will be reset immediately.
[3]	CAPEN	Timer External Capture Pin Enable Bit This bit enables the TMx_EXT capture pin input function. 0 =TMx_EXT (x= 0~3) pin Disabled. 1 =TMx_EXT (x= 0~3) pin Enabled.
[2:1]	Reserved	Reserved.
[0]	CNTPHASE	Timer External Count Phase This bit indicates the detection phase of external counting pin TMx (x= 0~3). 0 = A falling edge of external counting pin will be counted. 1 = A rising edge of external counting pin will be counted.

Timer External Interrupt Status Register (TIMERx_EINTSTS)

Register	Offset	R/W	Description	Reset Value
TIMER0_EINTSTS	TMR01_BA+0x18	R/W	Timer0 External Interrupt Status Register	0x0000_0000
TIMER1_EINTSTS	TMR01_BA+0x118	R/W	Timer1 External Interrupt Status Register	0x0000_0000
TIMER2_EINTSTS	TMR23_BA+0x18	R/W	Timer2 External Interrupt Status Register	0x0000_0000

Bits	Description
[31]	DBGTRIOFF ICE Debug Mode Acknowledge Disable Bit (Write Protect) 0 = ICE debug mode acknowledgement effects PWM output. PWM output pin will be forced as tri-state while ICE debug mode acknowledged. 1 = ICE debug mode acknowledgement disabled. PWM output pin will keep output no matter ICE debug mode acknowledged or not. Note: This bit is write protected. Refer to SYS_REGLCTL register.
[30]	DBGHALT ICE Debug Mode Counter Halt (Write Protect) If debug mode counter halt is enabled, PWM counter will keep current value until exit ICE debug mode. 0 = ICE debug mode counter halt disable. 1 = ICE debug mode counter halt enable. Note: This bit is write protected. Refer to SYS_REGLCTL register.
[29:17]	Reserved
[16]	OUTMODE PWM Output Mode This bit controls the output mode of corresponding PWM channel. 0 = PWM independent mode. 1 = PWM complementary mode.
[15:10]	Reserved
[9]	IMMLDEN Immediately Load Enable Bit 0 = PERIOD will load to PBUF when current PWM period is completed no matter CTRLD is enabled/disabled. If CTRLD is disabled, CMP will load to CMPBUF when current PWM

		period is completed; if CTRLD is enabled in up-down count type, CMP will load to CMPBUF at the center point of current period. 1 = PERIOD/CMP will load to PBUF/CMPBUF immediately when user update PERIOD/CMP. Note: If IMMLDEN is enabled, CTRLD will be invalid.
[8]	CTRLD	Center Re-load In up-down count type, PERIOD will load to PBUF when current PWM period is completed always and CMP will load to CMPBUF at the center point of current period.
[7:4]	Reserved	Reserved.
[3]	CNTMODE	PWM Counter Mode 0 = Auto-reload mode. 1 = One-shot mode.
[2:1]	CNTTYPE	PWM Counter Behavior Type 00 = Up count type. 01 = Down count type. 10 = Up-down count type. 11 = Reserved.
[0]	CNTEN	PWM Counter Enable Bit 0 = PWM counter and clock prescale Stop Running. 1 = PWM counter and clock prescale Start Running.

Timer PWM Counter Clock Source Register (TIMERx_PWMCLKSRC)

Register	Offset	R/W	Description	Reset Value
TIMER0_PWMCLKSRC	TMR01_BA+0x44	R/W	Timer0 PWM Counter Clock Source Register	0x0000_0000

6.8 Watchdog Timer (WDT)

6.8.1 Overview

The Watchdog Timer (WDT) is used to perform a system reset when system runs into an unknown state. This prevents system from hanging for an infinite period of time. Besides, this Watchdog Timer supports the function to wake up system from Idle/Power-down mode.

6.8.2 Features

- 18-bit free running up counter for WDT time-out interval
- Selectable time-out interval (24 ~ 218) and the time-out interval is 1.6 ms ~ 26.214 s if WDT_CLK = 10 kHz.
- System kept in reset state for a period of $(1 / \text{WDT_CLK}) * 63$
- Supports selectable WDT reset delay period, including 1026、130、18 or 3 WDT_CLK reset delay period
- Supports to force WDT enabled after chip powered on or reset by setting CWDTE[2:0] in Config0 register
- Supports WDT time-out wake-up function only if WDT clock source is selected as 10 kHz or LXT.

6.8.3 Block Diagram

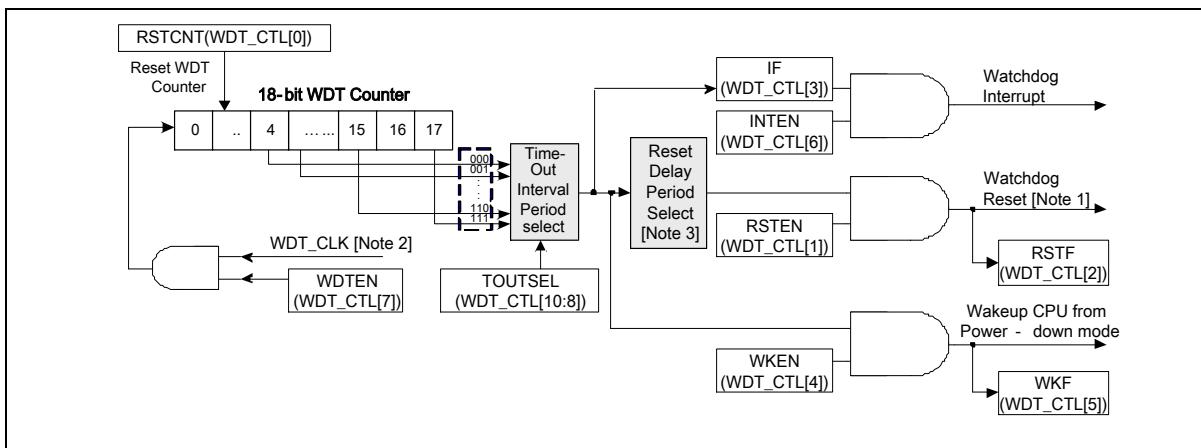

Figure 6.8-1 Watchdog Timer Block Diagram

Note1: WDT resets CPU and lasts 63 WDT_CLK.

Note2: Chip can be woken up by WDT time-out interrupt signal generated only if WDT clock source is selected to 10 kHz oscillator.

Note3: The WDT reset delay period can be selected as 3/18/130/1026 WDT_CLK.

6.8.4 Basic Configuration

- Clock Source Configuration
 - Select the source of WDT peripheral clock on WDTSEL (CLK_CLKSEL1[1:0])
 - Enable WDT peripheral clock in WDTCKEN (CLK_APBCLK0[0]).
 - Force enable WDT controller after chip powered on or reset in CWDTE[2:0]

(CWDTE[2] is Config0[31], CWDTE[1:0] is Config0[4:3])

The WDT clock control is shown in Figure 6.8-2.

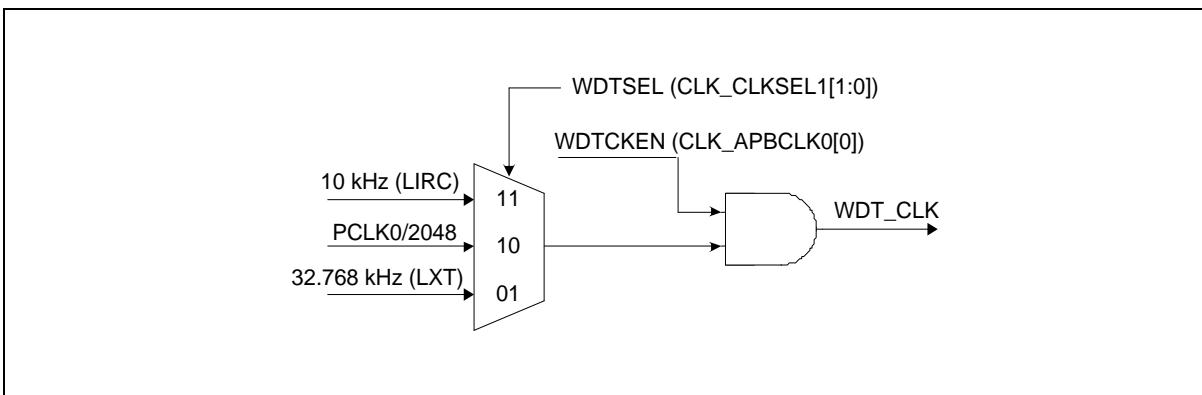

Figure 6.8-2 Watchdog Timer Clock Control

6.8.5 Functional Description

The WDT includes an 18-bit free running up counter with programmable time-out intervals. Table 6.8-1 shows the WDT time-out interval period selection and Figure 6.8-3 shows the WDT time-out interval and reset period timing.

6.8.5.1 WDT Time-out Interrupt

Setting WDTEN (WDTCR[7]) to 1 will enable the WDT function and the WDT counter to start counting up. The SYNC (WDT_CTL[30]) can be indicated whether enable/disable WDTEN function is completed or not. There are eight time-out interval period can be selected by setting TOUTSEL (WDTCR[10:8]). When the WDT up counter reaches the TOUTSEL (WDTCR[10:8]) settings, WDT time-out interrupt will occur then WDT time-out interrupt flag IF (WDT_CTL[3]) will be set to 1 immediately. If INTEN (WDT_CTL[6]) is enabled, WDT time-out interrupt will inform CPU.

6.8.5.2 WDT Reset Delay Period and Reset System

There is a specified T_{RSTD} reset delay period follows the IF (WDT_CTL[3]) is setting to 1. User should set RSTCNT (WDT_CTL[0]) or set WDT_RSTCNT to reset the 18-bit WDT up counter value to avoid generate WDT time-out reset signal before the T_{RSTD} reset delay period expires. Moreover, user should set RSTDSEL (WDT_ALTCTL [1:0]) to select reset delay period to clear WDT counter. If the WDT up counter value has not been cleared after the specific T_{RSTD} delay period expires, the WDT control will set RSTF (WDT_CTL[2]) to 1 if RSTEN (WDT_CTL[1]) bit is enabled, then chip enters to reset state immediately. Refer to Figure 6.8-3. T_{RST} reset period will keep last 63 WDT clocks then chip restart executing program from reset vector (0x0000_0000). The RSTF (WDT_CTL[2]) will keep 1 after WDT time-out resets the chip, user can check RSTF (WDT_CTL[2]) by software to recognize the system has been reset by WDT time-out reset or not.

TOUTSEL	Time-Out Interval Period T_{TIS}	Reset Delay Period T_{RSTD}
000	$2^4 * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
001	$2^6 * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
010	$2^8 * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
011	$2^{10} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
100	$2^{12} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
101	$2^{14} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
110	$2^{16} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
111	$2^{18} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$

Table 6.8-1 Watchdog Timer Time-out Interval Period Selection

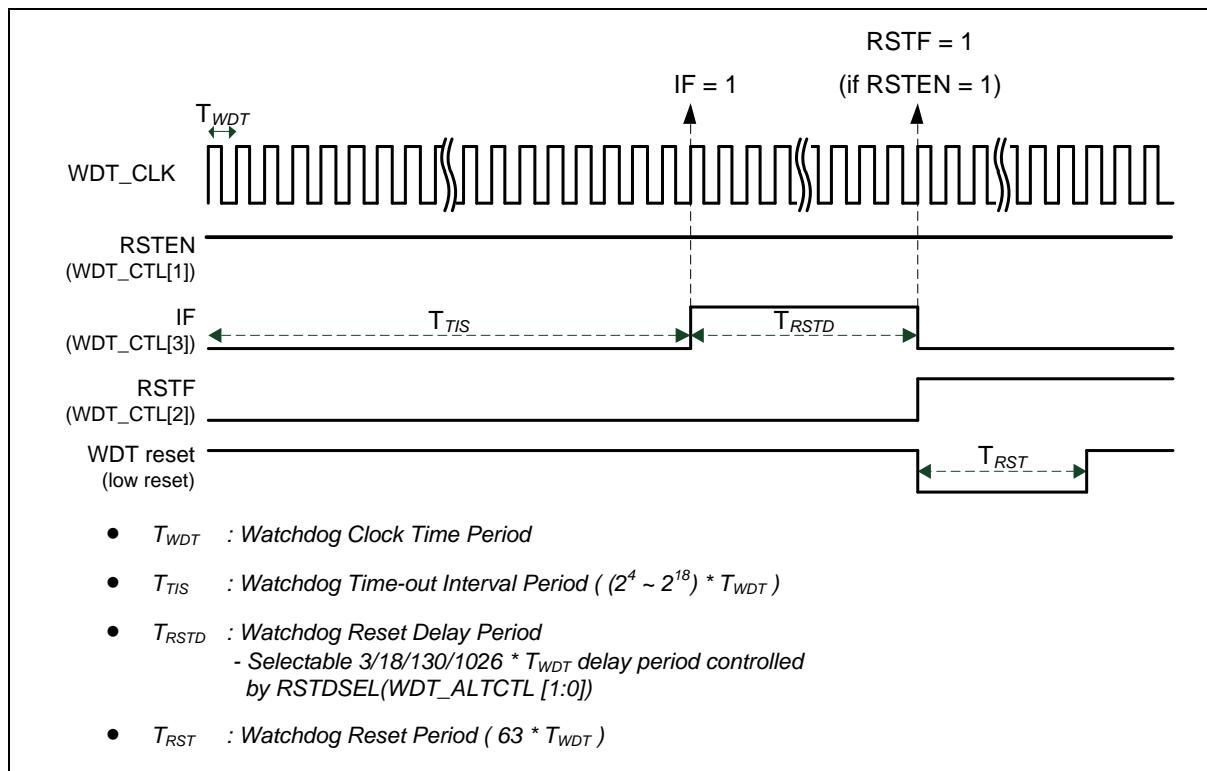

Figure 6.8-3 Watchdog Timer Time-out Interval and Reset Period Timing

6.8.5.3 WDT Wake-up

If WDT clock source is selected to 10 kHz or LXT, system can be woken up from Power-down mode while WDT time-out interrupt signal is generated and WKEN (WDT_CTL[4]) enabled. Note that user should set LXTEN (CLK_PWRCTL [1]) or LIRCEN (CLK_PWRCTL [3]) to select clock source before system enters Power-down mode because the system peripheral clock are disabled when system is in Power-down mode. In the meanwhile, the WKF (WDT_CTL[5]) will be set to 1 automatically, and user can check WKF (WDT_CTL[5]) status by software to recognize the system has been woken up by WDT time-out interrupt or not.

6.8.5.4 WDT ICE Debug

When ICE is connected to MCU, WDT counter is counting or not by ICEDEBUG (WDT_CTL[31]). The default value of ICEDEBUG is 0, WDT counter will stop counting when CPU is held by ICE. If ICEDEBUG is set to 1, WDT counter will keep counting no matter CPU is held by ICE or not.

6.8.6 Register Map

Bits	Description	
[31]	ICEDEBUG	ICE Debug Mode Acknowledge Disable Bit (Write Protect) 0 = ICE debug mode acknowledgement affects WDT counting. WDT up counter will be held while CPU is held by ICE. 1 = ICE debug mode acknowledgement Disabled. WDT up counter will keep going no matter CPU is held by ICE or not. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[30]	SYNC	WDT Enable Control SYNC Flag Indicator (Read Only) If user executes enable/disable WDTEN (WDT_CTL[7]), this flag can be indicated enable/disable WDTEN function is completed or not. 0 = Set WDTEN bit is completed. 1 = Set WDTEN bit is synchronizing and not become active yet. Note: Performing enable or disable WDTEN bit needs 2 * WDT_CLK period to become active.
[29:11]	Reserved	Reserved.
[10:8]	TOUTSEL	WDT Time-out Interval Selection (Write Protect) These three bits select the time-out interval period for the WDT. 000 = $2^4 * WDT_CLK$. 001 = $2^6 * WDT_CLK$. 010 = $2^8 * WDT_CLK$. 011 = $2^{10} * WDT_CLK$. 100 = $2^{12} * WDT_CLK$. 101 = $2^{14} * WDT_CLK$. 110 = $2^{16} * WDT_CLK$. 111 = $2^{18} * WDT_CLK$. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[7]	WDTEN	WDT Enable Bit (Write Protect)

		0 = WDT Disabled (This action will reset the internal up counter value). 1 = WDT Enabled. Note1: This bit is write protected. Refer to the SYS_REGLCTL register. Note2: If CWDTC[2:0] (combined by Config0[31] and Config0[4:3]) bits is not configured to 111, this bit is forced as 1 and user cannot change this bit to 0.
[6]	INTEN	WDT Time-out Interrupt Enable Bit (Write Protect) If this bit is enabled, the WDT time-out interrupt signal is generated and inform to CPU. 0 = WDT time-out interrupt Disabled. 1 = WDT time-out interrupt Enabled. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[5]	WKF	WDT Time-out Wake-up Flag (Write Protect) This bit indicates the interrupt wake-up flag status of WDT 0 = WDT does not cause chip wake-up. 1 = Chip wake-up from Idle or Power-down mode if WDT time-out interrupt signal generated. Note1: This bit is write protected. Refer to the SYS_REGLCTL register. Note2: This bit is cleared by writing 1 to it.
[4]	WKEN	WDT Time-out Wake-up Function Control (Write Protect) If this bit is set to 1, while WDT time-out interrupt flag IF (WDT_CTL[3]) is generated to 1 and interrupt enable bit INTEN (WDT_CTL[6]) is enabled, the WDT time-out interrupt signal will generate a wake-up trigger event to chip. 0 = Wake-up trigger event Disabled if WDT time-out interrupt signal generated. 1 = Wake-up trigger event Enabled if WDT time-out interrupt signal generated. Note1: This bit is write protected. Refer to the SYS_REGLCTL register. Note2: Chip can be woken up by WDT time-out interrupt signal generated only if WDT clock source is selected to 10 kHz internal low speed RC oscillator (LIRC) or LXT.
[3]	IF	WDT Time-out Interrupt Flag This bit will set to 1 while WDT up counter value reaches the selected WDT time-out interval 0 = WDT time-out interrupt did not occur. 1 = WDT time-out interrupt occurred. Note: This bit is cleared by writing 1 to it.
[2]	RSTF	WDT Time-out Reset Flag This bit indicates the system has been reset by WDT time-out reset or not. 0 = WDT time-out reset did not occur. 1 = WDT time-out reset occurred. Note: This bit is cleared by writing 1 to it.
[1]	RSTEN	WDT Time-out Reset Enable Bit (Write Protect) Setting this bit will enable the WDT time-out reset function If the WDT up counter value has not been cleared after the specific WDT reset delay period expires. 0 = WDT time-out reset function Disabled. 1 = WDT time-out reset function Enabled. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[0]	RSTCNT	Reset WDT Up Counter (Write Protect) 0 = No effect. 1 = Reset the internal 18-bit WDT up counter value. Note1: This bit is write protected. Refer to the SYS_REGLCTL register. Note2: This bit will be automatically cleared by hardware.

WDT Alternative Control Register (WDT_ALTCTL)

WDT Reset Counter Register (WDT_RSTCNT)

Register	Offset	R/W	Description	Reset Value
WDT_RSTCNT	WDT_BA+0x08	W	WDT Reset Counter Register	0x0000_0000

Bits	Description								
[31:0]	RSTCNT	WDT Reset Counter Register Writing 0x00005AA5 to this field will reset the internal 18-bit WDT up counter value to 0. Note1: Performing RSTCNT to reset counter needs 2 * WDT_CLK period to become active. Note2: RSTCNT (WDT_CTL[0]) bit is a write protected bit. RSTCNT (WDT_RSTCNT[31:0]) bits are not write protected.							

6.9 Window Watchdog Timer (WWDT)

6.9.1 Overview

The Window Watchdog Timer (WWDT) is used to perform a system reset within a specified window period to prevent software running to uncontrollable status by any unpredictable condition.

6.9.2 Features

- 6-bit down counter value (CNTDAT, WWDT_CNT[5:0]) and 6-bit compare value (CMPDAT, WWDT_CTL[21:16]) to make the WWDT time-out window period flexible
- Supports 4-bit value (PSCSEL, WWDT_CTL[11:8]) to programmable maximum 11-bit prescale counter period of WWDT counter
- WWDT counter suspends in Idle/Power-down mode

6.9.3 Block Diagram

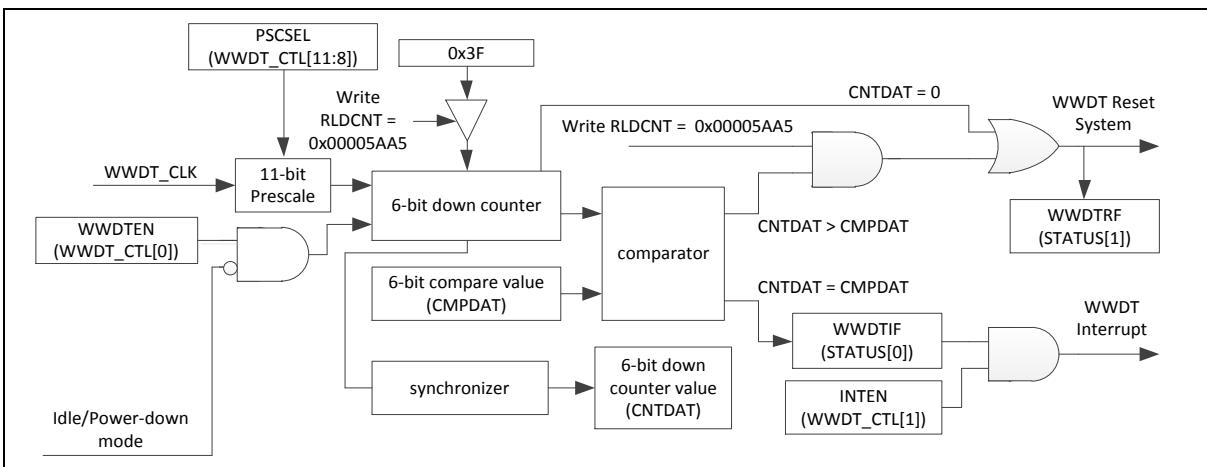

Figure 6.9-1 WWDT Block Diagram

6.9.4 Basic Configuration

- Clock Source Configuration
 - Select the source of WWDT peripheral clock on WWDTSEL (CLK_CLKSEL1[31:30])
 - Enable WWDT peripheral clock in WDTCKEN (CLK_APBCLK0[0]).

The WWDT clock control is shown in Figure 6.9-2.

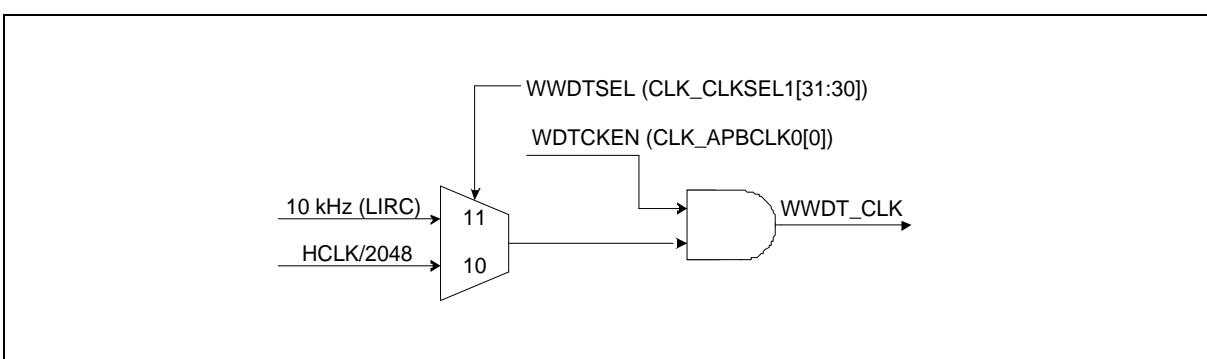

Figure 6.9-2 WWDT Clock Control

6.9.5 Functional Description

The WWDT includes a 6-bit down counter with programmable prescale value to define different WWDT time-out intervals. The clock source of 6-bit WWDT is based on system clock divide 2048 (HCLK/2048) or 10 kHz internal low speed RC oscillator (LIRC) with a programmable 11-bit prescale counter value which controlled by PSCSEL (WWDT_CTL[11:8]). Also, the correlate of PSCSEL (WWDT_CTL[11:8]) and prescale value are listed in Table 6.9-1.

PSCSEL	Prescaler Value	Max. Time-Out Period	Max. Time-Out Interval (WWDT_CLK=10 kHz)
0000	1	$1 * 64 * T_{WWDT}$	6.4 ms
0001	2	$2 * 64 * T_{WWDT}$	12.8 ms
0010	4	$4 * 64 * T_{WWDT}$	25.6 ms
0011	8	$8 * 64 * T_{WWDT}$	51.2 ms
0100	16	$16 * 64 * T_{WWDT}$	102.4 ms
0101	32	$32 * 64 * T_{WWDT}$	204.8 ms
0110	64	$64 * 64 * T_{WWDT}$	409.6 ms
0111	128	$128 * 64 * T_{WWDT}$	819.2 ms
1000	192	$192 * 64 * T_{WWDT}$	1.2288 s
1001	256	$256 * 64 * T_{WWDT}$	1.6384 s
1010	384	$384 * 64 * T_{WWDT}$	2.4576 s
1011	512	$512 * 64 * T_{WWDT}$	3.2768 s
1100	768	$768 * 64 * T_{WWDT}$	4.9152 s
1101	1024	$1024 * 64 * T_{WWDT}$	6.5536 s
1110	1536	$1536 * 64 * T_{WWDT}$	9.8304 s
1111	2048	$2048 * 64 * T_{WWDT}$	13.1072 s

Table 6.9-1 WWDT Prescaler Value Selection

6.9.5.1 WWDT Counting

When the WWDTEN (WWDT_CTL[0]) is set, WWDT down counter will start counting from 0x3F to 0. To prevent program runs to disable WWDT counter counting unexpected, the WWDT_CTL register can only be written once after chip is powered on or reset. User cannot disable WWDT counter counting (WWDTEN), change counter prescale period (PSCSEL) or change window compare value (CMPDAT) while WWDTEN (WWDT_CTL[0]) has been enabled by user unless chip is reset.

To avoid the system is reset while CPU clock is disabled, the WWDT counter will stop counting when CPU enters Idle/Power-down mode. After CPU enters normal mode, the WWDT counter will start down counting.

6.9.5.2 WWDT Compare Match Interrupt

During down counting by the WWDT counter, the WWDTIF (WWDT_STATUS[0]) is set to 1 while the WWDT counter value (CNTDAT) is equal to window compare value (CMPDAT) and WWDTIF can be cleared by user; if INTEN (WWDT_CTL[1]) is also set to 1 by user, the WWDT compare match interrupt signal is generated also while WWDTIF is set to 1 by hardware.

6.9.5.3 WWDT Reset System

Figure 6.9-3 shows three cases of WWDT reset and reload behavior.

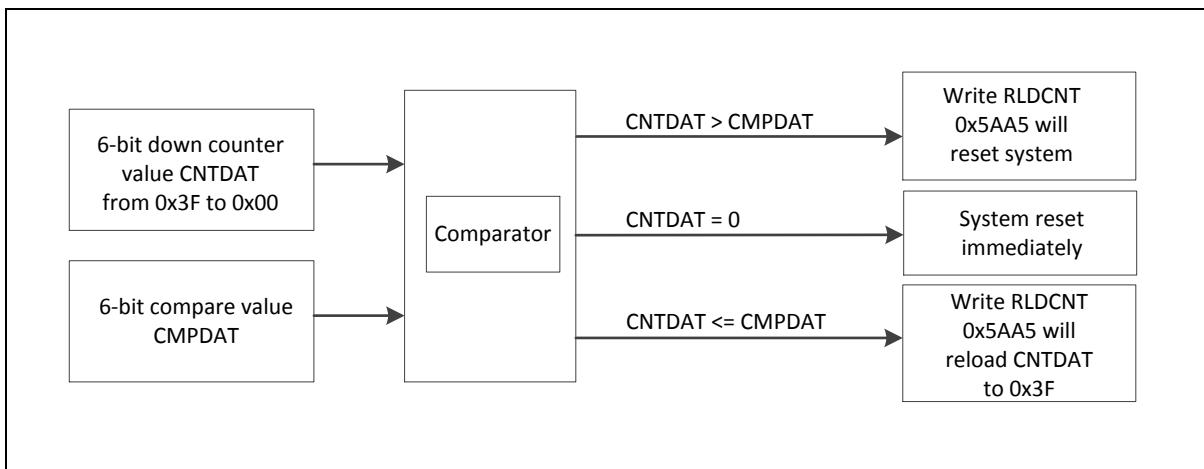

Figure 6.9-3 WWDT Reset and Reload Behavior

If the current CNTDAT (WWDT_CNT[5:0]) is larger than CMPDAT (WWDT_CTL[21:16]) and user writes 0x00005AA5 to the WWDT_RLDCNT register, the WWDT reset system signal will be generated immediately to cause chip reset also. The waveform of WWDT reload counter when CNTDAT > CMPDAT is shown in Figure 6.9-4.

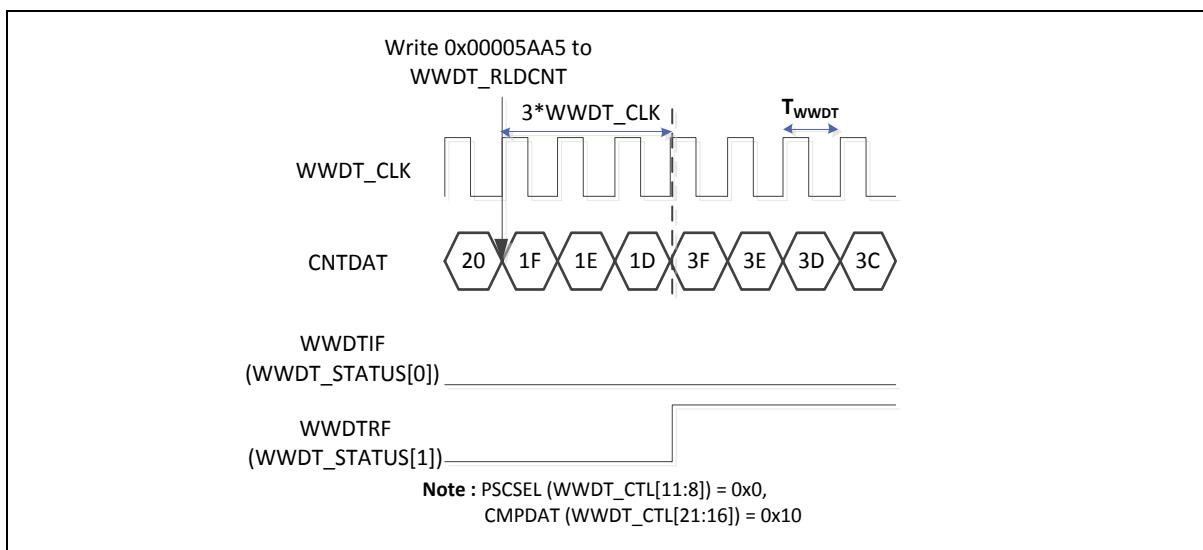

Figure 6.9-4 WWDT Reload Counter When CNTDAT > CMPDAT

When WWDTIF (WWDT_STATUS[0]) is generated, user must reload WWDT counter value to 0x3F by writing 0x00005AA5 to WWDT_RLDCNT register, and also to prevent the WWDT counter value from reaching 0 and generate WWDT reset system signal to inform system reset. Figure 6.9-5 shows the waveform of WWDT reload counter when CNTDAT is less than CMPDAT and Figure 6.9-6 shows the WWDT generates reset system signal (WWDTRF) if user does not write 0x00005AA5 to WWDT_RLD before WWDT counter value reaches 0.

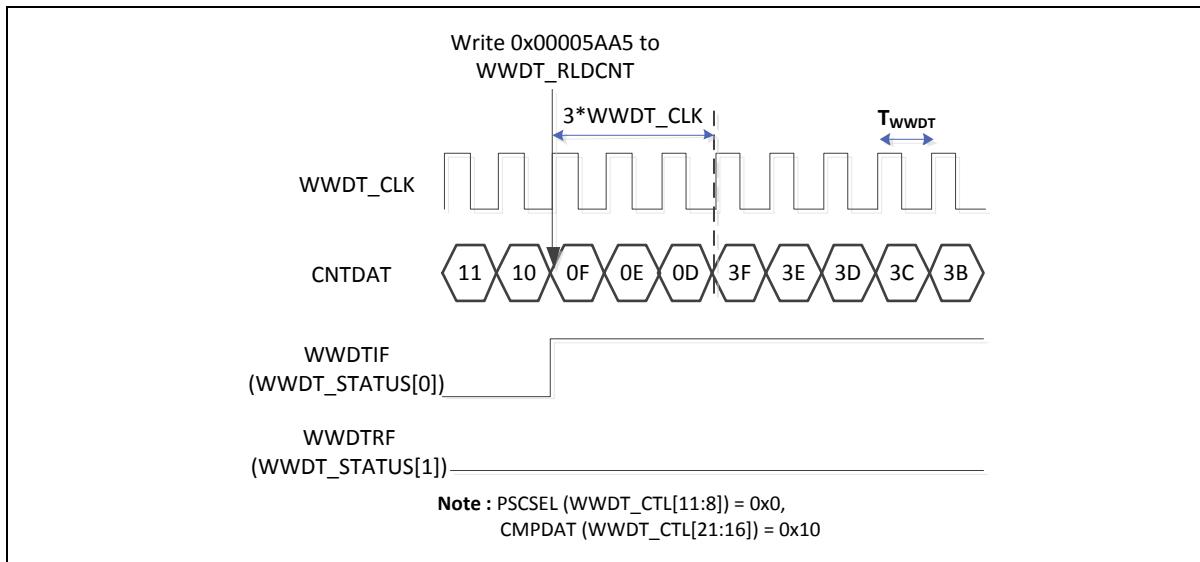

Figure 6.9-5 WWDT Reload Counter When WWDT_CNT < WINCMP

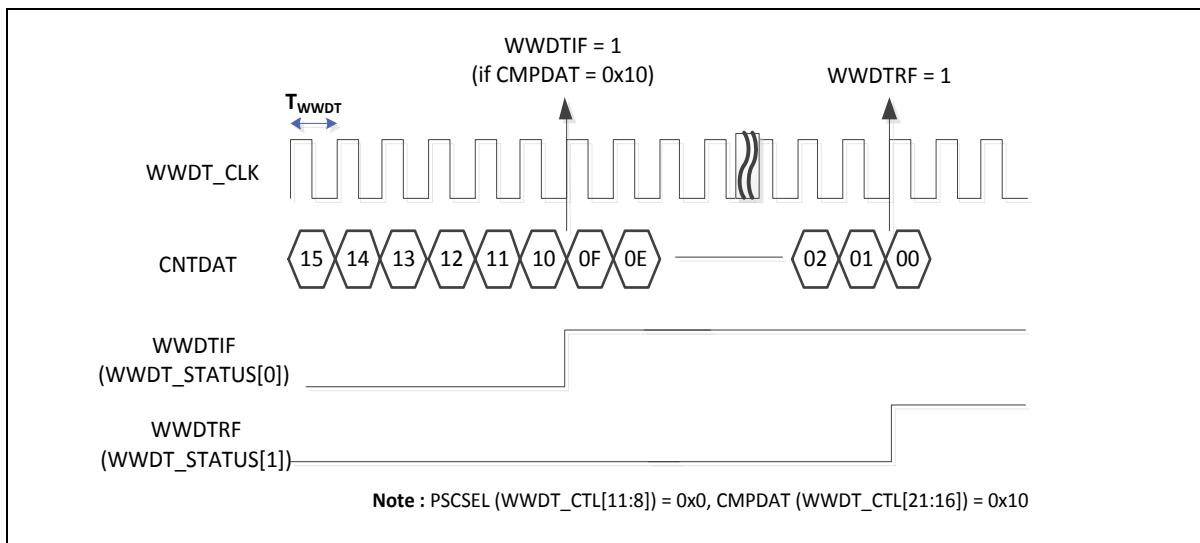

Figure 6.9-6 WWDT Interrupt and Reset Signals

6.9.5.4 WWDT Window Setting Limitation

When user writes 0x00005AA5 to WWDT_RLDCNT register to reload WWDT counter value to 0x3F, it needs 3 WWDT clocks to sync the reload command to actually perform reload action. Note that if user sets PSCSEL (WWDT_CTL[11:8]) to 0000, the counter prescale value should be as 1, and the CMPDAT (WWDT_CTL[21:16]) must be larger than 2. Otherwise, writing WWDT_RLDCNT register to reload WWDT counter value to 0x3F is unavailable, WWDTIF (WWDT_STATUS[0]) is generated, and WWDT reset system event always happened. The WWDT CMPDAT setting limitation is shown in Table 6.9-2.

If user sets CMPDATA as 0x3F and 0x0, the interrupt doesn't occur. The reset occurs when WWDT counts to 0x0, so the interrupt doesn't occur when CMPDATA is 0x0.

PSCSEL	Prescale Value	Valid CMPDAT Value
0000	1	0x3 ~ 0x3E

0001	2	0x2 ~ 0x3E
Others	Others	0x1 ~ 0x3E

Table 6.9-2 CMPDAT Setting Limitation

6.9.5.5 WWDT ICE Debug

When ICE is connected to MCU, the WWDT counter is counting (or not) by ICEDEBUG (WWDT_CTL[31]). The default value of ICEDEBUG is 0. The WWDT counter will stop counting when CPU is held by ICE. If ICEDEBUG is set to 1, WWDT counter will keep counting no matter CPU is held by ICE or not.

6.10 Real Time Clock (RTC)

6.10.1 Overview

The Real Time Clock (RTC) controller provides the real time and calendar message. The RTC offers programmable time tick and alarm match interrupts. The data format of time and calendar messages are expressed in BCD format. A digital frequency compensation feature is available to compensate external crystal oscillator frequency accuracy.

6.10.2 Features

- Supports real time counter in RTC_TIME (hour, minute, second) and calendar counter in RTC_CAL (year, month, day) for RTC time and calendar check.
- Supports alarm time (hour, minute, second) and calendar (year, month, day) settings in RTC_TALM and RTC_CALM.
- Supports alarm time (hour, minute, second) and calendar (year, month, day) mask enable in RTC_TAMSK and RTC_CAMSK.
- Selectable 12-hour or 24-hour time scale in RTC_CLKFMT register.
- Supports Leap Year indication in RTC_LEAPYEAR register.
- Supports Day of the Week counter in RTC_WEEKDAY register.
- Frequency of RTC clock source compensate by RTC_FREQADJ register.
- All time and calendar message expressed in BCD format.
- Supports periodic RTC Time Tick interrupt with 8 period interval options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second.
- Supports RTC Time Tick and Alarm Match interrupt.
- Supports 1 Hz clock output.
- Supports chip wake-up from Idle or Power-down mode while a RTC interrupt signal is generated.
- Supports Daylight Saving Time software control in RTC_DSTCTL.
- Supports up 3 pairs dynamic loop tamper pin or 6 individual tamper pin.
- Supports 80 bytes spare registers and tamper pins detection to clear the content of these spare registers.

6.10.3 Block Diagram

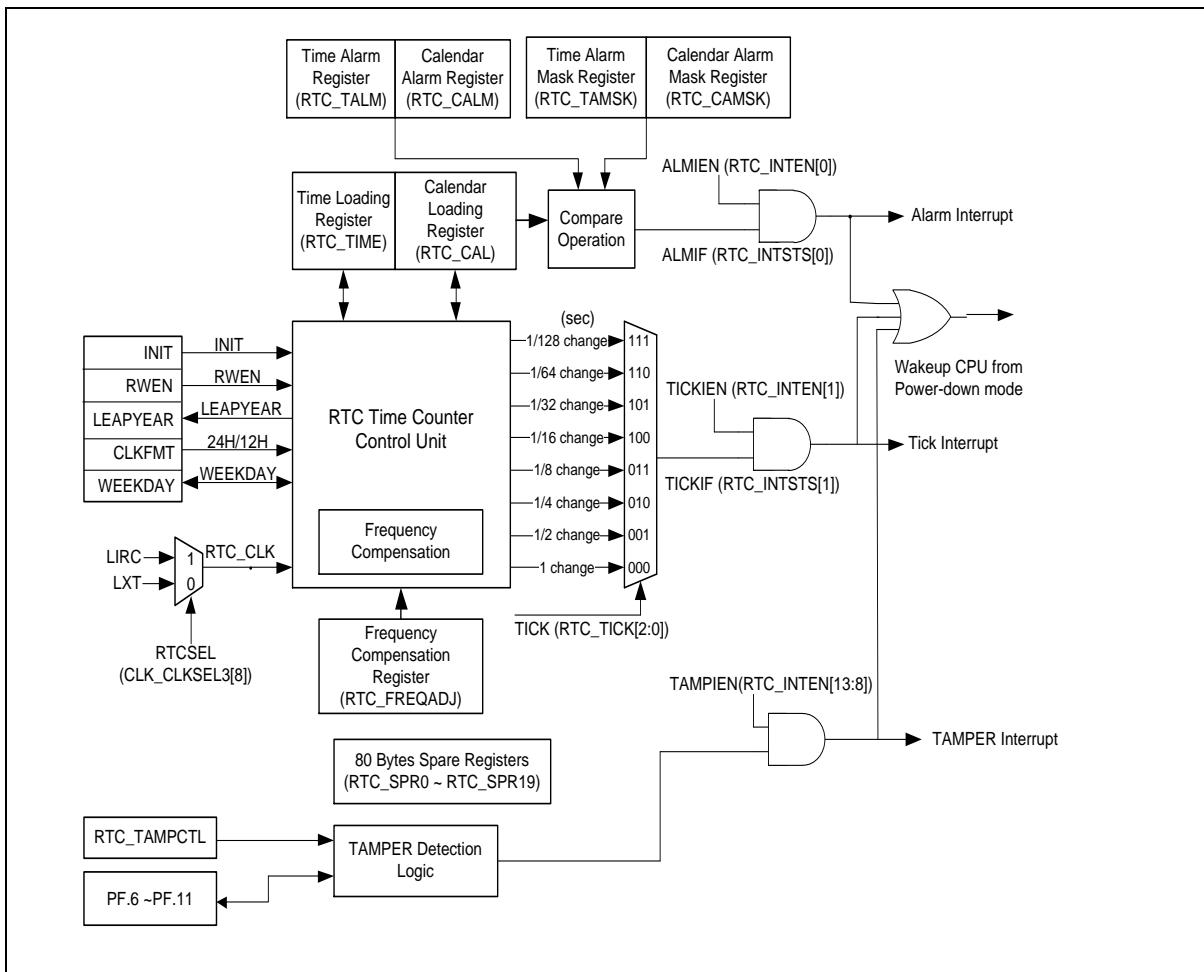

Figure 6.10-1 RTC Block Diagram

6.10.4 Basic Configuration

- Clock Source Configuration
 - The RTC controller clock source is enabled by RTCCKEN (APBCLK0[1]) and RTC Time Counter source is selected by CLK_CLKSEL3[8] LXT or LIRC.
- Pin Configuration

Group	Pin Name	GPIO	MFP
X32	X32_OUT	PF.4	MFP10
	X32_IN	PF.5	MFP10
TAMPER0	TAMPER0	PF.6	MFP10
TAMPER1	TAMPER1	PF.7	MFP10
TAMPER2	TAMPER2	PF.8	MFP10

TAMPER3	TAMPER3	PF.9	MFP10
TAMPER4	TAMPER4	PF.10	MFP10
TAMPER5	TAMPER5	PF.11	MFP10

6.10.5 Functional Description

6.10.5.1 RTC Initiation

When a RTC block is powered on, RTC is at reset state. User has to write a number 0xa5eb1357 to RTC initial register INIT(RTC_INIT[31:0]) to make RTC leave reset state. Once the INIT(RTC_INIT[31:0]) register is written as 0xa5eb1357, the RTC will be in normal active state permanently. User can read INIT[0](RTC_INIT[0]) to check the RTC is at normal active state or reset state.

6.10.5.2 RTC Read/Write Enable

If RWENF (RTC_RWEN[16]) bit is read as 1, it means the RTC registers are read/write accessible. When executing write RTC register command exceed 6 times within 1120 PCLK cycles, the RTCBUSY (RTC_RWEN[24]) flag will be set 1 and RWENF (RTC_RWEN[16]) will be clear to 0. The RTC control registers access attribute when RWENF is 1 and 0 are shown in Table 6.10-1.

Register	INIR = 0	RWENF = 1	RWENF = 0 Or RTCBUSY=1
RTC_INIT	available	R/W	R/W
RTC_RWEN	available	R/W	R/W

RTC_TAMPSEED	Not available	R/W	R

Table 6.10-1 RTC Read/Write Enable

6.10.5.3 Frequency Compensation

The RTC_FREQADJ register allows user to make digital compensation to a clock input. Please follow the example and formula below to write the actual frequency of 32k crystal to RTC_FREQADJ register. Following are the compensation examples for higher or lower than 32768 Hz.

Example 1:

Frequency counter measurement : 32773.65 Hz (> 32768 Hz)

$$\text{FREQADJ} = (32768 * 0x200000) / 32773.65 = 0x1FFE96$$

Example 2:

Frequency counter measurement : 32763.25 Hz (< 32768 Hz)

$$\text{FREQADJ} = (32768 * 0x200000) / 32763.25 = 0x200130$$

Note: The value of RTC_FREQADJ register will be the default value (0x0020_0000) while the compensation is not executed. User can utilize a frequency counter to measure RTC clock source via clock output function in manufacturing. In the meanwhile, user can use clock output function to check the result of RTC frequency compensation.

6.10.5.4 Time and Calendar Counter

RTC_TIME and RTC_CAL are used to load the real time and calendar. RTC_TALM and RTC_CALM are used for setup alarm time and calendar.

6.10.5.5 12/24 hour Time Scale Selection

The 12/24 hour time scale selection depends on 24HEN (RTC_CLKFMT[0]). When RTC runs as 12-hour time scale mode, RTC_TIME[21] (the high bit of TENHR[1:0]) means AM/PM indication, if RTC_TIME[21] is 1, it indicates PM time message and RTC_TIME[21] is 0 indicates AM time message.) Table 6.10-2 shows RTC_TIME mapping table of 12/24 hour time scale selection.

Note: The Hour Value Write Into RTC_TIME[21:16], Messages Are Expressed In BCD Format.			
24-Hour Time Scale (24HEN = 1)		12-Hour Time Scale (PM Time + 0x20) (24HEN = 0) (PM Time + 0x20)	
0x00 (AM12)	0x12 (PM12)	0x12 (AM12)	0x32 (PM12)
0x01 (AM01)	0x13 (PM01)	0x01 (AM01)	0x21 (PM01)
0x02 (AM02)	0x14 (PM02)	0x02 (AM02)	0x22 (PM02)
0x03 (AM03)	0x15 (PM03)	0x03 (AM03)	0x23 (PM03)
0x04 (AM04)	0x16 (PM04)	0x04 (AM04)	0x24 (PM04)
0x05 (AM05)	0x17 (PM05)	0x05 (AM05)	0x25 (PM05)
0x06 (AM06)	0x18 (PM06)	0x06 (AM06)	0x26 (PM06)
0x07 (AM07)	0x19 (PM07)	0x07 (AM07)	0x27 (PM07)
0x08 (AM08)	0x20 (PM08)	0x08 (AM08)	0x28 (PM08)

0x09 (AM09)	0x21 (PM09)	0x09 (AM09)	0x29 (PM09)
0x10 (AM10)	0x22 (PM10)	0x10 (AM10)	0x30 (PM10)
0x11 (AM11)	0x23 (PM11)	0x11 (AM11)	0x31 (PM11)

Table 6.10-212/24 Hour Time Scale Selection

6.10.5.6 Day of the Week Counter

The RTC controller provides day of week in WEEKDAY bits (RTC_WEEKDAY[2:0]). The value is defined from 0 to 6 to represent Sunday to Saturday respectively.

6.10.5.7 Periodic Time Tick Interrupt

The periodic time tick interrupt has 8 period interval options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second that are selected by TICK bits (RTC_TICK[2:0]). When Periodic Time Tick interrupt is enabled by setting TICKIEN (RTC_INTEN[1]) to 1, the Periodic Time Tick interrupt is requested periodically in the period selected by RTC_TICK[2:0] settings.

6.10.5.8 Alarm Interrupt

When the real time and calendar message in RTC_TIME and RTC_CAL registers are equal to alarm time and calendar values in RTC_TALM and RTC_CALM registers, the RTC alarm interrupt flag ALMIF (RTC_INTSTS[0]) is set to 1 and the RTC alarm interrupt signal assert if the alarm interrupt enable ALMIEN (RTC_INTEN[0]) is enabled.

The RTC controller provides time alarm mask register (RTC_TAMSK register) and Calendar Alarm Mask Register (RTC_CAMSK register) to mask the specified digit and generate periodic interrupt without changing the alarm match condition in RTC_TALM and RTC_CAL registers in each alarm interrupt service routine.

6.10.5.9 Daylight Saving Time

The RTC controller also provides RTC_DSTCTL register to store the control settings of daylight saving time application. User can read DSBAK(RTC_DSTCTL[2]) value to check current RTC date/time counter runs in daylight saving time mode or normal mode.

6.10.5.10 1 Hz clock output

The RTC controller provides 1Hz clock output to CLKO function pin. User can set CLK1HZEN (CLK_CLKOCTL[6]) to 1 and enable RTC, 1Hz clock will output to CLKO function pin.

6.10.5.11 Application Note

1. All data in RTC_TALM, RTC_CALM, RTC_TIME and RTC_CAL registers are all expressed in BCD format.
2. User has to make sure that the loaded values are reasonable. For example, Load RTC_CAL as 201a (year), 13 (month), 00 (day), or RTC_CAL does not match with RTC_WEEKDAY, etc.
3. In RTC_CAL and RTC_CALM, only 2 BCD digits are used to express "year". The 2 BCD digits of xy means 20xy, rather than 19xy or 21xy.

4. Example of 12-Hour Time Setting

If current RTC time is PM12:59:30 in 12-Hour Time Scale mode, the RTC_TIME setting as:

5. HOUR:

RTC_TIME[21:16]: 0x32 (0x12+0x20) combined by TENHR (RTC_TIME[21:20]) is 0x3, HR (RTC_TIME[19:16]) is 0x2.

6. MIN:

RTC_TIME[14:8]: 0x59 combined by TENMIN (RTC_TIME[14:12]) is 0x5, MIN (RTC_TIME[11:8]) is 0x9.

7. SEC:

RTC_TIME[6:0]: 0x30 combined by TENSEC (RTC_TIME[6:4]) is 0x3, SEC (RTC_TIME[3:0]) is 0x0.

8. Table 6.10-3 shows registers value after core power are first powered on.

Register	Reset State
RTC_INIT	0
RTC_RWEN	0
RTC_CAL	15/8/8 (year/month/day)
RTC_TIME	00:00:00 (hour : minute : second)
RTC_CALM	00/00/00 (year/month/day)
RTC_TALM	00:00:00 (hour : minute : second)
RTC_CLKFMT	1 (24-hour mode)
RTC_WEEKDAY	6 (Saturday)
RTC_INTEN	0
RTC_INTSTS	0
RTC_LEAPYEAR	0
RTC_TICK	0
RTC_DSTCTL	0

Table 6.10-3 Registers Value after Powered On

9. List registers locate in Core Power Domain as Table 6.10-4.

Register	Power Domain
RTC_RWEN	Core Power Domain
RTC_INTEN	Core Power Domain
RTC_INTSTS	Core Power Domain
Others	Core Power Domain

Table 6.10-4 Registers Power Domain

6.10.5.12 Spare Registers and Tamper Detector

The RTC module is equipped with 80 bytes spare registers to store user's important information. These spare registers are located in RTC domain, user needs to enable SPRRWEN (RTC_SPRCTL[2]) before writing one of 20 spare registers (RTC_SPR0 ~ RTC_SPR19).

When the transition level condition defined in RTC_TAMPCTL is mismatch, tamper detected interrupt flag TAMPxIF (RTC_INTSTS[13:8]) will be generated. Meanwhile, the 80 bytes spare registers (RTC_SPR0 ~ RTC_SPR19) content will be cleared automatically by hardware to prevent the security data be disclosure and current RTC time and calendar will be loaded to RTC_TAMPTIME and RTC_TAMPCAL registers, these values only can be cleared automatically or update again when all TAMPxIF are cleared to 0. And if TAMPxIF is set to 1, the interrupt is generated to NVIC if the tamper detect interrupt is activated.

RTC support 3 pair dynamic loop tamper pin or 6 individual tamper pin. The DYNRATE (RTC_TAMPCTL[7:5]) determine a reference pattern bit duration and it is shown in Figure 6.10-2. In

Table 6.10-5, setting DYNSRC (RTC_TAMPCTL[3:2]) can select detect signal is new value which generated by hardware random value generator, previous random value or user defined SEED value (RTC_TAMPSEED[31:0]) for dynamic loop tamper pin. Set DYN1ISS (RTC_TAMPCTL[0]) 1 can be select Pair1 detection source is from tamper 0, and DYN12SS (RTC_TAMPCTL[1]) 1 can be select Pair2 detection source is also from tamper 0. The TAMPxLV (RTC_TAMPCTL[4x+9], x=0, 1, ..., 5) depend on level attribute of TAMPERx pin for individual tamper detection. The tamper control effect is shown in Table 6.10-6 and Table 6.10-7.

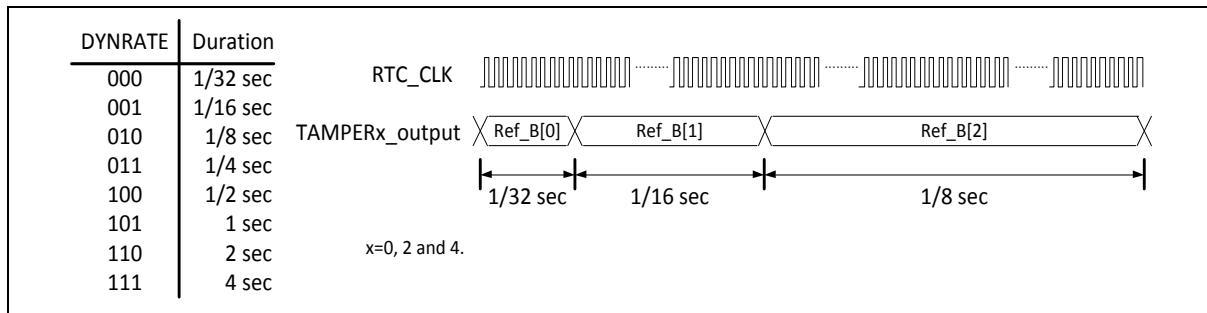

Figure 6.10-2 Dynamic Rate Definition

DYNPRxEN	DYNSRC[1:0]	The Detect Signal Description
0	x	The TAMPERn is static tamper detection (n=0 ~ 5)
1	00	Generating new random value as reference pattern when the value runs out
1	01	Repeated previous random value as reference pattern when the value runs out
1	10	Generating new random value as reference pattern when the value runs out
1	11	Repeated user defined SEED value as reference pattern when the value runs out

Table 6.10-7 Tamper Control Bit Effect for Pair 1 and 2

Static Tamper Programming Sequence Example

Clean the TAMPxIF (RTC_INTSTS[x+8], x=0, 1, ..., 5)

1. Set TAMPxLV (RTC_TAMPCTL[4x+9], x=0, 1, ..., 5) and TAMPxDBEN (RTC_TAMPCTL[4x+10], x=0, 1, ..., 5).
2. Enable TAMPxEN (RTC_TAMPCTL[4x+8], x=0, 1, ..., 5).

Dynamic Tamper Programming Sequence Example

1. Clean the TAMPxIF (RTC_INTSTS[x+8], x=0, 1, ..., 5)
2. Fill the SEED (RTC_TAMPSEED[31:0]).
3. Setting DYNsrc (RTC_TAMPCTL[3:2]), DYNxISS (RTC_TAMPCTL[x], x=0, 1) and DYNRATE (RTC_TAMPCTL[7:5]).
4. Enable DYNPRxEN (RTC_TAMPCTL[8x+16], x=0, 1, 2).
5. Enable TAMPxEN (RTC_TAMPCTL[4x+8], x=0, 1, ..., 5).
6. Set SEEDRLD (RTC_TAMPCTL[4]).

6.10.5.13 Backup Domain GPIO Function

When PF.4/X32O and PF.5/X32I pins are not used as low speed 32K oscillator function, they can be used as GPIO pin function. The CTLSEL0 (RTC_GPIOCTL0[3]) is used to select the PF.4/X32O pin is controlled by RTC or GPIO module and the PF.5/X32I pin is controlled by CTLSEL1 in RTC_GPIOCTL0[11]. Figure 6.10-3 shows backup I/O control diagram.

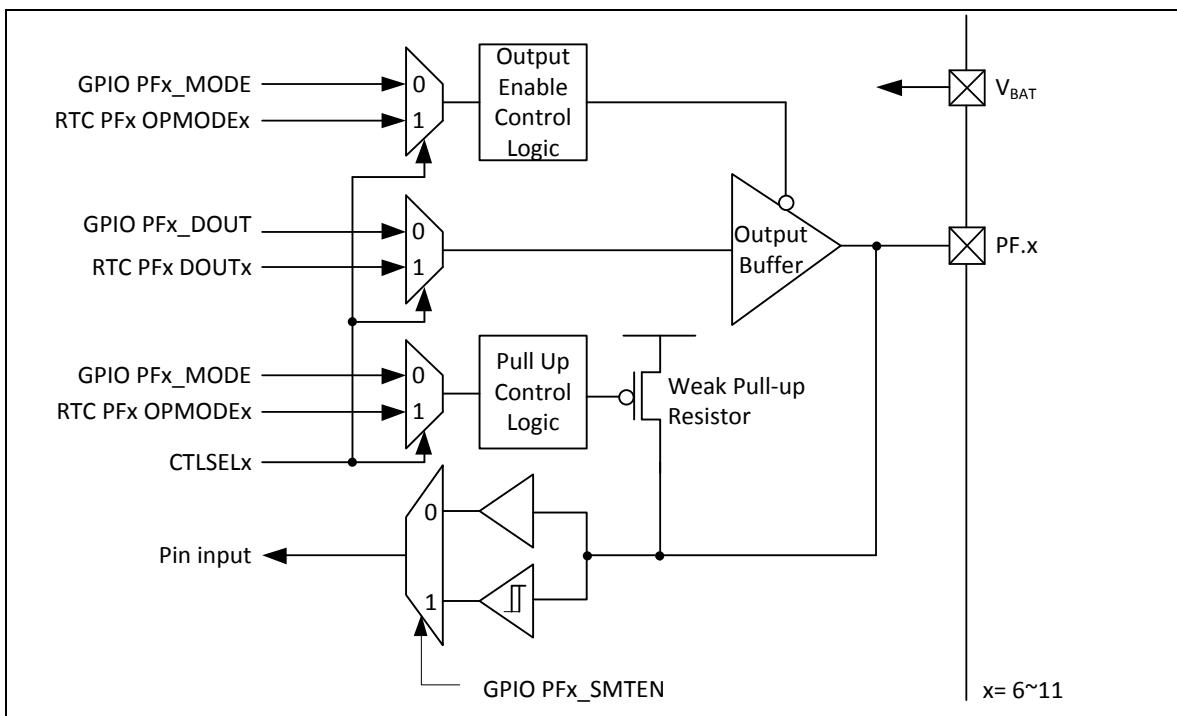

Figure 6.10-3 Backup I/O Control Diagram

RTC_TAMPCTL	RTC_BA+0x120	R/W	RTC Tamper Pin Control Register	0x0000_0000
RTC_TAMPSEED	RTC_BA+0x128	R/W	RTC Tamper Dynamic Seed Register	0x0000_0000
RTC_TAMPTIME	RTC_BA+0x130	R	RTC Tamper Time Register	0x0000_0000
RTC_TAMPCAL	RTC_BA+0x134	R	RTC Tamper Calendar Register	0x0000_0000

6.10.7 Register Description

RTC Initiation Register (RTC_INIT)

Register	Offset	R/W	Description					Reset Value
RTC_INIT	RTC_BA+0x00	R/W	RTC Initiation Register					0x0000_0000

Bits	Description	
[31:1]	INIT[31:1]	RTC Initiation (Write Only) When RTC block is powered on, RTC is at reset state. User has to write a number (0xa5eb1357) to INIT to make RTC leave reset state. Once the INIT is written as 0xa5eb1357, the RTC will be in un-reset state permanently. The INIT is a write-only field and read value will be always 0.
[0]	INIT[0]/ACTIVE	RTC Active Status (Read Only) 0 = RTC is at reset state. 1 = RTC is at normal active state.

RTC Access Enable Register (RTC_RWEN)

Register	Offset	R/W	Description				Reset Value
RTC_RWEN	RTC_BA+0x04	R/W	RTC Access Enable Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved							RTCBUSY
23	22	21	20	19	18	17	16
Reserved							RWENF
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved							

Bits	Description	
[31:25]	Reserved	Reserved.
[24]	RTCBUSY	<p>RTC Write Busy Flag This bit indicates RTC registers are writable or not. 0 = RTC registers are writable. 1 = RTC registers can't be written. RTC is under Busy Status. Note: RTCBUSY flag will be set when execute write RTC register command exceed 6 times within 1120 PCLK cycles.</p>
[23:17]	Reserved	Reserved.
[16]	RWENF	<p>RTC Register Access Enable Flag (Read Only) 0 = RTC register read/write Disabled. 1 = RTC register read/write Enabled. Note: RWENF will be masked to 0 during RTCBUSY is 1, and first turn on RTCCKEN (CLK_APBCLK[1]) also.</p>
[15:0]	Reserved	Reserved.

RTC Frequency Compensation Register (RTC_FREQADJ)

Register	Offset	R/W	Description				Reset Value
RTC_FREQADJ	RTC_BA+0x08	R/W	RTC Frequency Compensation Register				0x0020_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
FREQADJ							
7	6	5	4	3	2	1	0
FREQADJ							

Bits	Description	
[31:22]	Reserved	Reserved.
[21:0]	FREQADJ	<p>Frequency Compensation Register User must to get actual LXT frequency for RTC application. $FCR = 0x200000 * (32768 / LXT\ frequency)$.</p> <p>Note: This formula is suitable only when RTC clock source is from LXT, RTCSEL (CLK_CLKSEL3[8]) is 0.</p>

RTC Time Loading Register (RTC_TIME)

Register	Offset	R/W	Description					Reset Value
RTC_TIME	RTC_BA+0x0C	R/W	RTC Time Loading Register					0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved		TENHR				HR	
15	14	13	12	11	10	9	8
Reserved		TENMIN				MIN	
7	6	5	4	3	2	1	0
Reserved		TENSEC				SEC	

Bits	Description	
[31:22]	Reserved	Reserved.
[21:20]	TENHR	10-Hour Time Digit (0~2) When RTC runs as 12-hour time scale mode, RTC_TIME[21] (the high bit of TENHR[1:0]) means AM/PM indication (If RTC_TIME[21] is 1, it indicates PM time message.)
[19:16]	HR	1-Hour Time Digit (0~9)
[15]	Reserved	Reserved.
[14:12]	TENMIN	10-Min Time Digit (0~5)
[11:8]	MIN	1-Min Time Digit (0~9)
[7]	Reserved	Reserved.
[6:4]	TENSEC	10-Sec Time Digit (0~5)
[3:0]	SEC	1-Sec Time Digit (0~9)

Note:

1. RTC_TIME is a BCD digit counter and RTC will not check loaded data.
2. The reasonable value range is listed in the parenthesis.
3. FREQADJ's counter will be reset for start to Compensation when writing RTC_FREQADJ, RTC_TIME, RTC_CAL, RTC_WEEKDAY. Imply RTC Time will be restarted.

RTC Calendar Loading Register (RTC_CAL)

Register	Offset	R/W	Description				Reset Value
RTC_CAL	RTC_BA+0x10	R/W	RTC Calendar Loading Register				0x0015_0808

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
TENYEAR				YEAR			
15	14	13	12	11	10	9	8
Reserved			TENMON	MON			
7	6	5	4	3	2	1	0
Reserved		TENDAY		DAY			

Bits	Description	
[31:24]	Reserved	Reserved.
[23:20]	TENYEAR	10-Year Calendar Digit (0~9)
[19:16]	YEAR	1-Year Calendar Digit (0~9)
[15:13]	Reserved	Reserved.
[12]	TENMON	10-Month Calendar Digit (0~1)
[11:8]	MON	1-Month Calendar Digit (0~9)
[7:6]	Reserved	Reserved.
[5:4]	TENDAY	10-Day Calendar Digit (0~3)
[3:0]	DAY	1-Day Calendar Digit (0~9)

Note:

1. RTC_CAL is a BCD digit counter and RTC will not check loaded data.
2. The reasonable value range is listed in the parenthesis.

RTC Time Scale Selection Register (RTC_CLKFMT)

Register	Offset	R/W	Description					Reset Value
RTC_CLKFMT	RTC_BA+0x14	R/W	RTC Time Scale Selection Register					0x0000_0001

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved							24HEN

Bits	Description	
[31:1]	Reserved	Reserved.
[0]	24HEN	<p>24-hour / 12-hour Time Scale Selection</p> <p>Indicates that RTC_TIME and RTC_TALM are in 24-hour time scale or 12-hour time scale</p> <p>0 = 12-hour time scale with AM and PM indication selected. 1 = 24-hour time scale selected.</p>

RTC Day of the Week Register (RTC_WEEKDAY)

Register	Offset	R/W	Description	Reset Value
RTC_WEEKDAY	RTC_BA+0x18	R/W	RTC Day of the Week Register	0x0000_0006

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved					WEEKDAY		

Bits	Description	
[31:3]	Reserved	Reserved.
[2:0]	WEEKDAY	Day of the Week Register 000 = Sunday. 001 = Monday. 010 = Tuesday. 011 = Wednesday. 100 = Thursday. 101 = Friday. 110 = Saturday. 111 = Reserved.

RTC Time Alarm Register (RTC_TALM)

Register	Offset	R/W	Description	Reset Value
RTC_TALM	RTC_BA+0x1C	R/W	RTC Time Alarm Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved		TENHR				HR	
15	14	13	12	11	10	9	8
Reserved	TENMIN				MIN		
7	6	5	4	3	2	1	0
Reserved	TENSEC				SEC		

Bits	Description	
[31:24]	Reserved	Reserved.
[21:20]	TENHR	10-Hour Time Digit of Alarm Setting (0~2) When RTC runs as 12-hour time scale mode, RTC_TIME[21] (the high bit of TENHR[1:0]) means AM/PM indication (If RTC_TIME[21] is 1, it indicates PM time message.)
[19:16]	HR	1-Hour Time Digit of Alarm Setting (0~9)
[15]	Reserved	Reserved.
[14:12]	TENMIN	10-Min Time Digit of Alarm Setting (0~5)
[11:8]	MIN	1-Min Time Digit of Alarm Setting (0~9)
[7]	Reserved	Reserved.
[6:4]	TENSEC	10-Sec Time Digit of Alarm Setting (0~5)
[3:0]	SEC	1-Sec Time Digit of Alarm Setting (0~9)

Note:

1. RTC_TALM is a BCD digit counter.
2. The reasonable value range is listed in the parenthesis.
3. This register can be read back after the RTC register access enable bit RWENF (RTC_RWEN[16]) is active.

RTC Calendar Alarm Register (RTC_CALM)

Register	Offset	R/W	Description	Reset Value
RTC_CALM	RTC_BA+0x20	R/W	RTC Calendar Alarm Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
TENYEAR				YEAR			
15	14	13	12	11	10	9	8
Reserved			TENMON	MON			
7	6	5	4	3	2	1	0
Reserved		TENDAY		DAY			

Bits	Description	
[31:24]	Reserved	Reserved.
[23:20]	TENYEAR	10-Year Calendar Digit of Alarm Setting (0~9)
[19:16]	YEAR	1-Year Calendar Digit of Alarm Setting (0~9)
[15:13]	Reserved	Reserved.
[12]	TENMON	10-Month Calendar Digit of Alarm Setting (0~1)
[11:8]	MON	1-Month Calendar Digit of Alarm Setting (0~9)
[7:6]	Reserved	Reserved.
[5:4]	TENDAY	10-Day Calendar Digit of Alarm Setting (0~3)
[3:0]	DAY	1-Day Calendar Digit of Alarm Setting (0~9)

Note:

1. RTC_CALM is a BCD digit counter.
2. The reasonable value range is listed in the parenthesis.
3. This register can be read back after the RTC register access enable bit RWENF (RTC_RWEN[16]) is active.

RTC Leap Year Indication Register (RTC_LEAPYEAR)

Register	Offset	R/W	Description	Reset Value
RTC_LEAPYEAR	RTC_BA+0x24	R	RTC Leap Year Indicator Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved							LEAPYEAR

Bits	Description	
[31:1]	Reserved	Reserved.
[0]	LEAPYEAR	Leap Year Indication (Read Only) 0 = This year is not a leap year. 1 = This year is leap year.

RTC Interrupt Enable Register (RTC_INTEN)

Register	Offset	R/W	Description				Reset Value
RTC_INTEN	RTC_BA+0x28	R/W	RTC Interrupt Enable Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved		TAMP5IEN	TAMP4IEN	TAMP3IEN	TAMP2IEN	TAMP1IEN	TAMPOIEN
7	6	5	4	3	2	1	0
Reserved						TICKIEN	ALMIEN

Bits	Description	
[31:14]	Reserved	Reserved.
[13]	TAMP5IEN	Tamper 5 or Pair 2 Interrupt Enable Bit Set TAMP5IEN to 1 can also enable chip wake-up function when tamper 5 interrupt event is generated. 0 = Tamper 5 or Pair 2 interrupt Disabled. 1 = Tamper 5 or Pair 2 interrupt Enabled.
[12]	TAMP4IEN	Tamper 4 Interrupt Enable Bit Set TAMP4IEN to 1 can also enable chip wake-up function when tamper 4 interrupt event is generated. 0 = Tamper 4 interrupt Disabled. 1 = Tamper 4 interrupt Enabled.
[11]	TAMP3IEN	Tamper 3 or Pair 1 Interrupt Enable Bit Set TAMP3IEN to 1 can also enable chip wake-up function when tamper 3 interrupt event is generated. 0 = Tamper 3 or Pair 1 interrupt Disabled. 1 = Tamper 3 or Pair 1 interrupt Enabled.
[10]	TAMP2IEN	Tamper 2 Interrupt Enable Bit Set TAMP2IEN to 1 can also enable chip wake-up function when tamper 2 interrupt event is generated. 0 = Tamper 2 interrupt Disabled. 1 = Tamper 2 interrupt Enabled.
[9]	TAMP1IEN	Tamper 1 or Pair 0 Interrupt Enable Bit Set TAMP1IEN to 1 can also enable chip wake-up function when tamper 1 interrupt event is generated. 0 = Tamper 1 or Pair 0 interrupt Disabled. 1 = Tamper 1 or Pair 0 interrupt Enabled.
[8]	TAMPOIEN	Tamper 0 Interrupt Enable Bit Set TAMPOIEN to 1 can also enable chip wake-up function when tamper 0 interrupt event

		is generated. 0 = Tamper 0 interrupt Disabled. 1 = Tamper 0 interrupt Enabled.
[7:2]	Reserved	Reserved.
[1]	TICKIEN	Time Tick Interrupt Enable Bit Set TICKIEN to 1 can also enable chip wake-up function when RTC tick interrupt event is generated. 0 = RTC Time Tick interrupt Disabled. 1 = RTC Time Tick interrupt Enabled.
[0]	ALMIEN	Alarm Interrupt Enable Bit Set ALMIEN to 1 can also enable chip wake-up function when RTC alarm interrupt event is generated. 0 = RTC Alarm interrupt Disabled. 1 = RTC Alarm interrupt Enabled.

RTC Interrupt Status Register (RTC_INTSTS)

Register	Offset	R/W	Description				Reset Value
RTC_INTSTS	RTC_BA+0x2C	R/W	RTC Interrupt Status Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved		TAMP5IF	TAMP4IF	TAMP3IF	TAMP2IF	TAMP1IF	TAMPOIF
7	6	5	4	3	2	1	0
Reserved						TICKIF	ALMIF

Bits	Description	
[31:14]	Reserved	Reserved.
[13]	TAMP5IF	<p>Tamper 5 or Pair 2 Interrupt Flag This bit is set when TAMP5_PIN detected level non-equal TAMP5LV (RTC_TAMPCTL[29]) or TAMP4_PIN and TAMP5_PIN disconnected during DYNPR2EN (RTC_TAMPCTL[31]) is activated or TAMP0_PIN and TAMP5_PIN disconnected during DYNPR2EN (RTC_TAMPCTL[31]) and DYN2ISS (RTC_TAMPCTL[1]) are activated. 0 = No Tamper 5 or Pair 2 interrupt flag is generated. 1 = Tamper 5 or Pair 2 interrupt flag is generated. Note1: Write 1 to clear this bit. Note2: Clear all TAPMxF will clear RTC_TAMPTIME and RTC_TAMPCAL automatically.</p>
[12]	TAMP4IF	<p>Tamper 4 Interrupt Flag This bit is set when TAMP4_PIN detected level non-equal TAMP4LV (RTC_TAMPCTL[25]). 0 = No Tamper 4 interrupt flag is generated. 1 = Tamper 4 interrupt flag is generated. Note1: Write 1 to clear this bit. Note2: Clear all TAPMxF will clear RTC_TAMPTIME and RTC_TAMPCAL automatically.</p>
[11]	TAMP3IF	<p>Tamper 3 or Pair 1 Interrupt Flag This bit is set when TAMP3_PIN detected level non-equal TAMP3LV (RTC_TAMPCTL[21]) or TAMP2_PIN and TAMP3_PIN disconnected during DYNPR1EN (RTC_TAMPCTL[23]) is activated or TAMP0_PIN and TAMP3_PIN disconnected during DYNPR1EN (RTC_TAMPCTL[23]) and DYN1ISS (RTC_TAMPCTL[0]) are activated. 0 = No Tamper 3 or Pair 1 interrupt flag is generated. 1 = Tamper 3 or Pair 1 interrupt flag is generated. Note1: Write 1 to clear this bit. Note2: Clear all TAPMxF will clear RTC_TAMPTIME and RTC_TAMPCAL automatically.</p>
[10]	TAMP2IF	<p>Tamper 2 Interrupt Flag This bit is set when TAMP2_PIN detected level non-equal TAMP2LV (RTC_TAMPCTL[17]).</p>

		<p>0 = No Tamper 2 interrupt flag is generated. 1 = Tamper 2 interrupt flag is generated.</p> <p>Note1: Write 1 to clear this bit.</p> <p>Note2: Clear all TAPMxF will clear RTC_TAMPTIME and RTC_TAMPCAL automatically.</p>
[9]	TAMP1IF	<p>Tamper 1 or Pair 0 Interrupt Flag This bit is set when TAMP1_PIN detected level non-equal TAMP1LV (RTC_TAMPCTL[13]) or TAMP0_PIN and TAMP1_PIN disconnected during DYNPR0EN (RTC_TAMPCTL[15]) is activated.</p> <p>0 = No Tamper 1 or Pair 0 interrupt flag is generated. 1 = Tamper 1 or Pair 0 interrupt flag is generated.</p> <p>Note1: Write 1 to clear this bit.</p> <p>Note2: Clear all TAPMxF will clear RTC_TAMPTIME and RTC_TAMPCAL automatically.</p>
[8]	TAMP0IF	<p>Tamper 0 Interrupt Flag This bit is set when TAMP0_PIN detected level non-equal TAMP0LV (RTC_TAMPCTL[9]).</p> <p>0 = No Tamper 0 interrupt flag is generated. 1 = Tamper 0 interrupt flag is generated.</p> <p>Note1: Write 1 to clear this bit.</p> <p>Note2: Clear all TAPMxF will clear RTC_TAMPTIME and RTC_TAMPCAL automatically.</p>
[7:2]	Reserved	Reserved.
[1]	TICKIF	<p>RTC Time Tick Interrupt Flag 0 = Tick condition did not occur. 1 = Tick condition occurred.</p> <p>Note: Write 1 to clear this bit.</p>
[0]	ALMIF	<p>RTC Alarm Interrupt Flag 0 = Alarm condition is not matched. 1 = Alarm condition is matched.</p> <p>Note: Write 1 to clear this bit.</p>

RTC Time Tick Register (RTC TICK)

Register	Offset	R/W	Description					Reset Value
RTC_TICK	RTC_BA+0x30	R/W	RTC Time Tick Register					0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved					TICK		

Bits	Description	
[31:3]	Reserved	Reserved.
[2:0]	TICK	<p>Time Tick Register</p> <p>These bits are used to select RTC time tick period for Periodic Time Tick Interrupt request.</p> <p>000 = Time tick is 1 second. 001 = Time tick is 1/2 second. 010 = Time tick is 1/4 second. 011 = Time tick is 1/8 second. 100 = Time tick is 1/16 second. 101 = Time tick is 1/32 second. 110 = Time tick is 1/64 second. 111 = Time tick is 1/128 second.</p> <p>Note: This register can be read back after the RTC register access enable bit RWENF (RTC_RWEN[16]) is active.</p>

Note: This register can be read back after the RTC register access enable bit RWENF (RTC_RWEN[16]) is active.

RTC Time Alarm MASK Register (RTC_TAMSK)

Register	Offset	R/W	Description				Reset Value
RTC_TAMSK	RTC_BA+0x34	R/W	RTC Time Alarm Mask Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		MTENHR	MHR	MTENMIN	MMIN	MTENSEC	MSEC

Bits	Description	
[31:6]	Reserved	Reserved.
[5]	MTENHR	Mask 10-Hour Time Digit of Alarm Setting (0~2)
[4]	MHR	Mask 1-Hour Time Digit of Alarm Setting (0~9)
[3]	MTENMIN	Mask 10-Min Time Digit of Alarm Setting (0~5)
[2]	MMIN	Mask 1-Min Time Digit of Alarm Setting (0~9)
[1]	MTENSEC	Mask 10-Sec Time Digit of Alarm Setting (0~5)
[0]	MSEC	Mask 1-Sec Time Digit of Alarm Setting (0~9)

Note:

1. RTC_TALM is a BCD digit counter and RTC will not check loaded data.
2. The reasonable value range is listed in the parenthesis.
3. MTENHR/MHR base on 24 hour Time Scale.

RTC Calendar Alarm MASK Register (RTC_CAMSK)

Register	Offset	R/W	Description					Reset Value
RTC_CAMSK	RTC_BA+0x38	R/W	RTC Calendar Alarm Mask Register					0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		MTENYEAR	MYEAR	MTENMON	MMON	MTENDAY	MDAY

Bits	Description	
	Reserved	Reserved.
[5]	MTENYEAR	Mask 10-Year Calendar Digit of Alarm Setting (0~9)
[4]	MYEAR	Mask 1-Year Calendar Digit of Alarm Setting (0~9)
[3]	MTENMON	Mask 10-Month Calendar Digit of Alarm Setting (0~1)
[2]	MMON	Mask 1-Month Calendar Digit of Alarm Setting (0~9)
[1]	MTENDAY	Mask 10-Day Calendar Digit of Alarm Setting (0~3)
[0]	MDAY	Mask 1-Day Calendar Digit of Alarm Setting (0~9)

Note:

1. RTC_CALM is a BCD digit counter and RTC will not check loaded data.
2. The reasonable value range is listed in the parenthesis.

RTC Spare Functional Control Register (RTC_SPRCTL)

Register	Offset	R/W	Description					Reset Value
RTC_SPRCTL	RTC_BA+0x3C	R/W	RTC Spare Functional Control Register					0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved

2. The reasonable value range is listed in the parenthesis.
3. This fields can't be updated until all TAMPxIF are cleared.

6.11 EPWM Generator and Capture Timer (EPWM)

6.11.1 Overview

The chip provides two EPWM generators — EPWM0 and EPWM1. Each EPWM supports 6 channels of EPWM output or input capture. There is a 12-bit prescaler to support flexible clock to the 16-bit EPWM counter with 16-bit comparator. The EPWM counter supports up, down and up-down counter types. EPWM uses comparator compared with counter to generate events. These events use to generate EPWM pulse, interrupt and trigger signal for EADC/DAC to start conversion.

The EPWM generator supports two standard EPWM output modes: Independent mode and Complementary mode, they have difference architecture. There are two output functions based on standard output modes: Group function and Synchronous function. Group function can be enabled under Independent mode or complementary mode. Synchronous function only enabled under complementary mode. Complementary mode has two comparators to generate various EPWM pulse with 12-bit dead-time generator and another free trigger comparator to generate trigger signal for EADC. For EPWM output control unit, it supports polarity output, independent pin mask and brake functions.

The EPWM generator also supports input capture function. It supports latch EPWM counter value to corresponding register when input channel has a rising transition, falling transition or both transition is happened. Capture function also support PDMA to transfer captured data to memory.

6.11.2 Features

6.11.2.1 EPWM Function Features

- Supports maximum clock frequency up to maximum PLL frequency
- Supports up to two EPWM modules, each module provides 6 output channels
- Supports independent mode for EPWM output/Capture input channel
- Supports complementary mode for 3 complementary paired EPWM output channel
 - Dead-time insertion with 12-bit resolution
 - Synchronous function for phase control
 - Two compared values during one period
- Supports 12-bit prescaler from 1 to 4096
- Supports 16-bit resolution EPWM counter
 - Up, down and up/down counter operation type
- Supports one-shot or auto-reload counter operation mode
- Supports group function
- Supports synchronous function
- Supports mask function and tri-state enable for each EPWM pin
- Supports brake function
 - Brake source from pin, analog comparator and system safety events (clock failed, SRAM parity error, Brown-out detection and CPU lockup).
 - Noise filter for brake source from pin
 - Leading edge blanking (LEB) function for brake source from analog comparator
 - Edge detect brake source to control brake state until brake interrupt cleared
 - Level detect brake source to auto recover function after brake condition removed

- Supports interrupt on the following events:
 - EPWM counter matches 0, period value or compared value
 - Brake condition happened
- Supports trigger EADC/DAC on the following events:
 - EPWM counter matches 0, period value or compared value
 - EPWM counter match free trigger comparator compared value (only for EADC)

6.11.2.2 Capture Function Features

- Supports up to 12 capture input channels with 16-bit resolution
- Supports rising or falling capture condition
- Supports input rising/falling capture interrupt
- Supports rising/falling capture with counter reload option
- Supports PDMA transfer function for EPWM all channels

6.11.3 Block Diagram

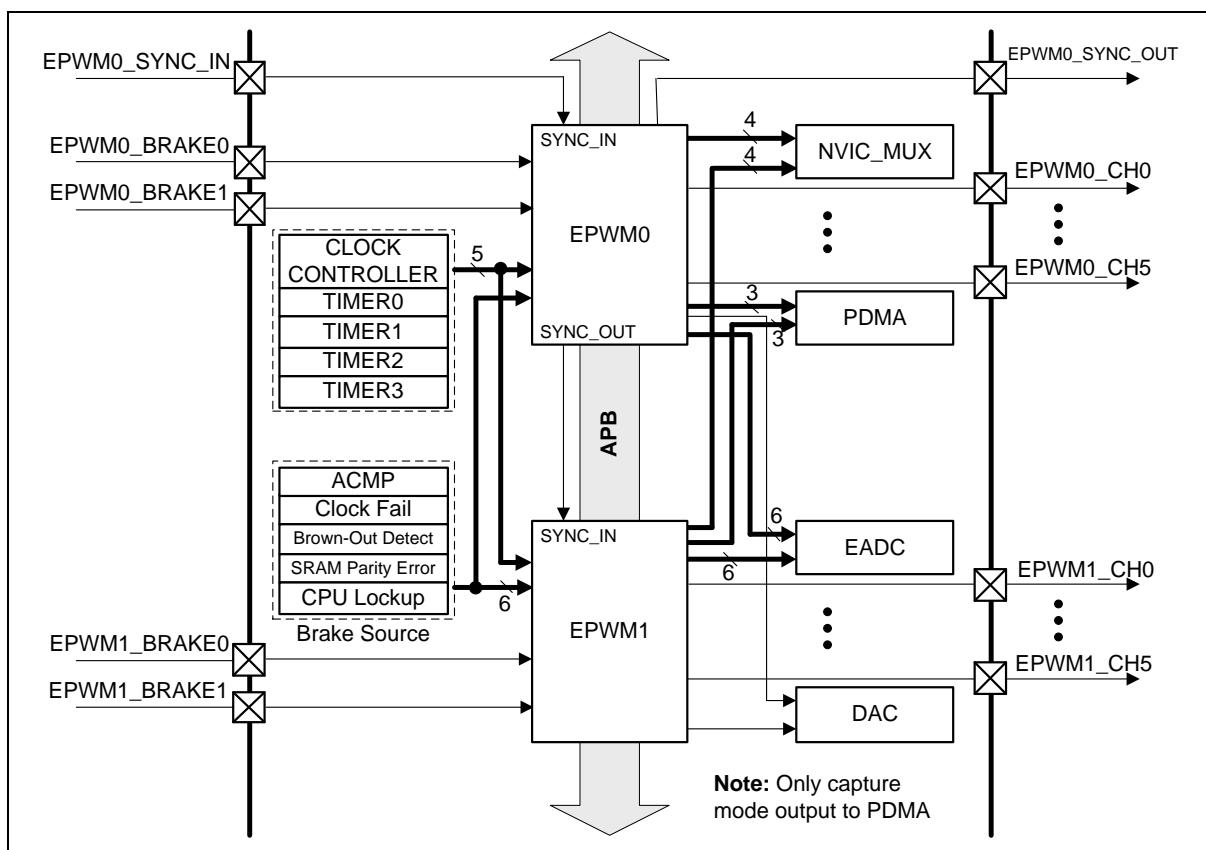

Figure 6.11-1 EPWM Generator Overview Block Diagram

EPWM Clock frequency can be set equal or double to PCLK frequency as Figure 6.11-2. For the detailed register setting, please refer to Table 6.11-1. Each EPWM generator has three clock source inputs, each clock source can be selected from EPWM Clock or four TIMER trigger EPWM outputs as Figure 6.11-3 by ECLKSRC0 (EPWM_CLKSRC[2:0]) for EPWM_CLK0, ECLKSRC2 (EPWM_CLKSRC[10:8]) for EPWM_CLK2 and ECLKSRC4 (EPWM_CLKSRC[18:16]) for EPWM_CLK4.

Table 6.11-1 EPWM Clock Source Control Registers Setting Table

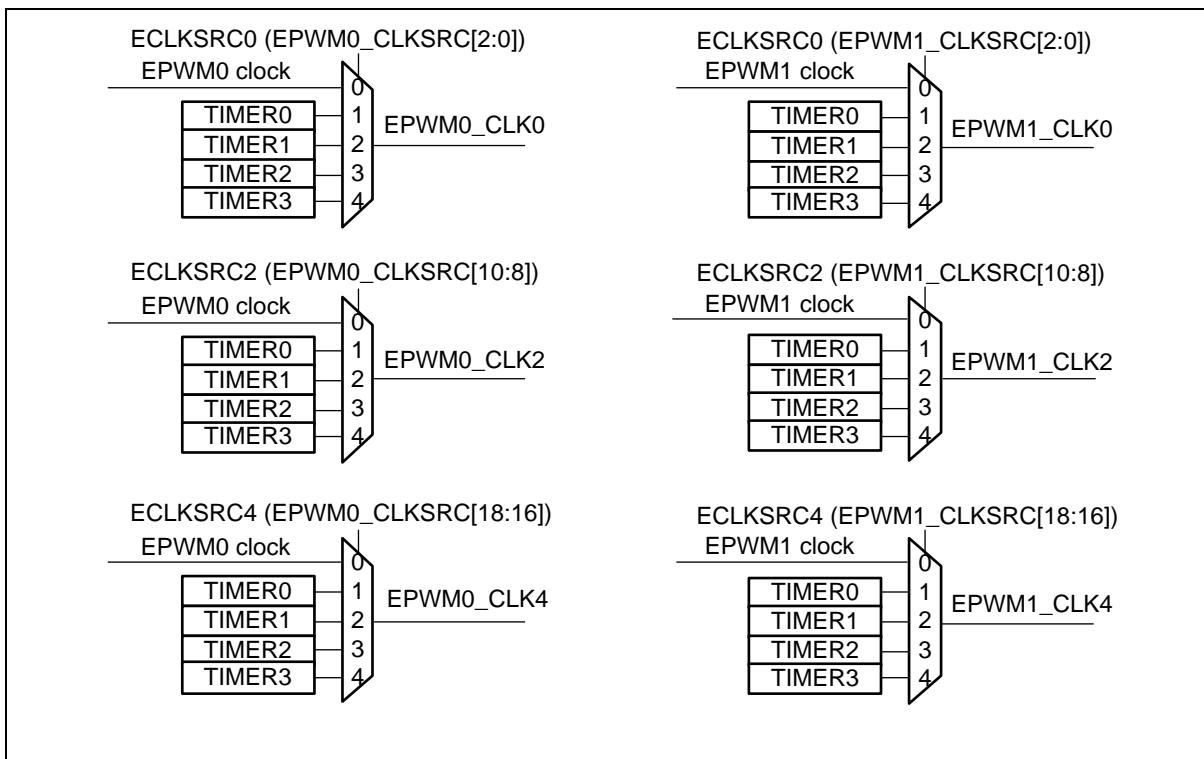

Figure 6.11-3 EPWM Clock Source Control

Figure 6.11-4 and Figure 6.11-5 illustrate the architecture of EPWM independent mode and complementary mode. No matter independent mode or complementary mode, paired channels' (EPWM_CH0 and EPWM_CH1, EPWM_CH2 and EPWM_CH3, EPWM_CH4 and EPWM_CH5) counters both come from the same clock source and prescaler. When counter count to 0, PERIOD (EPWM_PERIODn[15:0]) or equal to comparator, events will be generated. These events are passed to corresponding generators to generate EPWM pulse, interrupt signal and trigger signal for EADC/DAC to start conversion. Output control is used to changing EPWM pulse output state; brake function in output control also generates interrupt events. In complementary mode, synchronize function is available and even channel use odd channel comparator to generate events, free trigger comparator events only use to generate trigger EADC signals.

6.11.5 Functional Description

6.11.5.1 EPWM Prescaler

The EPWM prescaler is used to divide clock source, prescaler counting CLKPSC +1 times, EPWM counter only count once. The prescale double buffer is setting by CLKPSC (EPWM_CLKPSCn[11:0], n = 0, 2, 4) bits. Figure 6.11-6 is an example of EPWM channel 0 prescale waveform. The prescale counter will reload CLKPSC at the begin of the next prescale counter down-count.

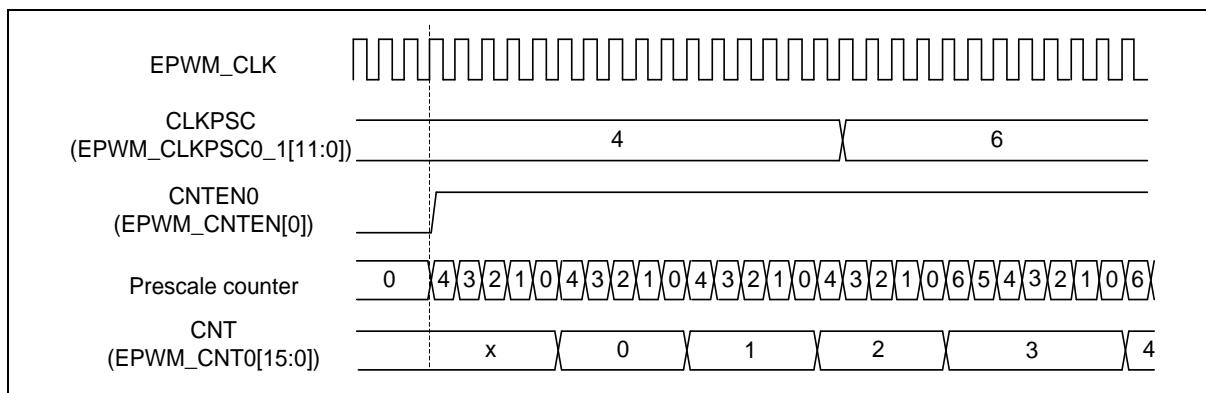

Figure 6.11-6 EPWM_CH0 Prescaler Waveform in Up Counter Type

6.11.5.2 EPWM Counter

The EPWM supports 3 counter types operation: Up Counter, Down Counter and Up-Down Counter types.

For EPWM channel0, CNT(EPWM_CNT0[15:0]) can clear to 0x00 by CNTCLR0 (EPWM_CNTCLR[0]). CNT will be cleared when prescale counter count to 0, and CNTCLR will be set 0 by hardware automatically.

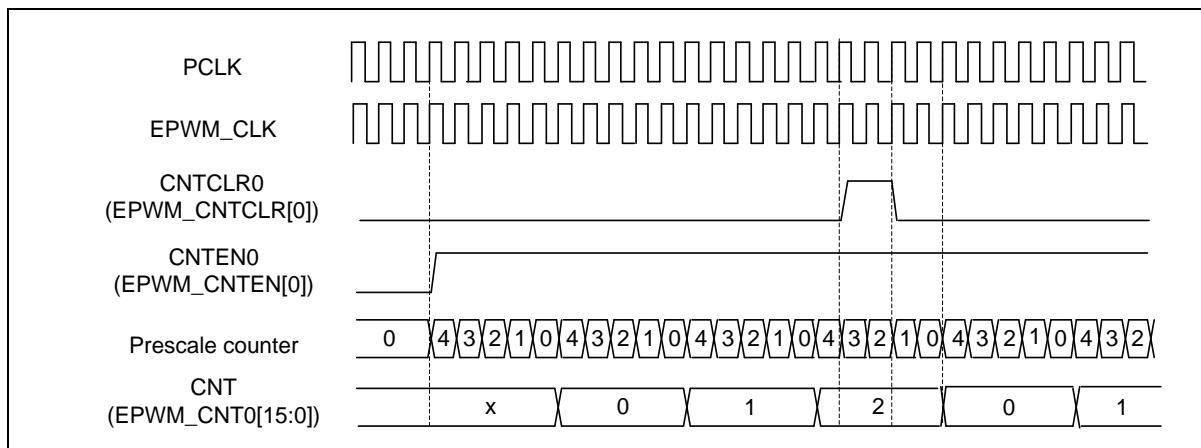

Figure 6.11-7 EPWM Counter Waveform when Setting Clear Counter

6.11.5.3 Up Counter Type

When EPWM counter is set to up counter type, CNTTYPE_n (EPWM_CTL1[2n+1:2n], n = 0,1..5) is 0x0, it starts up-counting from 0 to PERIOD (EPWM_PERIOD_n[15:0], where n denotes channel number) to complete a EPWM period. The current counter value can be read from CNT (EPWM_CNT_n[15:0]) bits. EPWM generates zero point event when the counter counts to 0 and prescale counts to 0. EPWM generates period point event when the counter counts to PERIOD and prescale counts to 0. Figure 6.11-8 shows an example of up counter, wherein

$$\text{EPWM period time} = (\text{PERIOD}+1) * (\text{CLKPSC}+1) * \text{EPWMx_CLK}.$$

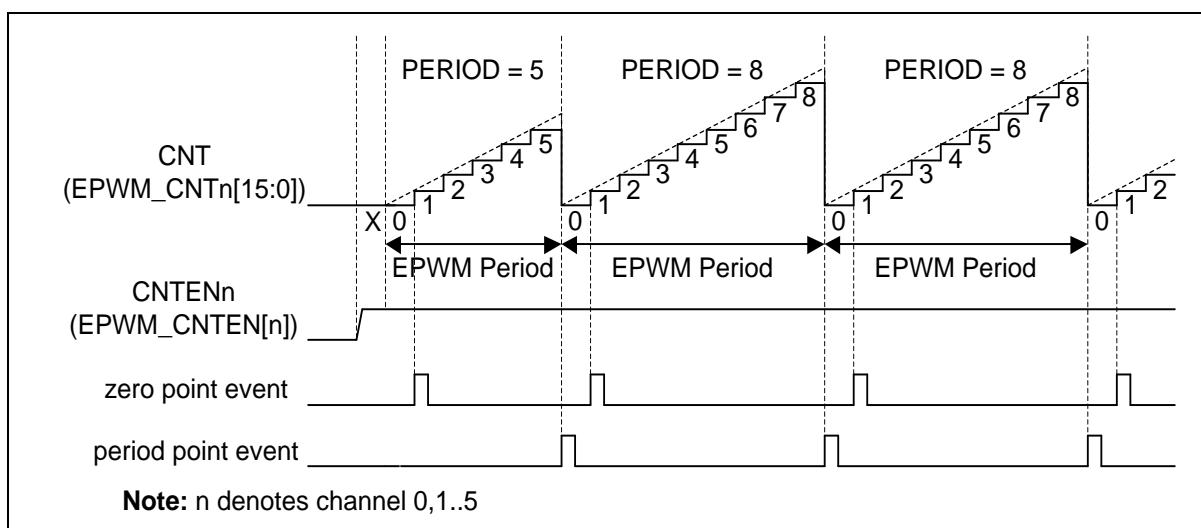

Figure 6.11-8 EPWM Up Counter Type

6.11.5.4 Down Counter Type

When EPWM counter is set to down counter type, CNTTYPE_n (EPWM_CTL1[2n+1:2n], n = 0,1..5) is 0x1, it starts down-counting from PERIOD to 0 to complete a EPWM period. The current counter value can be read from CNT (EPWM_CNT_n[15:0]) bits. EPWM generates zero point event when the counter counts to 0 and prescale counts to 0. EPWM generates period point event when the counter counts to PERIOD and prescale counts to 0. Figure 6.11-9 shows an example of down counter, wherein

EPWM period time = (PERIOD+1) * (CLKPSC+1) * EPWMx_CLK.

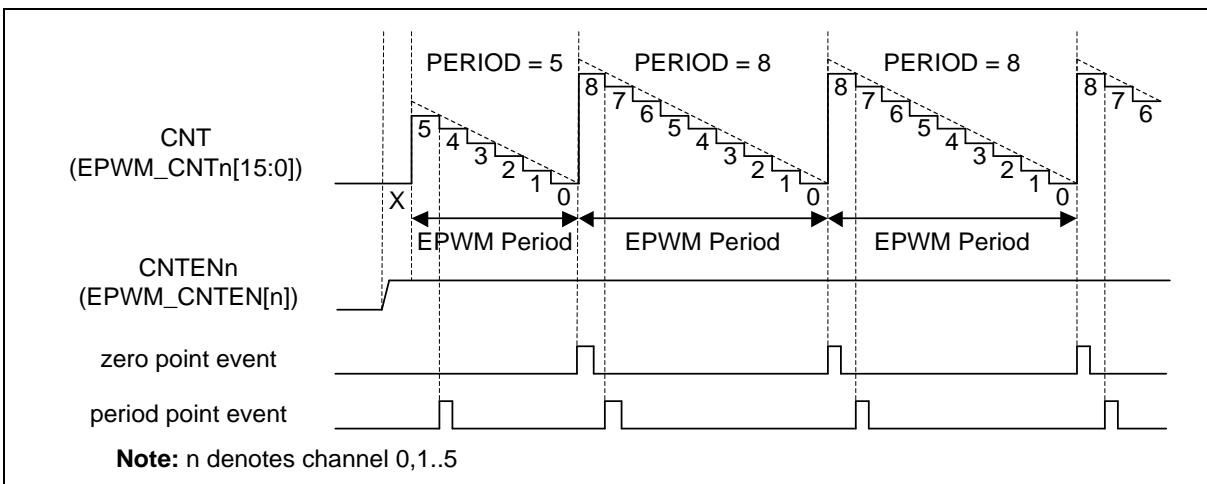

Figure 6.11-9 EPWM Down Counter Type

6.11.5.5 Up-Down Counter Type

When EPWM counter is set to up-down count type, CNTTYPE_n (EPWM_CTL1[2n+1:2n], n = 0,1..5) is 0x2, it starts counting-up from 0 to PERIOD and then starts counting down to 0 to complete a EPWM period. The current counter value can be read from CNT (EPWM_CNTn[15:0]) bits. EPWM generates zero point event when the counter counts to 0 and prescale counts to 0. EPWM generates center point event which is equal to period point event when the counter counts to PERIOD. Figure 6.11-10 shows an example of up-down counter, wherein

EPWM period time = (2*PERIOD) * (CLKPSC+1) * EPWMx_CLK.

The DIRF (EPWM_CNTn[16]) bit is counter direction indicator flag, where high is up counting, and low is down counting.

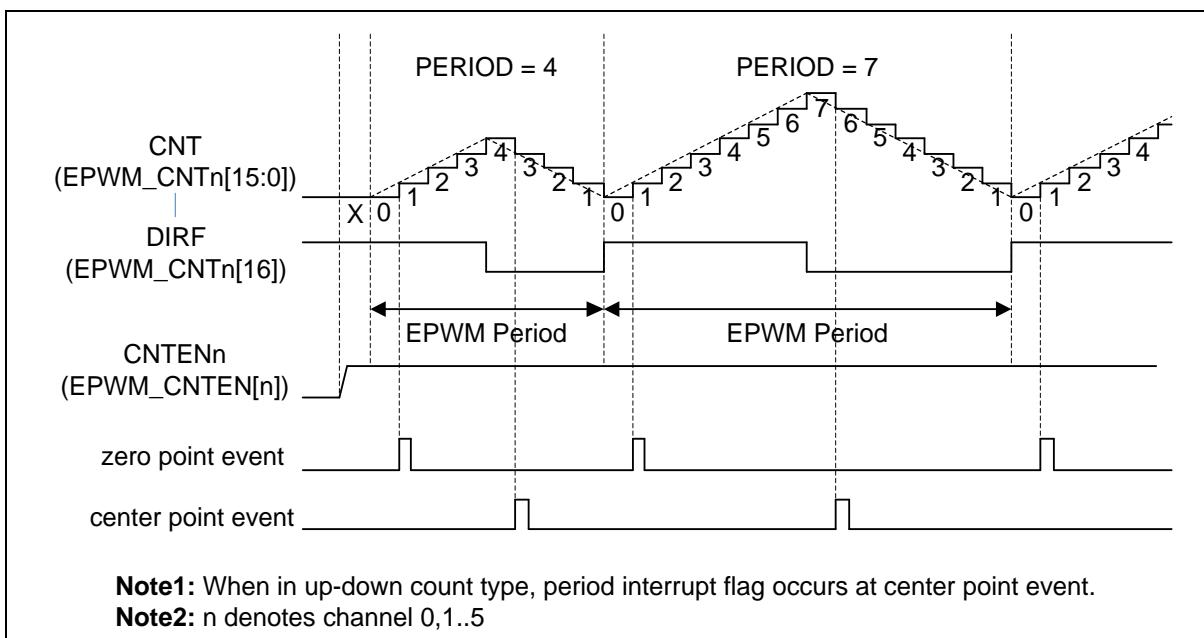

Figure 6.11-10 EPWM Up-Down Counter Type

6.11.5.6 EPWM Comparator

There are two kinds of comparator registers : one is CMPDATn($n = 0,1..5$), and the other is FTCMPDATn_m($n = 0,2,4$, $m = 1,3,5$) register. CMPDATn is a basic comparator register of EPWM channel n ; In Independent mode each channel only has one comparator, the value of CMPDATn register is continuously compared to the corresponding channel's counter value. In Complementary mode each paired channels has two comparators, and the value of CMPDATn and CMPDATm ($n = 0,2,4$, $m = 1,3,5$) registers are continuously compared to the complementary even channel's counter value, because of odd channel's counter is useless. For example, channel 0 and channel 1 are complementary channels, in Complementary mode, channel 1's comparator is continuously compared to channel 0's counter, but not channel 1's. When the counter is equal to value of CMPDAT0 register, EPWM generates a compared point event and uses the event to generate EPWM pulse, interrupt or use to trigger EADC/DAC. In up-down counter type, two events will be generated in a EPWM period as shown in Figure 6.11-11. The CMPU is up count compared point event and CMPD is down count compared point event.

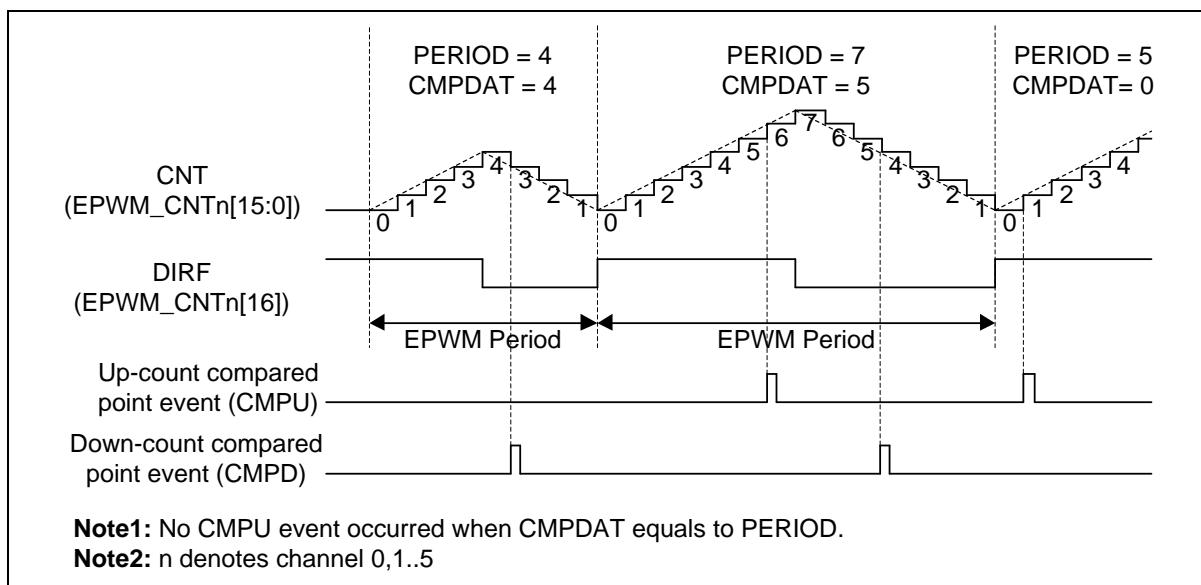

Figure 6.11-11 EPWM Compared point Events in Up-Down Counter Type

FTCMPDAT is a free trigger comparator register. Each complementary paired channel only supports one free trigger comparator. The value of FTCMPDAT_{n,m}(n = 0,2,4, m = 1,3,5) register is continuously compared to even channel's counter value. When counter is equal to the value of FTCMPDAT register, FTCMD_n (EPWM_FTCI[10:8], n=0,2,4) indicator is set in down count type and FTCMU_n (EPWM_FTCI[2:0], n=0,2,4) indicator is set in up count type. In addition, EPWM generates an event and only uses to trigger EADC.

6.11.5.7 EPWM Double Buffering

The double buffering uses double buffers to separate software writing and hardware action operation timing. There are four loading modes for loading values to buffer: period loading mode, immediately loading mode, window loading mode and center loading mode. After registers are modified through software, hardware will load register value to the buffer register according to the loading mode timing. The hardware action is based on the buffer value. This can prevent asynchronously operation problem due to software and hardware asynchronism.

The EPWM provides PBUF (EPWM_PBUFn[15:0]) as the active PERIOD buffer register, CMPBUF (EPWM_CMPBUFn[15:0]) as the active CMPDAT buffer register, FTCMPBUF (EPWM_FTCCMPBUFn_m[15:0]) as the active FTCMPDAT buffer register and CPSCBUF (EPWM_CPSBUF_m[15:0]) as the active CLKPSC buffer register. The concept of double buffering is used in loading modes, which are described in the following sections. For example, as shown Figure 6.11-12, in period loading mode, writing PERIOD, CMPDAT and FTCMPDAT registers through software, EPWM will load new values to their buffer PBUF (EPWM_PBUFn[15:0]), CMPBUF (EPWM_CMPBUFn[15:0]) and FTCMPBUF (EPWM_FTCCBUF[15:0]) at start of the next period without affecting the current period counter operation. FTCMPU denotes up-count free trigger compared point event and FTCMPD denotes down-count free trigger compared event.

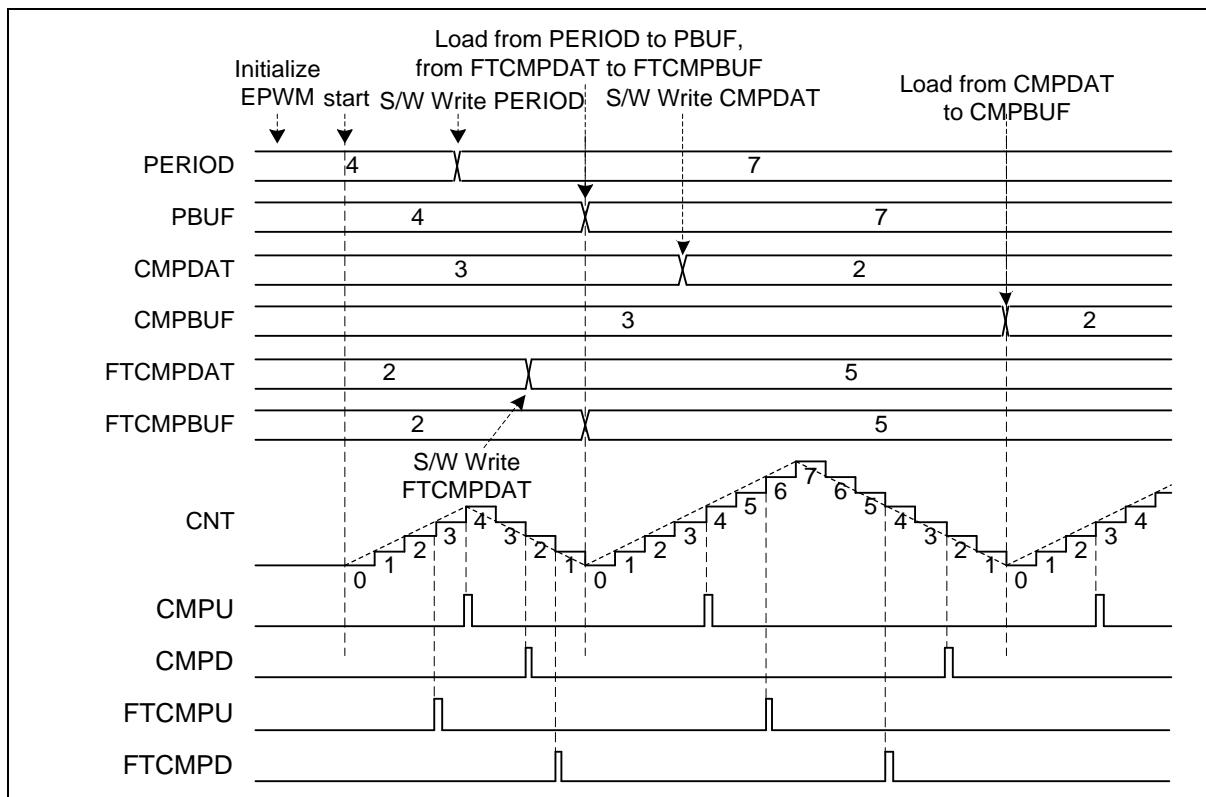

Figure 6.11-12 EPWM Double Buffering Illustration

6.11.5.8 Period Loading Mode

When immediately loading mode, window loading mode and center loading mode are disabled that IMMLDENn bits, WINLDENn bits and CTRLDn bits of EPWM_CTL0 register are set to 0, EPWM operates at period Loading mode. In period Loading mode, CLKPSC(EPWM_CLKPSCn_m[11:0]), PERIOD(EPWM_PERIODn[15:0]), CMP(EPWM_CMPDATn[15:0]) and FTCMPDAT (EPWM_FTCMPDATn_m[15:0]) will all load to their active CPSCBUF, PBUF. CMPBUF and FTCMPBUF registers while each period is completed. For example, after EPWM counter up counts from 0 to PERIOD in the up-counter operation or down counts from PERIOD to 0 in the down-counter operation or counts up from 0 to PERIOD and then counts down to 0 in the up-down counter operation.

Figure 6.11-13 shows period loading timing of up-count operation, where PERIOD DATA0 denotes the initial data of PERIOD, PERIOD DATA1 denotes the first updated PERIOD data by software and so on. CMPDAT also follows this rule. The following describes steps sequence of Figure 6.11-13. User can know the PERIOD and CMPDAT update condition, by watching EPWM period and CMPU event.

1. Software writes CMPDAT DATA1 to CMPDAT at point 1.
2. Hardware loads CMPDAT DATA1 to CMPBUF at the end of EPWM period at point 2.
3. Software writes PERIOD DATA1 to PERIOD at point 3.
4. Hardware loads PERIOD DATA1 to PBUF at the end of EPWM period at point 4.
5. Software writes PERIOD DATA2 to PERIOD at point 5.
6. Hardware loads PERIOD DATA2 to PBUF at the end of EPWM period at point 6.

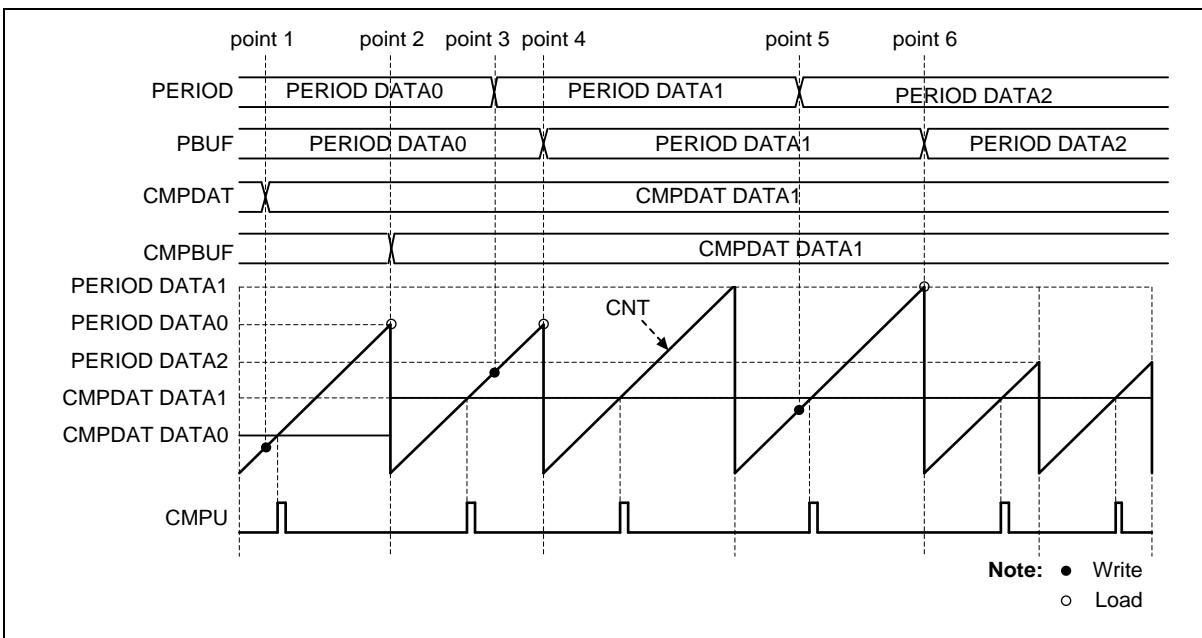

Figure 6.11-13 Period Loading in Up-Count Mode

6.11.5.9 Immediately Loading Mode

If the IMMLDENn (EPWM_CTL0[21:16]) bit is set to 1, EPWM operates at immediately loading mode. In immediately loading mode, when user update CLKPSC(EPWM_CLKPSCn_m[11:0]), PERIOD(EPWM_PERIODn[15:0]), CMP(EPWM_CMPDATn[15:0]), or FTCMPDAT (EPWM_FTCDATn_m[15:0]), CLKPSC, PERIOD, CMPDAT or FTCMPDAT will be load to active CPSCBUF (EPWM_CPSBUFn_m[15:0]), PBUF (EPWM_PBUFn[15:0]), CMPBUF (EPWM_CMPBUFn[15:0]) or FTCMPBUF (EPWM_FTBUF[15:0]) after current counter count is completed. If the updated PERIOD value is less than current counter value, counter will count to 0xFFFF, when counter count to 0xFFFF and prescale count to 0, the flag CNTMAXF(EPWMx_STATUS[5:0]) will raise, and then counter will count wraparound. Immediately loading mode has the highest priority. If IMMLDENn has been set, other loading mode for channel n will become invalid. Figure 6.11-14 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 and hardware immediately loading CMPDAT DATA1 to CMPBUF at point 1.
2. Software writes PERIOD DATA1 which is greater than current counter value at point 2; counter will continue counting until equal to PERIOD DATA1 to finish a period loading.
3. Software writes PERIOD DATA2 which is less than the current counter value at point 3; counter will continue counting to its maximum value 0xFFFF and count wraparound from 0 to PERIOD DATA2 to finish this period loading.

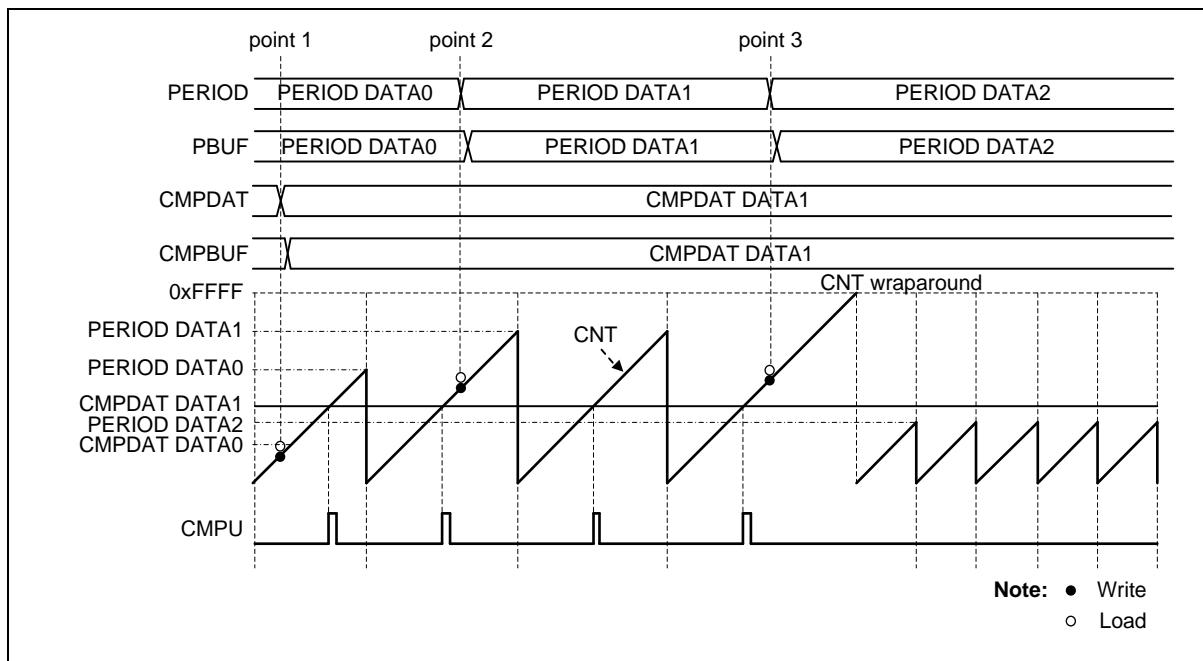

Figure 6.11-14 Immediately Loading in Up-Count Mode

6.11.5.10 Window Loading Mode

When the WINLDENn (EPWM_CTL0[13:8]) bit is set to 1, EPWM operates at window loading mode. In Window loading mode, CLKPSC(EPWM_CLKPSCn_m[11:0]), PERIOD(EPWM_PERIODn[15:0]) and CMP(EPWM_CMPDATn[15:0]) will all load to their active CPSCBUF, PBUF and CMPBUF registers while each period is completed, but CMPBUF loading are valid only when load window is opened. Every channel n's load window is opened by setting the corresponding LOADn (EPWM_LOAD[5:0]) to 1, and hardware will close the window at the end of EPWM period. Figure 6.11-15 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 at point 1, and the load window is not opened at this period so CMPDAT will not load to CMPBUF.
2. Software writes LOAD to open the load window at point2.
3. Software writes PERIOD DATA1 at point 3.
4. At point 4, load window has been opened, hardware loads CLKPSC DATA1, PERIOD DATA1 and CMPDAT DATA1 to their buffer and closes the load window at the end of EPWM period.
5. Software writes PERIOD DATA2 at point 5.
6. Hardware loads CLKPSC DATA2 and PERIOD DATA2 to their buffer at the end of EPWM period at point 6.
7. Software writes PERIOD DATA3 at point 7.
8. Software writes LOAD to open the load window at point8.
9. Hardware loads CLKPSC DATA3 and PERIOD DATA3 to their buffer and closes the load window at the end of EPWM period at point 9.

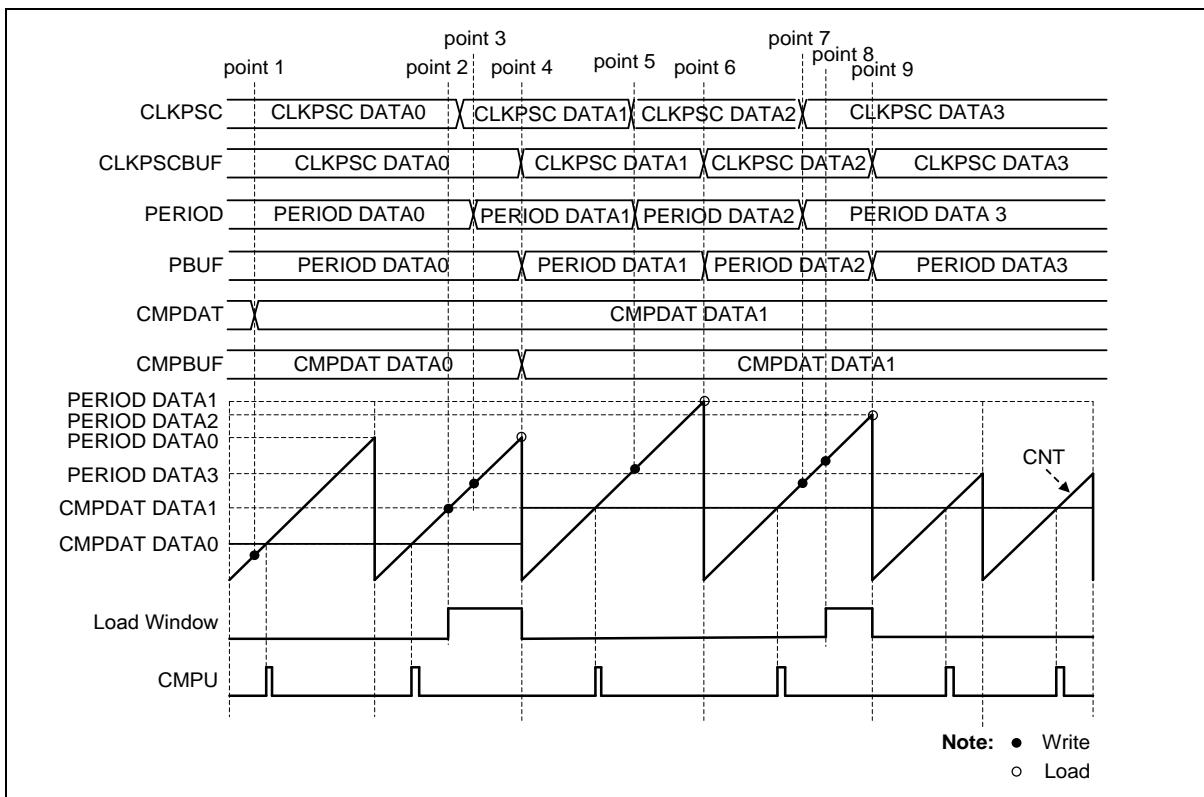

Figure 6.11-15 Window Loading in Up-Count Mode

6.11.5.11 Center Loading Mode

When the CTLRDn (EPWM_CTL0[5:0]) bit is set to 1 and EPWM counter is set to up-down count type, CNTTYPEEn (EPWM_CTL1[2n+1:2n], n = 0,1..5) is 0x2, EPWM operates at center loading mode. In center loading mode, CMP(EPWM_CMPDATn[15:0]) will load to active CMPBUF register in center of each period, that is, counter counts to PERIOD. CLKPSC(EPWM_CLKPSCn_m[11:0]) and PERIOD(EPWM_PERIODn[15:0]) will all load to their active CPSCBUF and PBUF registers while each period is completed. Center loading mode can work with window loading mode, the CMP(EPWM_CMPDATn[15:0]) will load to active CMPBUF register in center of each period, but it is valid only at the interval of load window. Figure 6.11-16 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 at point 1.
2. Hardware loads CMPDAT DATA1 to CMPBUF at center of EPWM period at point 2.
3. Software writes PERIOD DATA1 at point 3.
4. Hardware loads PERIOD DATA1 to PBUF at the end of EPWM period at point 4.
5. Software writes CMPDAT DATA2 at point 5.
6. Hardware loads CMPDAT DATA2 to CMPBUF at center of EPWM period at point 6.
7. Software writes PERIOD DATA2 at point 7.
8. Hardware loads PERIOD DATA2 to PBUF at the end of EPWM period at point 8.

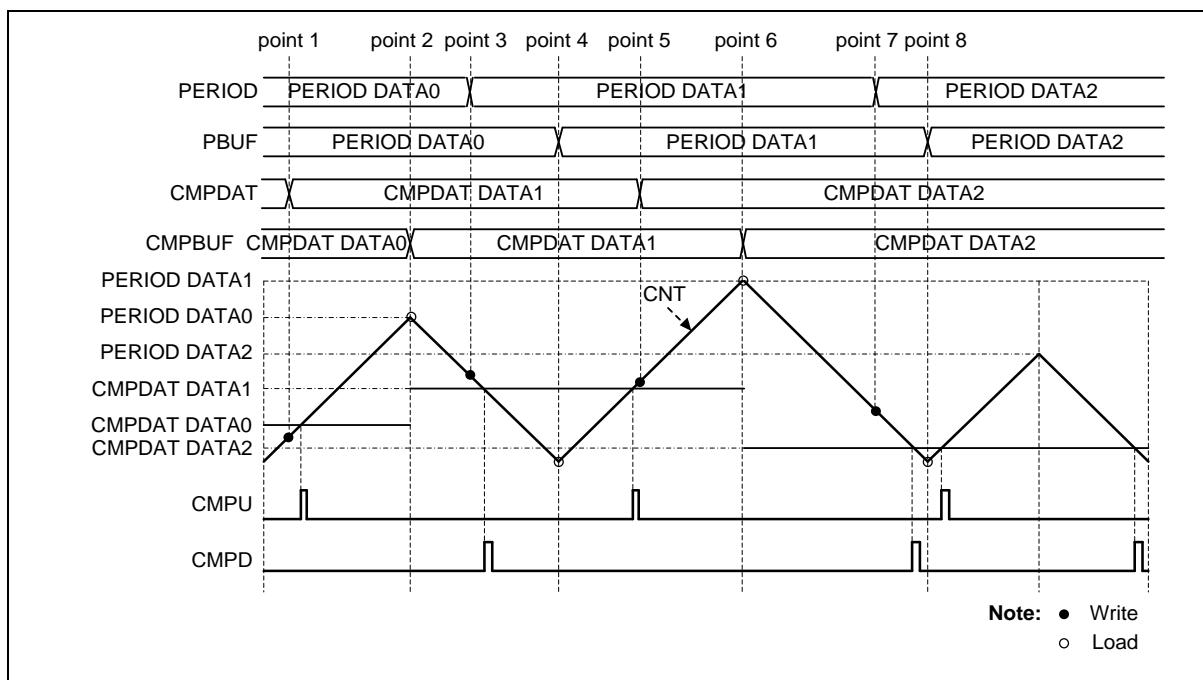

Figure 6.11-16 Center Loading in Up-Down-Count Mode

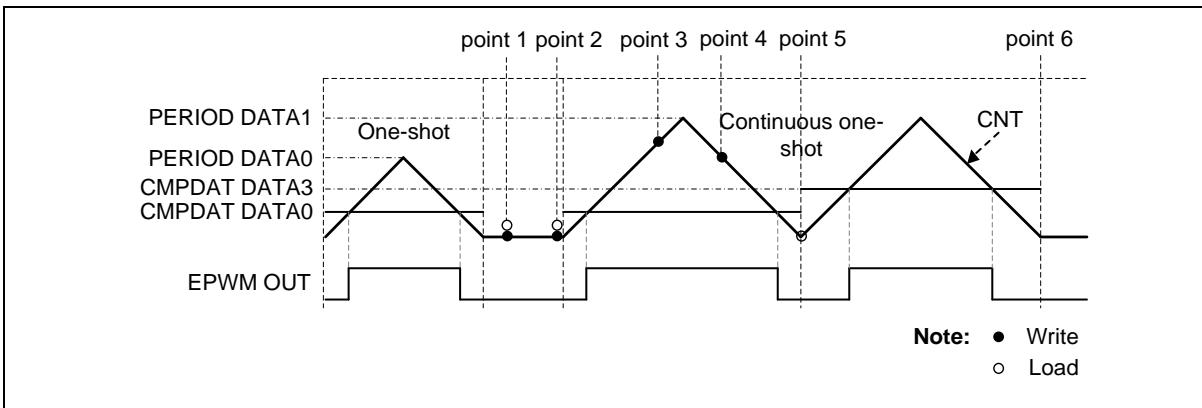

6.11.5.12 EPWM Counter Operation Mode

The EPWM counter supports two operation modes: One-shot mode and Auto-reload mode. EPWM counter will operate in One-shot mode if CNTMODEn (EPWM_CTL1[21:16]) bit is set to 1, and operate in Auto-reload mode if set to 0.

In One-shot mode, CMPDAT and PERIOD registers should be written first and then set CNTENEn (EPWM_CNTEN[5:0]) bit as 1 to enable EPWM prescaler and counter start running. After EPWM counter counted a period, counter value will keep 0.

User can re-start next one-shot by writing new value to CMP(EPWM_CMPDATn[15:0]) bits. If one-shot counter still running, to update CMPDAT register will cause next one-shot as continuous one-shot. Besides, to write CMPDAT register twice under continuous one-shot operation, latest value in CMPDAT register is valid at next one-shot period and only generate one-shot pulse once. Moreover, if user wants to clear counter within one-shot operation and starts next one-shot, user should monitor counter value to check counter has cleared and then writes CMPDAT register. Figure 6.11-17 is an example and following is steps sequence.

1. Software writes PERIOD DATA1 and hardware immediately loading PERIOD DATA1 to PBUF at point 1.
2. Software writes CMPDAT DATA1 which is equal to CMPDAT DATA0 at point 2 and hardware immediately loading CMPDAT DATA1 to CMPBUF, this event also trigger one-shot.
3. Software writes CMPDAT DATA2 and re-trigger next one-shot (continuous one-shot) at point 3.
4. Software writes CMPDAT DATA3 to cover CMPDAT DATA2 and re-trigger next one-shot at point 4.
5. Period loading CMPDAT DATA3 to CMPBUF at point 5.
6. There are no new CMPDAT write in the previous period, and the counter value is kept as 0 at point 6.

In Auto-reload mode, CMPDAT and PERIOD registers should be written first and then the CNTENn(EPWM_CNTEN[n]) bit is set to 1 to enable EPWM prescaler and start to run counter. The value of CLKPSC(EPWM_CLKPSCn_m[11:0]), PERIOD(EPWM_PERIODn[15:0]) and CMP(EPWM_CMPDATn[15:0]) will auto reload to their active buffer according different loading mode. If PERIOD(EPWM_PERIODn[15:0]) is set to 0, EPWM counter will be set to 0.

6.11.5.13 EPWM Pulse Generator

The EPWM pulse generator uses counter and comparator events to generate EPWM pulse. The events are: zero point, period point in up counter type and down counter type, center point in up-down counter type and counter equal to comparator point in three types. As to up-down counter type, there are two counter equal comparator points, one at up count and the other at down count. Besides, Complementary mode has two comparators compared with counter, and thus comparing equal points will become four in up-down counter type and two for up or down counter type.

Each event point can decide EPWM waveform to do nothing (X), set Low (L), set High (H) or toggle (T) by setting the EPWM_WGCTL0 and EPWM_WGCTL1 registers. Using these points can easily generate asymmetric EPWM pulse or variant waveform as shown in Figure 6.11-18. In the figure, EPWM is in complementary mode, there are two comparators n and m to generate EPWM pulse. n denotes even channel number 0, 2, or 4, and m denotes odd channel number 1, 3, or 5. n channel and m channel are complementary paired. Complementary mode uses two channels (CH0 and CH1, CH2 and CH3, or CH4 and CH5) as a pair of EPWM outputs to generate complement paired waveforms. CMPU denotes CNT(EPWM_CNTn[15:0]) is equal to CMP(EPWM_CMPDATn[15:0]) when counting up. CMPD denotes CNT bits is equal to CMP bits when counting down.

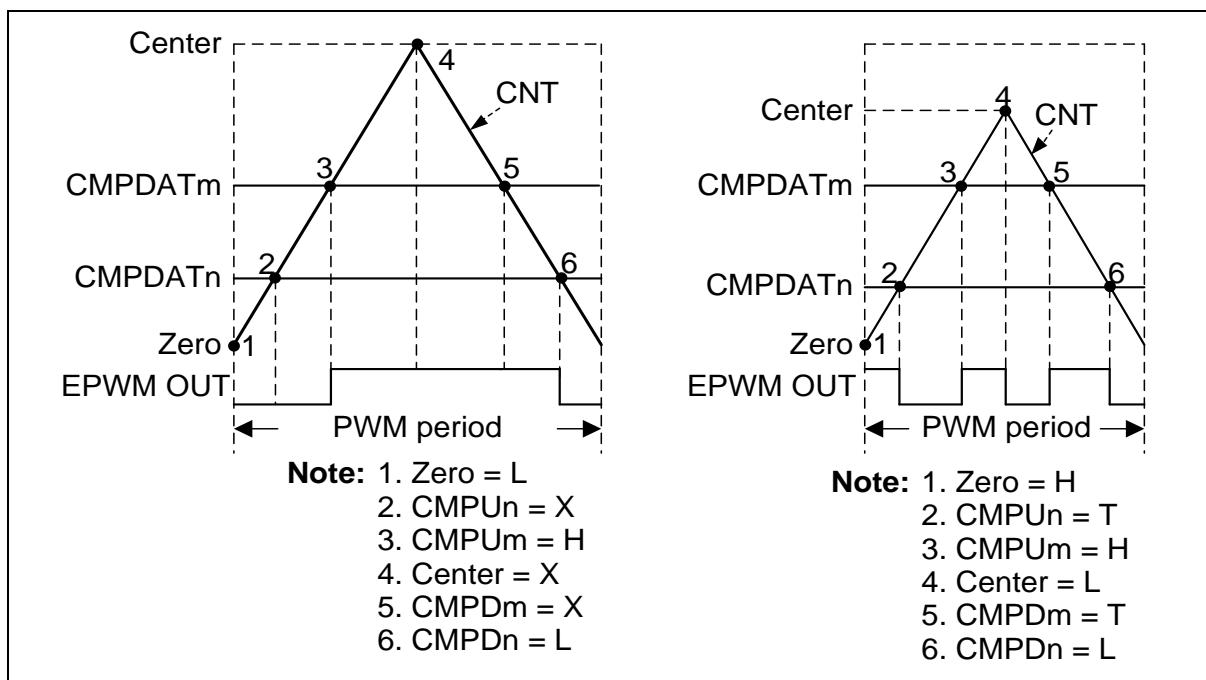

Figure 6.11-18 EPWM Pulse Generation

The generation events may sometimes set to the same value, as the reason, events priority between different counter types are listed below, up counter type (Table 6.11-2), down counter type (Table 6.11-3) and up-down counter type (Table 6.11-4). By using event priority, user can easily generate 0% to 100% duty pulse as shown in Figure 6.11-19.

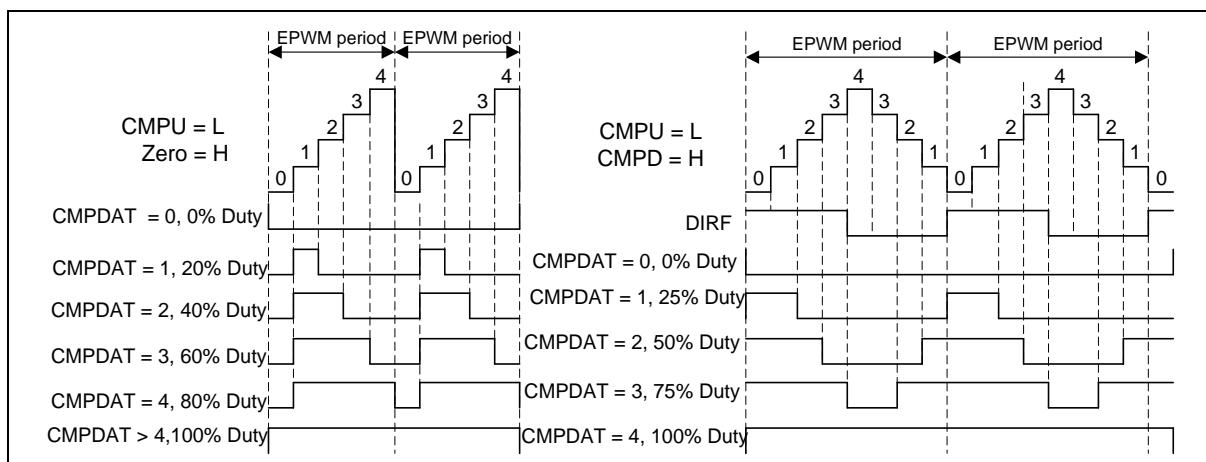

Figure 6.11-19 EPWM 0% to 100% Pulse Generation

Priority	Up Event
1 (Highest)	Period event (CNT = PERIOD)
2	Compare up event of odd channel (CNT = CMPUm)
3	Compare up event of even channel (CNT = CMPUn)
4 (Lowest)	Zero event (CNT = 0)

Table 6.11-2 EPWM Pulse Generation Event Priority for Up-Counter

Priority	Down Event
1 (Highest)	Zero event (CNT = 0)
2	Compare down event of odd channel (CNT = CMPDm)
3	Compare down event of even channel (CNT = CMPDn)
4 (Lowest)	Period event (CNT = PERIOD)

Table 6.11-3 EPWM Pulse Generation Event Priority for Down-Counter

Priority	Up Event	Down Event
1 (Highest)	Compare up event of odd channel (CNT = CMPUm)	Compare down event of odd channel (CNT = CMPDm)
2	Compare up event of even channel (CNT = CMPUn)	Compare down event of even channel (CNT = CMPDn)
3	Zero event (CNT = 0)	Period (center) event (CNT = PERIOD)

Table 6.11-4 EPWM Pulse Generation Event Priority for Up-Down-Counter

6.11.5.14 EPWM Output Mode

The EPWM supports two output modes: Independent mode which may be applied to DC motor system, Complementary mode with dead-time insertion which may be used in the application of AC induction motor and permanent magnet synchronous motor.

6.11.5.15 Independent mode

By default, the EPWM is operating in independent mode, independent mode is enabled when channel n corresponding EPWMMODEn (EPWM_CTL1[26:24]) bit is set to 0. In this mode six EPWM channels: EPWM_CH0, EPWM_CH1, EPWM_CH2, EPWM_CH3, EPWM_CH4 and EPWM_CH5 are running off its own period and duty as shown in Figure 6.11-20.

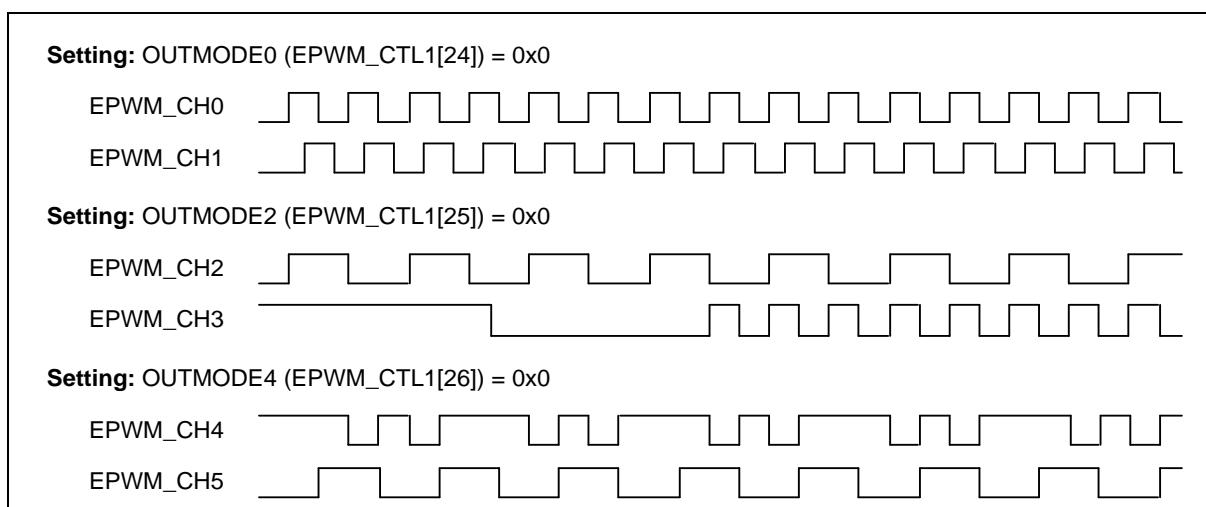

Figure 6.11-20 EPWM Independent Mode Waveform

6.11.5.16 Complementary Mode

Complementary mode is enabled when the pair channel corresponding EPWMMODEn (EPWM_CTL1[26:24]) bit set to 1. In this mode there are 3 EPWM generators utilized for complementary mode, with total of 3 EPWM output paired pins in this module. In Complimentary modes, the internal odd EPWM signal must always be the complement of the corresponding even EPWM signal. EPWM_CH1 will be the complement of EPWM_CH0. EPWM_CH3 will be the complement of EPWM_CH2 and EPWM_CH5 will be the complement of EPWM_CH4 as shown in Figure 6.11-21.

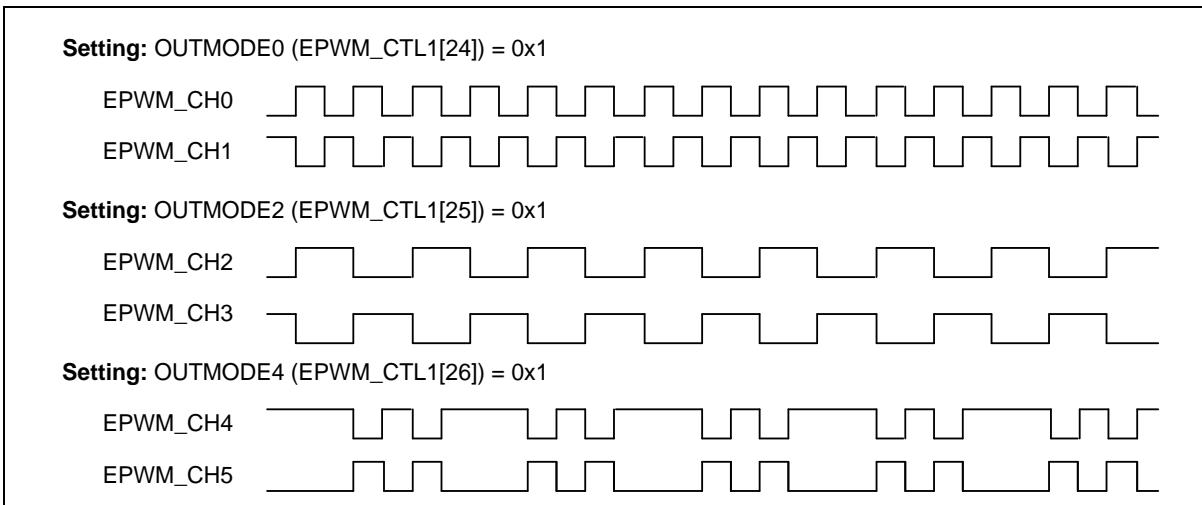

Figure 6.11-21 EPWM Complementary Mode Waveform

6.11.5.17 EPWM Output Function

Based on the output mode, there are two output functions: group and synchronous functions for advanced output control. Group function, forces the EPWM_CH2 and EPWM_CH4 synchronous with EPWM_CH0 generator and forces the EPWM_CH3 and EPWM_CH5 synchronous with EPWM_CH1, may simplify updating duty control in DC and BLDC motor applications. Besides, Synchronous function makes any channel of EPWM0 and EPWM1 in phase, user can control phase value and direction.

6.11.5.18 Group Function

Group function is enabled when GROUPEN (EPWM_CTL0[24]) is set to 1, no matter in independent or complementary mode. This control allows all even EPWM channels output to be controllable by EPWM_PERIOD0 and EPWM_CMPDAT0 registers and all odd EPWM channels output to be controllable by EPWM_PERIOD1 and EPWM_CMPDAT1 registers. That is, user only needs to set EPWM_CH0 to get EPWM_CH0, EPWM_CH2 and EPWM_CH4 output the same pulse, and set EPWM_CH1 to get EPWM_CH1, EPWM_CH3 and EPWM_CH5 output the same pulse, as shown in Figure 6.11-22. When operating group function, EPWMMODE0, EPWMMODE2 and EPWMMODE4 bits of CTL1 register must all set to 0 for independent mode or all set to 1 for complementary mode.

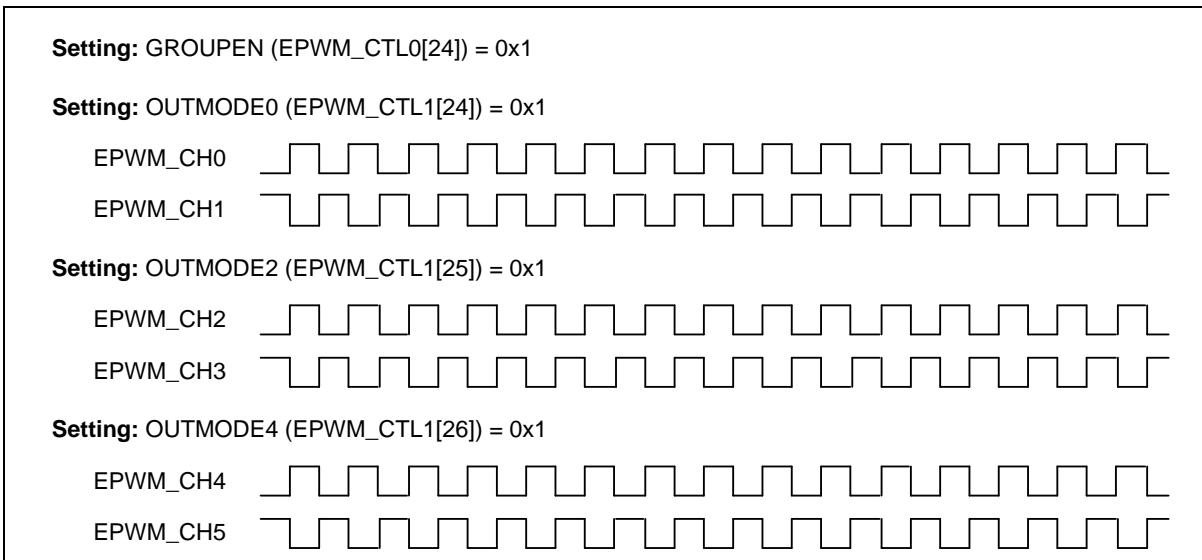

Figure 6.11-22 EPWM Group Function Waveform

6.11.5.19 Synchronous Function

Synchronous function can only be enabled when complementary mode is enabled. Figure 6.11-24 is counter synchronous function block diagram. Every counter of EPWM pairs has a SYNC_IN and a SYNC_OUT signals. The SYNC_IN signal for the first EPWM0 pair counter comes from EPWM0_SYNC_IN pin, and the others come from the SYNC_OUT signal of the previous EPWM pair counter. The input signal from EPWM0_SYNC_IN pin will be filtered by a 3-bit noise filter as Figure 6.11-23. In addition, it can be inversed by setting the bit SINPINV (EPWM_SYNC[23]) to realize the polarity setup for the input signal. The noise filter sampling clock can be selected by setting bits SFLTCSEL (EPWM_SYNC[19:17]) to fit different noise properties. Moreover, by setting the bits SFLTCNT (EPWM_SYNC[22:20]), user can define by how many sampling clock cycles a filter will recognize the effective edge of the SYNC_IN signal. Configuring the SNFLTEN (EPWM_SYNC[16]) will enable the noise filter function. By default, it is disabled.

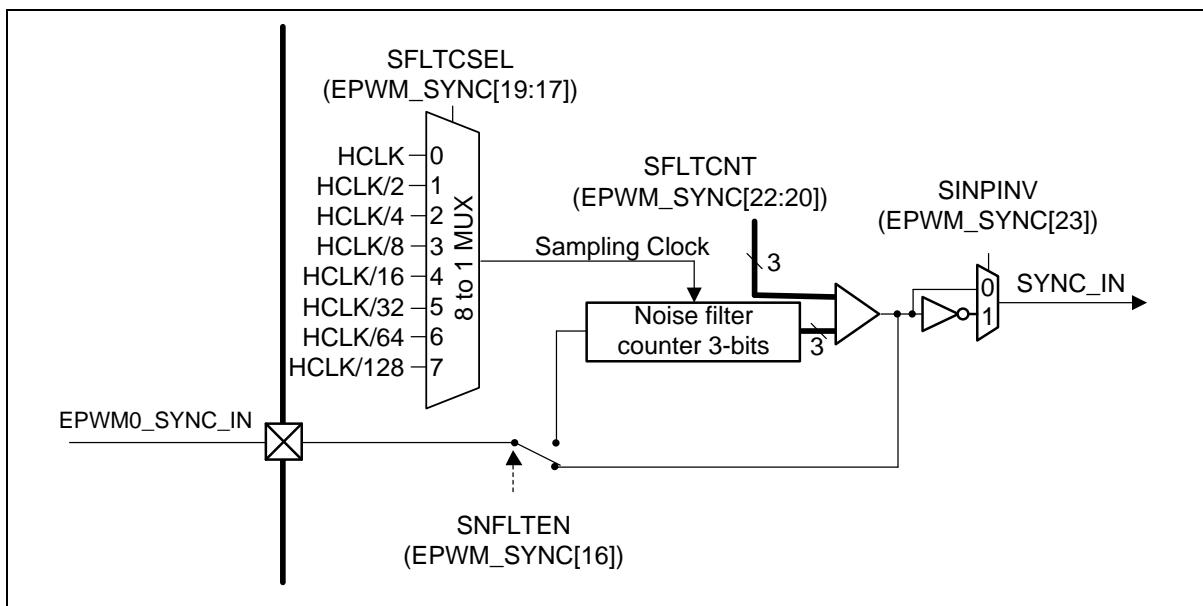

Figure 6.11-23 EPWM SYNC_IN Noise Filter Block Diagram

User can use SINSRCn (EPWM_SYNC[13:8]) bits to select the synchronize source. When SINSRCn bits is set to 0, user can generate SYNC_IN signal for the next counter's synchronization when EPWM0_SYNC_IN pin is high or setting SWSYNCn (EPWM_SWSYNC[2:0]) to 1. Synchronizing source can also be selected as CNT = 0 or CNT = EPWM_CMPDATm register (if being the up-down counter type, it will synchronize twice in a EPWM period) to trigger a sync event or to disable SYNC_OUT signal.

When the PHSENn (EPWM_SYNC[2:0]) is enabled and the synchronous source has a happening event, the counter will load a value from the PHS (EPWM_PHSn_m[15:0]) register. This method synchronizes counters to different phase in the same time. In the up-down counter type, user can set the value in PHSDIRn (EPWM_SYNC[26:24]) to control the counter direction after synchronization. Although the Synchronous function can synchronize channels in phase, it can't work from the beginning of EPWM enable. To start EPWM and BPWM counters in the same time, user have to set the EPWM Synchronous Start Control Register (EPWM_SSCTL[5:0]) to enable the channel counters which are planned to start counting together, and select the SSRC(EPWM_SSCTL[9:8]) to choose the Synchronous Start source, followed by setting the EPWM Synchronous Start Trigger Register CNTSEN (EPWM_SSTRG[0]).

For applications, please do not use Group and Synchronous function simultaneously because the Synchronous function will be inactive.

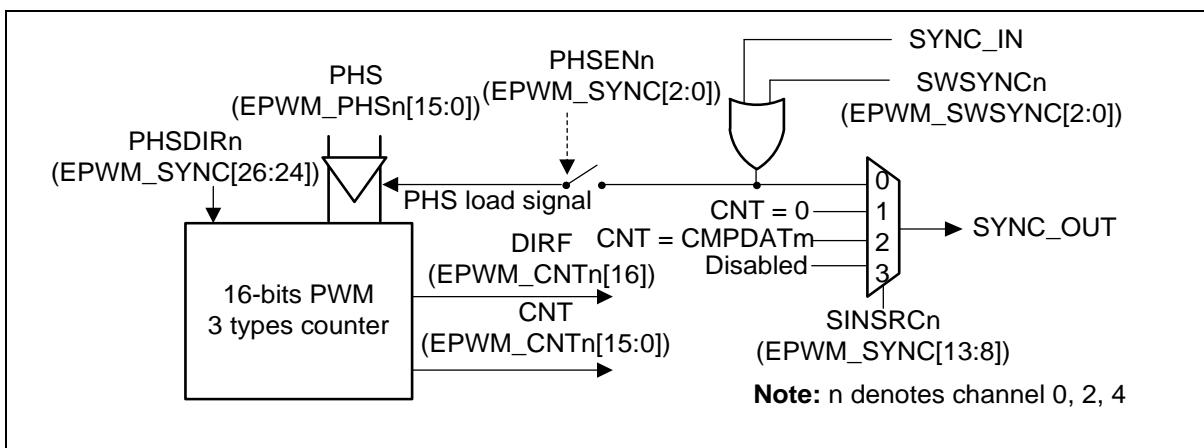

Figure 6.11-24 EPWM Counter Synchronous Function Block Diagram

Figure 6.11-25 is an example of the synchronous function in the up-down counter type. In the example, synchronizing source comes from the external EPWM SYNC_IN signal. At the beginning, the output waveform of EPWM_CH0, EPWM_CH2 and EPWM_CH4 are in the same phase. Then at Point A, the EPWM SYNC input signal comes as a sync event, resulting in phase shifts and counting direction changes for all of the counters. To realize the altered counter behaviors before the sync event coming, user has to setup the corresponding phase value in the PHS of(EPWM_PHSn_m[15:0]) as well as the counting direction in the PHSDIRn (EPWM_SYNC[26:24]). In this case, one third of phase shifts are made. by setting the corresponding channel n's counter counting direction after synchronizing, as illustrated around the left side of Figure 6.11-25.

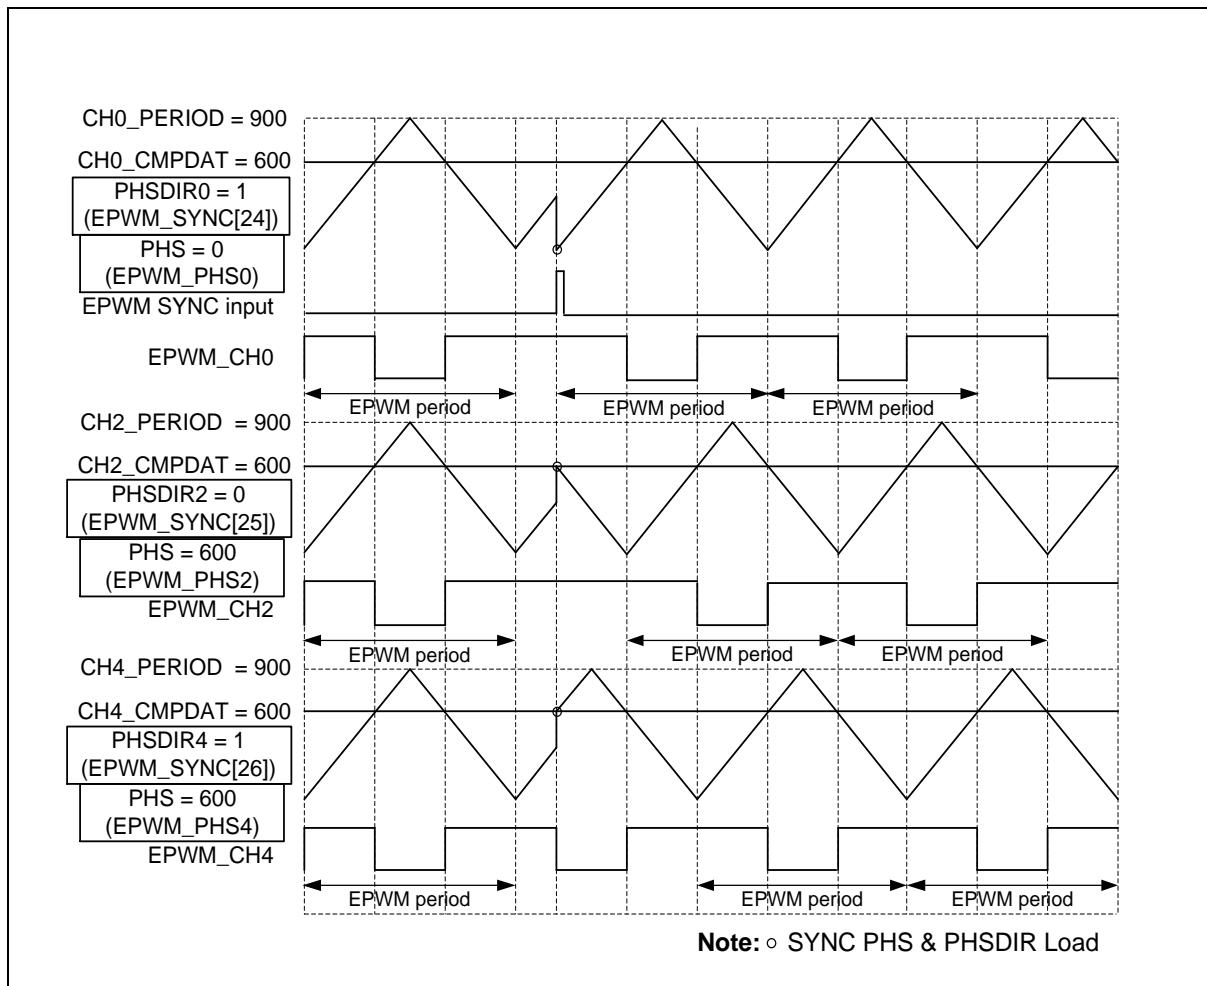

Figure 6.11-25 EPWM Synchronous Function with Synchronize source from SYNC_IN Signal

6.11.5.20 EPWM Output Control

After EPWM pulse generation, there are four to six steps to control the output of EPWM channels. In independent mode, there are Mask, Brake, Pin Polarity and Output Enable four steps as shown in Figure 6.11-26. In complementary mode, it needs two more steps to precede these four steps, Complementary channels and Dead-Time Insertion as shown in Figure 6.11-27.

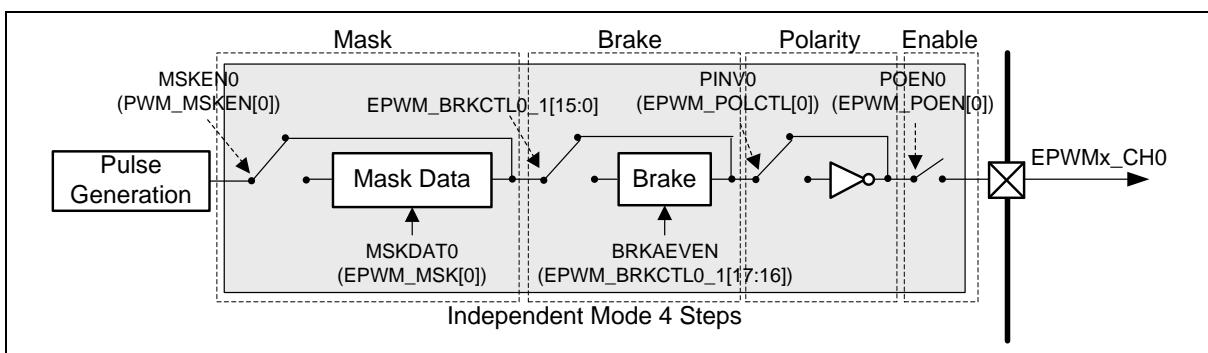

Figure 6.11-26 EPWMx_CH0 Output Control in Independent Mode

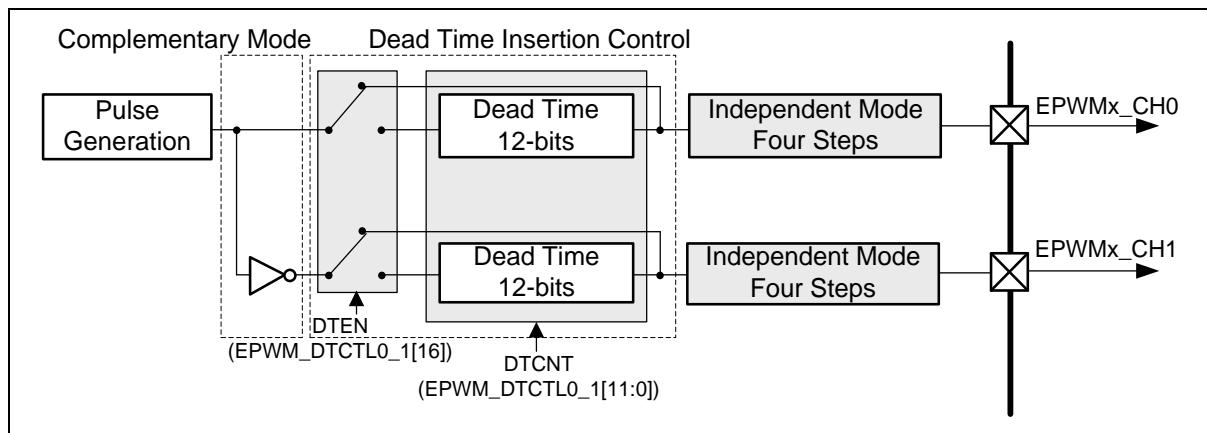

Figure 6.11-27 EPWMx_CH0 and EPWMx_CH1 Output Control in Complementary Mode

6.11.5.21 Dead-Time Insertion

In the complementary application, the complement channels may drive the external devices like power switches. The dead-time generator inserts a low level period called “dead-time” between complementary outputs to drive these devices safely and to prevent system or devices from the burn-out damage. Hence the dead-time control is a crucial mechanism to the proper operation of the complementary system. By setting corresponding channel n DTEN (EPWM_DTCTLn_m[16]) bit to enable dead-time function and DTCNT (EPWM_DTCTLn_m[11:0]) to control dead-time period, the dead-time can be calculated from the following formula:

$$\text{Dead-time} = (\text{DTCNT } (\text{EPWM}_\text{DTCTLn}[11:0])+1) * \text{EPWMx_CLK period}$$

Dead-time insertion clock source can be selected from prescaler output by setting DTCKSEL (EPWM_DTCTLn_m[24]) to 1. By default, clock source comes from EPWM_CLK, which is prescaler input. Then the dead-time can be calculated from the following formula:

$$\begin{aligned} \text{Dead-time} &= (\text{DTCNT } (\text{EPWM}_\text{DTCTLn}[11:0])+1) * \\ &(\text{CLKPSC } (\text{EPWM}_\text{CLKPSCn}[11:0])+1) * \text{EPWMx_CLK period} \end{aligned}$$

Please note that the EPWM_DTCTLn_m are write-protected registers.

Figure 6.11-28 indicates the dead-time insertion for one pair of EPWM signals.

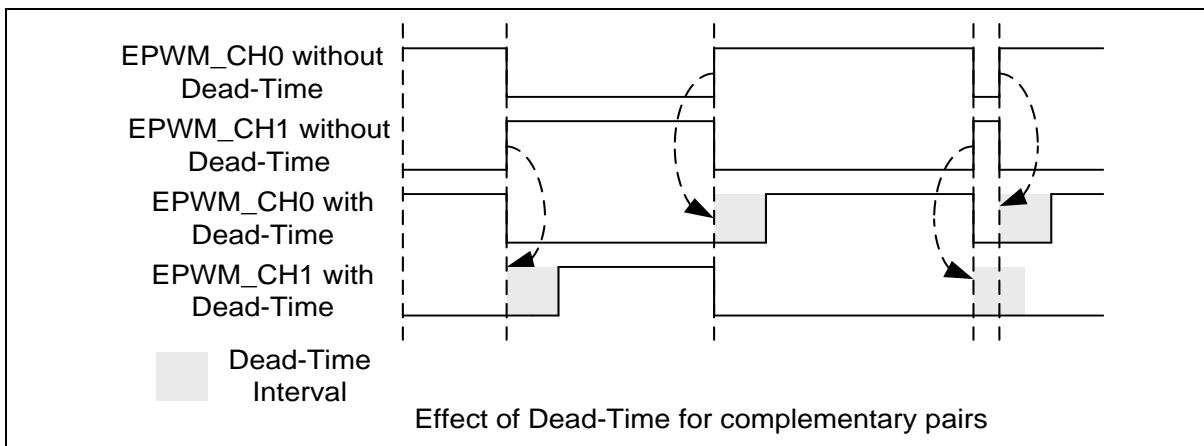

Figure 6.11-28 Dead-Time Insertion

6.11.5.22 EPWM Mask Output Function

Each of the EPWM channel output value can be manually overridden with the settings in the EPWM Mask Enable Control Register (EPWM_MSKEN) and the EPWM Masked Data Register (EPWM_MSK). With these settings, the EPWM channel outputs can be assigned to specified logic states independent of the duty cycle comparison units. The EPWM mask bits are useful when controlling various types of Electrically Commutated Motor (ECM) like a BLDC motor. The EPWM_MSKEN register contains six bits, MSKENn(EPWM_MSKEN[5:0]). If the MASKENn is set to active-high, the EPWM channel n output will be overridden. The EPWM_MSK register contains six bits, MSKDATn(EPWM_MSK[5:0]). The bit value of the MSKDATn determines the state value of the EPWM channel n output when the channel is overridden. Figure 6.11-29 shows an example of how EPWM mask control can be used for the override feature.

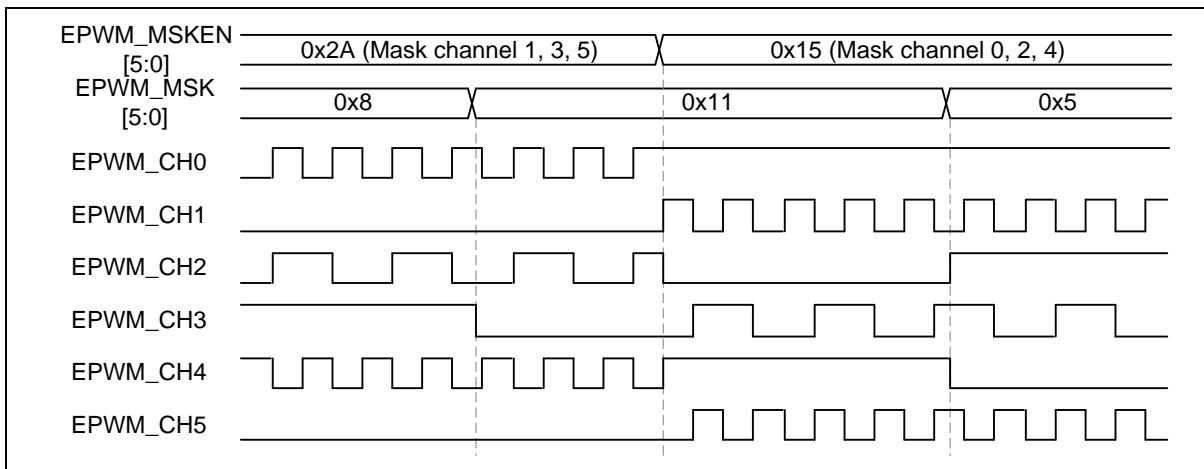

Figure 6.11-29 Illustration of Mask Control Waveform

6.11.5.23 EPWM Brake

Each EPWM module has two external input brake control signals. User can select active brake pin source is from EPWM_x_BRAKEy pin by BKxSRC bits of BNF register(x=0,1, y=0,1). The external signals will be filtered by a 3-bit noise filter. User can enable the noise filter function by BRKxNFFEN bits of BNF register, and noise filter sampling clock can be selected by setting BRKxNFSEL bits of BNF register to fit different noise properties. Moreover, by setting the BRKxFCNT bits, user can define by how many sampling clock cycles a filter will recognize the effective edge of the brake signal.

In addition, it can be inversed by setting the BRKxPINV (x denotes input external pin 0 or 1) bits of BNF register to realize the polarity setup for the brake control signals. Set BRKxPINV bit to 0, brake

event will occurred when EPWMx_BRAKEy(x=0,1, y=0,1) pin status is from low to high; set BRKxPINV to 1, brake event will occurred when EPWMx_BRAKEy pin status is from high to low.

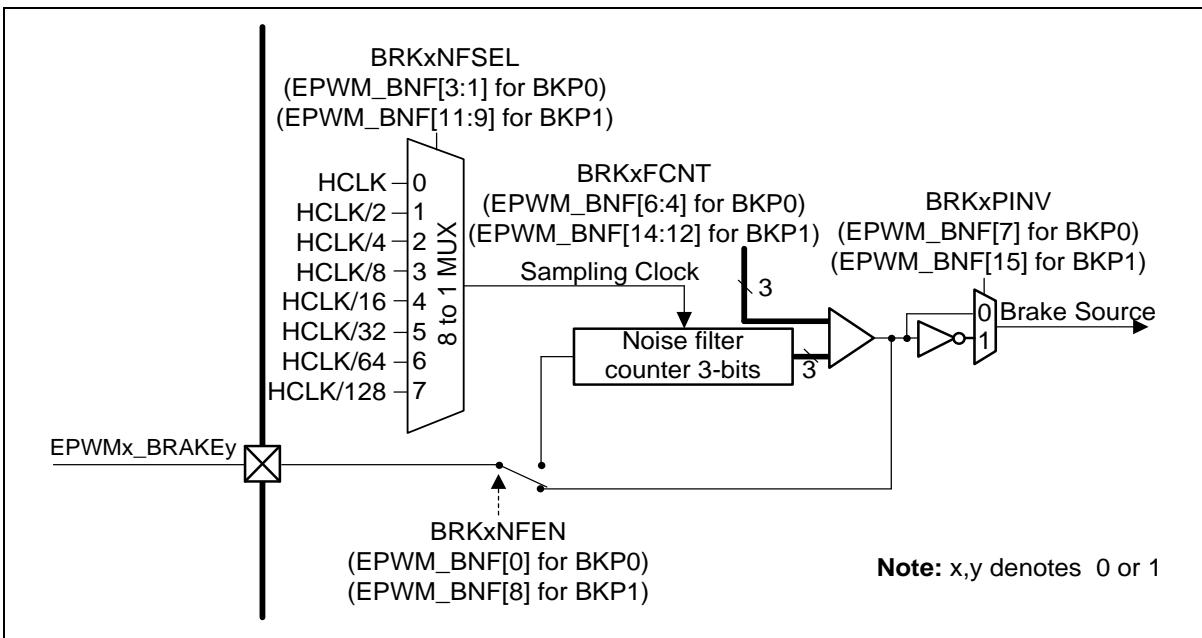

Figure 6.11-30 Brake Noise Filter Block Diagram

For Complementary mode, it is often necessary to set a safe output state to the complement output pairs once the brake event occurs.

Each complementary channel pair shares a EPWM brake function, as shown Figure 6.11-31. To control paired channels to output safety state, user can setup BRKAEVEN (EPWM_BRKCTL0_1[17:16]) for even channels and BRKAODD (EPWM_BRKCTL0_1[19:18]) for odd channels when the fault brake event happens. There are two brake detectors: Edge detector and Level detector. When the edge detector detects the brake signal and BRKEIENn_m (EPWM_INTEN1[2:0]) is enabled, the brake function generates BRK_INT. This interrupt needs software to clear, and the BRKESTS_n (EPWM_INTSTS1[21:16]) brake state will keep until the next EPWM period starts after the interrupt cleared. The brake function can also operate in another way through the level detector. Once the level detector detects the brake signal and the BRKLIEEn_m (EPWM_INTEN1[10:8]) is also enabled, the brake function will generate BRK_INT, but BRKLSTS_n (EPWM_INTSTS1[29:24]) brake state will auto recovery to normal output while level brake source recovery to high level and pass through "Low Level Detection" at the EPWM waveform period when brake condition removed without clear interrupt.

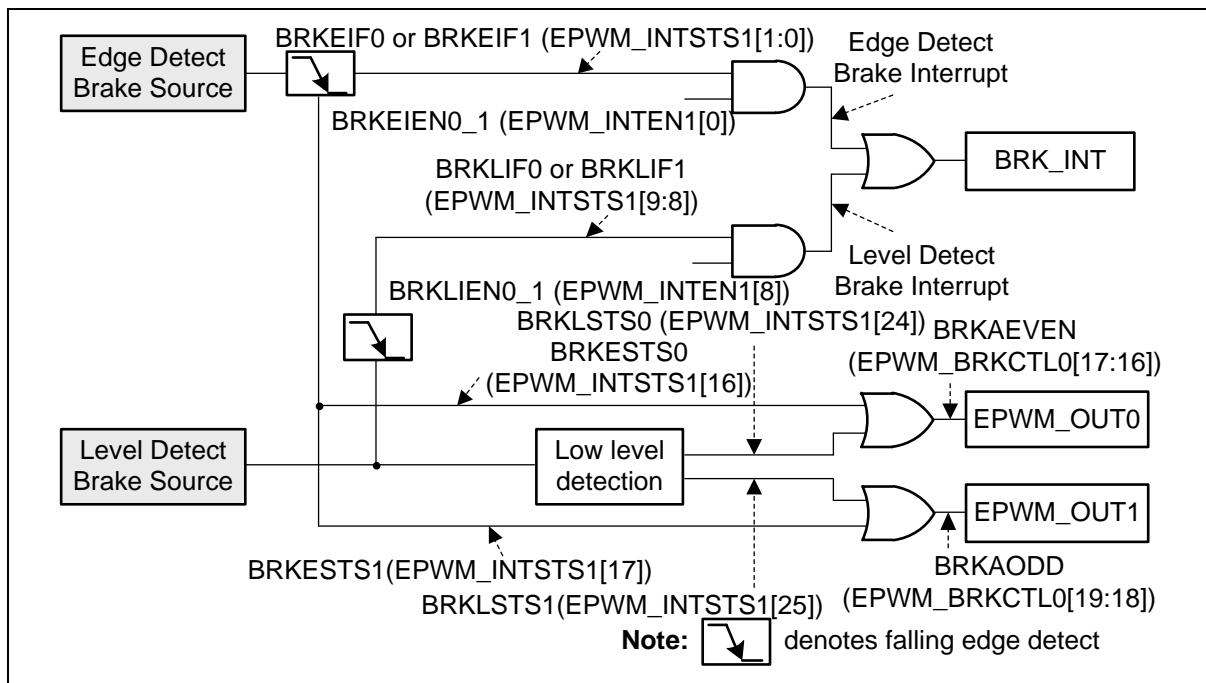

Figure 6.11-31 Brake Block Diagram for EPWMx_CH0 and EPWMx_CH1 Pair

Figure 6.11-32 illustrates the edge detector waveform for EPWMx_CH0 and EPWMx_CH1 pair. In this case, the edge detect brake source has occurred twice for the brake events. When the event occurs, both of the BRKEIF0 and BRKEIF1 flags are set and BRKESTS0 and BRKESTS1 bits are also set to indicate brake state of EPWMx_CH0 and EPWMx_CH1. For the first occurring event, software writes 1 to clear the BRKEIF0 flag. After that, the BRKESTS0 bit is cleared by hardware at the next start of the EPWM period. At the same moment, the EPWMx_CH0 outputs the normal waveform even though the brake event is still occurring. The second event also triggers the same flags, but at this time, software writes 1 to clear the BRKEIF1 flag. Afterward, EPWMx_CH1 outputs normally at the next start of the EPWM period.

As a contrast to the edge detector example, Figure 6.11-33 illustrates the level detector waveform for EPWMx_CH0 and EPWMx_CH1 pair. In this case, the BRKLIF0 and BRKLIF1 flags can only indicate the brake event having occurred. The BRKLSTS0 and BRKLSTS1 brake states will automatically recover at the start of the next EPWM period no matter at what states the BRKLIF0 and BRKLIF1 flags are at that moment.

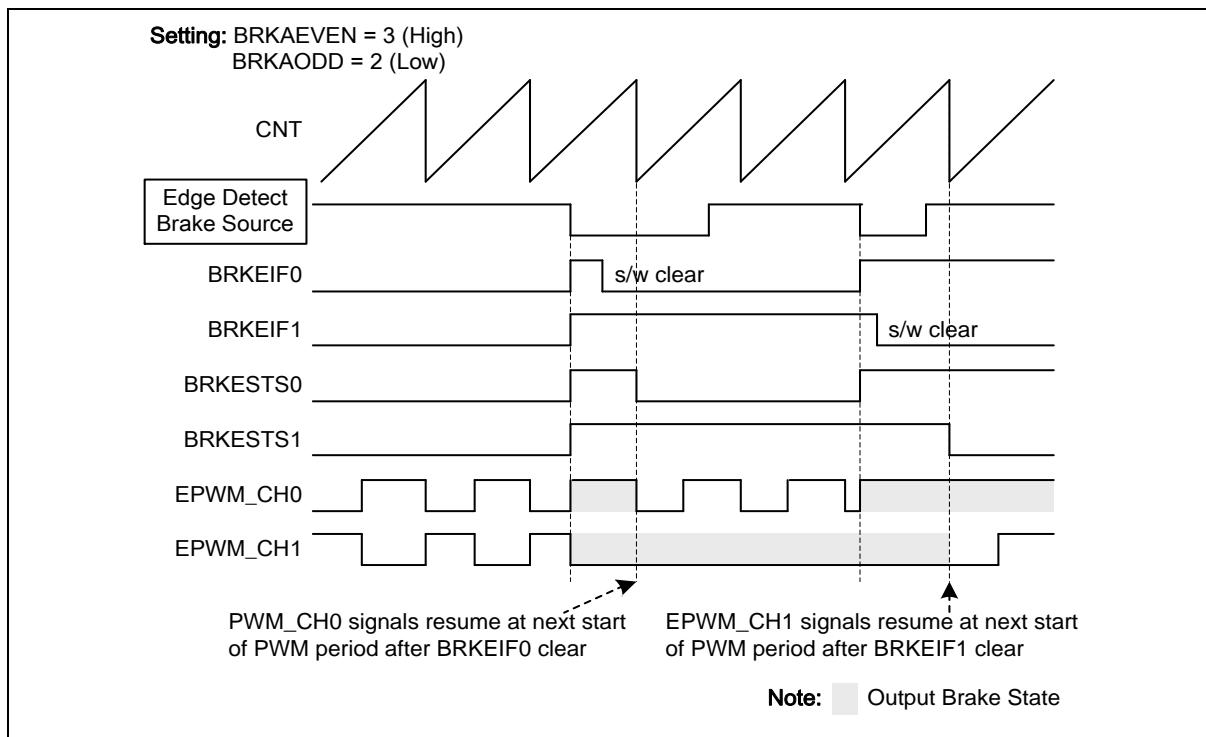

Figure 6.11-32 Edge Detector Waveform for EPWMx_CH0 and EPWMx_CH1 Pair

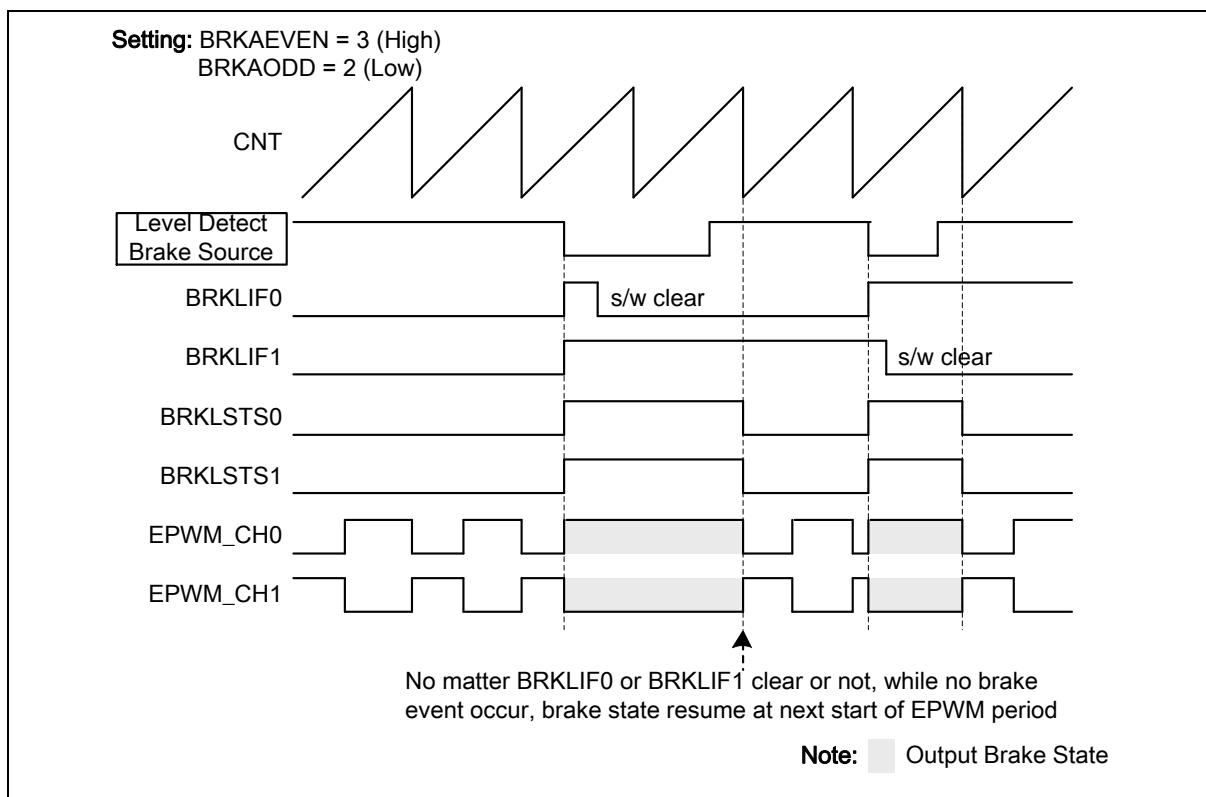

Figure 6.11-33 Level Detector Waveform for EPWMx_CH0 and EPWMx_CH1 Pair

The two kinds of detectors detect the same seven brake sources: two from external input signals, two from analog comparators(ACMP), one from EADC result monitor (EADCRM), one from system fail and

one from software triggered, that are shown in Figure 6.11-34. ACMP brake sources will be detected only when internal ACMP0_O or ACMP1_O signal from low to high.

Among the above described brake sources, the brake source coming from system fail can still be specified to several different system fail conditions. These conditions include clock fail, Brown-out detect, SRAM parity check error and Core lockup. Figure 6.11-35 shows that by setting corresponding enable bits, the enabled system fail condition can be one of the sources to issue the Brake system fail to the EPWM brake.

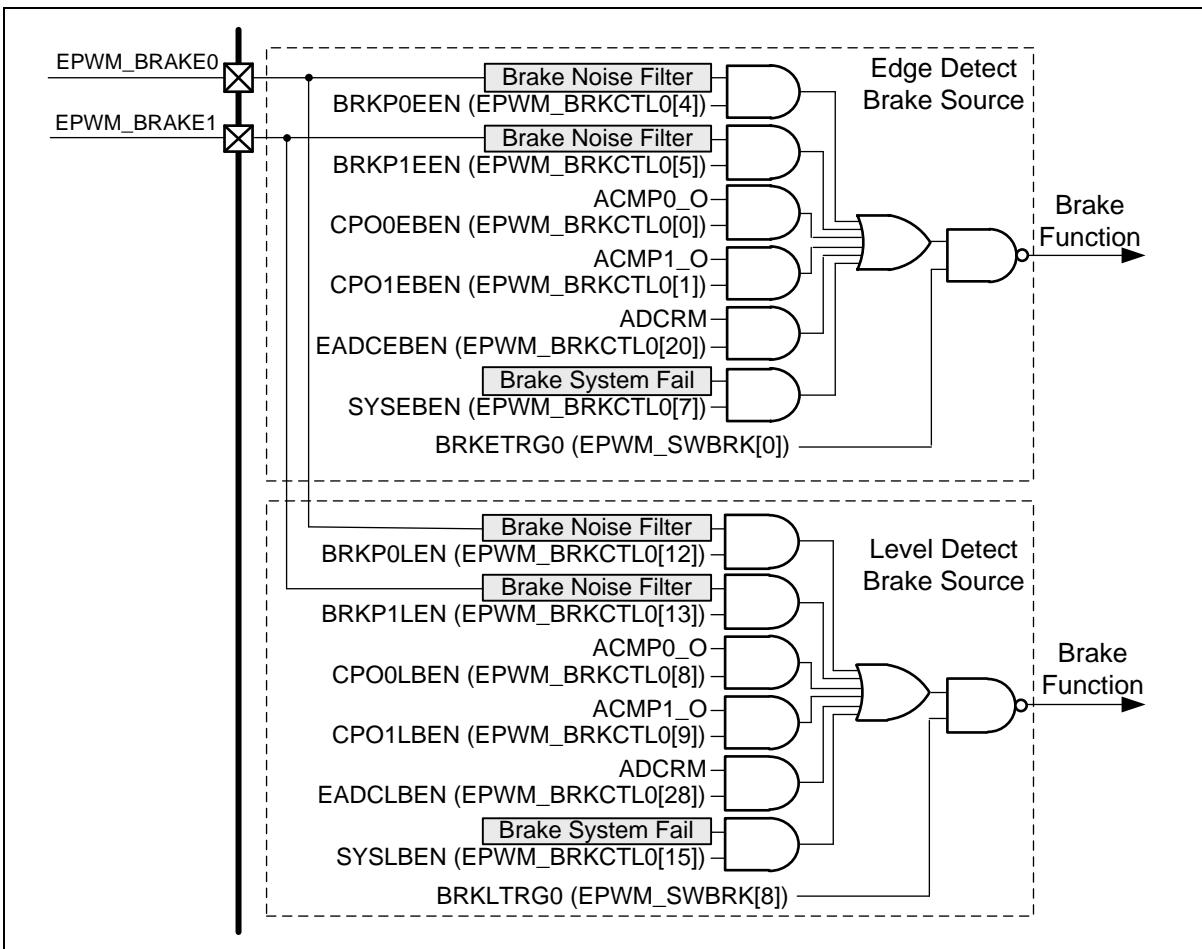

Figure 6.11-34 Brake Source Block Diagram

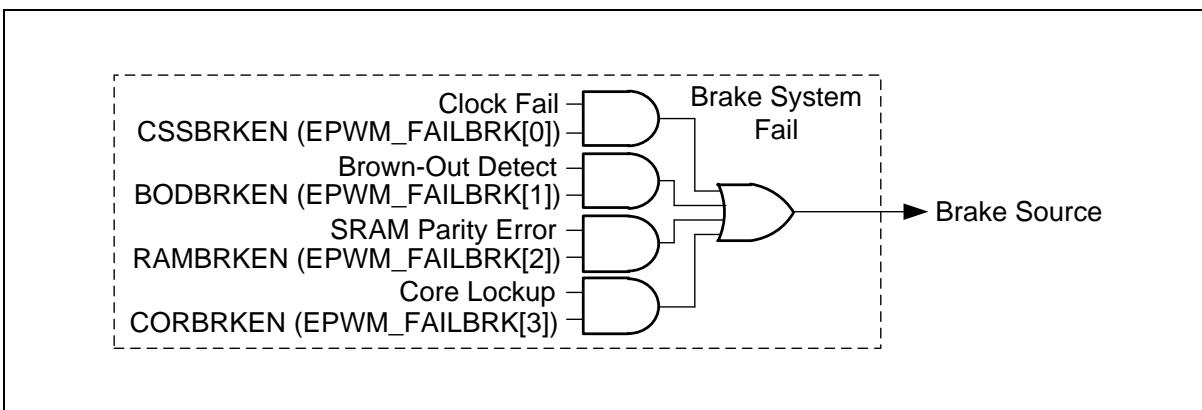

Figure 6.11-35 Brake System Fail Block Diagram

6.11.5.24 LEB Function

Leading edge blanking (LEB) function is used to blank the false trigger from brake source ACMP which may be caused by EPWM output transition. Set LEBEN (EPWM_LEBCTL[0]) to enable this function. LEB source comes from EPWM_CH0, EPWM_CH2 and EPWM_CH4, use SRCENn (EPWM_LEBCTL[10:8]) as input source enable. LEB function blanking time is decided by LEBCNT (EPWM_LEBCNT[8:0]), when LEB detected trigger edge, then blanking time will count from LEBCNT+1 to 0, the counter clock base is ECLK. If a new trigger event occurs, blanking counter will reset to LEBCNT and down count again. LEB trigger edge can be rising, falling or both rising and falling edge by setting TRGTYPE (EPWM_LEBCTL[17:16]). Figure 6.11-36 shows that LEB will blanking leading edge caused by EPWM_CH0 and EPWM_CH4.

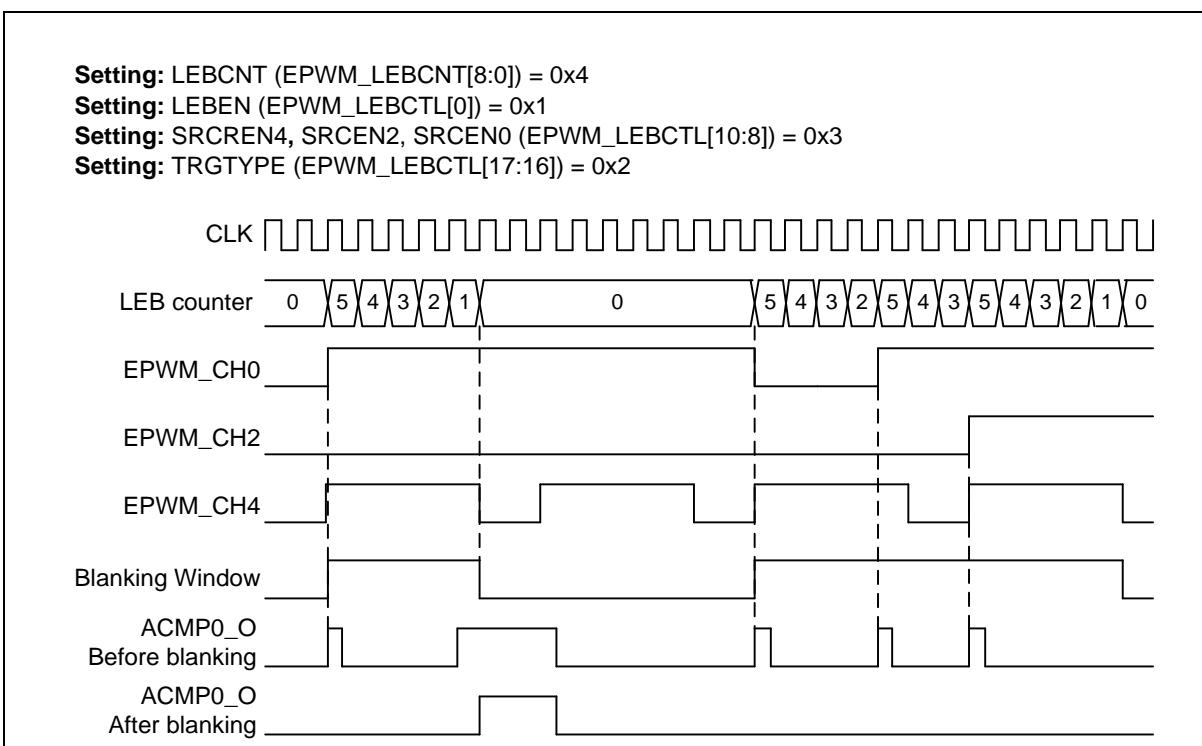

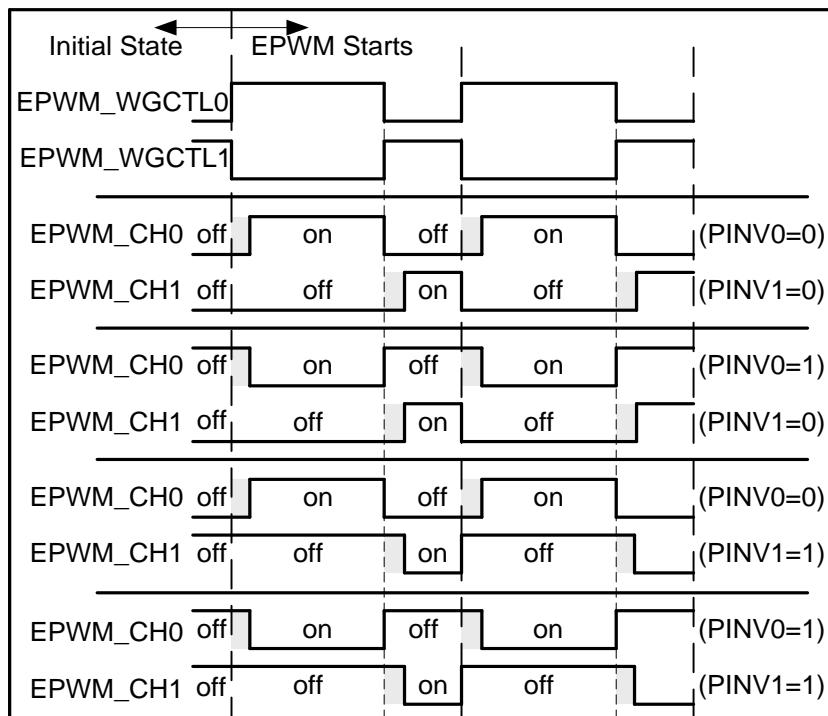

Figure 6.11-36 EPWM LEB Function Waveform

6.11.5.25 Polarity Control

Each EPWM port, from EPWM_CH0 to EPWM_CH5, has an independent polarity control module to configure the polarity of the active state of the EPWM output. By default, the EPWM output is active high. This implies the EPWM OFF state is low and ON state is high. This definition is variable through setting the EPWM Negative Polarity Control Register (EPWM_POLCTL), for each individual EPWM channel. Figure 6.11-37 shows the initial state before EPWM starting with different polarity settings.

Note: Dead-time insertion; It is only effective in complementary mode
Note: PINVx: Negative Polarity control bits; It controls the EPWM output initial state and polarity, x denotes 0 or 1.

Figure 6.11-37 Initial State and Polarity Control with Rising Edge Dead-Time Insertion

6.11.5.26 EPWM Interrupt Generator

There are three independent interrupts for each EPWM as shown in Figure 6.11-39.

The 1st EPWM interrupt (EPWM_INT) comes from EPWM complementary pair events. The counter can generate the Zero point Interrupt Flag ZIFn (EPWM_INTSTS0[5:0], n=0,1..5) and the Period point Interrupt Flag PIFn (EPWM_INTSTS0[13:8], n=0,1..5). When EPWM channel n's counter equals to the comparator value stored in EPWM_CMPDATn register, the different interrupt flags will be triggered depending on the counting direction. If the matching occurs at up-count direction, the Up Interrupt Flag CMPUIFn (EPWM_INTSTS0[21:16]) is set and if matching at the opposite direction, the Down Interrupt Flag CMPDIFn (EPWM_INTSTS0[29:24]) is set. If the corresponding interrupt enable bits are set, the trigger events will generate interrupt signals.

EPWM_INT can use the EPWM_IFAn (n=0~5) register to accumulate the number of times that the interrupt flags have been triggered for each channel. By setting one of IFAEN (EPWM_IFAN[31], n=0~5) bit to 1 to enable accumulator, EPWM_INT will switch interrupt source from every event trigger interrupt to trigger interrupt once every accumulate times.

By setting the IFASEL (EPWM_IFAn[29:28], n=0~5) bits, user can select one of the 4 interrupt sources to accumulate interrupt flag times for each channel, and the number of times interrupt flags will compare with IFACNT (EPWM_IFAn[15:0], n=0~5) bits. When interrupt accumulator equals IFACNT then set IFAIFn (EPWM_AINTSTS[n], n=0~5) bits as EPWM_INT signal if user enable IFAIENn (EPWM_AINTEN[n], n=0~5) bits. Accumulator interrupt of each channel can also be as request source of PDMA. Figure 6.11-38 is an example of channel 0 using EPWM_IFA0 register to

output EPWM_INT once every IFCNT0+1 times interrupt events occurred.

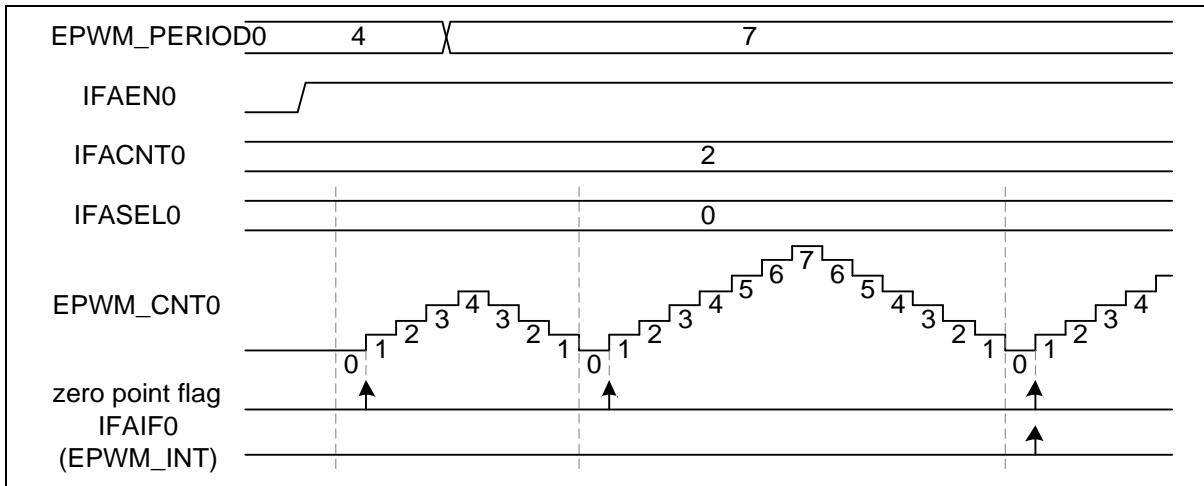

Figure 6.11-38 EPWMx_CH0 Accumulate Interrupt Waveform

The 2nd interrupt is the capture interrupt (CAP_INT). It shares the EPWM_INT vector in NVIC. The CAP_INT can be generated when the CAPRLIFn (EPWM_CAPIF[5:0]) flag is triggered and the Capture Rising Interrupt Enable bit CAPRIENn (EPWM_CAPIEN[5:0]) is set to 1. Or in the falling edge condition, the CAPFLIFn (EPWM_CAPIF[13:8]) flag can be triggered when the Capture Falling Interrupt Enable bit CAPFIENn (EPWM_CAPIEN[13:8]) is set to 1.

The last one is the brake interrupt (BRK_INT). The details of the BRK_INT is described in the EPWM Brake section.

Figure 6.11-39 demonstrates the architecture of the EPWM interrupts.

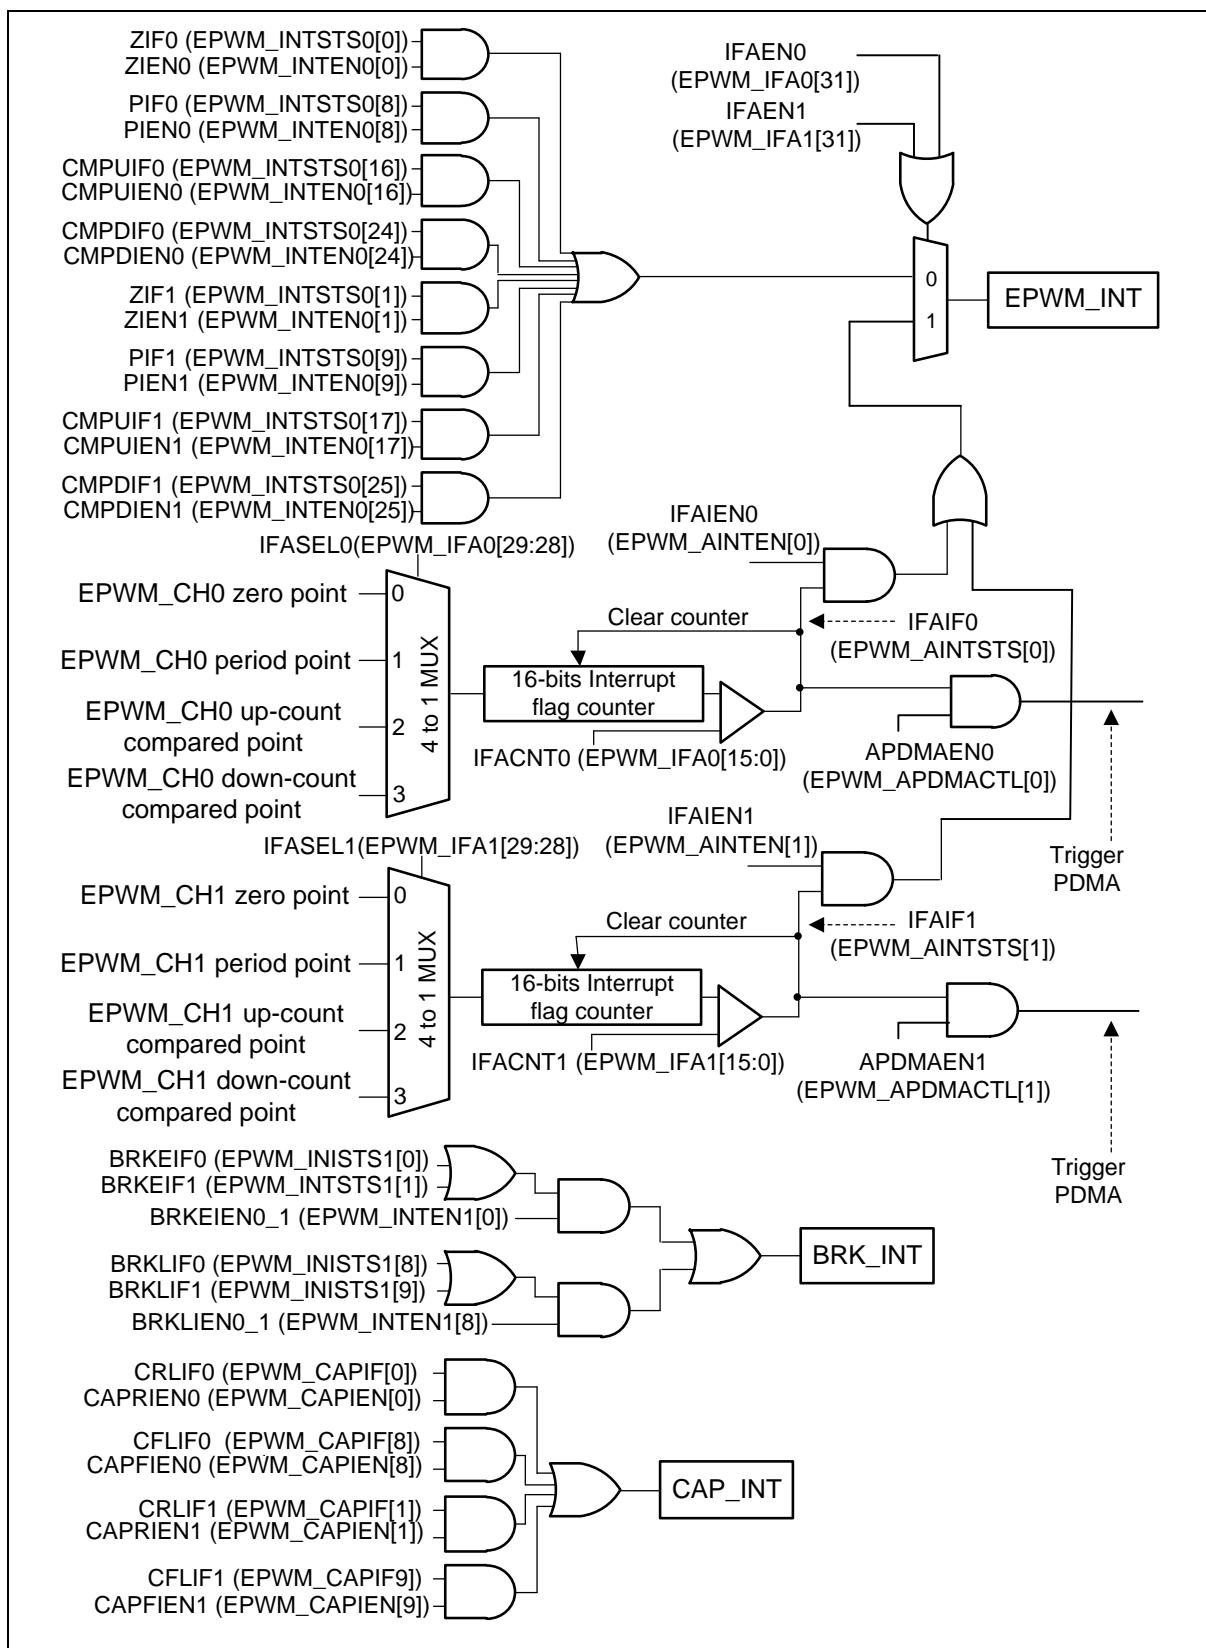

Figure 6.11-39 EPWMx_CH0 and EPWMx_CH1 Pair Interrupt Architecture Diagram

6.11.5.27 EPWM Trigger EADC/DAC Generator

EPWM can be one of the EADC conversion trigger source. Each EPWM pair channels share the same trigger source. Setting TRGSELn bit of EPWM_EADCTS0 and EPWM_EADCTS1 registers is to select the trigger sources, where TRGSELn bit is TRGSEL0, TRGSEL1, ..., and TRGSEL5, which are located in EPWM_EADCTS0[3:0], EPWM_EADCTS0[11:8], EPWM_EADCTS0[19:16], EPWM_EADCTS0[27:24], EPWM_EADCTS1[3:0] and EPWM_EADCTS1[11:8], respectively. Setting TRGENn bit of EPWM_EADCTS0 and EPWM_EADCTS1 registers is to enable the trigger output to EADC, where TRGENn bit is TRGEN0, TRGEN1, ..., TRGEN5, which are located in EPWM_EADCTS0[7], EPWM_EADCTS0[15], EPWM_EADCTS0[23], EPWM_EADCTS0[31], EPWM_EADCTS1[7] and EPWM_EADCTS1[15], respectively. The number n (n = 0,1,..,5) denotes EPWM channel number.

There are 16 EPWM events can be selected as the trigger source for one pair of channels which shown in Figure 6.11-40. Figure 6.11-41 is the trigger EADC timing waveform in the up-down counter type.

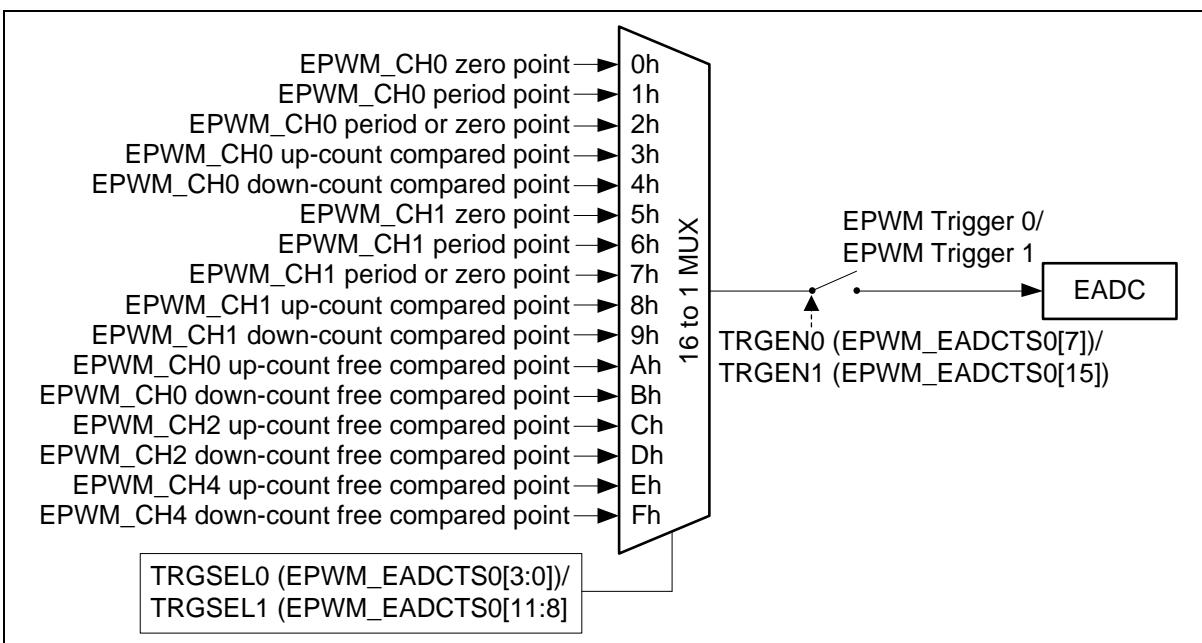

Figure 6.11-40 EPWMx_CH0 and EPWMx_CH1 Pair Trigger EADC Block Diagram

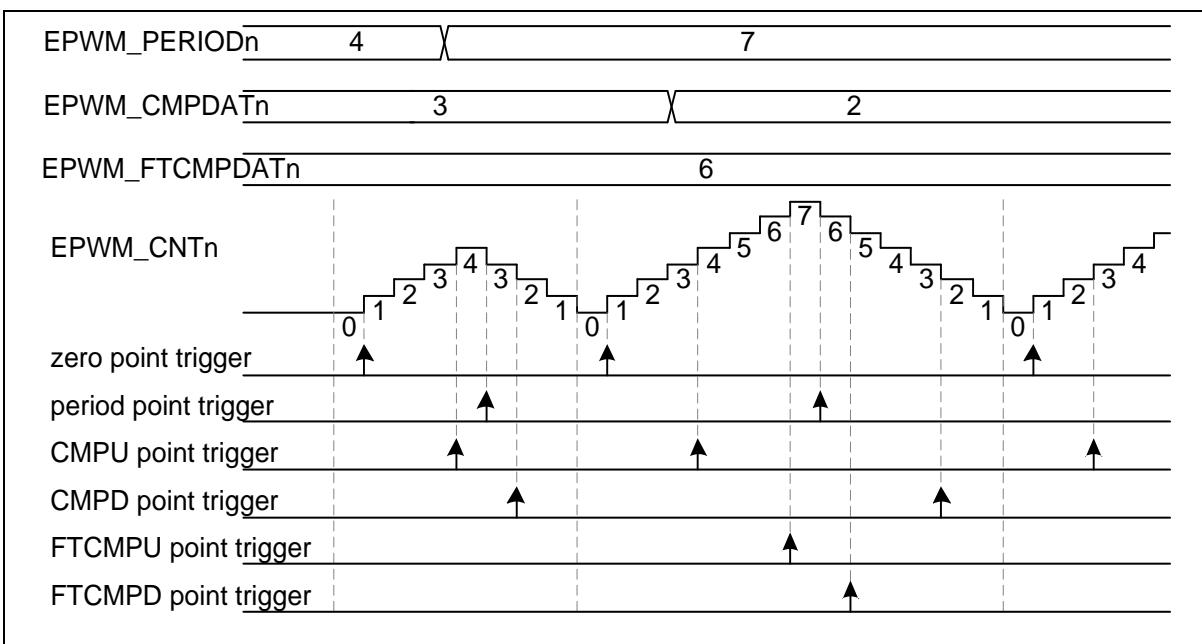

Figure 6.11-41 EPWM Trigger EADC in Up-Down Counter Type Timing Waveform

EPWM can also be used to trigger DAC conversion. Each EPWM pair channel (CH0 and CH1, CH2 and CH3, CH4 and CH5) generates a trigger signal. Using the EPWM Trigger DAC Enable Register (EPWM_DACTRGEN) can decide at which points to trigger DAC. The timing of the EPWM triggering DAC is similar to those for triggering EADC. However, DAC triggering function does not include the triggering events from comparison with FTCMPDAT, that is, there are no trigger points the same as FTCMPDATU and FTCMPDATD which are shown in EADC triggering.

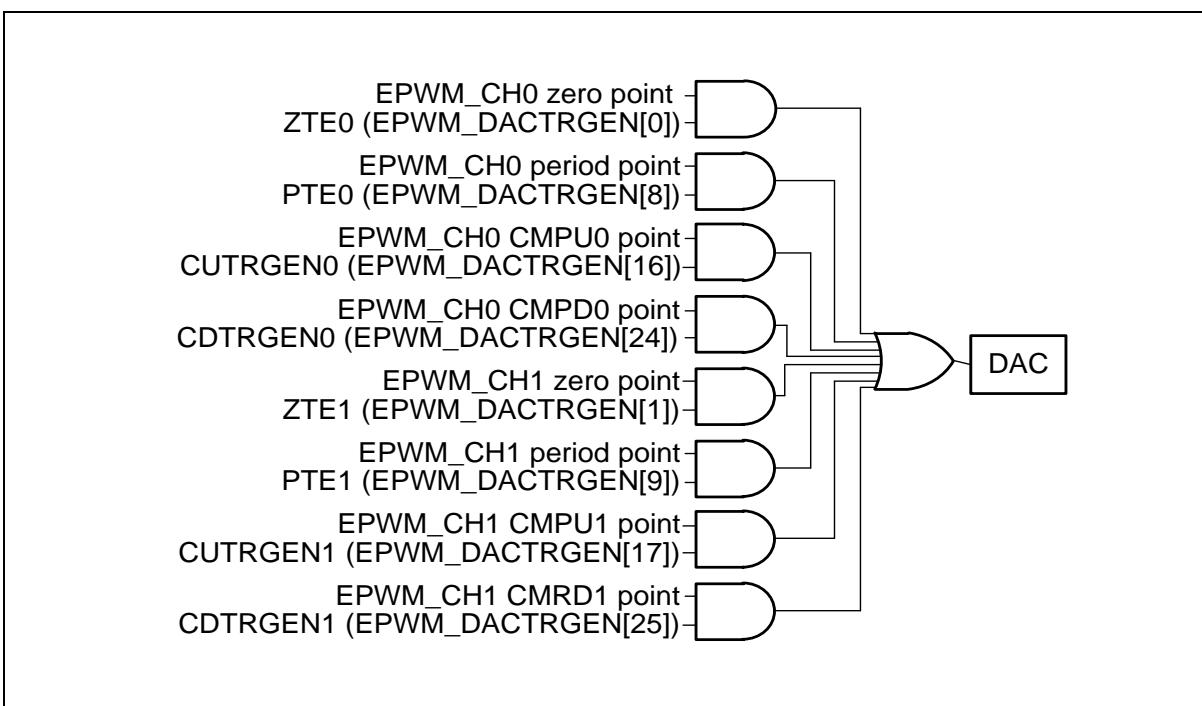

Figure 6.11-42 EPWM_CH0 and EPWM_CH1 Pair Trigger DAC Block Diagram

6.11.5.28 Capture Operation

The channels of the capture input and the EPWM output share the same pin and counter. The counter can operate in up or down counter type. The capture function will always latch the EPWM counter to the RCAPDATn (EPWM_RCAPDATn[15:0]) bits or the FCAPDATn (EPWM_FCAPDATn[15:0]) bits, if the input channel has a rising transition or a falling transition, respectively. The capture function will also generate an interrupt CAP_INT (using EPWM_INT vector) if the rising or falling latch occurs and the corresponding channel n's rising or falling interrupt enable bits are set, where the CAPRIENn (EPWM_CAPIEN[5:0]) bit is for the rising edge and the CAPFIENn (EPWM_CAPIEN[13:8]) bit is for the falling edge. When rising or falling latch occurs, the corresponding EPWM counter may be reloaded with the value of EPWM_PERIODn register, depending on the setting of RCRLDENn or FCRLDENn bits (where RCRLDENn and FCRLDENn are located at EPWM_CAPCTL[21:16] and EPWM_CAPCTL[29:24], respectively). Note that the corresponding GPIO pins must be configured as the capture function by enable the CAPINENn (EPWM_CAPINEN[5:0]) bits for the corresponding capture channel n. Figure 6.11-43 is the capture block diagram of channel 0.

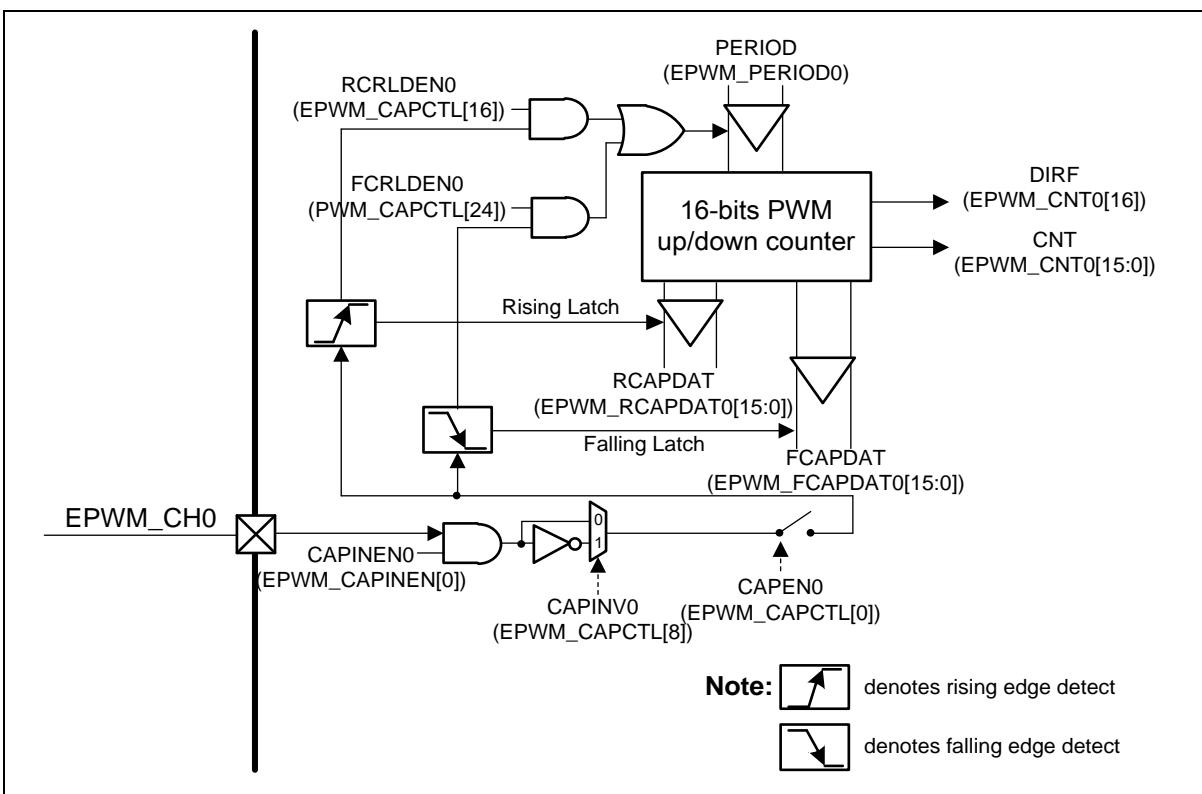

Figure 6.11-43 EPWM_CH0 Capture Block Diagram

Figure 6.11-44 illustrates the capture function timing. In this case, the capture counter is set as EPWM down counter type and the PERIOD is set to 8 so that the counter counts in the down direction, from 8 to 0. When detecting a falling edge at the capture input pin, the capture function latches the counter value to the EPWM_FCAPDATn register. When detecting the rising edge, it latches the counter value to the EPWM_RCAPDATn register. In this timing diagram, when the falling edge is detected at the first time, the capture function will reload the counter value from the PERIOD setting because the FCRLDENn bit is enabled. But at the second time, the falling edge does not result in a reload because of the disabled FCRLDENn bit. In this example, the counter also reloads at the rising edge of the capture input because the RCRLDENn bit is enabled, too.

Moreover, if the case is setup as the up counter type, the counter will reload the value zero and count up to the value PERIOD.

Figure 6.11-44 also illustrates the timing example for the interrupt and interrupt flag generation. When

the rising edge at channel n is detected, the corresponding CRLIFn (EPWM_CAPIF[5:0]) bit is set by hardware. Similarly, a falling edge detection at channel n causes the corresponding CFLIFn (EPWM_CAPIF[13:8]) bit is set by hardware. CRLIFn and CFLIFn bits can be cleared by software by writing '1'. If the CRLIFn bit is set and the CAPRIENn bit is enabled, the capture function generates an interrupt. If the CFLIFn bit is set and the CAPFIENn bit is enabled, the interrupt also happens.

A condition which is not shown in this figure is: if the rising latch happens again when the CRLIFn bit is already set, the Over run status CRLIFOVn (EPWM_CAPSTS[5:0]) bit will be set to 1 by hardware to indicate the CRLIF flag overrunning. Also, if the falling latch happens again, the same hardware operation occurs for the CFLIF interrupt flag and the Over run status CFLIFOVn (EPWM_CAPSTS[13:8]).

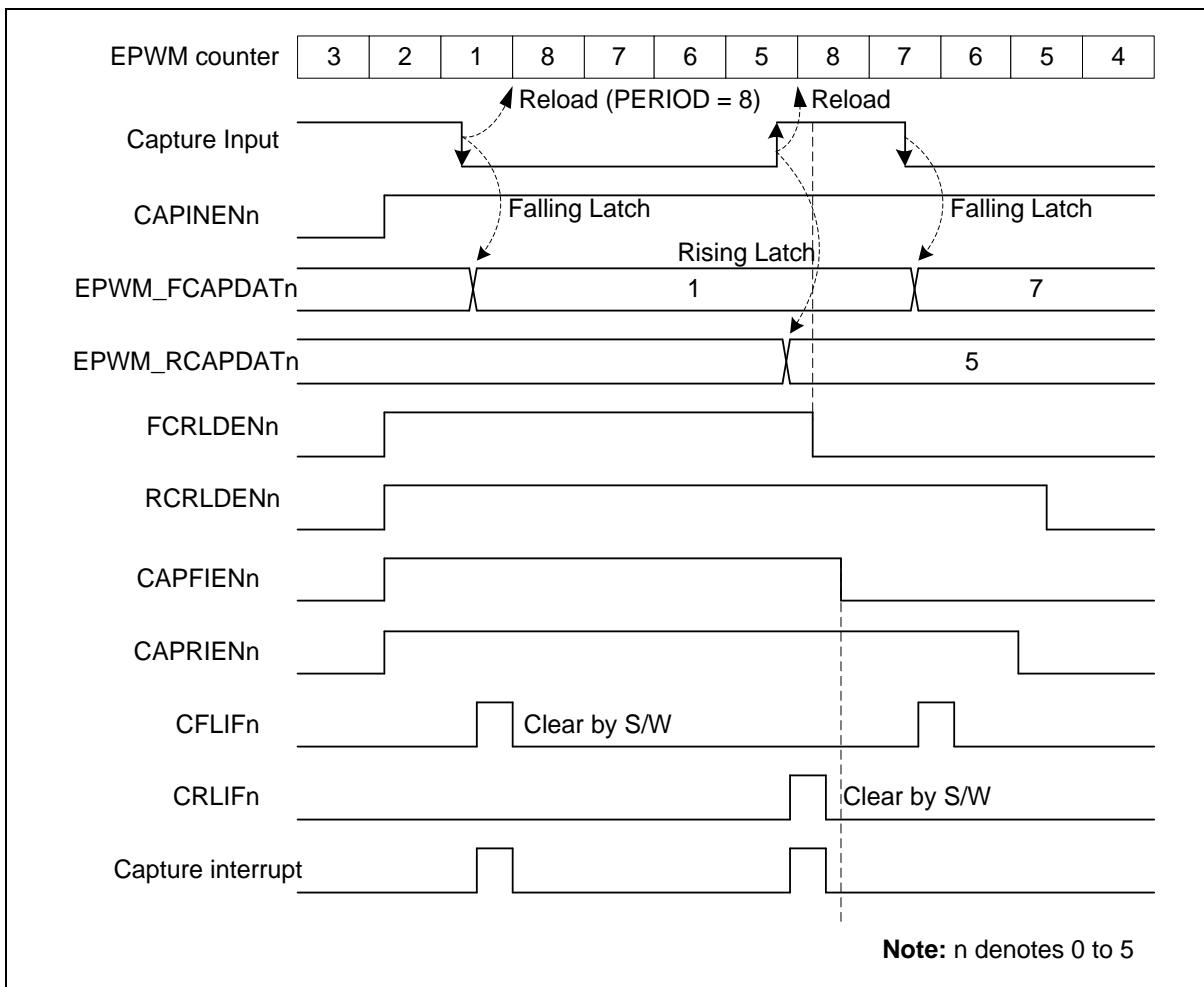

Figure 6.11-44 Capture Operation Waveform

The capture pulse width meeting the following conditions can be calculated according to the formula.

1. The capture positive or negative pulse width is shorter than a counter period.
2. The counter operates in down counter type.
3. The counter can be reloaded by both falling and rising capture events through setting FCRLDENn and RCRLDENn bits of PWM_CAPCTL register to 1.

For the negative pulse case, the channel low pulse width is calculated as $(EPWM_PERIODn + 1 - EPWM_RCAPDATn) / EPWM_{COUNTER}_{TIME}$, where one EPWM counter time is $(CLKPSC+1) * \frac{1}{FCLK}$.

EPWMx_CLK clock time. In Figure 6.11-44, the low pulse width is $8+1-5 = 4$ EPWM counter time.

For the positive pulse case, the channel high pulse width is calculated as $(EPWM_PERIODn + 1 - EPWM_FCAPDATn)$ EPWM counter time, where one EPWM counter time is $(CLKPSC+1) * EPWMx_CLK$ clock time. In Figure 6.11-44, the high pulse width is $8+1-7 = 2$ EPWM counter time.

6.11.5.29 Capture PDMA Function

The EPWM module supports the PDMA transfer function when operating in the capture mode. When the corresponding PDMA enable bit CHEnn_m (CHENO_1 at EPWM_PDMACTL[0], CHEN2_3 at EPWM_PDMACTL[8] and CHEN4_5 at EPWM_PDMACTL[16], where n and m denote complement pair channels) is set, the capture module will issue a request to PDMA controller when the preceding capture event has happened. The PDMA controller will issue an acknowledgement to the capture module after it has read back the CAPBUF (EPWM_PDMACAPn_m[15:0], n, m denotes complement pair channels) register in the capture module and has sent the register value to the memory. By setting CAPMODn_m (CAPMOD0_1 at EPWM_PDMACTL[2:1], CAPMOD2_3 at EPWM_PDMACTL[10:9] and CAPMOD4_5 at EPWM_PDMACTL[18:17]) bits, the PDMA can transfer the rising edge captured data or falling edge captured data or both of them to the memory. When using the PDMA to transfer both of the falling and rising edge data, remember to set CAPORDn_m (CAPORD0_1 at EPWM_PDMACTL[3], CAPORD2_3 at EPWM_PDMACTL[11] and CAPORD4_5 at EPWM_PDMACTL[19]) bit to decide the order of the transferred data (falling edge captured is first or rising edge captured first). The complement pair channels share a PDMA channel. Therefore, a selection bit CHSELn_m (CHSEL0_1 (EPWM_PDMACTL[4]), CHSEL2_3 (EPWM_PDMACTL[12]) and CHSEL4_5 (EPWM_PDMACTL[20])) bit is used to decide either channel n or channel m can be serviced by the PDMA channel.

Figure 6.11-45 is capture PDMA waveform. In this case, the CHSEL0_1 (EPWM_PDMACTL[4]) bit is set to 0. Hence the PDMA will service channel 0 for the capture data transfer. CAPMOD0_1 (EPWM_PDMACTL[2:1]) bits are set to 3. That means both of the rising and falling edge captured data will be transferred to the memory. The CAPORD0_1 (EPWM_PDMACTL[1]) bit is set to 1, so the rising edge data will be the first data to transfer and following is the falling edge data to transfer. As shown in Figure 6.11-45, the last assertions of the CAPRIFO CRLIFO and CAPFIFO CFLIFO signal have some overlap. The value of EPWM_RCAPDATA0 register is 11 will be loaded to EPWM_PDMACAP0_1 register to wait for transfer but not the EPWM_FCAPDATA0 value. The EPWM_PDMACAP0_1 register saves the data which will be transferred to the memory by PDMA. The HWDATA in this figure denotes the data which are being transferred by PDMA.

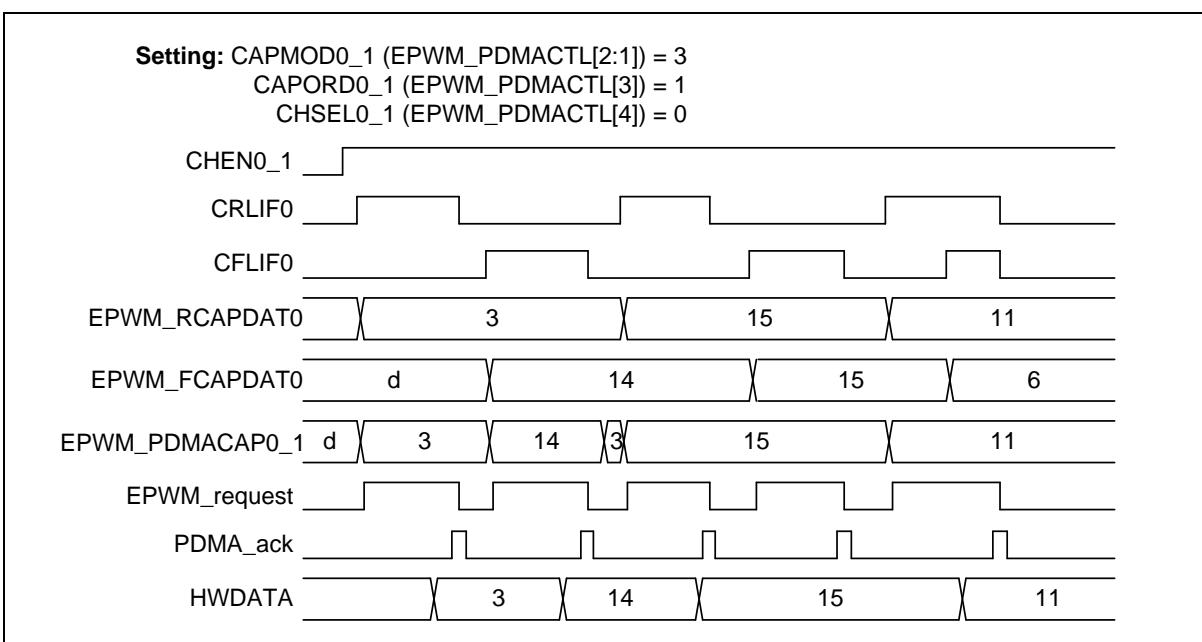

Figure 6.11-45 Capture PDMA Operation Waveform of Channel 0

6.11.5.30 Accumulator PDMA Function

The EPWM module supports the PDMA transfer function when accumulator interrupt happened. Figure 6.11-46 shows accumulator PDMA function architecture. When the corresponding PDMA enable bit APDMAENn (EPWM_APDMACTL[n], n=0~5) is set, accumulator module will send a request to PDMA controller when accumulator interrupt has happened, meaning that IFAIFn (EPWM_AINTSTS[n], n=0~5) is set 1. The PDMA controller will issue an acknowledge to accumulator after it has read memory data and send the data to the particular register (EPWM_PERIOD, etc.). So, user can use this function to change accumulator interrupt frequency.

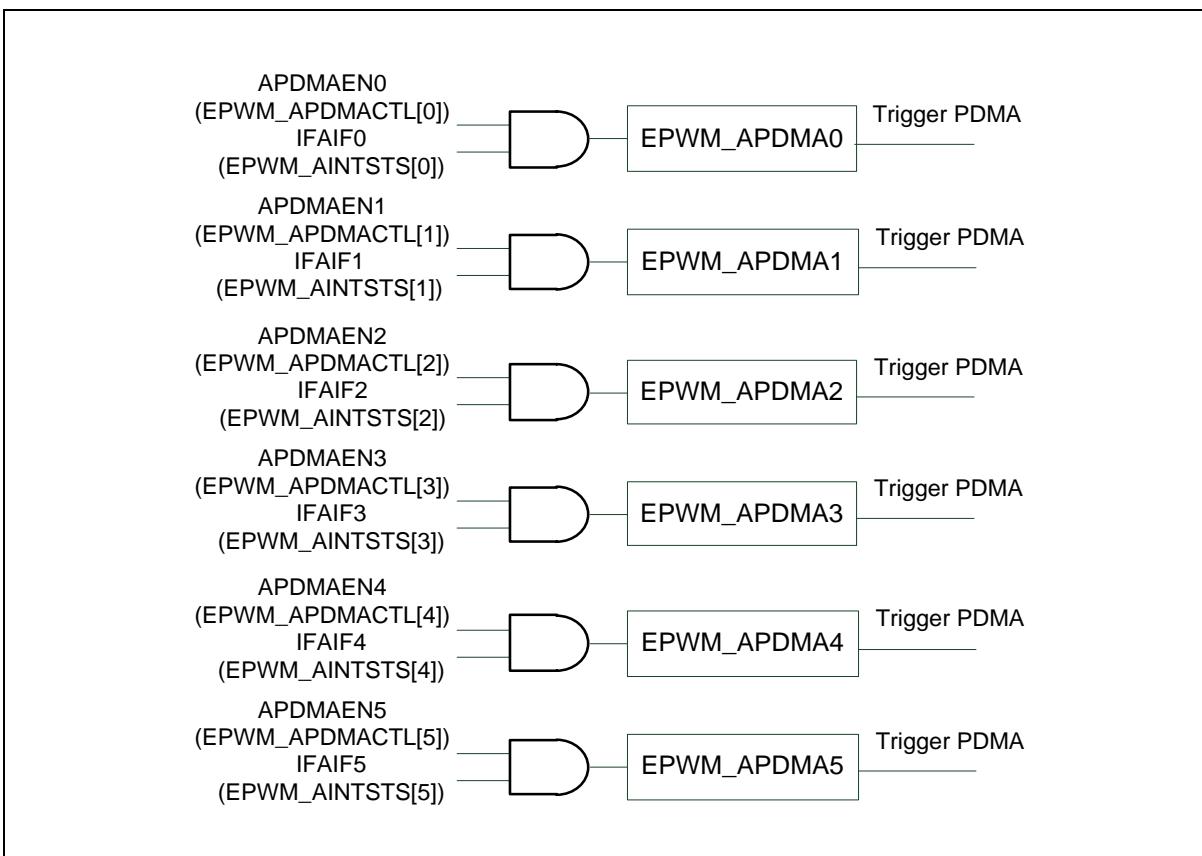

Figure 6.11-46 Accumulator PDMA Function Architecture

6.11.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

6.11.7 Register Description

EPWM Control Register 0 (EPWM_CTL0)

Register	Offset	R/W	Description				Reset Value
EPWM_CTL0	EPWMx_BA+0x00	R/W	EPWM Control Register 0				0x0000_0000

31	30	29	28	27	26	25	24
DBGTRIOFF	DBGHALT	Reserved				GROUPEN	
23	22	21	20	19	18	17	16
Reserved		IMMLDEN5	IMMLDEN4	IMMLDEN3	IMMLDEN2	IMMLDEN1	IMMLDEN0
15	14	13	12	11	10	9	8
Reserved		WINLDEN5	WINLDEN4	WINLDEN3	WINLDEN2	WINLDEN1	WINLDEN0
7	6	5	4	3	2	1	0
Reserved		CTRLD5	CTRLD4	CTRLD3	CTRLD2	CTRLD1	CTRLD0

Bits	Description
[31]	DBGTRIOFF ICE Debug Mode Acknowledge Disable Bit (Write Protect) 0 = ICE debug mode acknowledgement effects EPWM output. EPWM pin will be forced as tri-state while ICE debug mode acknowledged. 1 = ICE debug mode acknowledgement disabled. EPWM pin will keep output no matter ICE debug mode acknowledged or not. Note: This bit is write protected. Refer to SYS_REGLCTL register.
[30]	DBGHALT ICE Debug Mode Counter Halt (Write Protect) If counter halt is enabled, EPWM all counters will keep current value until exit ICE debug mode. 0 = ICE debug mode counter halt Disabled. 1 = ICE debug mode counter halt Enabled. Note: This bit is write protected. Refer to SYS_REGLCTL register.
[29:26]	Reserved Reserved.
[24]	GROUPEN Group Function Enable Bit 0 = The output waveform of each EPWM channel are independent. 1 = Unify the EPWM_CH2 and EPWM_CH4 to output the same waveform as EPWM_CH0 and unify the EPWM_CH3 and EPWM_CH5 to output the same waveform as EPWM_CH1.
[23:22]	Reserved Reserved.
[16+n] n=0,1..5	IMMLDENn Immediately Load Enable Bits 0 = PERIOD will load to PBUF at the end point of each period. CMPDAT will load to CMPBUF at the end point or center point of each period by setting CTRLD bit. 1 = PERIOD/CMPDAT will load to PBUF and CMPBUF immediately when software update PERIOD/CMPDAT. Note: If IMMLDENn is enabled, WINLDENn and CTRLDn will be invalid.
[15:14]	Reserved Reserved.

[8+n] n=0,1..5	WINLDEN_n	Window Load Enable Bits 0 = PERIOD will load to PBUF at the end point of each period. CMPDAT will load to CMPBUF at the end point or center point of each period by setting CTRLD bit. 1 = PERIOD will load to PBUF at the end point of each period. CMPDAT will load to CMPBUF at the end point of each period when valid reload window is set. The valid reload window is set by software write 1 to EPWM_LOAD register and cleared by hardware after load success.
[7:6]	Reserved	Reserved.
[n] n=0,1..5	CTRLD_n	Center Re-load In up-down counter type, PERIOD will load to PBUF at the end point of each period. CMPDAT will load to CMPBUF at the center point of a period.

EPWM Control Register 1 (EPWM_CTL1)

Register	Offset	R/W	Description				Reset Value
EPWM_CTL1	EPWMx_BA+0x04	R/W	EPWM Control Register 1				0x0000_0000

Reserved		SINSRC4		SINSRC2		SINSRC0	
7	6	5	4	3	2	1	0
Reserved					PHSEN4	PHSEN2	PHSEN0

Bits	Description	
[31:27]	Reserved	Reserved.
[24+n/2] n=0,2,4	PHSDIRn	EPWM Phase Direction Control 0 = Control EPWM counter count decrement after synchronizing. 1 = Control EPWM counter count increment after synchronizing.
[23]	SINPINV	SYNC Input Pin Inverse 0 = The state of pin SYNC is passed to the negative edge detector. 1 = The inversed state of pin SYNC is passed to the negative edge detector.
[22:20]	SFLTCNT	SYNC Edge Detector Filter Count The register bits control the counter number of edge detector.
[19:17]	SFLTCSEL	SYNC Edge Detector Filter Clock Selection 000 = Filter clock = HCLK. 001 = Filter clock = HCLK/2. 010 = Filter clock = HCLK/4. 011 = Filter clock = HCLK/8. 100 = Filter clock = HCLK/16. 101 = Filter clock = HCLK/32. 110 = Filter clock = HCLK/64. 111 = Filter clock = HCLK/128.
[16]	SNFLTEN	EPWM0_SYNC_IN Noise Filter Enable Bits 0 = Noise filter of input pin EPWM0_SYNC_IN Disabled. 1 = Noise filter of input pin EPWM0_SYNC_IN Enabled.
[15:14]	Reserved	Reserved.
[9+n:8+n] n=0,2,4	SINSRCn	EPWM0_SYNC_IN Source Selection 00 = Synchronize source from SYNC_IN or SWSYNC. 01 = Counter equal to 0.

		10 = Counter equal to EPWM_CMPDATm, m denotes 1, 3, 5. 11 = SYNC_OUT will not be generated.
[7:3]	Reserved	Reserved.
[n/2] n=0,2,4	PHSENn	SYNC Phase Enable Bits 0 = EPWM counter disable to load PHS value. 1 = EPWM counter enable to load PHS value.

EPWM Software Control Synchronization Register (EPWM_SWSYNC)

Register	Offset	R/W	Description					Reset Value
EPWM_SWSYNC	EPWMx_BA+0x0C	R/W	EPWM Software Control Synchronization Register					0x0000_0000

Bits	Description	
[31:12]	Reserved	Reserved.
[11:0]	CLKPSC	EPWM Counter Clock Prescale The clock of EPWM counter is decided by clock prescaler. Each EPWM pair share one EPWM counter clock prescaler. The clock of EPWM counter is divided by (CLKPSC+1).

EPWM Counter Enable Register (EPWM_CNTEN)

Register	Offset	R/W	Description	Reset Value
EPWM_CNTEN	EPWMx_BA+0x20	R/W	EPWM Counter Enable Register	0x0000_0000

31	30	29	28	27	26	25	24

Reserved							
7	6	5	4	3	2	1	0
Reserved		LOAD5	LOAD4	LOAD3	LOAD2	LOAD1	LOAD0

Bits	Description	
[31:6]	Reserved	Reserved.
[n] n=0,1..5	LOADn	<p>Re-load EPWM Comparator Register (CMPDAT) Control Bit</p> <p>This bit is software write, hardware clear when current EPWM period end.</p> <p>Write Operation:</p> <p>0 = No effect. 1 = Set load window of window loading mode.</p> <p>Read Operation:</p> <p>0 = No load window is set. 1 = Load window is set.</p> <p>Note: This bit only use in window loading mode, WINLDENn(EPWM_CTRL0[13:8]) = 1.</p>

EPWM Period Register 0~5 (EPWM_PERIOD0~5)

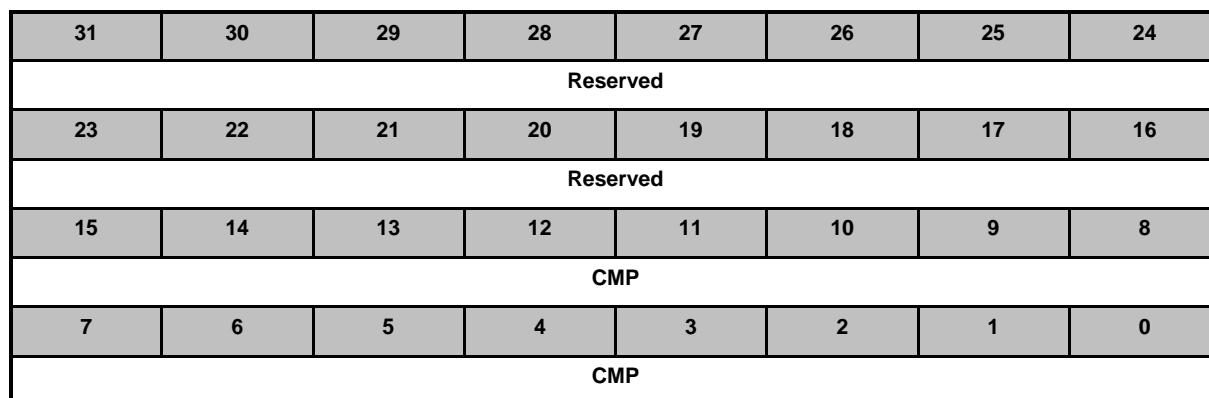

Register	Offset	R/W	Description	Reset Value
EPWM_PERIOD0	EPWMx_BA+0x30	R/W	EPWM Period Register 0	0x0000_0000
EPWM_PERIOD1	EPWMx_BA+0x34	R/W	EPWM Period Register 1	0x0000_0000
EPWM_PERIOD2	EPWMx_BA+0x38	R/W	EPWM Period Register 2	0x0000_0000
EPWM_PERIOD3	EPWMx_BA+0x3C	R/W	EPWM Period Register 3	0x0000_0000
EPWM_PERIOD4	EPWMx_BA+0x40	R/W	EPWM Period Register 4	0x0000_0000
EPWM_PERIOD5	EPWMx_BA+0x44	R/W	EPWM Period Register 5	0x0000_0000

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	PERIOD	<p>EPWM Period Register</p> <p>Up-Count mode: In this mode, EPWM counter counts from 0 to PERIOD, and restarts from 0.</p> <p>Down-Count mode: In this mode, EPWM counter counts from PERIOD to 0, and restarts from PERIOD.</p> <p>EPWM period time = (PERIOD+1) * EPWM_CLK period.</p> <p>Up-Down-Count mode: In this mode, EPWM counter counts from 0 to PERIOD, then decrements to 0 and repeats again.</p> <p>EPWM period time = 2 * PERIOD * EPWM_CLK period.</p>

EPWM Comparator Register 0~5 (EPWM_CMPDAT0~5)

Register	Offset	R/W	Description	Reset Value
EPWM_CMPDAT0	EPWMx_BA+0x50	R/W	EPWM Comparator Register 0	0x0000_0000
EPWM_CMPDAT1	EPWMx_BA+0x54	R/W	EPWM Comparator Register 1	0x0000_0000
EPWM_CMPDAT2	EPWMx_BA+0x58	R/W	EPWM Comparator Register 2	0x0000_0000
EPWM_CMPDAT3	EPWMx_BA+0x5C	R/W	EPWM Comparator Register 3	0x0000_0000
EPWM_CMPDAT4	EPWMx_BA+0x60	R/W	EPWM Comparator Register 4	0x0000_0000
EPWM_CMPDAT5	EPWMx_BA+0x64	R/W	EPWM Comparator Register 5	0x0000_0000

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	CMP	<p>EPWM Comparator Register</p> <p>CMP is used to compare with CNTR to generate EPWM waveform, interrupt and trigger EADC/DAC.</p> <p>In independent mode, CMPDAT0~5 denote as 6 independent EPWM_CH0~5 compared point.</p> <p>In complementary mode, CMPDAT0, 2, 4 denote as first compared point, and CMPDAT1, 3, 5 denote as second compared point for the corresponding 3 complementary pairs EPWM_CH0 and EPWM_CH1, EPWM_CH2 and EPWM_CH3, EPWM_CH4 and EPWM_CH5.</p>

EPWM Dead-time Control Register 0_1, 2_3, 4_5 (EPWM_DTCTL0_1, 2_3, 4_5)

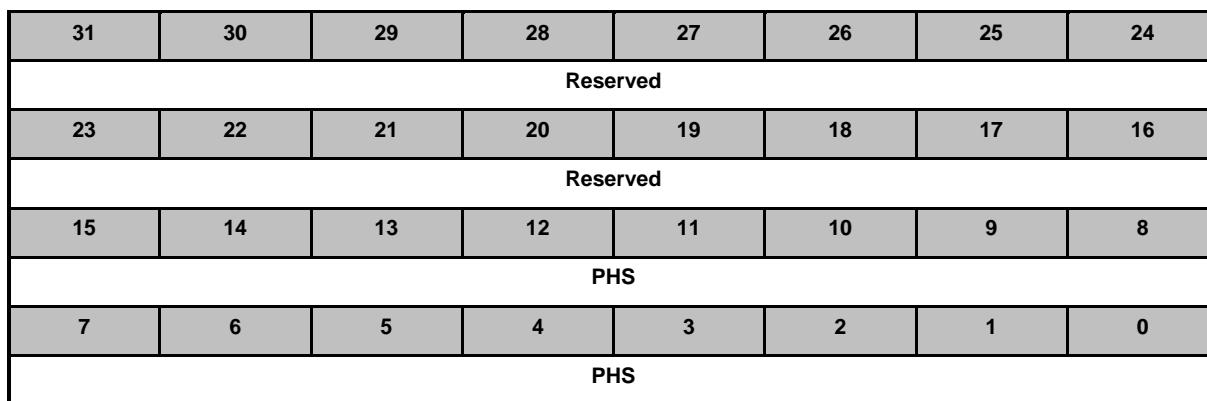

Register	Offset	R/W	Description				Reset Value
EPWM_DTCTL0_1	EPWMx_BA+0x70	R/W	EPWM Dead-Time Control Register 0/1				0x0000_0000
EPWM_DTCTL2_3	EPWMx_BA+0x74	R/W	EPWM Dead-Time Control Register 2/3				0x0000_0000
EPWM_DTCTL4_5	EPWMx_BA+0x78	R/W	EPWM Dead-Time Control Register 4/5				0x0000_0000

31	30	29	28	27	26	25	24
Reserved							DTCKSEL
23	22	21	20	19	18	17	16
Reserved							DTEN
15	14	13	12	11	10	9	8
Reserved				DTCNT			
7	6	5	4	3	2	1	0
DTCNT							

Bits	Description	
[31:25]	Reserved	Reserved.
[24]	DTCKSEL	Dead-time Clock Select (Write Protect) 0 = Dead-time clock source from EPWM_CLK. 1 = Dead-time clock source from prescaler output. Note: This bit is write protected. Refer to REGWRPROT register.
[23:17]	Reserved	Reserved.
[16]	DTEN	Enable Dead-time Insertion for EPWM Pair (EPWM_CH0, EPWM_CH1) (EPWM_CH2, EPWM_CH3) (EPWM_CH4, EPWM_CH5) (Write Protect) Dead-time insertion is only active when this pair of complementary EPWM is enabled. If dead-time insertion is inactive, the outputs of pin pair are complementary without any delay. 0 = Dead-time insertion Disabled on the pin pair. 1 = Dead-time insertion Enabled on the pin pair. Note: This bit is write protected. Refer to SYS_REGLCTL register.
[15:12]	Reserved	Reserved.
[11:0]	DTCNT	Dead-time Counter (Write Protect) The dead-time can be calculated from the following formula: DTCKSEL=0: Dead-time = (DTCNT[11:0]+1) * EPWM_CLK period. DTCKSEL=1: Dead-time = (DTCNT[11:0]+1) * EPWM_CLK period * (CLKPSC+1). Note: This bit is write protected. Refer to SYS_REGLCTL register.

EPWM Counter Phase Register 0_1, 2_3, 4_5 (EPWM_PHS0_1, 2_3, 4_5)

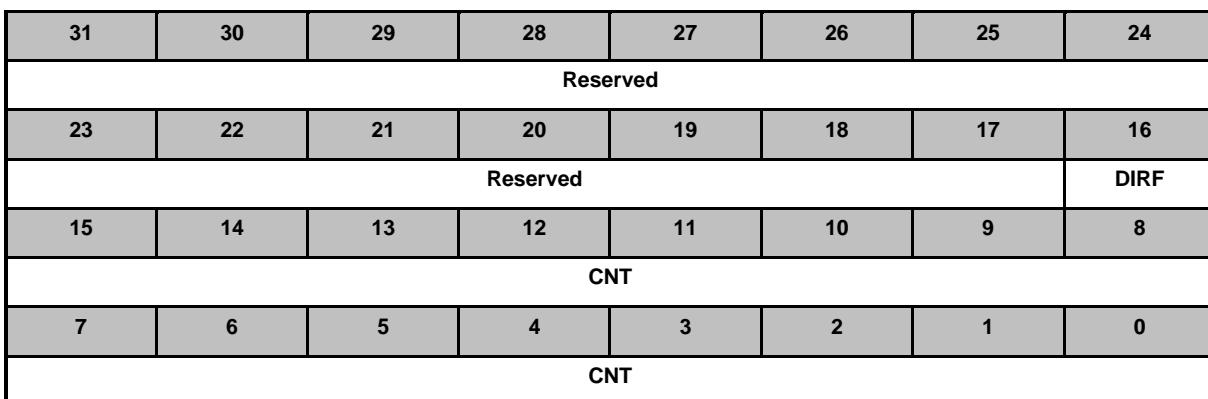

Register	Offset	R/W	Description	Reset Value
EPWM_PHS0_1	EPWMx_BA+0x80	R/W	EPWM Counter Phase Register 0/1	0x0000_0000
EPWM_PHS2_3	EPWMx_BA+0x84	R/W	EPWM Counter Phase Register 2/3	0x0000_0000
EPWM_PHS4_5	EPWMx_BA+0x88	R/W	EPWM Counter Phase Register 4/5	0x0000_0000

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	PHS	EPWM Synchronous Start Phase Bits PHS determines the EPWM synchronous start phase value. These bits only use in synchronous function.

EPWM Counter Register 0~5 (EPWM_CNT0~5)

Register	Offset	R/W	Description	Reset Value
EPWM_CNT0	EPWMx_BA+0x90	R	EPWM Counter Register 0	0x0000_0000
EPWM_CNT1	EPWMx_BA+0x94	R	EPWM Counter Register 1	0x0000_0000
EPWM_CNT2	EPWMx_BA+0x98	R	EPWM Counter Register 2	0x0000_0000
EPWM_CNT3	EPWMx_BA+0x9C	R	EPWM Counter Register 3	0x0000_0000
EPWM_CNT4	EPWMx_BA+0xA0	R	EPWM Counter Register 4	0x0000_0000
EPWM_CNT5	EPWMx_BA+0xA4	R	EPWM Counter Register 5	0x0000_0000

Bits	Description	
[31:17]	Reserved	Reserved.
[16]	DIRF	EPWM Direction Indicator Flag (Read Only) 0 = Counter is counting down. 1 = Counter is counting up.
[15:0]	CNT	EPWM Data Register (Read Only) User can monitor CNTR to know the current value in 16-bit period counter.

EPWM Generation Register 0 (EPWM_WGCTL0)

Register	Offset	R/W	Description				Reset Value
EPWM_WGCTL0	EPWMx_BA+0xB0	R/W	EPWM Generation Register 0				0x0000_0000

31	30	29	28	27	26	25	24

6.12 Basic PWM Generator and Capture Timer (BPWM)

6.12.1 Overview

The chip provides two BPWM generators — BPWM0 and BPWM1 as shown in Figure 6.12-1. Each BPWM supports 6 channels of BPWM output or input capture. There is a 12-bit prescaler to support flexible clock to the 16-bit BPWM counter with 16-bit comparator. The BPWM counter supports up, down and up-down counter types, all 6 channels share one counter. BPWM uses the comparator compared with counter to generate events. These events are used to generate BPWM pulse, interrupt and trigger signal for EADC to start conversion. For BPWM output control unit, it supports polarity output, independent pin mask and tri-state output enable.

The BPWM generator also supports input capture function to latch BPWM counter value to corresponding register when input channel has a rising transition, falling transition or both transition is happened.

6.12.2 Features

6.12.2.1 BPWM Function Features

- Supports maximum clock frequency up to maximum PLL frequency.
- Supports up to two BPWM modules; each module provides 6 output channels
- Supports independent mode for BPWM output/Capture input channel
- Supports 12-bit prescalar from 1 to 4096
- Supports 16-bit resolution BPWM counter; each module provides 1 BPWM counter
 - Up, down and up/down counter operation type
- Supports mask function and tri-state enable for each BPWM pin
- Supports interrupt in the following events:
 - BPWM counter matches 0, period value or compared value
- Supports trigger EADC in the following events:
 - BPWM counter matches 0, period value or compared value

6.12.2.2 Capture Function Features

- Supports up to 12 capture input channels with 16-bit resolution
- Supports rising or falling capture condition
- Supports input rising/falling capture interrupt
- Supports rising/falling capture with counter reload option

6.12.3 Block Diagram

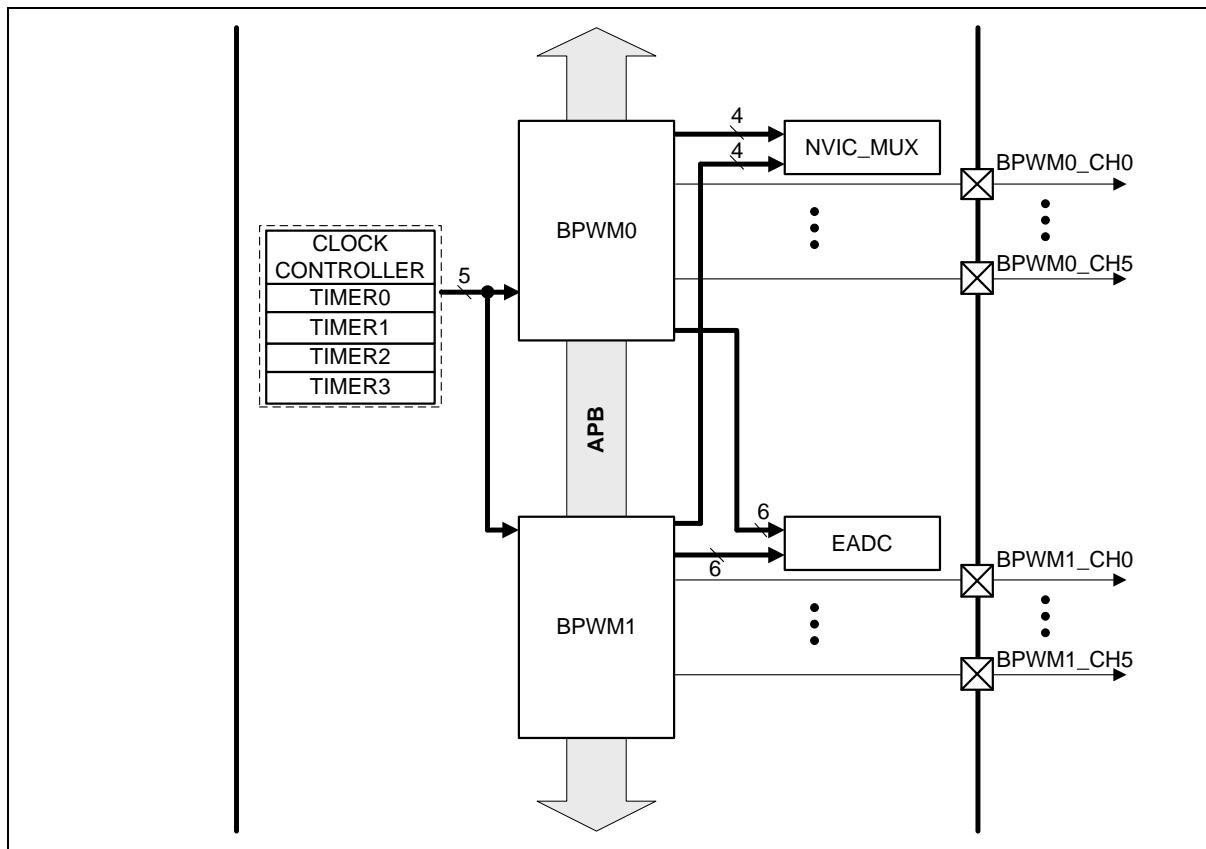

Figure 6.12-1 BPWM Generator Overview Block Diagram

Each BPWM generator has only one clock source inputs and can be selected from BPWM Clock or four TIMER trigger BPWM outputs as shown in Figure 6.12-2 by ECLKSRC0 (BPWM_CLKSRC[2:0]) for BPWM_CLK0. In general case, BPWM0 Clock must be selected from PCLK0 by setting BPWM0SEL (CLK_CLKSEL2[8]) to 1 and BPWM1 Clock from PCLK1 by setting BPWM1SEL (CLK_CLKSEL2[9]) to 1.

When operating in maximum PLL clock frequency as shown in Figure 6.12-3, and Table 6.12-1 BPWM Clock Source Control Registers Setting Table. BPWM0 and BPWM1 Clock must be selected to PLL clock by setting BPWM0SEL (CLK_CLKSEL2[8]) and BPWM1SEL (CLK_CLKSEL2[9]) to 0.

1:2	PLL/2	PLL/2	PLL	2	1	0	0

Table 6.12-1 BPWM Clock Source Control Registers Setting Table

Figure 6.12-4 illustrates the architecture of BPWM Independent mode. All six channels share the same counter. When the counter counts to 0, PERIOD (BPWM_PERIOD[15:0]) or equal to the comparator, events will be generated. These events are passed to the corresponding generators to generate BPWM pulse, interrupt signal and trigger signal for EADC to start conversion. Output control is used to change the BPWM pulse output state.

6.12.5 Functional Description

6.12.5.1 BPWM Prescaler

The BPWM prescaler is used to divide clock source, prescaler counting CLKPSC +1 times, and BPWM counter only count once. The prescale is set by CLKPSC (BPWM_CLKPSC[11:0]). Figure 6.12-5 shows an example of BPWM channel 0 CLKPSC waveform. The prescale counter will reload CLKPSC at the begin of the next prescale counter down-count.

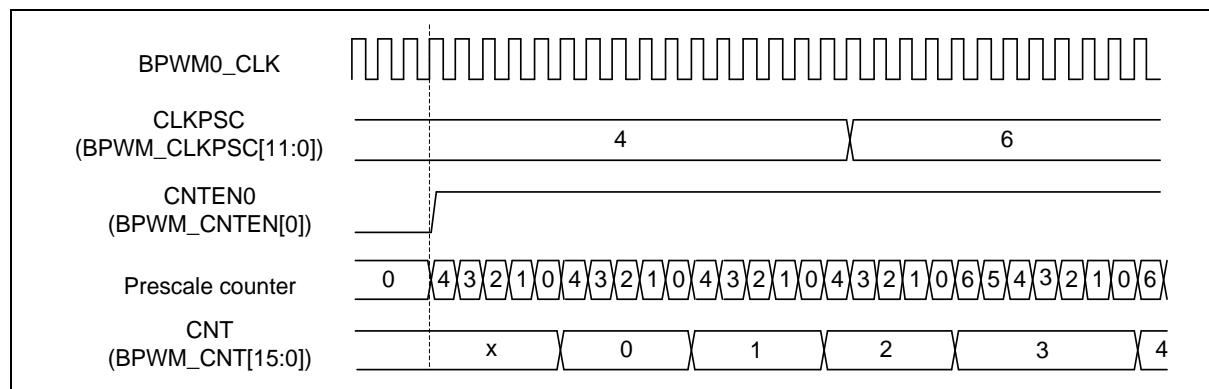

Figure 6.12-5 BPWM_CH0 CLKPSC waveform

6.12.5.2 BPWM Counter

BPWM has one counter, and supports 3 counter types operation: Up Counter, Down Counter and Up-

Down Counter types.

For BPWM channel0, CNT(BPWM_CNT[15:0]) can clear to 0x00 by CNTCLR0 (BPWM_CNTCLR[0]) when prescale counter down count to 0, and CNTCLR0(BPWM_CNTCLR[0]) will be set 0 by hardware automatically.

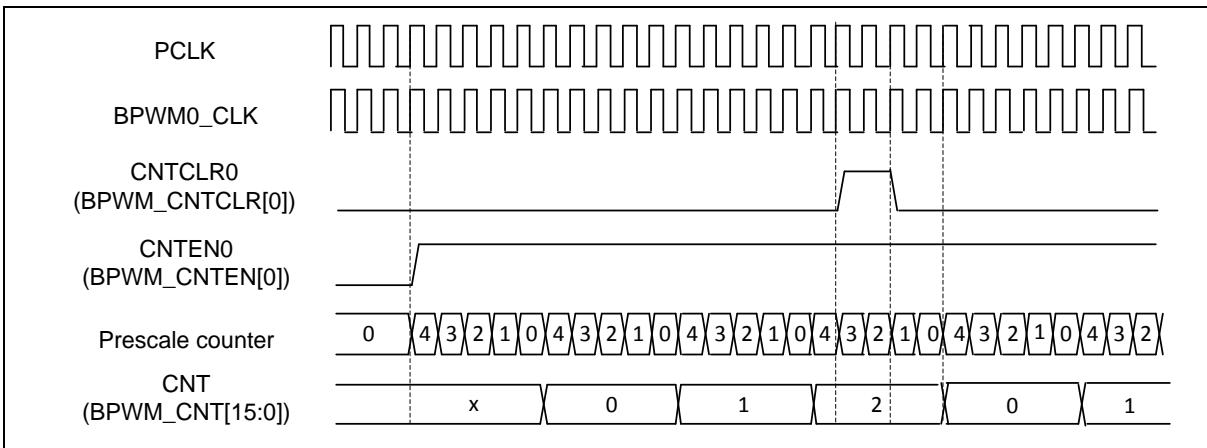

Figure 6.12-6 BPWM Counter Clear waveform

6.12.5.3 Up Counter Type

In the up counter operation, the 16 bits BPWM counter is an up counter and starts up-counting from 0 to PERIOD (BPWM_PERIOD) to finish a BPWM period. The current counter value can be found by reading the CNT (BPWM_CNT[15:0]). BPWM generates zero point event when counter counts to 0 and generates period point event when counting to PERIOD. An example of the period time in up counter type, the BPWM period time = (PERIOD+1) * (CLKPSC+1) * BPWMx_CLK clock time, as shown in Figure 6.12-7.

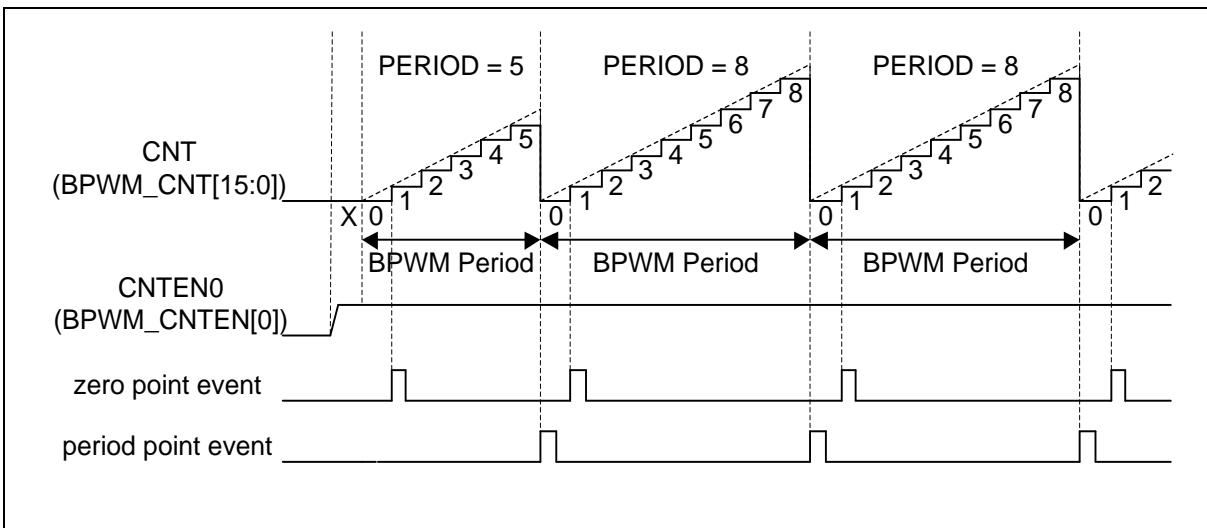

Figure 6.12-7 BPWM Up Counter Type

6.12.5.4 Down Counter Type

In the down counter operation, the 16 bits BPWM counter is a down counter and starts down-counting from PERIOD to 0 to finish a BPWM period. The current counter value can be found by reading the CNT. BPWM generates zero point event when counter counts to 0 and generates period point event when counting to PERIOD. An example of the period time in down counter type, the BPWM period time = (PERIOD+1) * (CLKPSC+1) * BPWMx_CLK clock time, as shown in Figure 6.12-8.

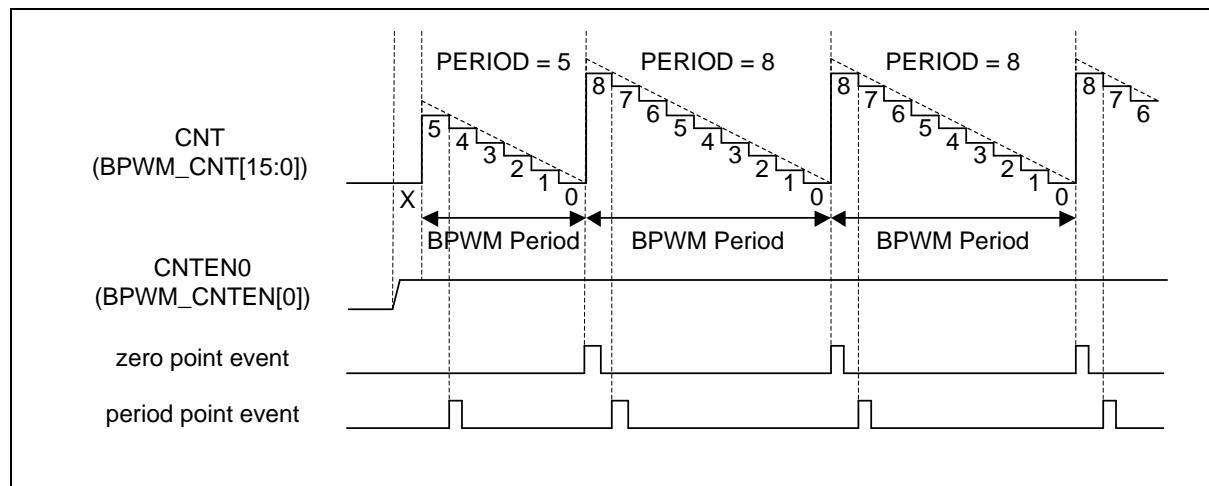

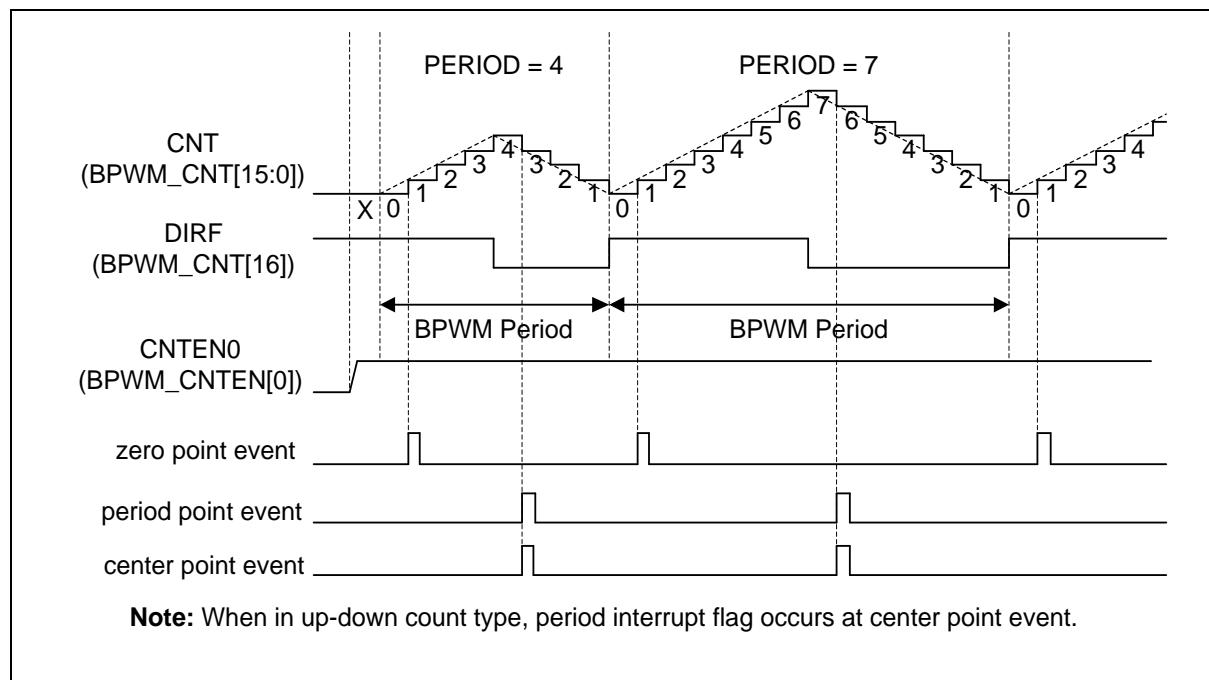

Figure 6.12-8 BPWM Down Counter Type

6.12.5.5 Up-Down Counter Type

In the up-down counter operation, the 16 bits BPWM counter is an up-down counter and starts counting-up from 0 to PERIOD and then starts counting down to 0 to finish a BPWM period. The current counter value can be found by reading the CNT. BPWM generates zero point event when counter counts to 0 and generates center point event when counting to PERIOD. An example of the period time in up-down counter type, the BPWM period time = $(2 \times \text{PERIOD}) * (\text{CLKPSC} + 1) * \text{BPWMx_CLK}$ clock time, as shown in Figure 6.12-9. The DIRF (BPWM_CNT[16]) is counter direction indicator flag, where high is up counting, and low is down counting.

Note: When in up-down count type, period interrupt flag occurs at center point event.

Figure 6.12-9 BPWM Up-Down Counter Type

6.12.5.6 BPWM Comparator

The CMPDAT (BPWM_CMPDATn[15:0]) is a basic comparator register of BPWM channel n; each channel only has one CMPDAT. The CMPDAT's value is continuously compared to the counter value. When the counter is equal to compared register, BPWM generates an event and uses the event to

generate BPWM pulse, interrupt or use to trigger EADC. In up-down counter type, two events will be generated in a BPWM period as shown in Figure 6.12-10.

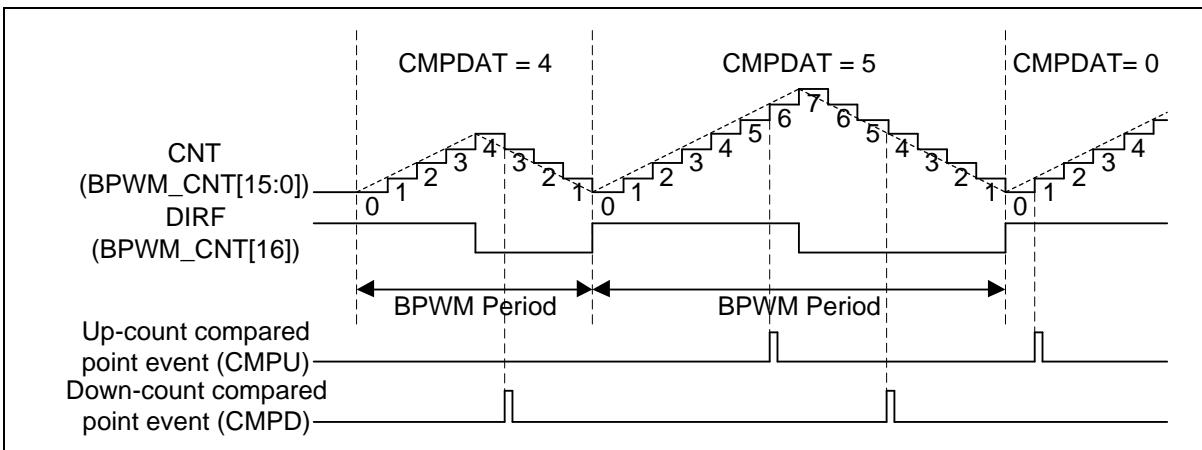

Figure 6.12-10 BPWM CMPDAT Events in Up-Down Counter Type

6.12.5.7 Period Loading Mode

Period Loading mode is the default loading mode. It has lowest priority in loading modes. PERIOD and CMPDAT will both load to their buffer while a period is completed. For example, after BPWM counter up counts from 0 to PERIOD in up-counter operation or down counts from PERIOD to 0 in the down-counter operation or up counts from 0 to PERIOD and then down counts to 0 in up-down counter operation.

Figure 6.12-11 shows period loading timing of up-count operation, where PERIOD DATA0 denotes the initial data of PERIOD, PERIOD DATA1 denotes the first updated PERIOD data by software and so on, CMPDAT also follows this rule. The following describes steps sequence of Figure 6.12-11. User can know the PERIOD and CMPDAT update condition, by watching BPWM period and CMU event.

1. Software writes CMPDAT DATA1 to CMPDAT at point 1.
2. Hardware loads CMPDAT DATA1 to CMPBUF at the end of PWM period at point 2.
3. Software writes PERIOD DATA1 to PERIOD at point 3.
4. Hardware loads PERIOD DATA1 to PBUF at the end of PWM period at point 4.
5. Software writes PERIOD DATA2 to PERIOD at point 5.
6. Hardware loads PERIOD DATA2 to PBUF at the end of PWM period at point 6.

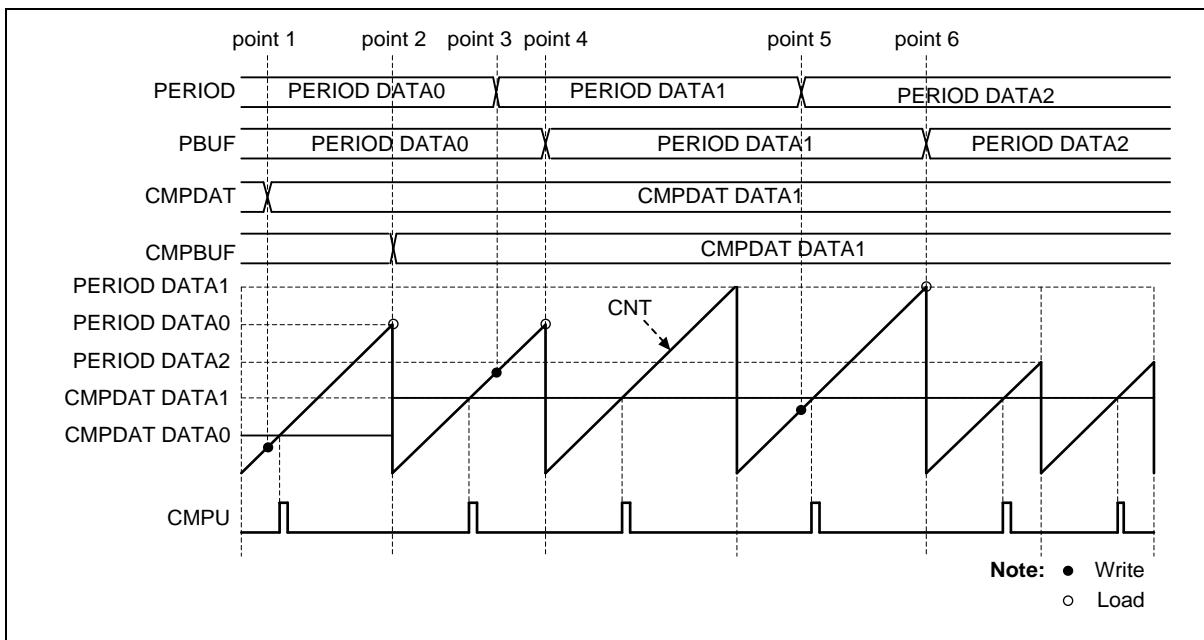

Figure 6.12-11 Period Loading Mode with Up-Counter Type

6.12.5.8 Immediately Loading Mode

If the IMMLDEN_n (BPWM_CTL0[21:16]) bit which corresponds to BPWM channel _n is set to 1, software will load a value to buffer from PERIOD and CMPDAT immediately while software updates PERIOD or CMPDAT. If the update PERIOD value is less than current counter value, counter will count to 0xFFFF, when counter count to 0xFFFF and prescale count to 0, the flag CNTMAX0(BPWM_STATUS[0]) will raise, and then counter will count wraparound. Immediately loading mode has the highest priority. If IMMLDEN_n has been set, other loading mode for channel _n will become invalid. Figure 6.12-12 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 and hardware immediately loading CMPDAT DATA1 to CMPBUF at point 1.
2. Software writes PERIOD DATA1 which is greater than current counter value at point 2; counter will continue counting until equal to PERIOD DATA1 to finish a period loading.
3. Software writes PERIOD DATA2 which is less than the current counter value at point 3; counter will continue counting to its maximum value 0xFFFF and count wraparound from 0 to PERIOD DATA2 to finish this period loading.

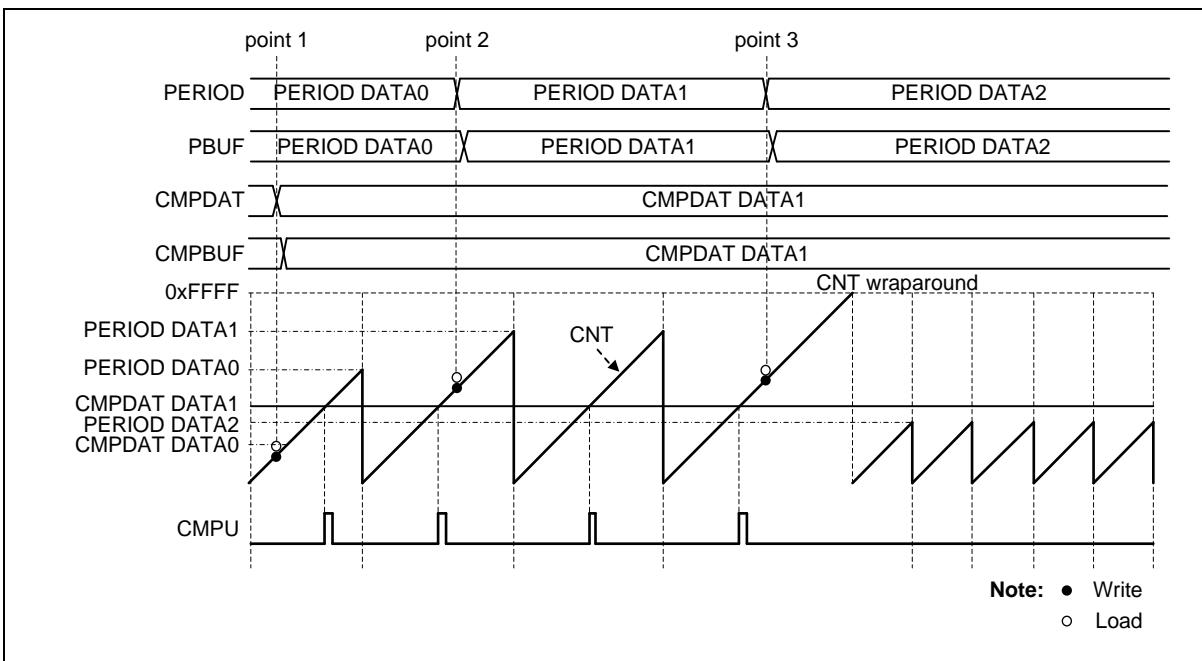

Figure 6.12-12 Immediately Loading Mode with Up-Counter Type

6.12.5.9 Center Loading Mode

If the CTRLDn (BPWM_CTL0[5:0]) bit which corresponds to BPWM channel n is set to 1 and in up-down counter type, CMPDAT will load to CMPBUFn in center of a period, that is, counter counts to PERIOD. PERIOD loading timing is the same as period loading mode. Figure 6.12-13 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 at point 1.
2. Hardware loads CMPDAT DATA1 to CMPBUF at center of PWM period at point 2.
3. Software writes PERIOD DATA1 at point 3.
4. Hardware loads PERIOD DATA1 to PBUF at the end of PWM period at point 4.
5. Software writes CMPDAT DATA2 at point 5.
6. Hardware loads CMPDAT DATA2 to CMPBUF at center of PWM period at point 6.
7. Software writes PERIOD DATA2 at point 7.
8. Hardware loads PERIOD DATA2 to PBUF at the end of PWM period at point 8.

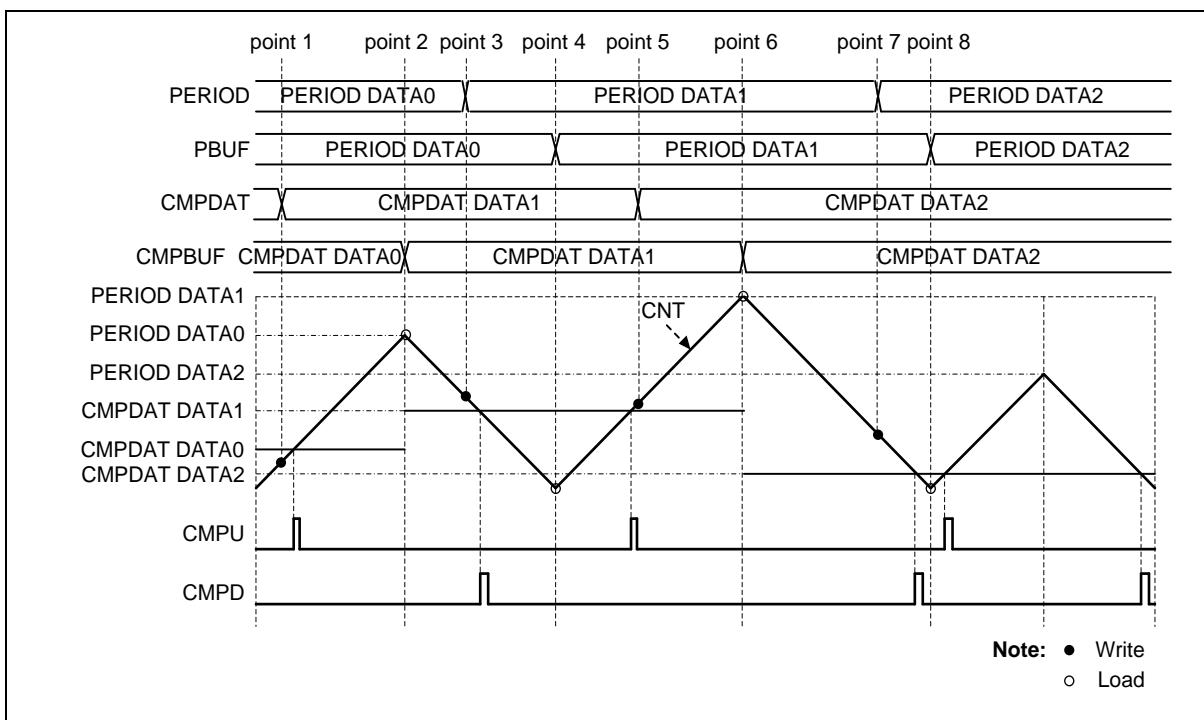

Figure 6.12-13 Center Loading Mode with Up-Down-Counter Type

6.12.5.10 BPWM Pulse Generator

The BPWM pulse generator uses counter and comparator events to generate BPWM pulse. The events are: zero point, period point in up counter type and down counter type, center point in up-down counter type and counter equal to comparator point in three types. As to up-down counter type, there are two counter equal comparator points, one at up count another at down count.

Each event point can decide BPWM waveform to do nothing (X), set Low (L), set High (H) or toggle (T) by setting BPWM_WGCTL0 and BPWM_WGCTL1 registers. Using these points can easily generate asymmetric BPWM pulse or variant waveform as shown in Figure 6.12-14. In the figure, there is a comparator n to generate BPWM pulse, whrer n denotes channel number 0 to 5. CMPU denotes CNT is equal to CMPDAT when counting up, and CMPD denotes CNT is equal to CMPDAT when counting down.

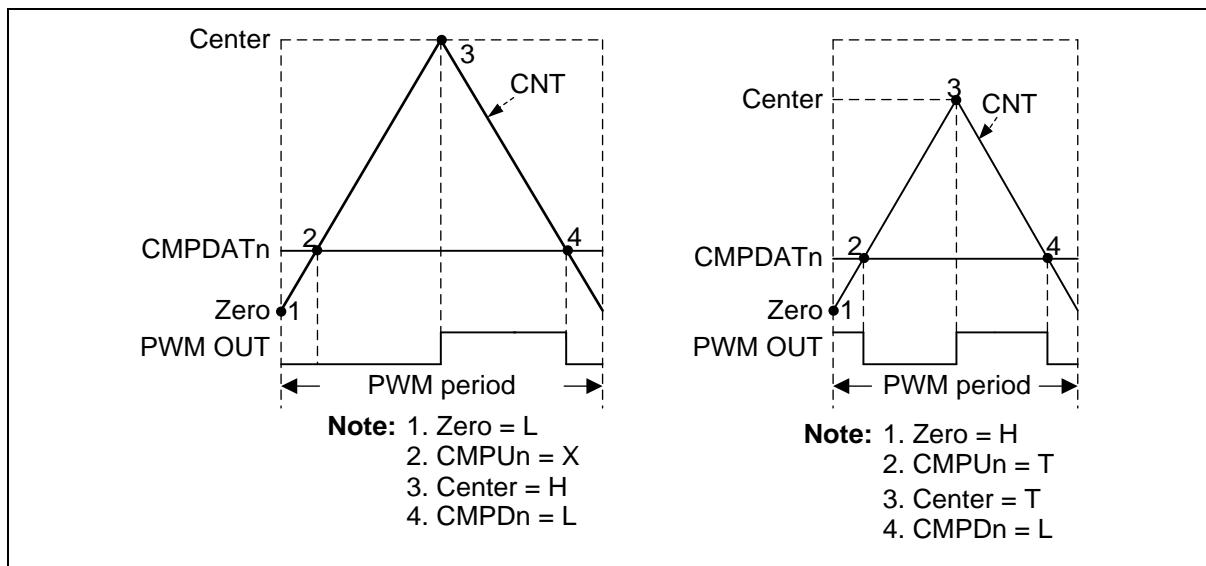

Figure 6.12-14 BPWM Pulse Generation (Left: Asymmetric Pulse, Right: Variety Pulse)

The generation events may be sometimes set to the same value, as the reason, events priority between different counter types are list below, up counter type (Table 1.1-1), down counter type (Table 1.1-2) and up-down counter type (Table 1.1-3). By using event priority, user can easily generate 0% to 100% duty pulse as shown in Figure 6.12-15.

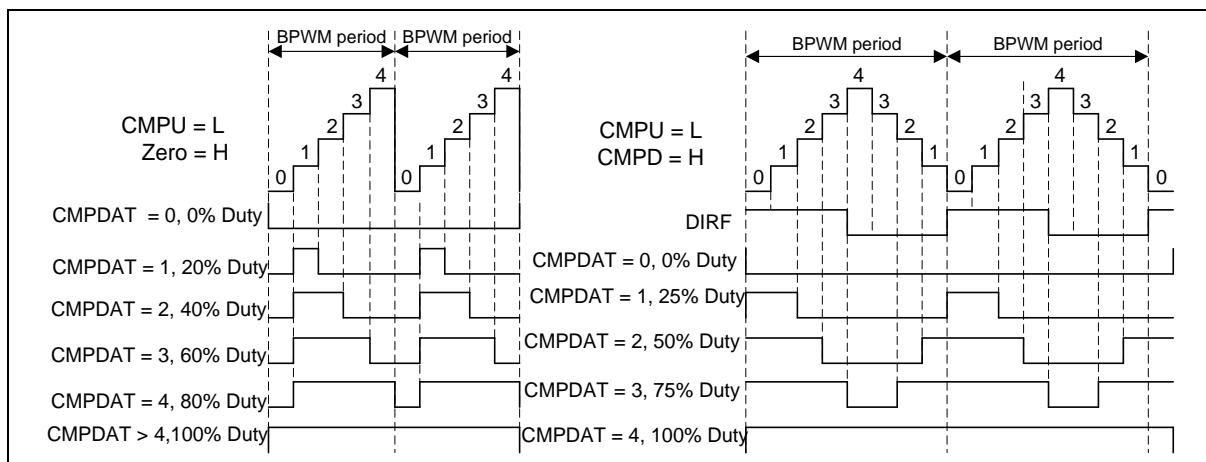

Figure 6.12-15 BPWM 0% to 100% Pulse Generation (Left: Up Counter Type, Right: Up-down Counter Type)

Priority	Up Event
1 (Highest)	Period event (CNT = PERIOD)
2	Compare up event(CNT = CMPUn)
3 (Lowest)	Zero event (CNT = 0)

Table 6.12-2 BPWM Pulse Generation Event Priority for Up-Counter

Priority	Down Event
1 (Highest)	Zero event (CNT = 0)

2	Compare down event (CNT = CMPDn)
3 (Lowest)	Period event (CNT = PERIOD)

Table 6.12-3 BPWM Pulse Generation Event Priority for Down-Counter

Priority	Up Event	Down Event
1 (Highest)	Compare up event (CNT = CMPUn)	Compare down event (CNT = CMPDn)
2	Zero event (CNT = 0)	Period (center) event (CNT = PERIOD)

Table 6.12-4 BPWM Pulse Generation Event Priority for Up-Down-Counter

6.12.5.11 Synchronous function

To start BPWM and PWM counters in the same time, user have to set the BPWM Synchronous Start Control Register (BPWM_SSCTL[0]) to enable the channel counters which are planned to start counting together, and select the SSRC(BPWM_SSCTL[9:8]) to choose the Synchronous Start source, followed by setting the BPWM Synchronous Start Trigger Register CNTSEN (BPWM_SSTRG[0]).

6.12.5.12 BPWM Output Control

After BPWM pulse generation, there are three steps to control the output of BPWM channels. There are Mask, Pin Polarity and Output Enable three steps as shown in Figure 6.12-16.

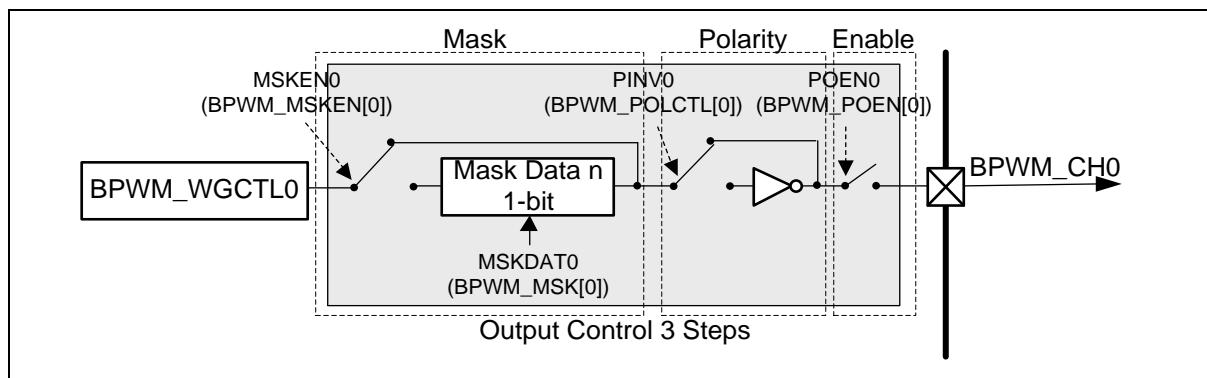

Figure 6.12-16 BPWM_CH0 Output Control 3 Steps

6.12.5.13 BPWM Mask Output Function

Each of the BPWM output channels can be manually overridden by using the appropriate bits in the BPWM Mask Enable Control Register (BPWM_MSKEN) and BPWM Masked Data Register (BPWM_MSK) to drive the BPWM channel outputs to specified logic states independent of the duty cycle comparison units. The BPWM mask bits are useful when controlling various types of Electrically Commutated Motor (ECM) like a BLDC motor. The BPWM_MSKEN register contains six bits, MSKENn(BPWM_MSKEN[5:0]) determine which BPWM channel output will be overridden, MSKENn(BPWM_MSKEN[5:0]) bits are active-high. The BPWM_MSK register contains six bits, MSKDATn(BPWM_MSK[5:0]) determine the state of the BPWM channel output when the channel is masked via the MSKDAT bits. Figure 6.12-17 shows an example of how BPWM mask control can be used for the override feature.

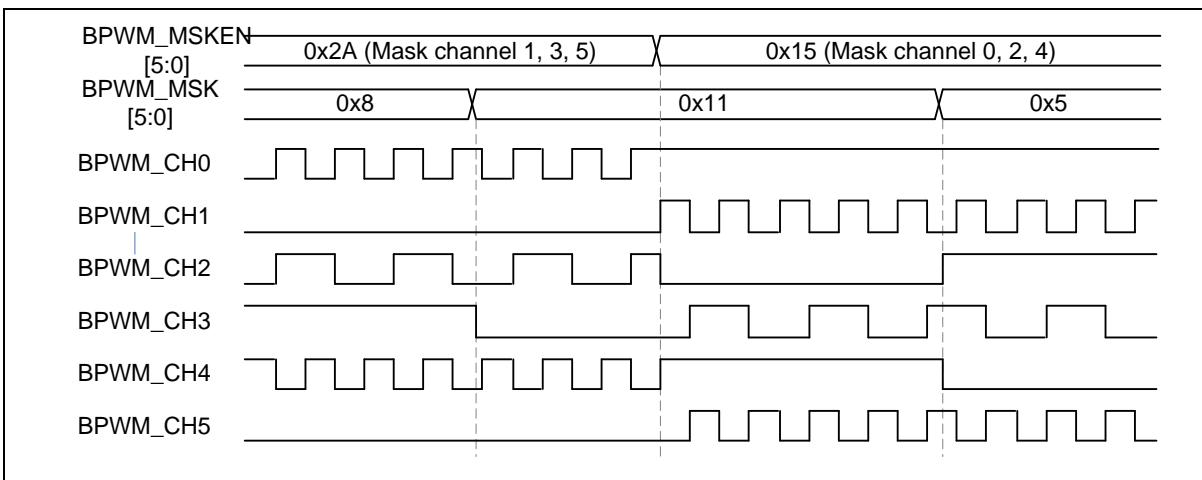

Figure 6.12-17 Mask Control Waveform Illustration

6.12.5.14 Polarity Control

Each BPWM port from BPWM_CH0 to BPWM_CH5 has an independent polarity control module to configure the polarity of the active state of BPWM output. By default, the BPWM output is active high. This implies the BPWM OFF state is low and ON state is high. This definition is variable through setting BPWM Negative Polarity Control Register (BPWM_POLCTL), for each individual BPWM channel. Figure 6.12-18 shows the initial state before BPWM starts with different polarity settings.

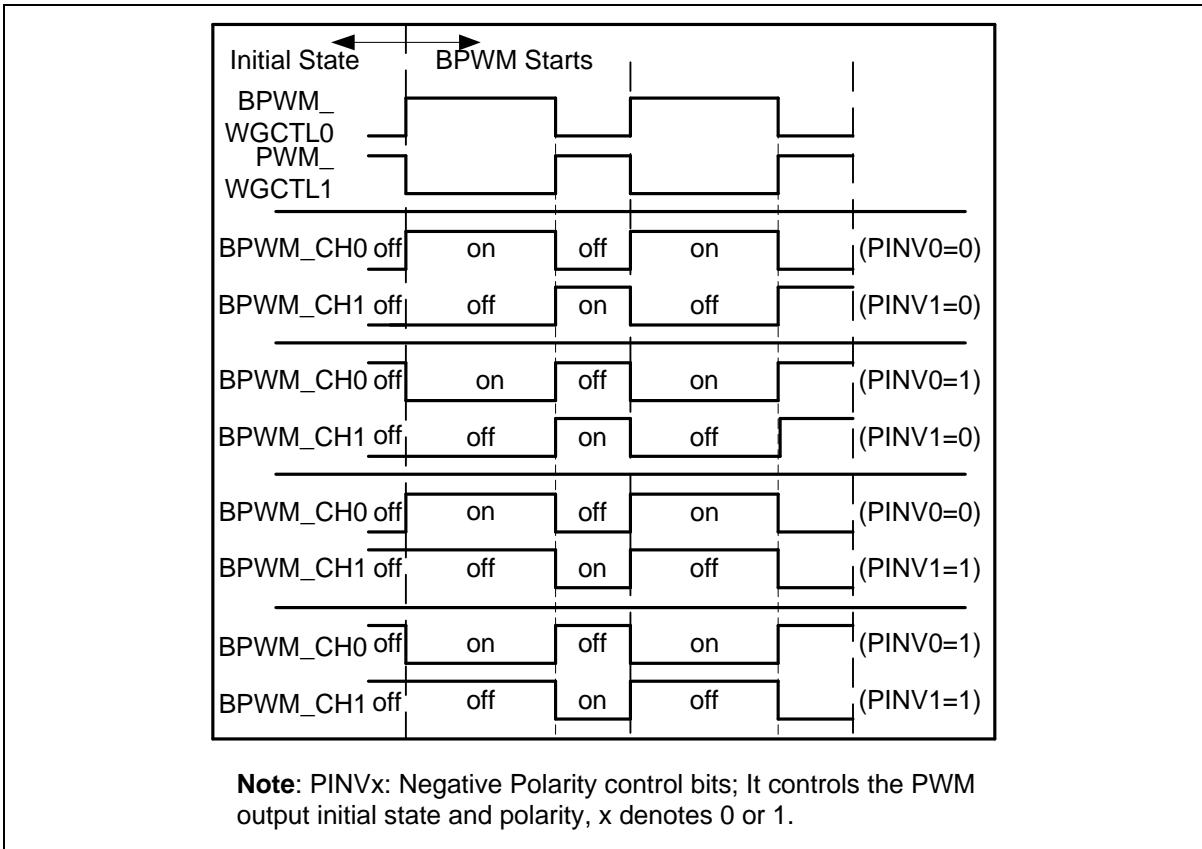

Figure 6.12-18 Initial State and Polarity Control

6.12.5.15 BPWM Interrupt Generator

There are two independent interrupts for each BPWM as shown in Figure 6.12-19.

BPWM interrupt (BPWM_INT) comes from BPWM complementary pair events. The counter can generate the Zero point Interrupt Flag ZIF0 (BPWM_INTSTS0[0]) and the Period point Interrupt Flag PIF0 (BPWM_INTSTS0[8]). When BPWM channel n's counter equals to the comparator value stored in BPWM_CMPDATn, the different interrupt flags will be triggered depending on the counting direction. If the matching occurs at up-count direction, the Up Interrupt Flag CMPUIFn (BPWM_INTSTS0[21:16]) is set and if matching at the opposite direction, the Down Interrupt Flag CMPDIFn (BPWM_INTSTS0[29:24]) is set. If the correspond interrupt enable bits are set, the trigger events will generates interrupt signals.

Another interrupt is the capture interrupt (CAP_INT). It shares the BPWM_INT vector in NVIC, CAP_INT can be generated when the CAPRIFn (BPWM_CAPIF[5:0]) is triggered and the Capture Rising Interrupt Enable bit CAPRIENn (BPWM_CAPIEN[5:0]) is set to 1. Or in the falling edge condition, the CAPFIFn (BPWM_CAPIF[13:8]) can be triggered when the Capture Falling Interrupt Enable bit CAPFIEnn (BPWM_CAPIEN[13:8]) is set to 1.

Figure 6.12-19 demonstrates the architecture of the BPWM interrupts.

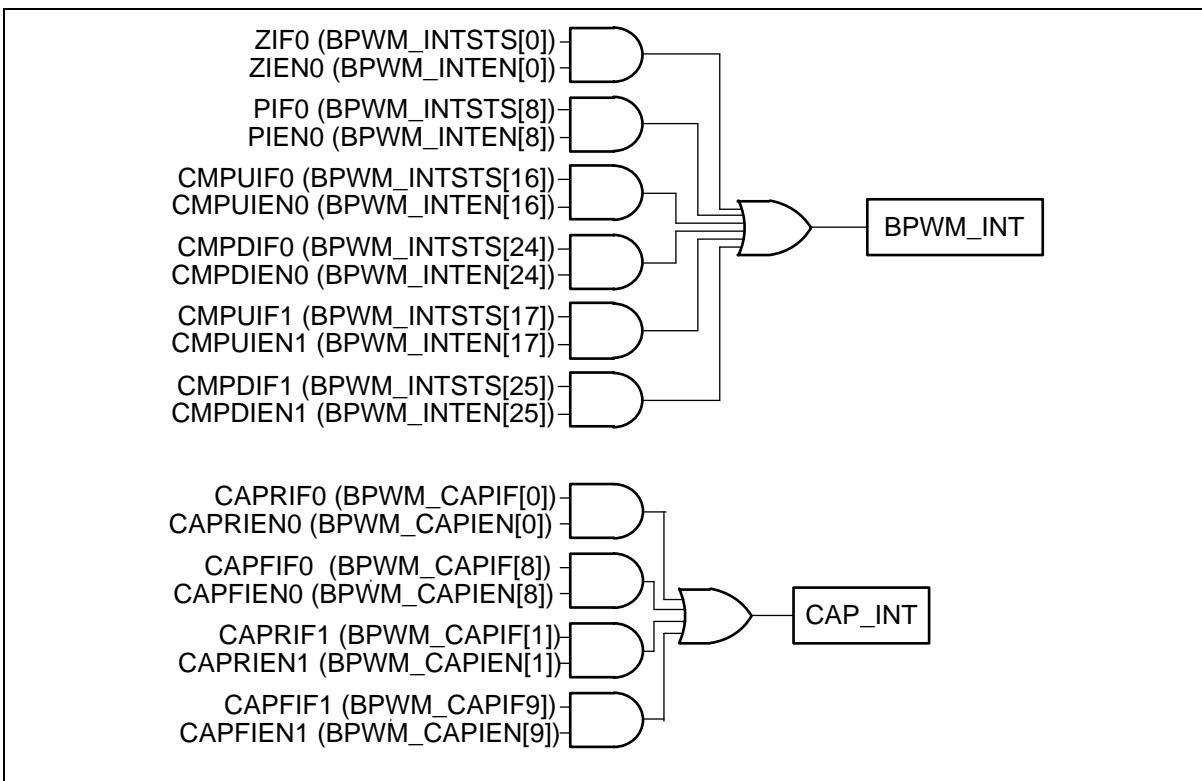

Figure 6.12-19 BPWM_CH0 and BPWM_CH1 Pair Interrupt Architecture Diagram

6.12.5.16 BPWM Trigger EADC Generator

BPWM can be one of the EADC conversion trigger source. Each BPWM pair channels share the same trigger source. Setting TRGSELn is to select the trigger sources, where TRGSELn is TRGSEL0, TRGSEL1, ..., and TRGSEL5, which are located in BPWM_EADCTS0[3:0], BPWM_EADCTS0[11:8], BPWM_EADCTS0[19:16], BPWM_EADCTS0[27:24], BPWM_EADCTS1[3:0] and BPWM_EADCTS1[11:8], respectively. Setting TRGENn is to enable the trigger output to EADC, where TRGENn is TRGEN0, TRGEN1, ..., TRGEN5, which are located in BPWM_EADCTS0[7], BPWM_EADCTS0[15], BPWM_EADCTS0[23], BPWM_EADCTS0[31], BPWM_EADCTS1[7] and BPWM_EADCTS1[15], respectively. The number n (n = 0, 1, ..,5) denotes BPWM channel number.

There are 7 BPWM events can be selected as the trigger source for one pair of channels. Figure 6.12-20 is an example of BPWM_CH0 and BPWM_CH1. BPWM can trigger EADC to start conversion in different timings by setting PERIOD and CMPDAT. Figure 6.12-22 is the trigger EADC timing waveform in the up-down counter type.

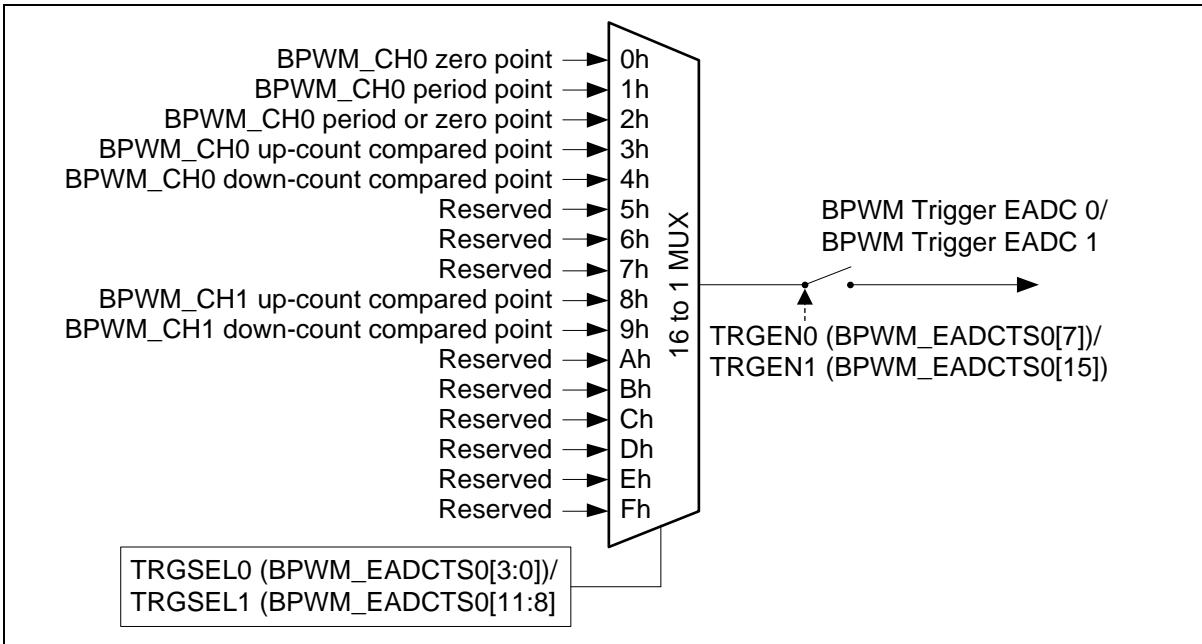

Figure 6.12-20 BPWM_CH0 and BPWM_CH1 Pair Trigger EADC Source Block Diagram

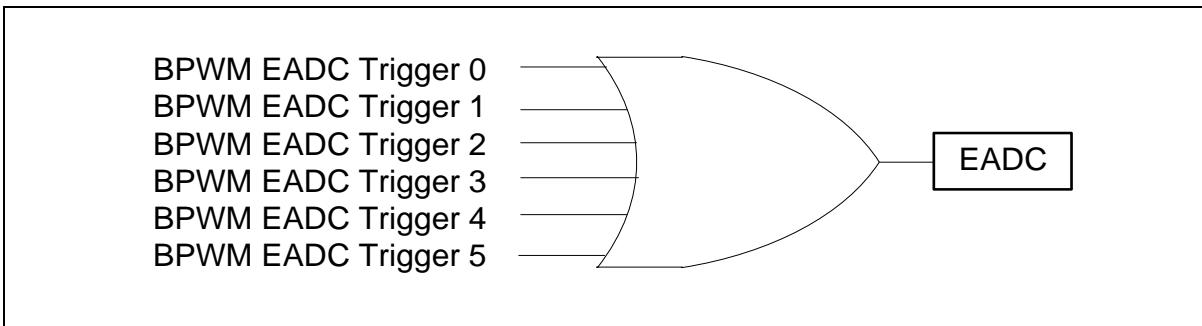

Figure 6.12-21 BPWM CH0~ CH5 Trigger EADC Block Diagram

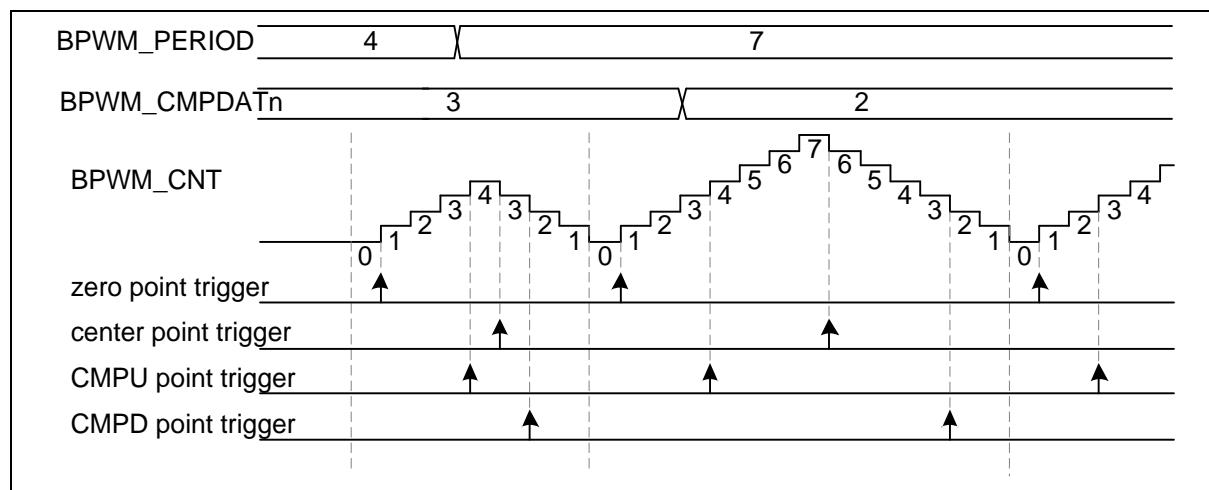

Figure 6.12-22 BPWM Trigger EADC in Up-Down Counter Type Timing Waveform

6.12.5.17 Capture Operation

The channels of the capture input and the BPWM output share the same pin and counter. The counter can operate in up or down counter type. The capture function will always latch the BPWM counter to the register RCAPDATn (BPWM_RCAPDATn[15:0]) or the register FCAPDATn (BPWM_FCAPDATn[15:0]) if the input channel has a rising transition or a falling transition, respectively. The capture function will also generate an interrupt CAP_INT (using BPWM_INT vector) if the rising or falling latch occurs and the corresponding channel n's rising or falling interrupt enable bits are set, where the CAPRIENn (BPWM_CAPIEN[5:0]) is for the rising edge and the CAPFIENn (BPWM_CAPIEN[13:8]) is for the falling edge. When rising or falling latch occurs, the corresponding BPWM counter may be reloaded with the value BPWM_PERIOD, depending on the setting of RCRLDENn or FCRLDENn (where RCRLDENn and FCRLDENn are located at BPWM_CAPCTL[21:16] and BPWM_CAPCTL[29:24], respectively). Note that the corresponding GPIO pins must be configured as the capture function by enable the CAPINENn (BPWM_CAPINEN[5:0]) for the corresponding capture channel n. Figure 6.12-23 is the capture block diagram of channel 0.

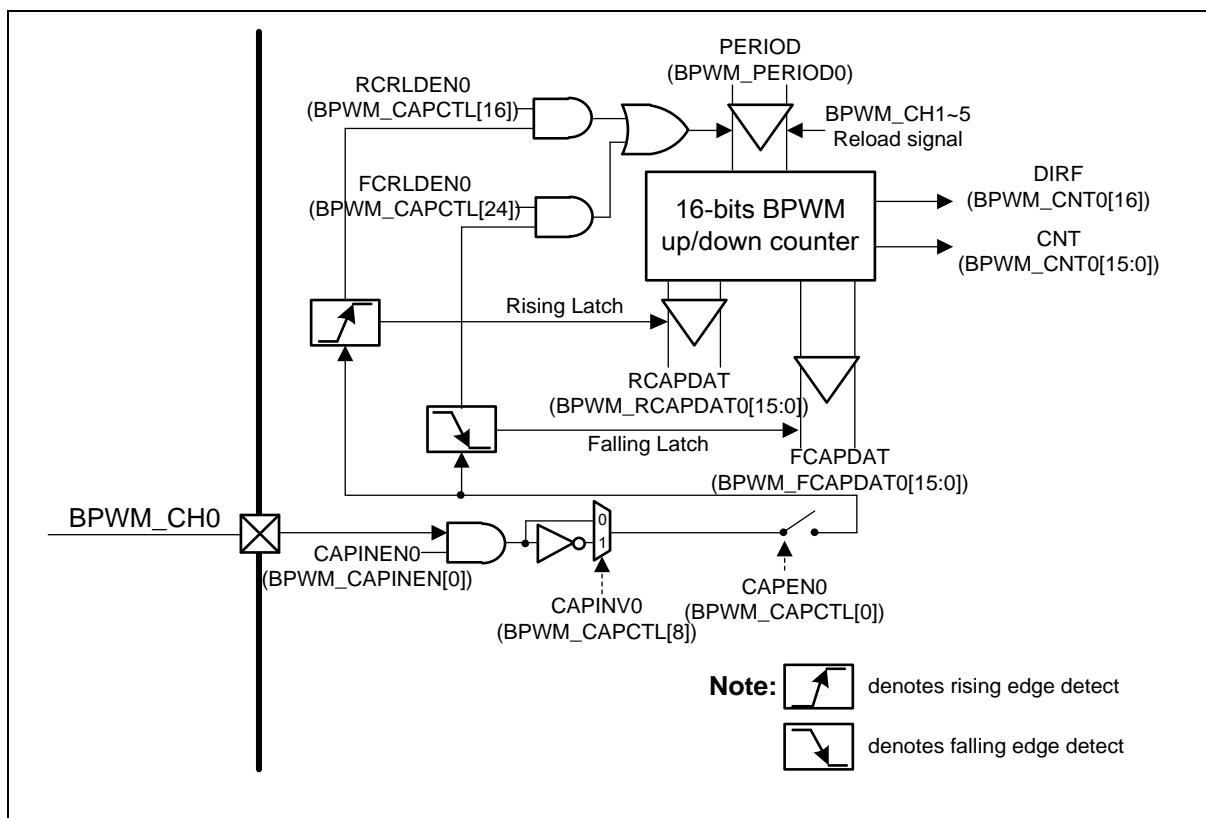

Figure 6.12-23 BPWM_CH0 Capture Block Diagram

Figure 6.12-24 illustrates the capture function timing. In this case, the capture counter is set as BPWM down counter type and the PERIOD is set to 8 so that the counter counts in the down direction, from 8 to 0. When detecting a falling edge at the capture input pin, the capture function latches counter value to the BPWM_FCAPDATn. When detecting the rising edge, it latches the counter value to the BPWM_RCAPDATn. In this timing diagram, when the falling edge is detected at the first time, the capture function will reload the counter value from the PERIOD setting because the FCRLDENn is enabled. But at the second time, the falling edge does not result in a reload because of the disabled FCRLDENn. In this example, the counter also reloads at the rising edge of the capture input because the RCRLDENn is enabled, too.

Moreover, if the case is setup as the up counter type, the counter will reload the value zero and count up to the value PERIOD. It is important that the counter is shared by all channels, so the counter reloads time also controlled by all channels' reload signals.

Figure 6.12-24 also illustrates the timing example for the interrupt and interrupt flag generation. When the rising edge at channel n is detected, the corresponding bit CAPRIFn (BPWM_CAPIF[5:0]) is set by hardware. Similarly, a falling edge detection at channel n causes the corresponding bit CAPFIFn (BPWM_CAPIF[13:8]) set by hardware. CAPRIFn (BPWM_CAPIF[5:0]) and CAPFIFn (BPWM_CAPIF[13:8]) can be cleared by software by writing '1'. If the CAPRIFn (BPWM_CAPIF[5:0]) is set and the CAPRIENn is enabled, the capture function generates an interrupt. If the CAPFIFn (BPWM_CAPIF[13:8]) is set and the CAPFIEn is enabled, the interrupt also happens.

A condition which is not shown in this figure is: if the rising latch happens again when the CAPRIFn(BPWM_CAPIF[5:0]) is already set, the Over run status CRIFOVn (BPWM_CAPSTS[5:0]) will be set to 1 by hardware to indicate the CAPRIFn (BPWM_CAPIF[5:0]) overrunning. Also, if the falling latch happens again, the same hardware operation occurs for the interrupt flag CAPFI n (BPWM_CAPIF[13:8]) and the Over run status CFIFOVn (BPWM_CAPSTS[13:8]).

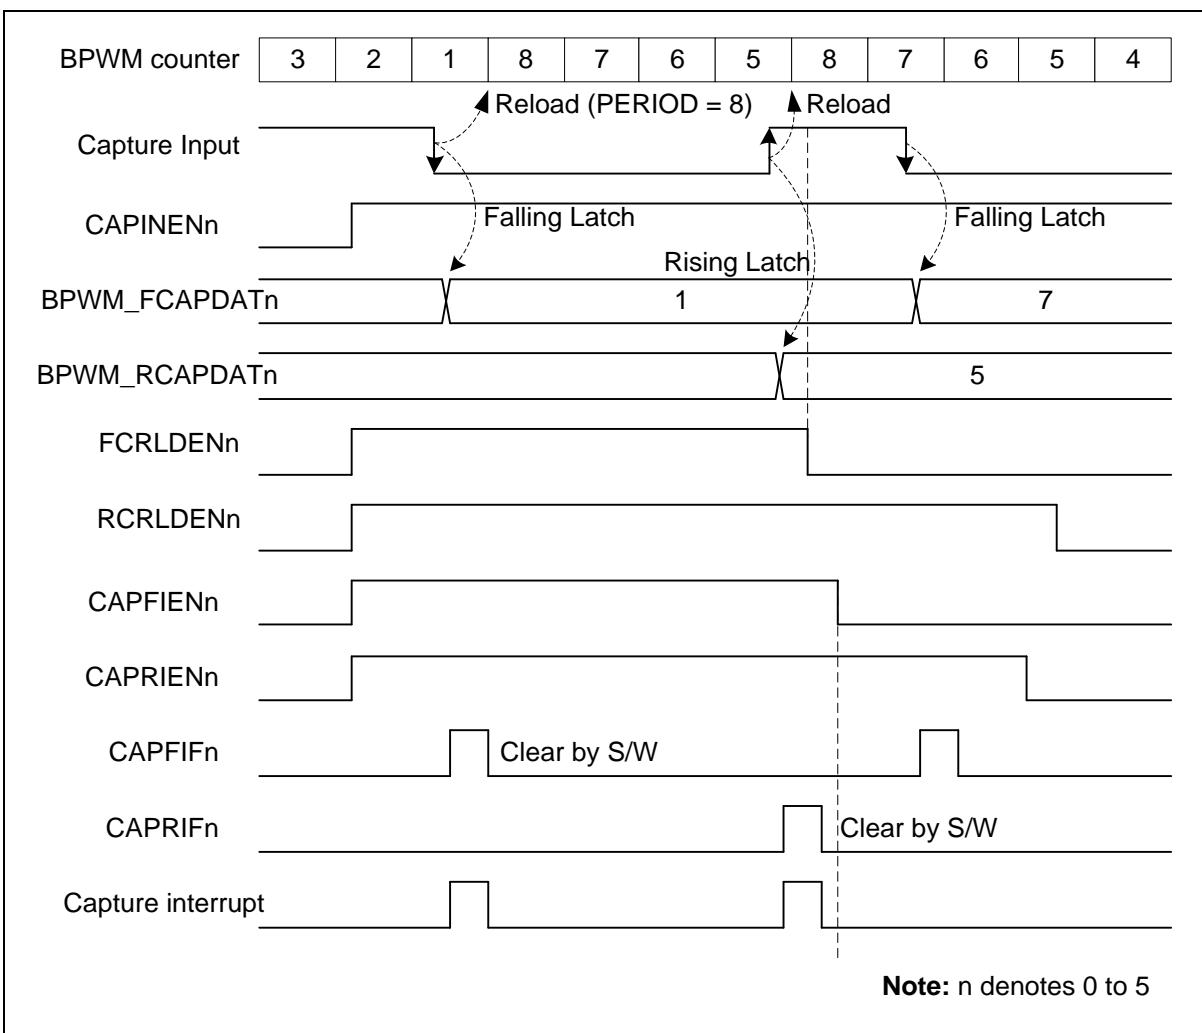

Figure 6.12-24 Capture Operation Waveform

The capture pulse width meeting the following conditions can be calculated according to the formula.

1. The capture positive or negative pulse width is shorter than a counter period.
2. The counter operates in down counter type.
3. The counter can be reloaded by both falling and rising capture events through setting FCRLDEN_n and RCRLDEN_n bits of PWM_CAPCTL register to 1.

For the negative pulse case, the channel low pulse width is calculated as $(\text{BPWM_PERIOD} + 1 - \text{BPWM_RCAPDAT}_n)$ BPWM counter time, where one BPWM counter time is $(\text{CLKPSC}+1) * \text{BPWMx_CLK}$ clock time. In the case shown in Figure 6.12-24, low pulse width is $8+1-5 = 4$ BPWM counter time.

For the positive pulse case, the channel high pulse width is calculated as $(\text{BPWM_PERIOD} + 1 - \text{BPWM_FCAPDAT}_n)$ BPWM counter time, where one BPWM counter time is $(\text{CLKPSC}+1) * \text{BPWMx_CLK}$ clock time. In the case shown in Figure 6.12-24, high pulse width is $8+1-7 = 2$ BPWM counter time.

Reserved							
7	6	5	4	3	2	1	0
Reserved		CTRLD5	CTRLD4	CTRLD3	CTRLD2	CTRLD1	CTRLD0

Bits	Description
[31]	DBGTRIOFF ICE Debug Mode Acknowledge Disable (Write Protect) 0 = ICE debug mode acknowledgement effects BPWM output. BPWM pin will be forced as tri-state while ICE debug mode acknowledged. 1 = ICE debug mode acknowledgement Disabled. BPWM pin will keep output no matter ICE debug mode acknowledged or not. Note: This bit is write protected. Refer to SYS_REGLCTL register.
[30]	DBGHALT ICE Debug Mode Counter Halt (Write Protect) If counter halt is enabled, BPWM all counters will keep current value until exit ICE debug mode. 0 = ICE debug mode counter halt Disabled. 1 = ICE debug mode counter halt Enabled. Note: This bit is write protected. Refer to SYS_REGLCTL register.
[29:22]	Reserved Reserved.
[16+n] n=0,1..5	IMMLDENn Immediately Load Enable Bit(S) Each bit n controls the corresponding BPWM channel n. 0 = PERIOD will load to PBUF at the end point of each period. CMPDAT will load to CMPBUF at the end point or center point of each period by setting CTRLD bit. 1 = PERIOD/CMPDAT will load to PBUF and CMPBUF immediately when software update PERIOD/CMPDAT. Note: If IMMLDENn is Enabled, WINLDENn and CTRLDn will be invalid.
[15:6]	Reserved Reserved.
[n] n=0,1..5	CTRLDn Center Re-load Each bit n controls the corresponding BPWM channel n. In up-down counter type, PERIOD will load to PBUF at the end point of each period. CMPDAT will load to CMPBUF at the center point of a period.

BPWM Control Register 1 (BPWM_CTL1)

6.13 Quadrature Encoder Interface (QEI)

6.13.1 Overview

There are two QEI controllers in this device. The Quadrature Encoder Interface (QEI) decodes speed of rotation and motion sensor information. It can be used in any application that uses a quadrature encoder for feedback.

6.13.2 Features

6.13.2.1 Quadrature Encoder Interface (QEI) Features

- Up to two QEI controllers, QEI0 and QEI1.
- Two QEI phase inputs, QEA and QEB; One Index input.
- A 32-bit up/down Quadrature Encoder Pulse Counter (QEI_CNT)
- A 32-bit software-latch Quadrature Encoder Pulse Counter Hold Register (QEI_CNTHOLD)
- A 32-bit Quadrature Encoder Pulse Counter Index Latch Register (QEI_CNTLATCH)
- A 32-bit Quadrature Encoder Pulse Counter Compare Register (QEI_CNTCMP) with a Pre-set Maximum Count Register (QEI_CNTMAX)
- One QEI control register (QEI_CTL) and one QEI Status Register (QEI_STATUS)
- Four Quadrature encoder pulse counter operation modes
 - Support x4 free-counting mode
 - Support x2 free-counting mode
 - Support x4 compare-counting mode
 - Support x2 compare-counting mode
- Encoder Pulse Width measurement mode
- Input frequency of QEA/QEB/IDX without noise filter must lower than PCLK/4
- Input frequency of QEA/QEB/IDX with noise filter must lower than Noise Filter Clk/8

6.13.3 Block Diagram

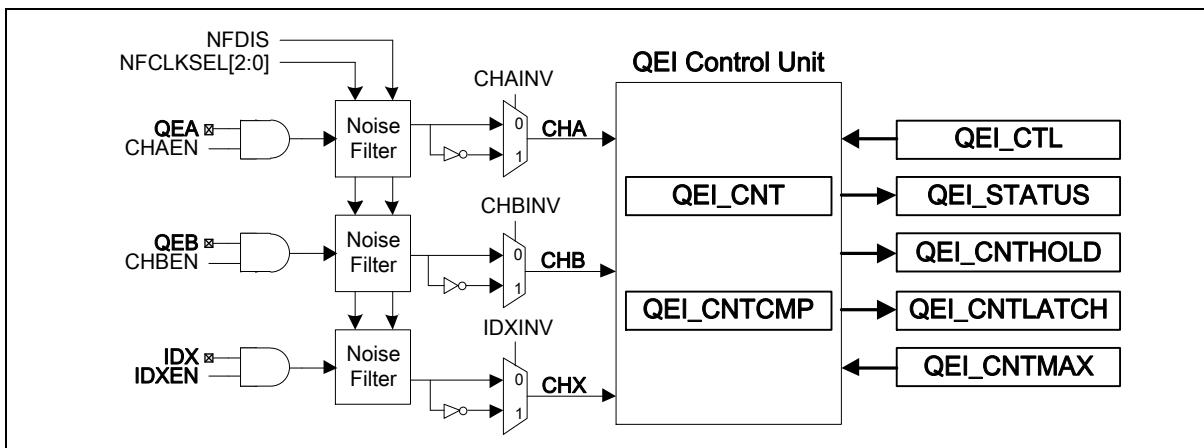

Figure 6.13-1 QEI Block Diagram

The QEI controller inputs, QEA and QEB, accept the outputs from a quadrature encoded source, such as incremental optical shaft encoder. Two channels, A and B, nominally 90 degrees out of phase, are required. A quadrature encoder usually provides an index signal (to pin INDEX) which can be used to indicate an absolute position. There is a noise filter and polarity control for each signal before QEI control unit.

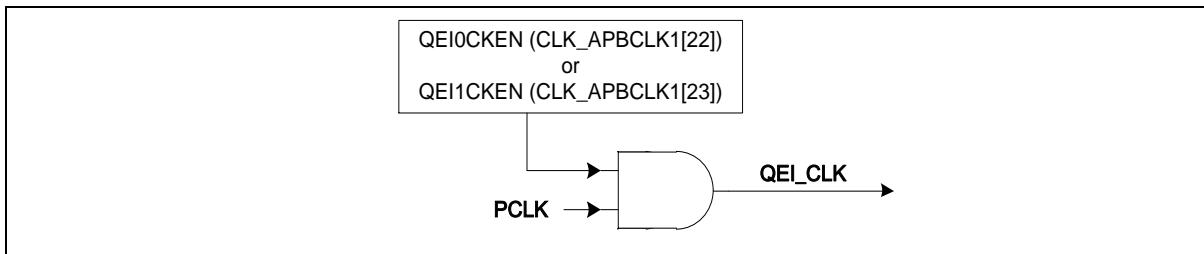

Figure 6.13-2 QEI Clock Source Control

6.13.4 Basic Configuration

6.13.4.1 QEI0 Basic Configuration

- Clock Source Configuration
 - Enable QEI0 peripheral clock in QEI0CKEN (CLK_APBCLK1[22]).
- Reset Configuration
 - Reset QEI0 controller in QEI0RST (SYS_IPRST2[22]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
QEI0	QEI0_A	PD.11	MFP10
		PE.3	MFP11
		PA.4	MFP14
	QEI0_B	PD.10	MFP10

		PA.14	MFP12
QEI1_INDEX		PA.10	MFP10
		PE.7	MFP11
		PA.12	MFP12

6.13.5 Functional Description

The QEI control logic detects the relation of phase lead/lag between the filtered signals CHA and CHB and CHX to produce direction indication bit DDIR(QEI_STATUS[8]) to control the pulse counter. The comparator/reload logic compares the pulse counter and maximum count and control the function of reloading pulse counter in compare-counting mode. In Free-counting mode the pulse counter CNT(QEI_CNT[31:0]) will count until the 0xFFFF_FFFF value; while in Compare-counting mode the pulse counter will counts until the CNTMAX (QEI_CNTMAX[31:0]) and the pulse counter will be reset to 0 to restart the next cyclic counting.

6.13.5.1 Input Noise Filter

Each pin of QEI inputs is equipped with a noise filter which can filter the unwanted noise from. The QEA, QEB and IDX noise filters can be disabled through bits NFDIS (QEI_CTL[3]). If enabled, the capture logic is required to sample 4 consecutive same capture input value in order to recognize an edge as a capture event. In Figure 6.13-5, it is a possible implementation of digital noise filter; the interval between pulses requirement for input capture is 4 QEI_CLK clocks width. Any pulse width less than or equal to 3 QEI_CLK clocks will not have any trigger. The timing requirement through Noise Filter is also shown in Figure 6.13-5. CHA, CHB and CHX are the outputs of QEA, QEB and IDX respectively after going through noise filter and polarity control. Refer to Figure 6.13-3. If the noise filter is disabled the input signals QEA, QEB and IDX are passed to the internal signals CHA, CHB and CHX respectively without any delay.

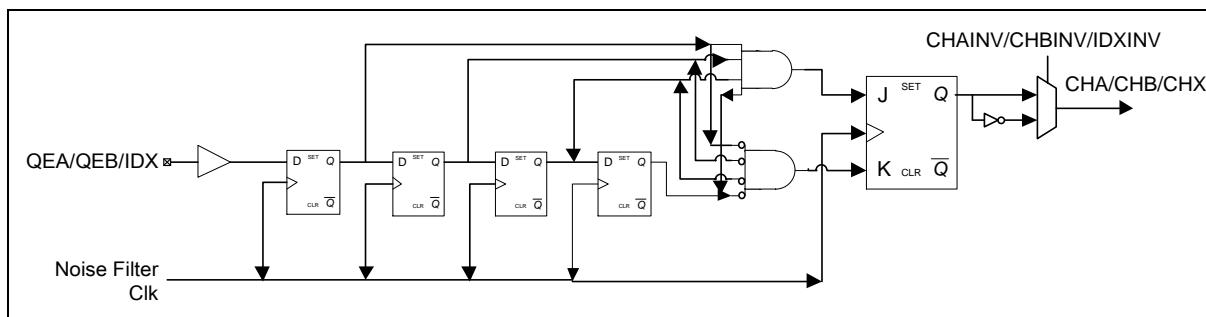

Figure 6.13-3 Noise Filter

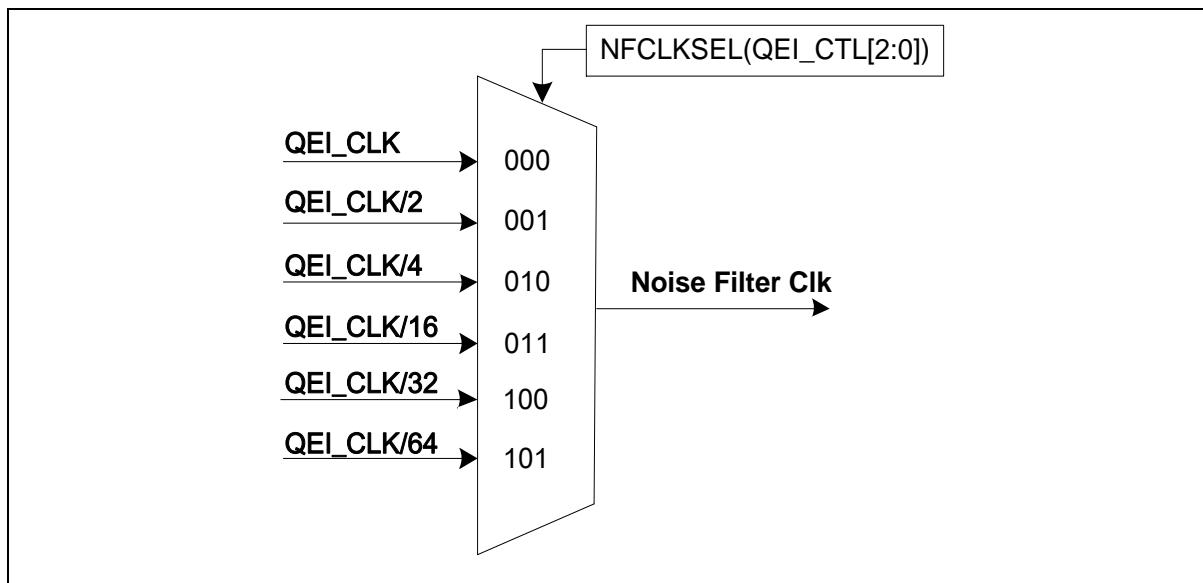

Figure 6.13-4 Noise Filter Sampling Clock Selection

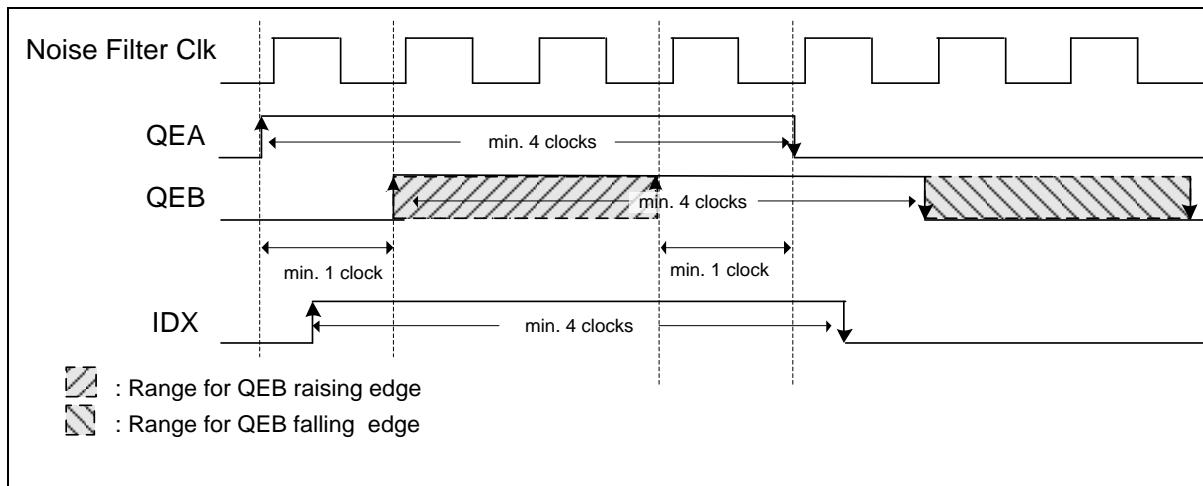

Figure 6.13-5 QEA/QEB/IDX Timing Requirement through Noise Filter

6.13.5.2 Operation of Quadrature Encoder Interface

There are four Quadrature encoder pulse counter operation modes:

- Mode0: x4 free-counting mode
- Mode1: x2 free-counting mode
- Mode2: x4 compare-counting mode
- Mode3: x2 compare-counting mode

6.13.5.3 Free-counting mode

The quadrature encoder pulse counter CNT(QEI_CNT[31:0]) up or down counts according to the direction indication bit DIRF (QEI_STATUS[8]). When overflow or underflow occurs, it sets flag OVUNF (QEI_STATUS[2]). Refer to Figure 6.13-6 and Figure 6.13-7 for detailed timing.

6.13.5.4 Compare-counting Mode

The pulse counter up or down counts according to the direction indication bit DIRF (QEI_STATUS[8]).

On up counting, flag OVUNF (QEI_STATUS[2]) will be asserted when CNT(QEI_CNT[31:0]) overflows from CNTMAX (QEI_CNTMAX[31:0]) to 0 on the next CHA edge for x2 counting mode, and on CHA/CHB edge for x4 counting mode. On down counting, flag OVUNF (QEI_STATUS[2]) will be asserted when CNT(QEI_CNT[31:0]) underflows from 0 to CNTMAX (QEI_CNTMAX[31:0]) on the next CHA edge for x2 counting mode, and on CHA/CHB edge for x4 counting mode. This mode provides the position of a rotor to user. If a quadrature encoder output 1024 pulses to CHA per round, user can write QEI_MAXCNT and CNTCMP(QEI_CNTCMP[31:0]) with 4095 in x4 mode or 2047 in x2 mode and reset CNT(QEI_CNT[31:0]) at initial before compare-counting mode is active. When the CNT(QEI_CNT[31:0]) overflows from CNTCMP(QEI_CNTCMP[31:0]), here CNTCMP(QEI_CNTCMP[31:0]) should be preset the same value as CNTMAX (QEI_CNTMAX[31:0]), it means rotor runs one round on next CHA/CHB edge. Refer to Figure 6.13-6 and Figure 6.13-7 for detailed timing.

6.13.5.5 X4/X2 Counting Modes

In **X4 Counting mode**, the pulse counter increases or decreases one on every CHA and CHB edge based on the phase relationship of CHA and CHB signals.

QEI x4 Counting mode provides a finer resolution of the rotor position, since the counter increments or decrements more frequently for each QEA/QEB input pulse pair than in QEI x2 mode. This mode is selected by setting the QEI Counting Mode Selection bits MODE(QEI_CTL[9:8]) to 00b or 01b. In this mode, the QEI logic detects every edge on every QEA and QEB input edges.

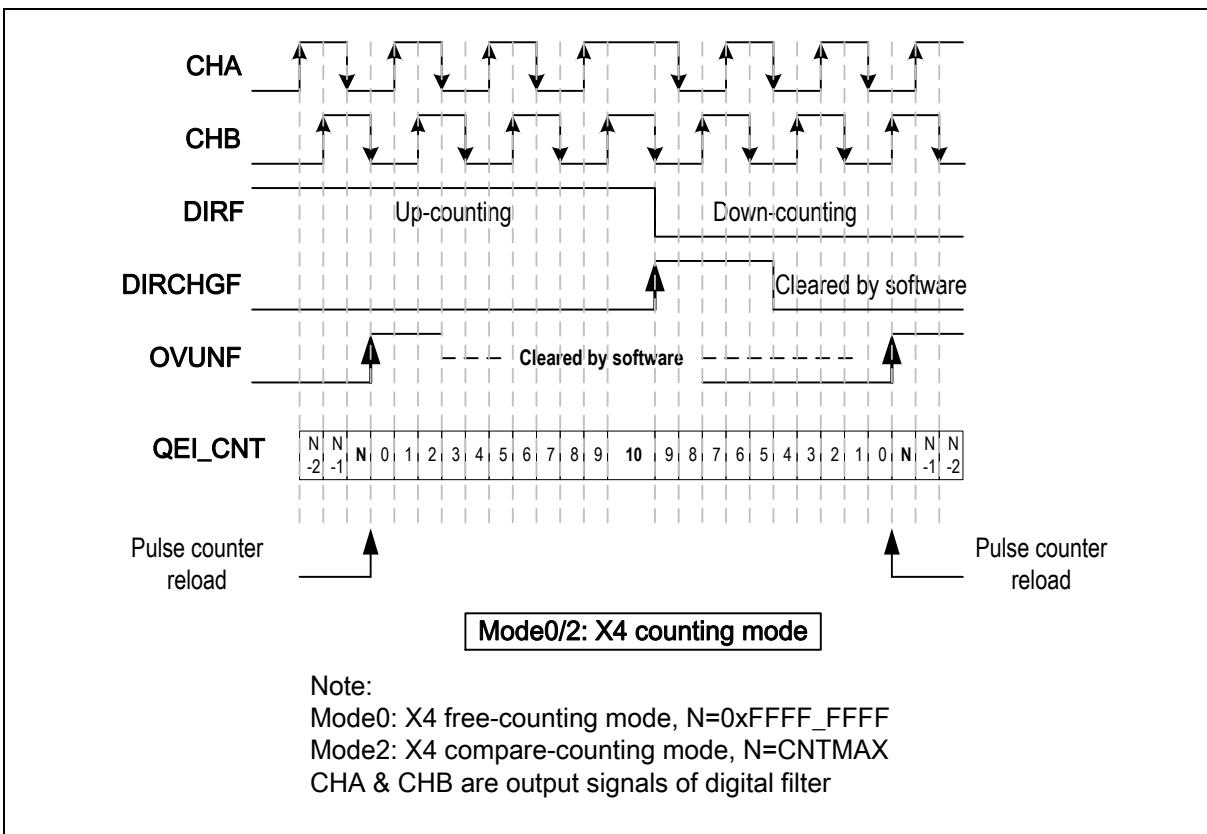

Figure 6.13-6 X4 Counting Mode

In **X2 Counting mode**, the pulse counter increases or decreases one on every CHA edge based on the phase relationship of CHA and CHB signals.

QEI x2 Counting mode is selected by setting the QEI Counting Mode Selection bits (QEI_CTL[9:8]) to 01b or 11b. In this mode, the QEI logic detects every edge on the QEA input only. Every rising and falling edge on the QEA signal clocks the pulse counter.

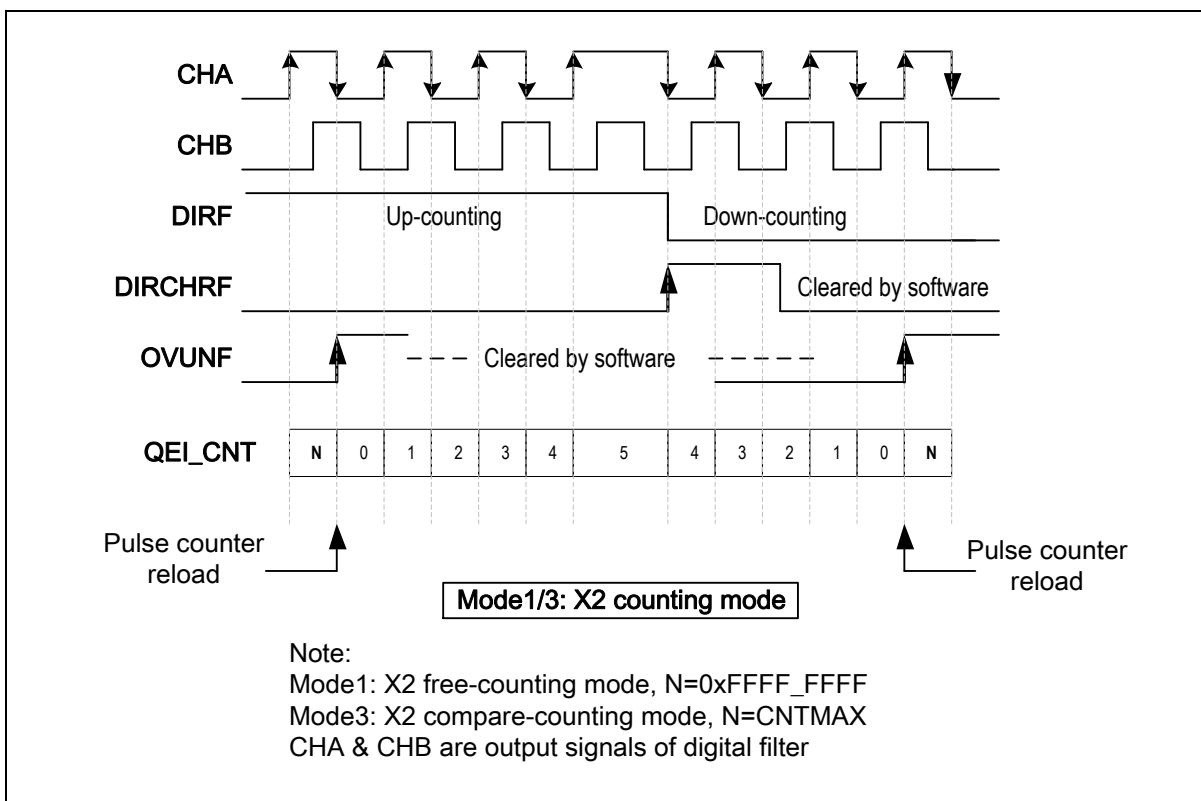

Figure 6.13-7 X2 Counting Mode

6.13.5.6 Direction of Counting

If CHA leads CHB, the pulse counter is increased by 1. If CHA lags CHB, the pulse counter is decreased by 1. The QEI control logic generates a signal that sets the DIRF (QEI_STATUS[8]); this in turn determines the direction of the count. When CHA leads CHB, DIRF(QEI_STATUS[8]) is set as 1, and the position counter increments on every active edge. When CHA lags CHB, DIRF(QEI_STATUS[8]) is cleared, and the position counter decrements on every active edge. Refer to Table 6.13-1.

Current Signal Detected	Previous Signal Detected				DIR (Counting Direction)	
	Rising		Falling			
	CHA	CHB	CHA	CHB		
CHA rising				✓	1 (Increment)	
		✓			0 (Decrement)	
			✓		Toggle (direction change)	
CHA falling				✓	0 (Decrement)	
		✓			1 (Increment)	
	✓				Toggle (direction change)	
CHB rising	✓				1 (Increment)	
			✓		0 (Decrement)	
				✓	Toggle (direction change)	

CHB falling			✓		1 (Increment)
	✓				0 (Decrement)
		✓			Toggle (direction change)

Table 6.13-1 Direction of Counting

6.13.5.7 Up-Counting

Under the forward direction the DIRF(QEI_STATUS[8]) bit is 1 when up-counting. Software needs to clear the OVUNF (QEI_STATUS[2]) flag. For the free-counting mode the CNT(QEI_CNT[31:0]) counter will count until it matches 0xFFFF_FFFF and next edges on the forward direction will set the bit OVUNF (QEI_STATUS[2]) high and reset CNT(QEI_CNT[31:0]) to 0. For compare-counting mode the CNT(QEI_CNT[31:0]) counter counts until the CNTMAX (QEI_CNTMAX[31:0]) value and next edges on the forward direction will set the bit OVUNF (QEI_STATUS[2]) high and reset CNT(QEI_CNT[31:0]) to 0. Changes of direction trigger a down-count and CNT(QEI_CNT[31:0]) decreasing in counter value. For X2 mode, only CHA edge will set OVUNF (QEI_STATUS[2]) while for X4 mode both CHA and CHB edges will set OVUNF (QEI_STATUS[2]).

6.13.5.8 Down-Counting

A change of direction will cause the counter to down count for X2/X4 counting mode. It is indicated with the DIRF(QEI_STATUS[8]) bit as 0 and DIRCHGF (QEI_STATUS[3]) flag is set to 1. At this stage the CNT(QEI_CNT[31:0]) will start to down-count. In free-counting mode the pulse counter will reload with 0xFFFF_FFFF when it down counts to 0 and sets OVUNF (QEI_STATUS[2]) to high in the next edge. The pulse counter will reload with CNTMAX (QEI_CNTMAX[31:0]) when it down counts to 0 in compare-counting mode and sets OVUNF (QEI_STATUS[2]) to high in the next edge. For X2 mode, only CHA edge will set OVUNF (QEI_STATUS[2]) while for X4 mode both CHA and CHB edges will set OVUNF (QEI_STATUS[2]).

6.13.5.9 Compare Function

The compare function in QEI controller is to compare the dynamic counting CNT(QEI_CNT[31:0]) with the compare register CNTCMP(QEI_CNTCMP[31:0]). When CNT(QEI_CNT[31:0]) up or down counts and reaches CNTCMP(QEI_CNTCMP[31:0]), the flag CMPF(QEI_STATUS[1]) will be set. Set bit CMP_EN (QEI_CTL[28]) to one to enable the compare function otherwise disable it.

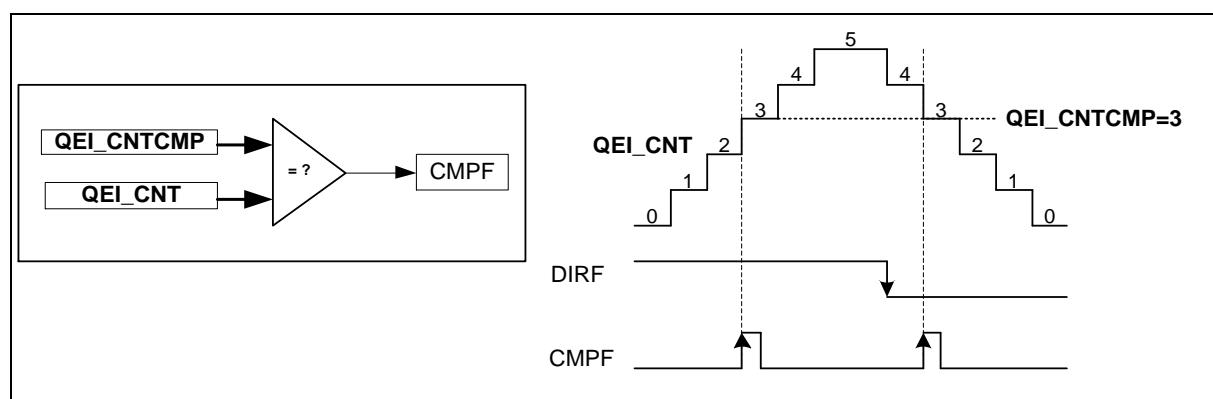

Figure 6.13-8 Compare Operation

6.13.5.10 Reload Counter by Pin IDX

The CNT(QEI_CNT[31:0]) counter can be reset to 0 or reload with the content of CNTMAX (QEI_CNTMAX[31:0]) by the signal CHX (the filtered and polarity-set output of pin IDX) trigger. When the IDX Reload bit IDXRLD_EN(QEI_CTL[27]) is set, a rising edge of CHX causes QEI controller to reset the CNT(QEI_CNT[31:0]) to 0 if the counter is in up-counting; if the counter is in down-counting the rising edge of CHX causes the QEI controller to reload the CNT(QEI_CNT[31:0]) with the content

of CNTMAX (QEI_CNTMAX[31:0]). Refer to Figure 6.13-9 for details.

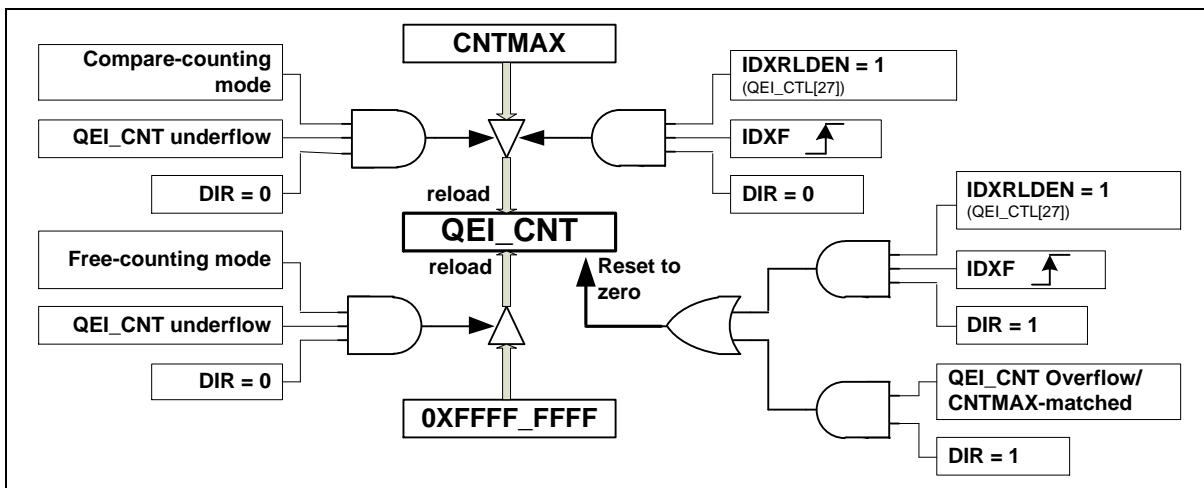

Figure 6.13-9 QEI_CNT Reload/Reset Control

6.13.5.11 Capture QEI Counter

If the bit HOLDCNT(QEI_CTL[24]) is set, the CNT(QEI_CNT[31:0]) content will be captured into QEI Counter Hold Register CNTHOLD(QEI_CNTHOLD[31:0]), the data will be held until the next HOLDCNT (QEI_CTL[24]) trigger comes. The bit HOLDCNT can be set by writing 1 to it or the rising edge of timers interrupt flags TIF (TIMERx_INTSTS[0]).

Note: The bit HOLDCNT is automatically cleared by hardware after CNTHOLD(QEI_CNTHOLD[31:0]) captures the content of QEI counter.

If the bit IDXLATEN (QEI_CTL[25]) is set, the CNT(QEI_CNT[31:0]) content will be latched into QEI Counter Index Latch Register CNTLATCH (QEI_CNTLATCH[31:0]) at every rising edge of CHX signal.

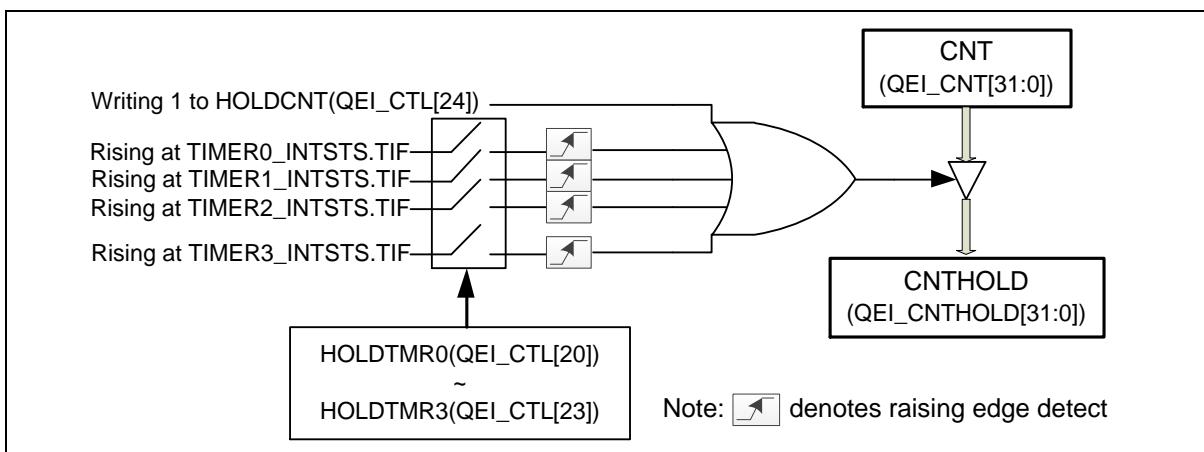

Figure 6.13-10 Trigger Control of Capturing QEI Counter

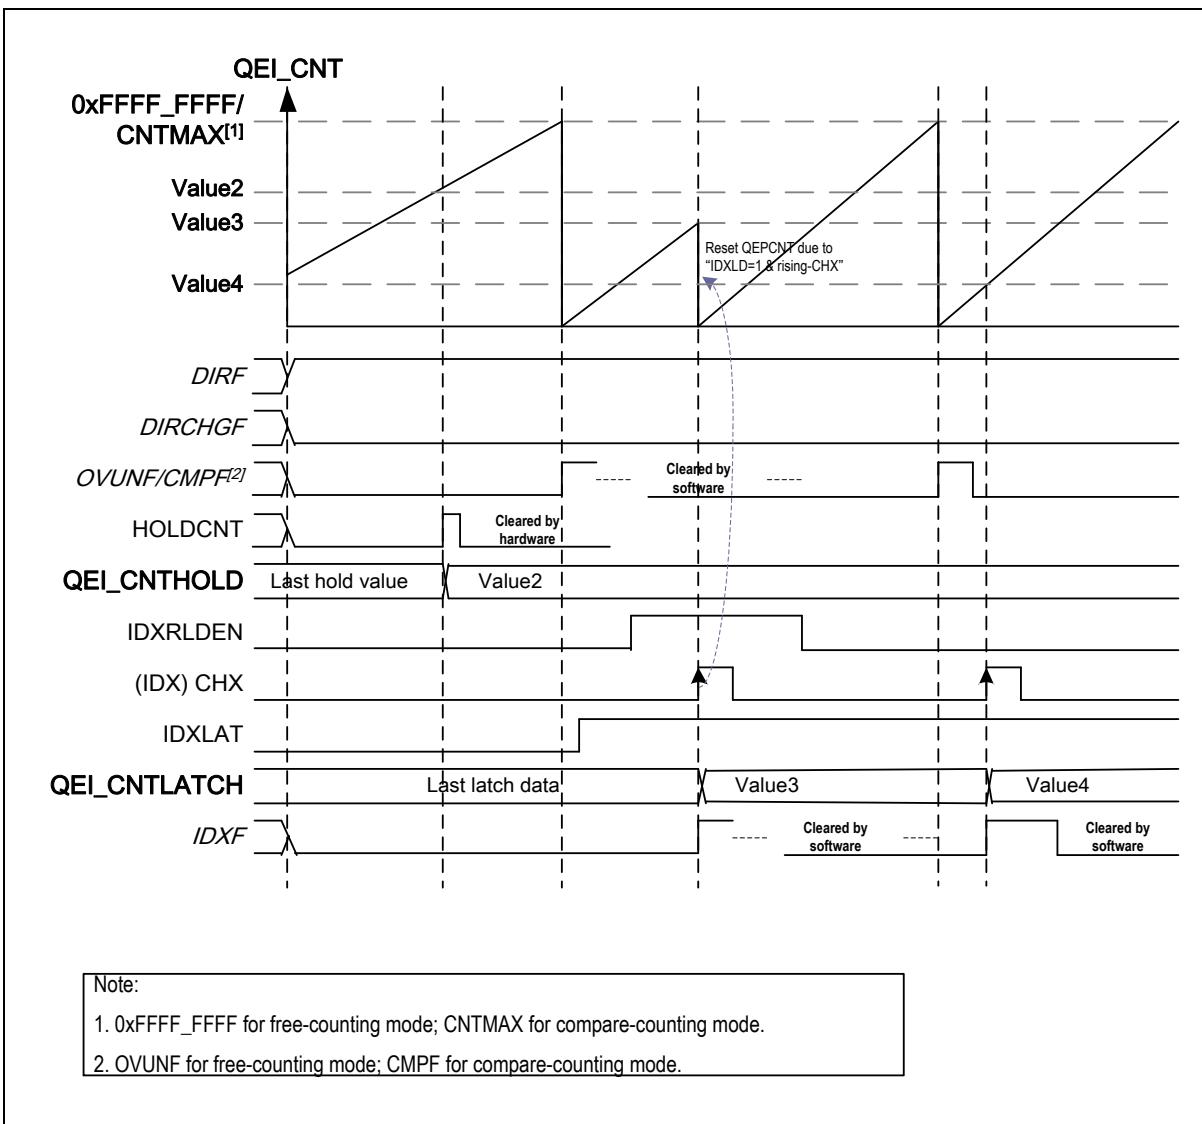

Figure 6.13-11 Capture and Latch QEI Counter

6.13.5.12 QEI Interrupt Architecture

There are four interrupt sources, each one of them has an interrupt flag and enable control bit, to trigger QEI Interrupt. When the QEI counter is up-counting and CNT(QEI_CNT[31:0]) overflows or down-counting and underflows, the Overflow/Underflow flag OVUNF (QEI_STATUS[2]) will be set by hardware and it will trigger QEI Interrupt request if bit OVUNIEN (QEI_CTL[16]) is high. When QEI controller detects the encoder rotation change, it toggles the direction indication bit DDIRF (QEI_STATUS[8]) and the direction change flag DIRCHGF (QEI_STATUS[3]) will be set by hardware that requests the QEI interrupt if bit DIRIEN (QEI_CTL[17]) is set. When the QEI counter counting value is equal to the value of QEI Counter Compare Register (CNTCMP(QEI_CNTCMP[31:0])), the flag CMPF (QEI_STATUS[1]) will be set by hardware and the QEI Interrupt will be requested if bit CMPIEN (QEI_CTL[18]) is high. When QEI controller detects a rising edge at signal CHX (the filtered and polarity-set output of pin IDX), the flag IDXF(QEI_STATUS[1]) will set by hardware and the QEI interrupt will be requested if bit IDXIEN (QEI_CTL[19]) is set. Note that the four flags, OVUNF(QEI_STATUS[2]), DIRCHGF(QEI_STATUS[3]), CMPF(QEI_STATUS[1]) and IDXF(QEI_STATUS[0]) are set by hardware and must be cleared by software. Figure 6.13-12 demonstrates the architecture of Quadrature Encoder Interface Controller interrupts.

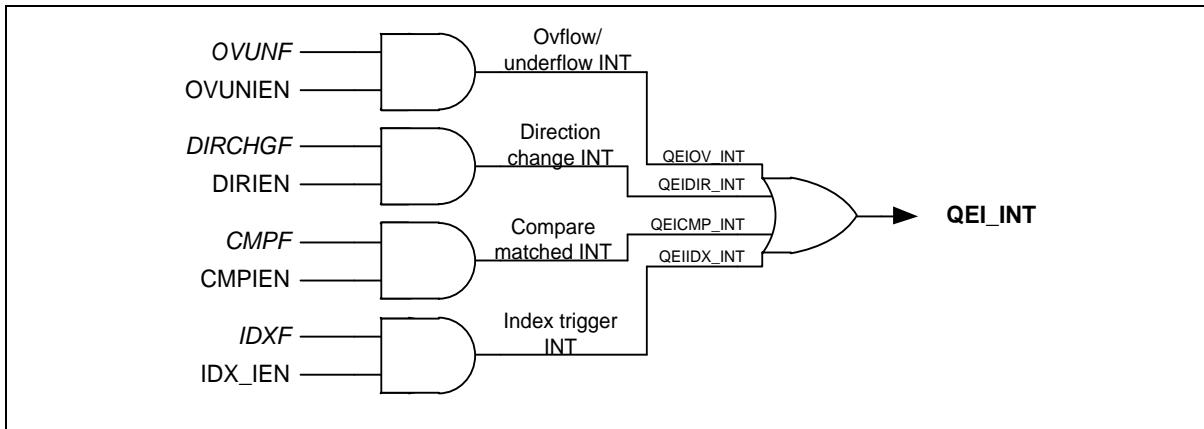

Figure 6.13-12 Quadrature Encoder Interface Interrupt Architecture Diagram

6.13.6 Register Map

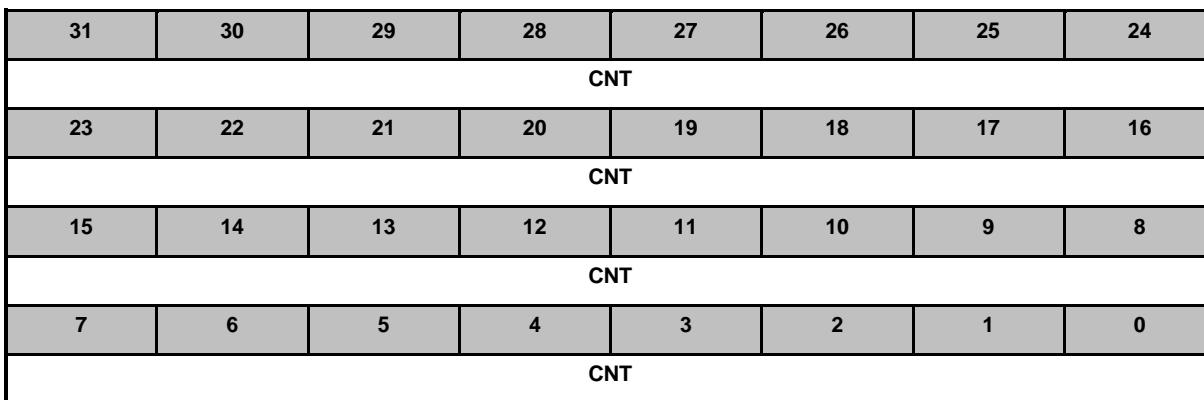

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

6.13.7 Register Description

QEI Counter Register (QEI_CNT)

Register	Offset	R/W	Description				Reset Value
QEI_CNT	QEIx_BA+0x00	R/W	QEI Counter Register				0x0000_0000

Bits	Description	
[31:0]	CNT	Quadrature Encoder Interface Counter A 32-bit up/down counter. When an effective phase pulse is detected, this counter is increased by one if the bit DIRF (QEI_STATUS[8]) is one or decreased by one if the bit DIRF(QEI_STATUS[8]) is 0. This register performs an integrator which count value is proportional to the encoder position. The pulse counter may be initialized to a predetermined value by one of three events occurs: 1. Software is written if QEIEN (QEI_CTL[29]) = 0. 2. Compare-match event if QEIEN(QEI_CTL[29])=1 and QEI is in compare-counting mode. 3. Index signal change if QEIEN(QEI_CTL[29])=1 and IDXRLDEN (QEI_CTL[27])=1.

QEI Counter Hold Register (QEI_CNTHOLD)

Bits	Description	
[31:9]	Reserved	Reserved.
[8]	DIRF	QEI Counter Counting Direction Indication 0 = QEI Counter is in down-counting. 1 = QEI Counter is in up-counting. Note: This bit is set/reset by hardware according to the phase detection between CHA and CHB.
[7:4]	Reserved	Reserved.
[3]	DIRCHGF	Direction Change Flag Flag is set by hardware while QEI counter counting direction is changed. Software can clear this bit by writing 1 to it. 0 = No change in QEI counter counting direction. 1 = QEI counter counting direction is changed. Note: This bit is only cleared by writing 1 to it.
[2]	OVUNF	QEI Counter Overflow or Underflow Flag Flag is set by hardware while CNT(QEI_CNT[31:0]) overflows from 0xFFFF_FFFF to 0 in free-counting mode or from the CNTMAX (QEI_CNTMAX[31:0]) to 0 in compare-counting mode. Similarly, the flag is set while QEI counter underflows from 0 to 0xFFFF_FFFF or CNTMAX (QEI_CNTMAX[31:0]). 0 = No overflow or underflow occurs in QEI counter. 1 = QEI counter occurs counting overflow or underflow. Note: This bit is only cleared by writing 1 to it.
[1]	CMPF	Compare-match Flag If the QEI compare function is enabled, the flag is set by hardware while QEI counter up or down counts and reach to the CNTCMP(QEI_CNTCMP[31:0]). 0 = QEI counter does not match with CNTCMP(QEI_CNTCMP[31:0]). 1 = QEI counter counts to the same as CNTCMP(QEI_CNTCMP[31:0]). Note: This bit is only cleared by writing 1 to it.

[0]	IDXF	IDX Detected Flag When the QEI controller detects a rising edge on signal CHX it will set flag IDXF to high. 0 = No rising edge detected on signal CHX. 1 = A rising edge occurs on signal CHX. Note: This bit is only cleared by writing 1 to it.

6.14 Enhanced Input Capture Timer (ECAP)

6.14.1 Overview

This device provides up to two units of Input Capture Timer/Counter whose capture function can detect the digital edge-changed signal at channel inputs. Each unit has three input capture channels. The timer/counter is equipped with up counting, reload and compare-match capabilities.

6.14.2 Features

- Up to two Input Capture Timer/Counter units, CAP0 and CAP1.
- Each unit has 3 input channels.
- Each unit has its own interrupt vector.
- Each input channel has its own capture counter hold register.
- 24-bit Input Capture up-counting timer/counter.
- With noise filter in front end of input ports.
- Edge detector with three options:
 - Rising edge detection
 - Falling edge detection
 - Both edge detection
- Captured events reset and/or reload capture counter.
- Supports compare-match function.

		PE.11	MFP13

6.14.5 Functional Description

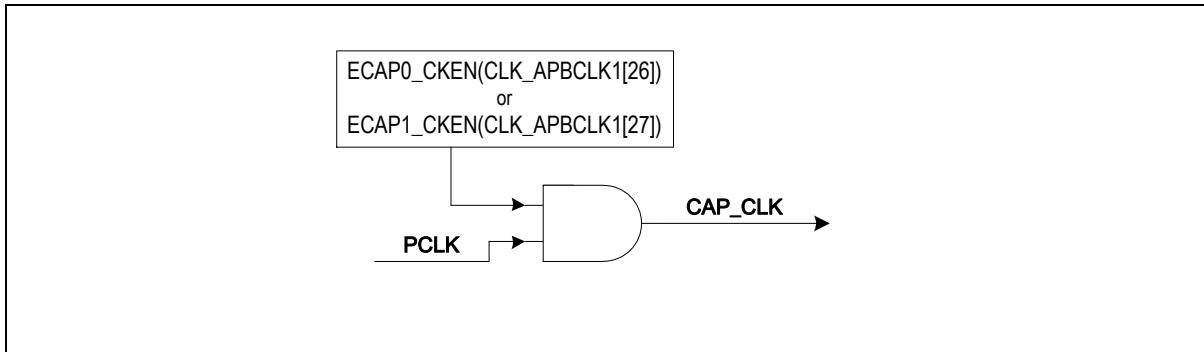

Figure 6.14-2 Input Capture Timer/Counter Clock Source Control

Figure 6.14-1 illustrates the architecture of the Input Capture. Each input capture timer/counter unit supports 3 input channels with programmable input signal sources. The port pins ECAP_IC0 to ECAP_IC2 can be fed to the inputs of capture unit through noise filter or bypass it (CAPNFDIS = 1), and the QEI controller input signals (CHA, CHB and CHX) also can be internally routed to the capture inputs by setting the register ECAP_CTL0(CAPSEL0~ CAPSEL 2).

6.14.5.1 Input Noise Filter

The architecture of input noise filter is similar to that one used for QEI (refer to Figure 6.13-3). With 6 sampling-rate options, it supports a wide range of filtering noise whose duration is from 33 ns (NFCLKSEL = 000) to 2.1 us (NFCLKSEL = 101) while PCLK is running at the frequency of 90 MHz. Table 6.14-1 lists the relation between the setting of NFCLKSEL, the duration of filtered noise and the duration of the signal that is guaranteed to be sampled.

The maximum duration of the noise that is filtered out should not be more than 3 clock cycle, while the minimum duration of the signal that is guaranteed to be sampled should be more than 4 clock cycle.

NFCLKSEL	Maximum Duration Of Noise	Minimum Duration Of Signal
000	33 ns	44 ns
001	67 ns	89 ns
010	133 ns	178 ns
011	533 ns	711 ns
100	1067 ns	1422 ns
101	2133 ns	2844 ns
PCLK= 90 MHz		

Table 6.14-1 Typical Case of Noise Filter Settings

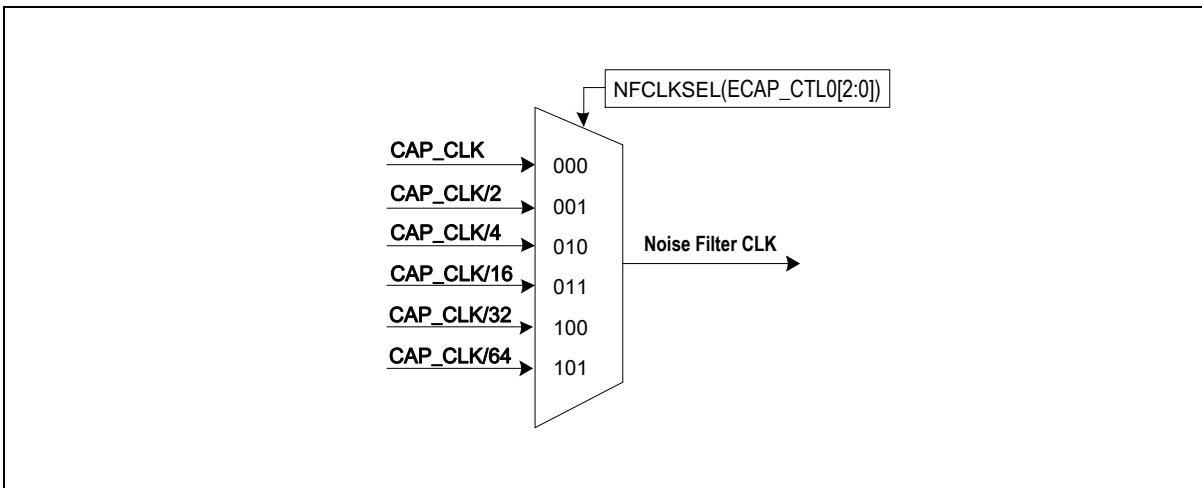

Figure 6.14-3 Noise Filter Sampling Clock Selection

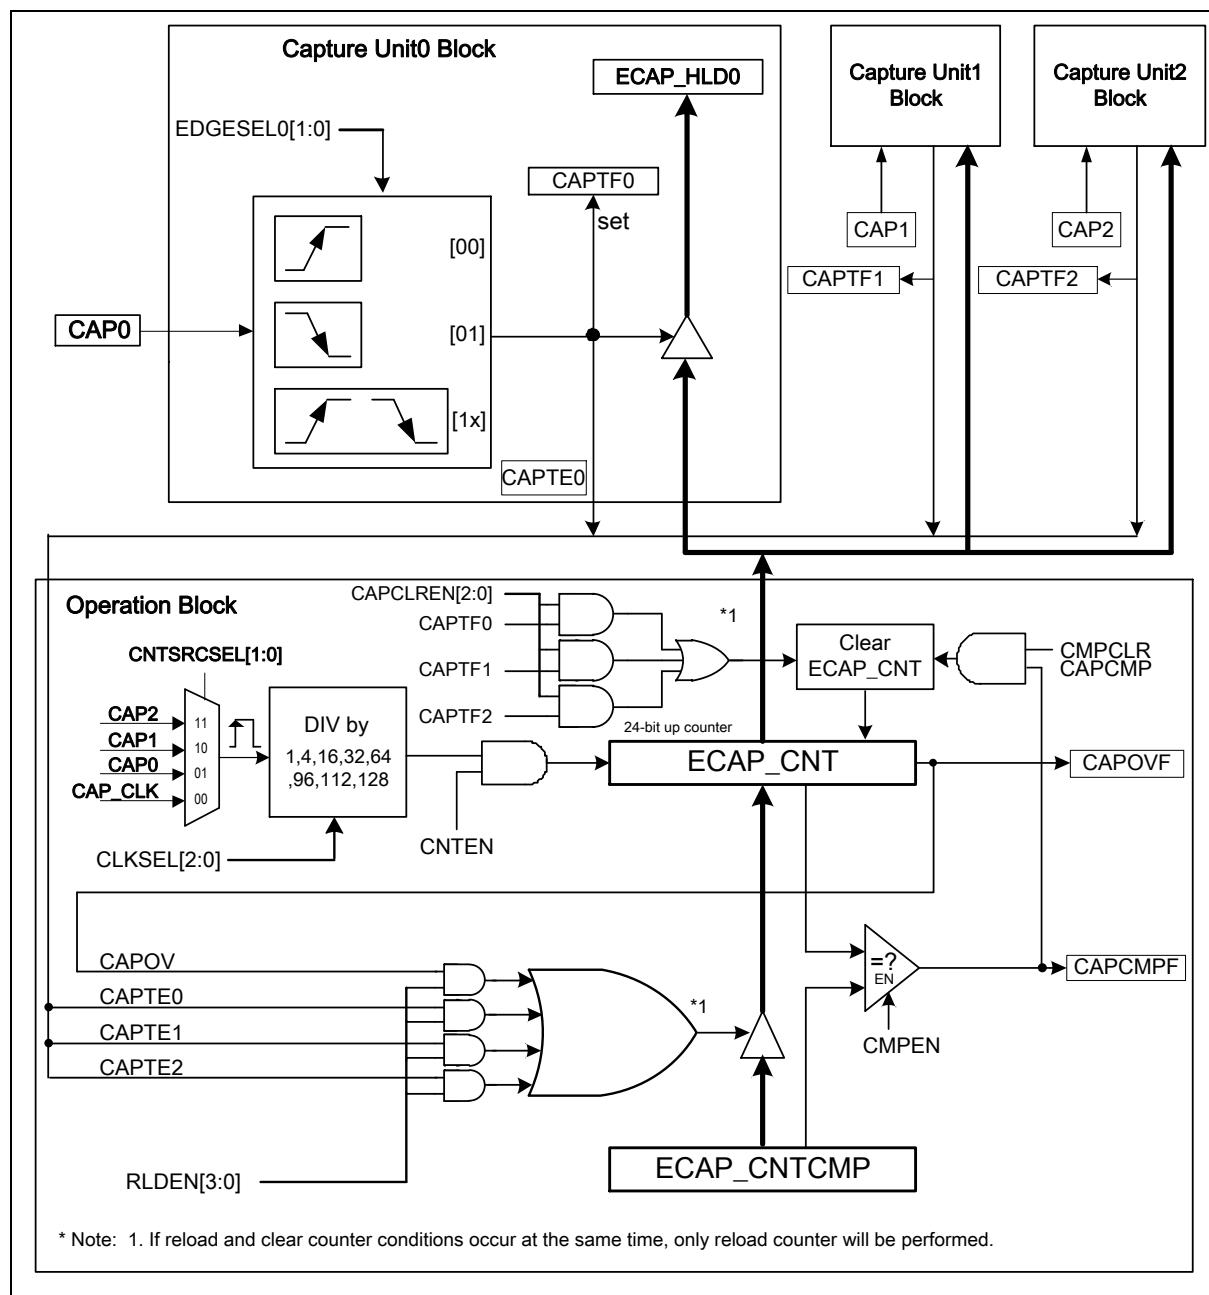

Figure 6.14-4 Input Capture Timer/Counter Function Block

6.14.5.2 Input Capture Timer/Counter Operation

An Input Capture Timer/Counter unit consists of 2 main functional blocks, Capture block and Operation block. There are 3 Input Capture units in Capture block for 3 input channel.

The capture units function as detecting and measuring the pulse width and the period of a square wave. The input channel 0 to 2 have their own edge detectors, which are in Input Capture block but share with one capture timer/counter, ECAP_CNT, which is in Operation block. The edge trigger option is programmable through EDGESEL (ECAP_CTL1[5,4], [3,2], [1,0]) register supporting positive edge, negative edge and both edge triggers. Each capture unit consists of an enable control bit, IC0EN ~ IC2EN (ECAP_CTL0[6:4]) to enable/disable each input channel and a status bit CAP0 ~ CAP2 (ECAP_STATUS[10:8]) to let software monitor the current status of each channel.

The Input Capture supports reload mode and compare mode. For both mode, the capture counter (ECAP_CNT) serves as a 24-bit up-counting counter whose clock comes from the output of the clock divider and is gated with CNTEN, and the clock source of the clock divider, which can be set by CLKSEL[2:0] to divide clock by 1,4,16,32,64,96,112 and 128, is programmable (by setting CNTSRCSEL[1:0]) to be from system clock source, CAP_CLK or input channel CAP0 ~ CAP2. In reload mode, ECAP_CNTCMP serves as a reload register while in compare mode ECAP_CNTCMP serves as a compare register. The Input Capture Timer/Counter Enable bit (CAPEN) must be set to enable Input Capture Timer/Counter functions. More details of operation are described in the following.

Capture Function

Each time when the capture input detect a valid edge change, it triggers a valid capture event (CAPTE0~2) so that the content of the free running 24-bit capture counter ECAP_CNT will be captured/transferred into the capture hold registers, ECAP_HLD0~2 depending on which channel is triggered. This event also causes the corresponding flag CAPTFx (ECAP_STATUS[2:0]) to be set, which will generate an interrupt if the corresponding interrupt enable bit CAPIENx (ECAP_CTL0[18:16]) is set. Triggered Flags are set by hardware and should be cleared by software. Software can read the register ECAP_STATUS to get the status of flags and has to write 1 to the corresponding bit(s) of ECAP_STATUS to clear flag(s).

In addition, setting the CAPxCLREN(ECAP_CTL1[22:20]) will allow hardware to reset capture counter (ECAP_CNT) automatically whenever the event happens.

Compare Mode

The compare function is enabled by setting the CMPEN (ECAP_CTL0[28]) bit to 1, and ECAP_CNTCMP will serve as a compare register. As ECAP_CNT counting up, upon matching ECAP_CNTCMP value, the flag, CAPCMF (ECAP_STATUS[4]), will be set, which will generate an interrupt, CMP_INT, if compare interrupt enable bit, CMPIEN (ECAP_CTL0[21]), is set.

Besides, setting the CMPCLR (ECAP_CTL0[25]) will allow hardware to make capture counter cleared to 0 automatically after a compare-match event occurs.

Reload Mode

The Input Capture Timer/Counter can also be configured for reload mode. The reload function is enabled by setting the RLDEN[3:0] bits (ECAP_CTL1[11:8]) – OVRLDEN, CAPxRLDEN – to 1, and each bit enables a reload source.

In this mode, ECAP_CNTCMP serves as a reload register. If OVRLDEN is set, a reload event is generated and causes the content of the ECAP_CNTCMP register to be loaded into the ECAP_CNT register when ECAP_CNT overflows. Furthermore, CAPxRLDEN, x=0~2, are enable bits of making CAPTE2 ~ CAPTE0 as reload sources.

One thing should be noted is that if CAPxCLREN as well as CAPxRLDEN are set, when a valid trigger event (CAPTE_x) occurs, only RELAOD function will be executed.

6.14.5.3 Input Capture Timer/Counter Interrupt Architecture

Figure 6.14-5 demonstrates the architecture of Input Capture Timer/Counter interrupt module. There are 5 interrupt sources (OVF_INT, CMP_INT, CAPTF0_INT~CAPTF2_INT), which are logical ‘OR’ together, in a input capture unit, and each one has an interrupt flag (CAPOVF, CAPCMF, CAPTF0~CAPTF2), which can trigger Interrupt (ECAP_INT), as well as an the enable control bit (OVIEN, CMPIEN, CAPIEN0~CAPIEN2) to enable/disable the flag.

Note that all the interrupt flags are set by hardware and must be cleared by software by writing 1 to the bit (ECAP_STATUS[5:4],[2:0]) corresponding to the flag.

[10]	CAP2	Value of Input Channel 2, CAP2 (Read Only) Reflecting the value of input channel 2, CAP2. (The bit is read only and write is ignored)
[9]	CAP1	Value of Input Channel 1, CAP1 (Read Only) Reflecting the value of input channel 1, CAP1 (The bit is read only and write is ignored)
[8]	CAP0	Value of Input Channel 0, CAP0 (Read Only) Reflecting the value of input channel 0, CAP0 (The bit is read only and write is ignored)
[7:6]	Reserved	Reserved.
[5]	CAPOVF	Input Capture Counter Overflow Flag Flag is set by hardware when counter (ECAP_CNT) overflows from 0x00FF_FFFF to 0. 0 = No overflow event has occurred since last clear. 1 = Overflow event(s) has/have occurred since last clear. Note: This bit is only cleared by writing 1 to it.
[4]	CAPCMPPF	Input Capture Compare-match Flag If the input capture compare function is enabled, the flag is set by hardware when capture counter (ECAP_CNT) up counts and reaches the ECAP_CNTCMP value. 0 = ECAP_CNT has not matched ECAP_CNTCMP value since last clear. 1 = ECAP_CNT has matched ECAP_CNTCMP value at least once since last clear. Note: This bit is only cleared by writing 1 to it.
[3]	Reserved	Reserved.

Bits	Description	
[2]	CAPTF2	Input Capture Channel 2 Triggered Flag When the input capture channel 2 detects a valid edge change at CAP2 input, it will set flag CAPTF2 to high. 0 = No valid edge change has been detected at CAP2 input since last clear. 1 = At least a valid edge change has been detected at CAP2 input since last clear. Note: This bit is only cleared by writing 1 to it.
[1]	CAPTF1	Input Capture Channel 1 Triggered Flag When the input capture channel 1 detects a valid edge change at CAP1 input, it will set flag CAPTF1 to high. 0 = No valid edge change has been detected at CAP1 input since last clear. 1 = At least a valid edge change has been detected at CAP1 input since last clear. Note: This bit is only cleared by writing 1 to it.
[0]	CAPTF0	Input Capture Channel 0 Triggered Flag When the input capture channel 0 detects a valid edge change at CAP0 input, it will set flag CAPTF0 to high. 0 = No valid edge change has been detected at CAP0 input since last clear. 1 = At least a valid edge change has been detected at CAP0 input since last clear. Note: This bit is only cleared by writing 1 to it.

6.15 UART Interface Controller (UART)

6.15.1 Overview

The chip provides six channels of Universal Asynchronous Receiver/Transmitters (UART). The UART controller performs Normal Speed UART and supports flow control function. The UART controller performs a serial-to-parallel conversion on data received from the peripheral and a parallel-to-serial conversion on data transmitted from the CPU. Each UART controller channel supports ten types of interrupts. The UART controller also supports IrDA SIR, LIN and RS-485 function modes and auto-baud rate measuring function.

6.15.2 Features

- Full-duplex asynchronous communications
- Separates receive and transmit 16/16 bytes entry FIFO for data payloads
- Supports hardware auto-flow control
- Programmable receiver buffer trigger level
- Supports programmable baud rate generator for each channel individually
- Supports nCTS, incoming data, Received Data FIFO reached threshold and RS-485 Address Match (AAD mode) wake-up function
- Supports 8-bit receiver buffer time-out detection function
- Programmable transmitting data delay time between the last stop and the next start bit by setting DLY (UART_TOUT [15:8])
- Supports Auto-Baud Rate measurement and baud rate compensation function
 - Support 9600 bps for UART_CLK is selected LXT.
- Supports break error, frame error, parity error and receive/transmit buffer overflow detection function
- Fully programmable serial-interface characteristics
 - Programmable number of data bit, 5-, 6-, 7-, 8- bit character
 - Programmable parity bit, even, odd, no parity or stick parity bit generation and detection
 - Programmable stop bit, 1, 1.5, or 2 stop bit generation
- Supports IrDA SIR function mode
 - Supports for 3/16 bit duration for normal mode
- Supports LIN function mode (Only UART0 /UART1 with LIN function)
 - Supports LIN master/slave mode
 - Supports programmable break generation function for transmitter
 - Supports break detection function for receiver
- Supports RS-485 function mode
 - Supports RS-485 9-bit mode
 - Supports hardware or software enables to program nRTS pin to control RS-485 transmission direction
- Supports PDMA transfer function

UART Feature	UART0/ UART1	UART2/ UART4/ UART5	UART3/ UART5	SC_UART	USCI-UART
FIFO	16 Bytes	16 Bytes	4 Bytes	TX: 1byte RX: 2byte	
Auto Flow Control (CTS/RTS)	√	√	-	√

Table 6.15-1 NuMicro® M480 Series UART Features

6.15.3 Block Diagram

The UART clock control and block diagram are shown in Figure 6.15-1 and Figure 6.15-2 respectively.

Note: The frequency of UARTx_CLK should not be greater than 30 times HCLK.

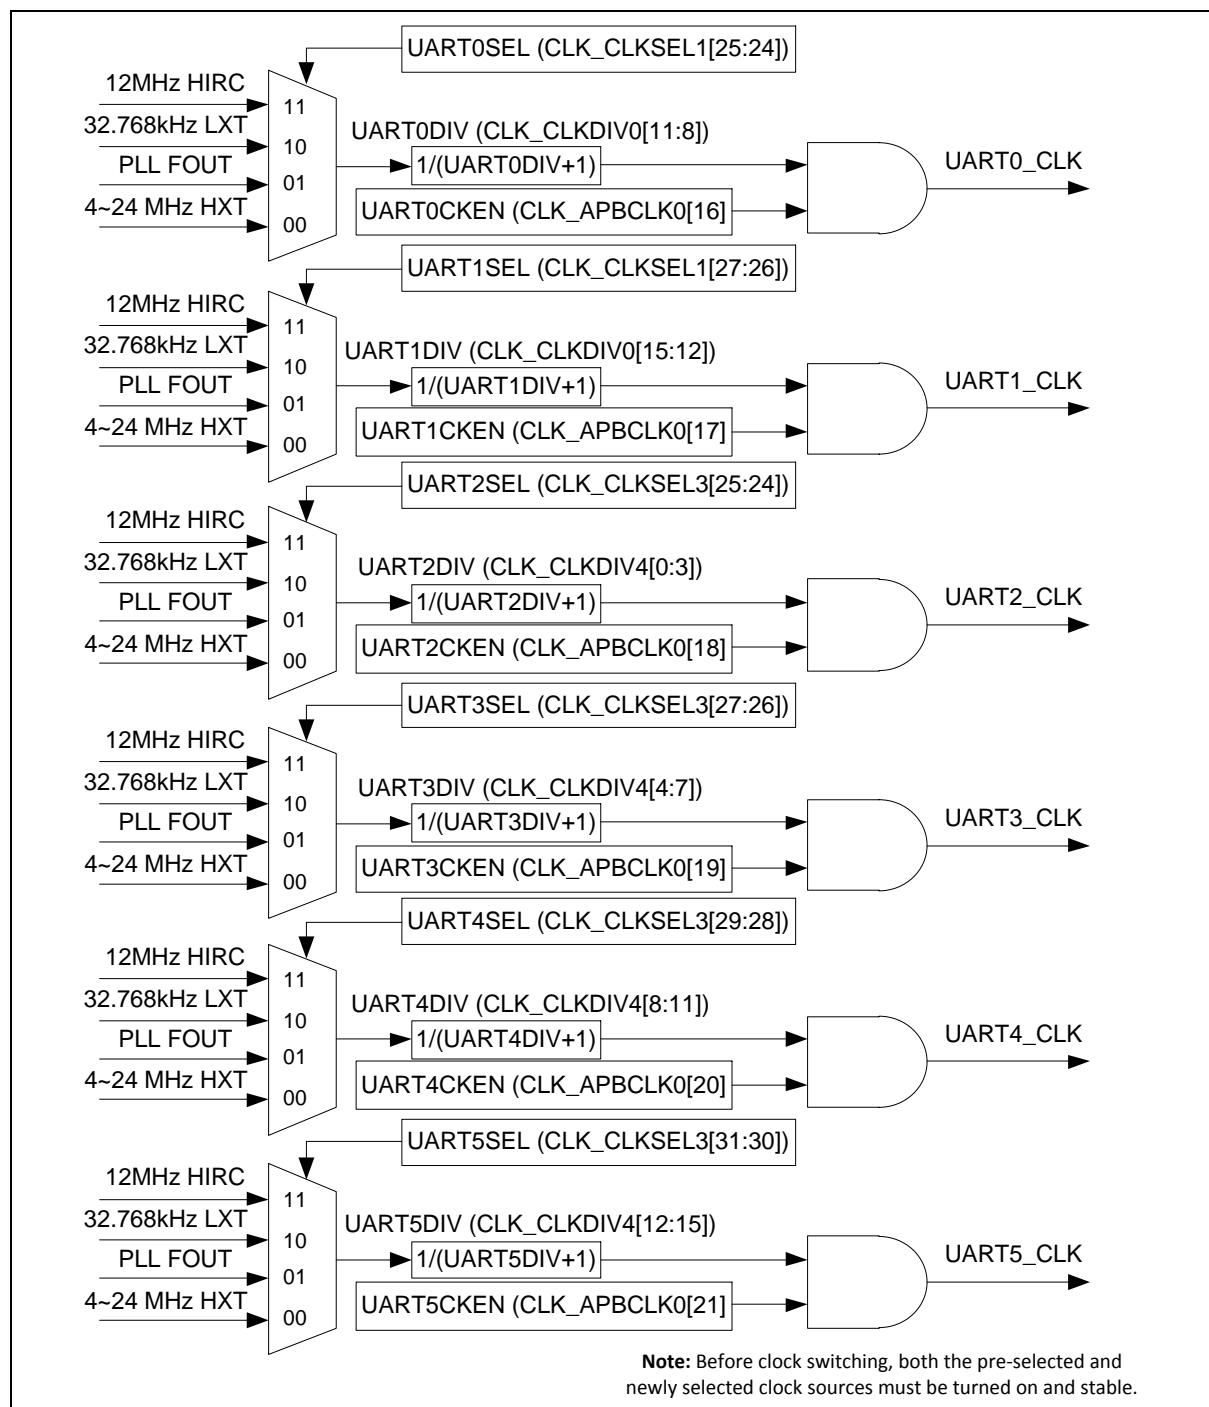

Figure 6.15-1 UART Clock Control Diagram

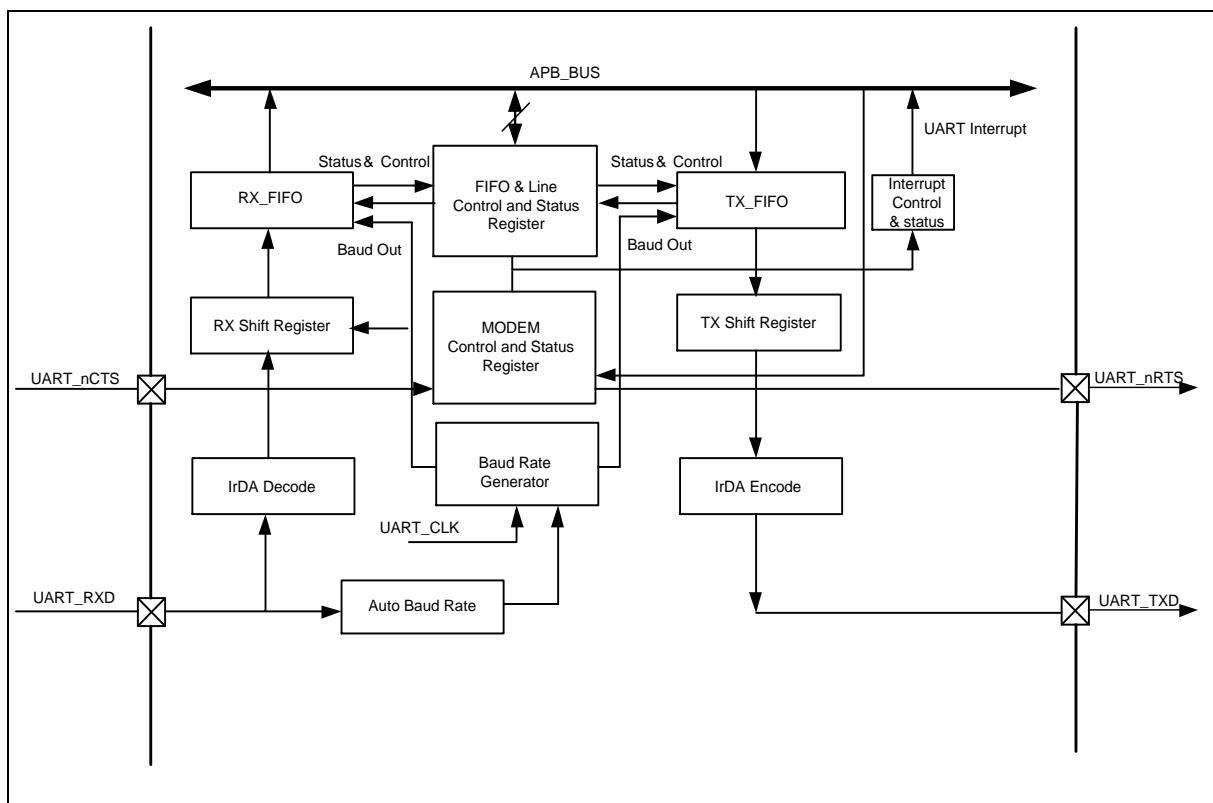

Figure 6.15-2 UART Block Diagram

Each block is described in detail as follows:

TX_FIFO

The transmitter is buffered with a 16 bytes FIFO to reduce the number of interrupts presented to the CPU.

RX_FIFO

The receiver is buffered with a 16 bytes FIFO (plus three error bits, BIF (UART_FIFOSTS[6]), FEF (UART_FIFOSTS[5]), PEF (UART_FIFOSTS[4])) to reduce the number of interrupts presented to the CPU.

TX Shift Register

This block is responsible for shifting out the transmitting data serially.

RX Shift Register

This block is responsible for shifting in the receiving data serially.

Modem Control and Status Register

This register controls the interface to the MODEM or data set (or a peripheral device emulating a MODEM).

Baud Rate Generator

Divide the external clock by the divisor to get the desired baud rate clock. Refer to baud rate equation.

IrDA Encode

This block is IrDA encoding control block.

IrDA Decode

This block is IrDA decoding control block.

FIFO & Line Control and Status Register

This field is register set that including the FIFO control register (UART_FIFO), FIFO status register (UART_FIFOSTS), and line control register (UART_LINE) for transmitter and receiver. The time-out register (UART_TOUT) identifies the condition of time-out interrupt.

Auto-Baud Rate Measurement

This block is responsible for auto-baud rate measurement.

Interrupt Control and Status Register

There are ten types of interrupts, Receive Data Available Interrupt (RDAINT), Transmit Holding Register Empty Interrupt (THERINT), Transmitter Empty Interrupt (TXENDINT), Receive Line Status Interrupt (parity error or framing error or break interrupt) (RLSINT), MODEM Status Interrupt (MODEMINT), Receiver Buffer Time-out Interrupt (RXTOINT), Buffer Error Interrupt (BUFERRINT), LIN Bus Interrupt (LININT), Wake-up Interrupt (WKINT) and Auto-Baud Rate Interrupt (ABRINT). Interrupt enable register (UART_INTEN) enable or disable the responding interrupt and interrupt status register (UART_INTSTS) identifying the occurrence of the responding interrupt.

Interrupt	Description
RDAINT	Receive Data Available Interrupt.
THERINT	Transmit Holding Register Empty Interrupt.
TXENDINT	Transmitter Empty Interrupt.
RLSINT	Receive Line Status Interrupt (parity error or frame error or break error).
MODEMINT	MODEM Status Interrupt.
RXTOINT	Receiver Buffer Time-out Interrupt.
BUFERRINT	Buffer Error Interrupt.
LININT	LIN Bus Interrupt.
WKINT	Wake-up Interrupt.
ABRINT	Auto-Baud Rate Interrupt.

Table 6.15-2 UART Interrupt

6.15.4 Basic Configuration

The basic configurations of UART0 are as follows:

- Clock Source Configuration
 - Select the source of UART0 peripheral clock on UART0SEL (CLK_CLKSEL1[25:24]).
 - Select the clock divider number of UART0 peripheral clock on UART0DIV (CLK_CLKDIV0[11:8]).
 - Enable UART0 peripheral clock in UART0CKEN (CLK_APBCLK1[16]).
- Reset UART0 controller in UART0RST (SYS_IPRST1[16]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
UART0	UART0_RXD	PA.15, PC.11, PF.2	MFP3
		PB.8	MFP5
		PB.12	MFP6
		PA.0, PA.6	MFP7

UART0_TXD	PH.11	MFP8
	PD.2	MFP9
	PA.14, PC.12, PF.3	MFP3
	PB.9	MFP5
	PB.13	MFP6
	PA.1, PA.7	MFP7
	PH.10	MFP8
	PD.3	MFP9
	PB.11	MFP5
	PB.15	MFP6
UART0_nCTS	PA.5, PC.7	MFP7
	PB.10	MFP5
	PB.14	MFP6
UART0_nRTS	PA.4, PC.6	MFP7

The basic configurations of UART1 are as follows:

- Clock Source Configuration
 - Select the source of UART1 peripheral clock on UART1SEL (CLK_CLKSEL1[27:26]).
 - Select the clock divider number of UART1 peripheral clock on UART1DIV (CLK_CLKDIV0[15:12]).
 - Enable UART1 peripheral clock in UART1CKEN (CLK_APBCLK1[17]).
- Reset UART1 controller in UART1RST (SYS_IPRST1[17]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
UART1	UART1_RXD	PF.1	MFP2
		PD.6, PD.10	MFP3
		PB.2, PB.6	MFP6
		PA.8	MFP7
		PA.2, PC.8, PG.1	MFP8
		PH.9	MFP10
	UART1_TXD	PF.0	MFP2
		PD.7, PD.11	MFP3
		PB.3, PB.7	MFP6
		PA.9	MFP7
		PA.3, PE.13, PG.0	MFP8
		PH.8	MFP10
	UART1_nCTS	PB.9	MFP6

		PA.1, PE.11	MFP8
	UART1_nRTS	PB.8	MFP6
		PA.0, PE.12	MFP8

The basic configurations of UART2 are as follows:

- Clock Source Configuration
 - Select the source of UART2 peripheral clock on UART2SEL (CLK_CLKSEL3[25:24]).
 - Select clock divider number of UART2 peripheral clock on UART2DIV (CLK_CLKDIV4[3:0]).
 - Enable UART2 peripheral clock in UART2CKEN (CLK_APBCLK1[18]).
- Reset UART2 controller in UART2RST (SYS_IPRST1[18]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
UART2	UART2_RXD	PF.5	MFP2
		PE.15	MFP3
		PG.0	MFP6
		PB.0, PD.12, PE.9	MFP7
		PC.0, PC.4	MFP8
	UART2_TXD	PF.4	MFP2
		PE.14	MFP3
		PG.1	MFP6
		PB.1, PC.13, PE.8	MFP7
		PC.1, PC.5	MFP8
	UART2_nCTS	PD.9, PF.5	MFP4
		PC.2	MFP8
	UART2_nRTS	PD.8, PF.4	MFP4
		PC.3	MFP8

The basic configurations of UART3 are as follows:

- Clock Source Configuration
 - Select the source of UART3 peripheral clock on UART3SEL (CLK_CLKSEL3[27:26]).
 - Select the clock divider number of UART3 peripheral clock on UART3DIV (CLK_CLKDIV4[7:4]).
 - Enable UART3 peripheral clock in UART3CKEN (CLK_APBCLK1[19]).
- Reset UART3 controller in UART3RST (SYS_IPRST1[19]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
UART3	UART3_RXD	PD.0	MFP5

	UART3_TXD	PB.14, PC.9, PE.0, PE.11	MFP7
		PC.2	MFP11
		PD.1	MFP5
		PB.15, PC.10, PE.1, PE.10	MFP7
	UART3_nCTS	PC.3	MFP11
		PD.2	MFP5
	UART3_nRTS	PB.12, PH.9	MFP7
		PD.3	MFP5
		PB.13, PH.8	MFP7

The basic configurations of UART4 are as follows:

- Clock Source Configuration
 - Select the source of UART4 peripheral clock on UART4SEL (CLK_CLKSEL3[29:28]).
 - Select the clock divider number of UART4 peripheral clock on UART4DIV (CLK_CLKDIV4[11:8]).
 - Enable UART4 peripheral clock in UART4CKEN (CLK_APBCLK1[20]).
- Reset UART4 controller in UART4RST (SYS_IPRST1[20]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
UART4	UART4_RXD	PA.13	MFP3
		PC.6, PH.3	MFP5
		PB.10, PF.6	MFP6
		PA.2, PH.11	MFP7
		PC.4	MFP11
	UART4_TXD	PA.12	MFP3
		PC.7, PH.2	MFP5
		PB.11, PF.7	MFP6
		PA.3, PH.10	MFP7
		PC.5	MFP11
	UART4_nCTS	PC.8	MFP5
		PE.1	MFP9
	UART4_nRTS	PE.13	MFP5
		PE.0	MFP9

The basic configurations of UART5 are as follows:

- Clock Source Configuration
 - Select the source of UART5 peripheral clock on UART5SEL (CLK_CLKSEL3[31:30]).
 - Select the clock divider number of UART5 peripheral clock on UART5DIV (CLK_CLKDIV4[15:12]).

- Enable UART5 peripheral clock in UART5CKEN (CLK_APBCLK1[21]).
- Reset UART5 controller in UART5RST (SYS_IPRST1[21]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
UART5	UART5_RXD	PH.1	MFP4
		PB.4	MFP7
		PA.4, PE.6	MFP8
	UART5_TXD	PH.0	MFP4
		PB.5	MFP7
		PA.5, PE.7	MFP8
	UART5_nCTS	PH.3	MFP4
		PB.2	MFP7
	UART5_nRTS	PH.2	MFP4
		PB.3	MFP7

UART Interface Controller Pin description is shown in Table 6.15-3:

Pin	Type	Description
UARTx_TXD	Output	UARTx transmit
UARTx_RXD	Input	UARTx receive
UARTx_nCTS	Input	UARTx modem clear to send
UARTx_nRTS	Output	UARTx modem request to send

Table 6.15-3 UART Interface Controller Pin

6.15.5 Functional Description

The UART controller supports four function modes including UART, IrDA, LIN and RS-485 mode. User can select a function by setting the UART_FUNCSEL register. The four function modes will be described in following section.

6.15.5.1 UART Controller Baud Rate Generator

The UART controller includes a programmable baud rate generator capable of dividing clock input by divisors to produce the serial clock that transmitter and receiver need. Table 6.15-4 list the UART baud rate equations in the various conditions. Table 6.15-5 and Table 6.15-6 list the UART baud rate parameter and register setting example. In IrDA function mode, the baud rate generator must be set in mode 0. More detail register description is shown in UART_BAUD register. There are three setting mode. Mode 0 is set by UART_BAUD[29:28] with 00. Mode 1 is set by UART_BAUD[29:28] with 10. Mode 2 is set by UART_BAUD[29:28] with 11.

Mode	BAUDM1	BAUDM0	Baud Rate Equation
Mode 0	0	0	UART_CLK / [16 * (BRD+2)].
Mode 1	1	0	UART_CLK / [(EDIVM1+1) * (BRD+2)], EDIVM1 must >= 8.
Mode 2	1	1	UART_CLK / (BRD+2) If UART_CLK <= 3*HCLK, BRD must >= 9.

		If $\text{UART_CLK} > 3^*\text{HCLK}$, $\text{BRD} \geq 3^*N - 1$. N is the smallest integer larger than or equal to the ratio of $\text{UART_CLK} / \text{HCLK}$. For example, if $3^*\text{HCLK} < \text{UART_CLK} \leq 4^*\text{HCLK}$, $\text{BRD} \geq 11$. if $4^*\text{HCLK} < \text{UART_CLK} \leq 5^*\text{HCLK}$, $\text{BRD} \geq 14$. (If the UART_CLK is selected from LXT, BRD can be greater than or equal to 1)
--	--	--

Table 6.15-6 UART controller Baud Rate Register Setting Example Table

6.15.5.2 UART Controller Baud Rate Compensation

The UART controller supports baud rate compensation function. It is used to optimize the precision in each bit. The precision of the compensation is half of UART module clock because there is BRCOMDEC bit (UART_BRCOMP[31]) to define the positive or negative compensation in each bit. If

the BRCOMPDEC (UART_BRCOMP[31]) = 0, it is positive compensation for each bit, one more module clock will be append in the compensated bit. If the BRCOMPDEC (UART_BRCOMP[31]) = 1, it is negative compensation for each bit, decrease one module clock in the compensated bit.

There is 9-bits location, BRCOMP[8:0] (UART_BRCOMP[8:0]), can be configured by user to define the relative bit is compensated or not. BRCOMP[7:0] is used to define the compensation of UART_DAT[7:0] and BRCOMP[8] is used to define the parity bit.

Example:

1. UART's peripheral clock = 32.768K and baud rate is 9600

Baud rate is 9600, UART peripheral clock is 32.768K → 3.413 peripheral clock/bit

if the baud divider is set 1 (3 peripheral clock/bit), the inaccuracy of each bit is -0.413 peripheral clock and BRCOMPDEC =0,

Bit	Name	Total INACCURACY	BRCOMP Compensated	Final Inaccuracy
0	Start	-0.413	x	-0.413
1	UART_DAT[0]	-0.826(-0.413-0.413)	1	0.174
2	UART_DAT[1]	-0.239(0.174-0.413)	0	-0.239
3	UART_DAT[2]	-0.652(-0.239-0.413)	1	0.348
4	UART_DAT[3]	-0.065(0.348-0.413)	0	-0.065
5	UART_DAT[4]	-0.478(-0.065-0.413)	0	-0.478
6	UART_DAT[5]	-0.891(-0.478-0.413)	1	0.109
7	UART_DAT[6]	-0.304(0.109-0.413)	0	-0.304
8	UART_DAT[7]	-0.717(-0.304-0.413)	1	0.283
9	Parity	-0.130(0.283-0.413)	0	-0.13

Table 6.15-7 Baud Rate Compensation Example Table 1

So that the BRCOMP (UART_BRCOMP[8:0]) can be set as 9'b010100101 = 0xa5.

2. UART's peripheral clock = 32.768K and baud rate is 4800

Baud rate is 4800, UART peripheral clock is 32.768K → 6.827 peripheral clock/bit

if the baud divider is set 5 (7 peripheral clock/bit), the inaccuracy of each bit is 0.173 peripheral clock and BRCOMPDEC =1,

Bit	Name	Total INACCURACY	BRCOMP Compensated	Final Inaccuracy
0	Start	0.173	x	0.173
1	UART_DAT[0]	0.346(0.173+0.173)	0	0.346
2	UART_DAT[1]	0.519(0.346+0.173)	1	-0.481
3	UART_DAT[2]	-0.308(-0.481+0.173)	0	-0.308
4	UART_DAT[3]	-0.135(-0.308+0.173)	0	-0.135
5	UART_DAT[4]	-0.038(-0.135+0.173)	0	0.038
6	UART_DAT[5]	0.211(0.038+0.173)	0	0.211

7	UART_DAT[6]	0.384(0.211+0.173)	0	0.384
8	UART_DAT[7]	0.557(0.384+0.173)	1	-0.443
9	Parity	-0.270(-0.443+0.173)	0	-0.270

Table 6.15-8 Baud Rate Compensation Example Table 2

So that the BRCOMP (UART_BRCOMP[8:0]) can be set as 9'b010000010 = 0x82.

UART Controller Auto-Baud Rate Function Mode

Auto-Baud Rate function can measure baud rate of receiving data from UART RX pin automatically. When the Auto-Baud Rate measurement is finished, the measuring baud rate is loaded to BRD (UART_BAUD[15:0]). Both of the BAUDM1 (UART_BAUD[29]) and BAUDM0 (UART_BAUD[28]) are set to 1 automatically. UART RX data from Start bit to 1st rising edge time is set by 2 ABRDBITS bit time in Auto-Baud Rate function detection frame.

2 ABRDBITS bit time from Start bit to the 1st rising edge is calculated by setting ABRDBITS (UART_ALTCTL[20:19]). Setting ABRDEN (UART_ALTCTL[18]) is to enable auto-baud rate function. In beginning stage, the UART RX is kept at 1. Once falling edge is detected, START bit is received. The auto-baud rate counter is reset and starts counting. The auto-baud rate counter will be stop when the 1 st rising edge is detected. Then, auto-baud rate counter value divided by ABRDBITS (UART_ALTCTL[20:19]) is loaded to BRD (UART_BAUD[15:0]) automatically. ABRDEN (UART_ALTCTL[18]) is cleared. The Auto-Baud is shown in Figure 6.15-3. Once the auto-baud rate measurement is finished, the ABRDIF (UART_FIFOSTS[1]) is set. When auto-baud rate counter is overflow, ABRDTOIF (UART_FIFOSTS[2]) is set. ABRDIF (UART_FIFOSTS[1]) or ABRDTOIF (UART_FIFOSTS[2]) cause the auto-baud rate flag ABRIF(UART_ALTCTL[17]) is generated. If the ABRIEN (UART_INTEN[18]) is enabled, ABRIF(UART_ALTCTL[17]) cause the auto-baud rate interrupt ABRINT (UART_INTSTS[31]) is generated.

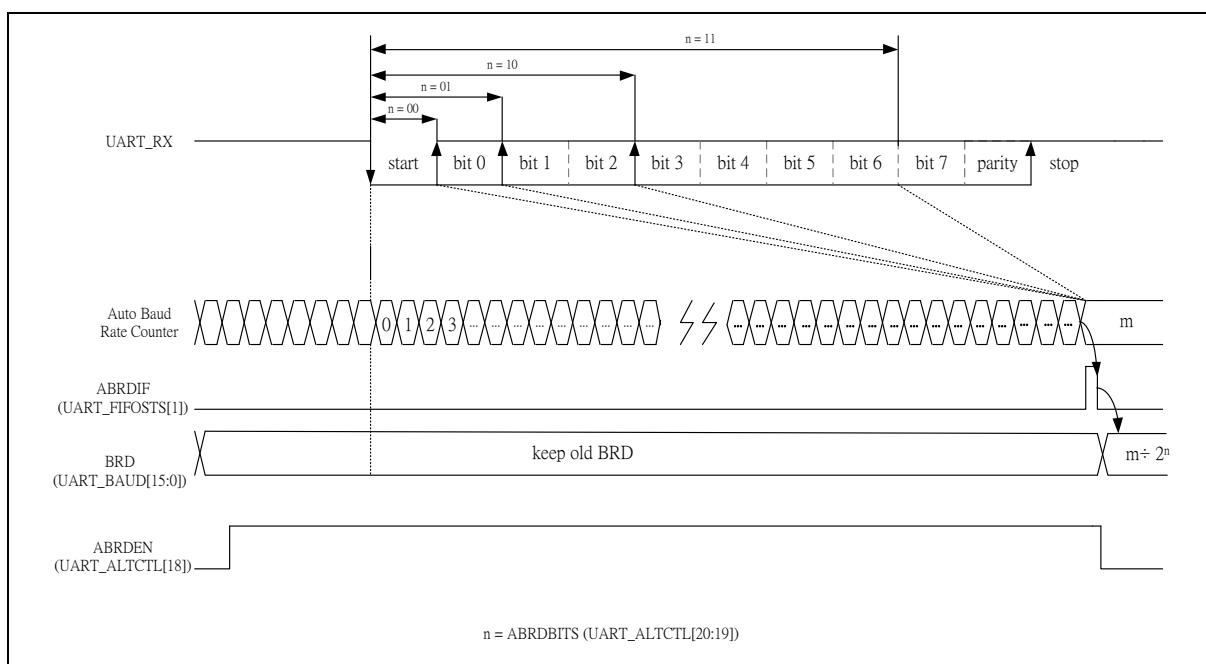

Figure 6.15-3 Auto-Baud Rate Measurement

Programming Sequence Example:

3. Program ABRDBITS (UART_ALTCTL[20:19]) to determines UART RX data 1st rising edge

time from Start by 2^{ABRDBITS} bit time.

4. Set ABRIEN (UART_INTEN[18]) to enable auto-baud rate function interrupt.
5. Set ABRDEN (UART_ALTCTL[18]) to enable auto-baud rate function.
6. ABRDIF (UART_FIFOSTS[1]) is set, the auto-baud rate measurement is finished.
7. Operate UART transmit and receive action.
8. ABRDTOIF (UART_FIFOSTS[2]) is set, if auto-baud rate counter is overflow.
9. Go to Step 3.

6.15.5.3 UART Controller Transmit Delay Time Value

The UART controller programs DLY (UART_TOUT [15:8]) to control the transfer delay time between the last stop bit and next start bit in transmission. The unit is baud. The operation is shown in Figure 6.15-4.

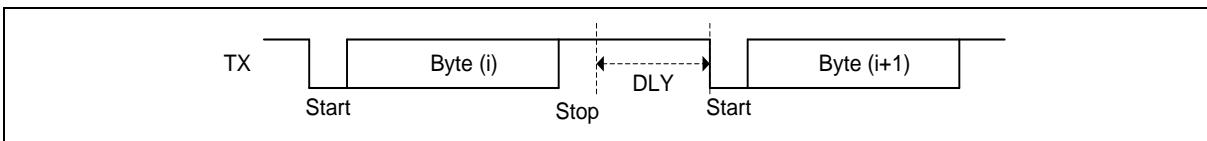

Figure 6.15-4 Transmit Delay Time Operation

6.15.5.4 UART Controller FIFO Control and Status

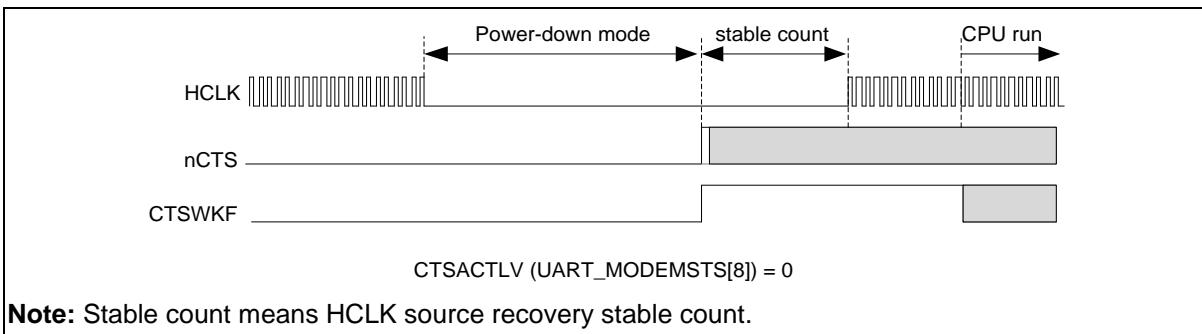

The UART controller is built-in with a 16 bytes transmitter FIFO (TX_FIFO) and a 16 bytes receiver FIFO (RX_FIFO) that reduces the number of interrupts presented to the CPU. The CPU can read the status of the UART at any time during operation. The reported status information includes condition of the transfer operations being performed by the UART, as well as 3 error conditions (parity error, framing error, break interrupt) occur if receiving data has parity, frame or break error. UART, IrDA, LIN and RS-485 mode support FIFO control and status function.

6.15.5.5 UART Controller Wake-up Function

The UART controller supports wake-up system function. The wake-up function includes nCTS pin, incoming data wake-up, Received Data FIFO reached threshold wake-up, RS-485 Address Match (AAD mode) wake-up and Received Data FIFO threshold time-out wake-up function. CTSWKF (UART_WKSTS[0]), DATWKF (UART_WKSTS[1]), RFRTWKF (UART_WKSTS[2]), RS485WKF (UART_WKSTS[3]) or TOUTWKF (UART_WKSTS[4]) cause the wake-up interrupt flag WKIF(UART_INTSTS[6]) is generated. If the WKIEN (UART_INTEN[6]) is enabled, the wake-up interrupt flag WKIF(UART_INTSTS[6]) cause the wake-up interrupt WKINT (UART_INTSTS[14]) is generated.

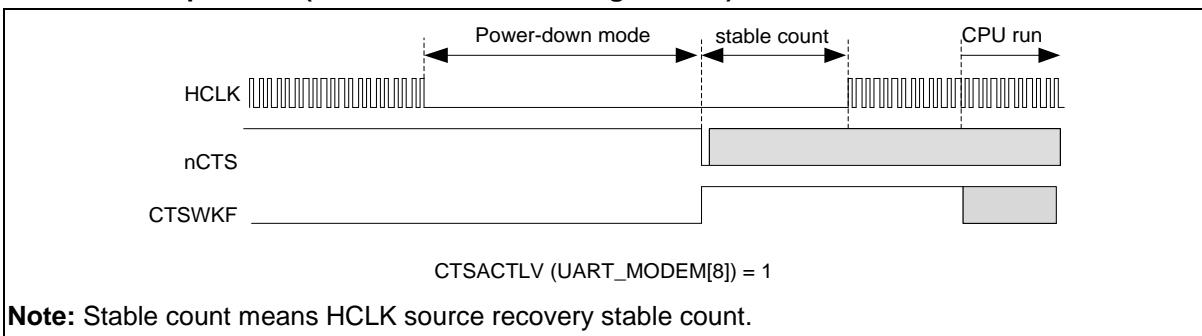

nCTS pin wake-up :

When the system is in Power-down mode and WKCTSEN (UART_WKCTL[0]) is set, the toggle of nCTS pin can wake-up system. If the WKCTSEN (UART_WKCTL[0]) is enabled, the toggle of nCTS pin cause the nCTS wake-up flag CTSWKF (UART_WKSTS[0]) is generated. The nCTS wake-up is shown in Figure 6.15-5 and Figure 6.15-6.

nCTS Wake-up Case 1 (nCTS transition from low to high)

Note: Stable count means HCLK source recovery stable count.

Figure 6.15-5 UART nCTS Wake-up Case1

nCTS Wake-up Case 2 (nCTS transition from high to low)

Note: Stable count means HCLK source recovery stable count.

Figure 6.15-6 UART nCTS Wake-up Case2

Incoming Data Wake-up

When system is in Power-down mode and the WKDATEN (UART_WKCTL [1]) is set, the toggle of incoming data (UART_RXD) pin can wake-up the system. In order to receive the incoming data after the system wake-up, the STCOMP (UART_DWKCOMP[15:0]) shall be set. These bits field of STCOMP indicate how many clock cycle selected by UART_CLK do the UART controller can get the 1st bit (start bit) when the system is wakeup from Power-down mode.

When incoming data wakes system up, the incoming data will be received and stored in FIFO. If the WKDATEN (UART_WKCTL[1]) is enabled, the toggle of incoming data (UART_RXD) pin cause the incoming data wake-up flag DATWKF (UART_WKSTS[1]) is generated. The imcoing data wake-up is shown in Figure 6.15-7.

Note1: The UART controller clock source should be selected as HIRC and the compensation time for start bit is about 15.68us. It means that the value of STCOMP (UART_DWKCOMP[15:0]) can be set as 347.

Note2: The value of BRD(UART_BAUD[15:0]) should be greater than STCOMP (UART_DWKCOMP[15:0]).

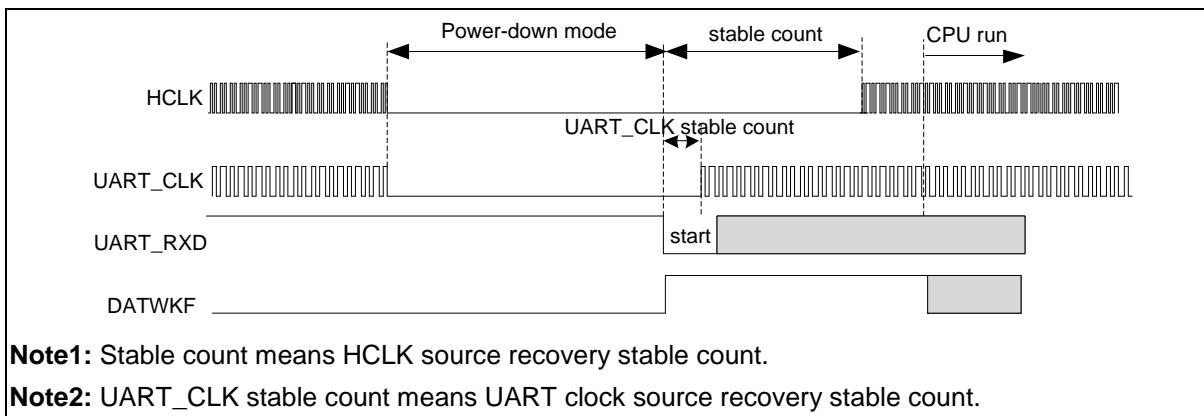

Figure 6.15-7 UART Data Wake-up

Received Data FIFO Reached Threshold Wake-up

The received data FIFO threshold reached wake-up function is enabled by setting WKFRRTEN (UART_WKCTL[2]). In Power-down mode, when the number of received data in RX FIFO reaches the threshold value RFITL (UART_FIFO[7:4]), it can wake-up the system. If the WKFRRTEN (UART_WKCTL[2]) is enabled, the number of received data in RX FIFO reaches the threshold value RFITL (UART_FIFO[7:4]) cause the received data FIFO reached threshold wake-up flag RFRTWKF (UART_WKSTS[2]) is generated. The Received Data FIFO reached threshold wake-up is shown in Figure 6.15-8.

Note: The UART controller clock source should be selected as LXT in Power-down mode to receive data.

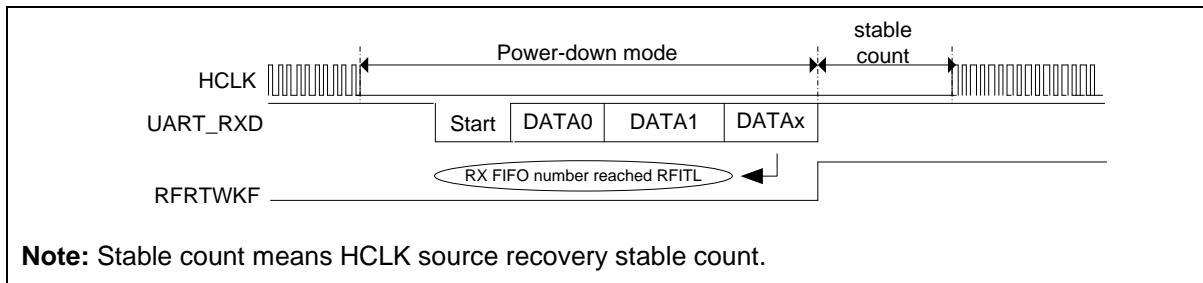

Figure 6.15-8 UART Received Data FIFO reached threshold wake-up

RS-485 Address Match (AAD Mode) Wake-up

The RS-485 address match wake-up function is enabled by setting WKFRRTEN (UART_WKCTL[2]) and WKRS485EN (UART_WKCTL[3]). This function is used for RS-485 Auto Address Detection (AAD) mode in RS-485 function mode and ADDRDEN (UART_ALTCTL[15]) is set to 1. In Power-down mode, when an address byte is detected and matches the ADDRMV (UART_ALTCTL[31:24]) or the number of received data in RX FIFO reaches the threshold value RFITL (UART_FIFO[7:4]), it can wake-up the system. If the WKRS485EN (UART_WKCTL[3]) is enabled, when an address byte is detected and matches the ADDRMV (UART_ALTCTL[31:24]) that cause the RS485 address match (AAD mode) wake-up flag RS485WKF (UART_WKSTS[3]) is generated. The RS-485 Address Match (AAD mode) wake-up is shown in Figure 6.15-9.

Note: The UART controller clock source should be selected as LXT in Power-down mode to receive data.

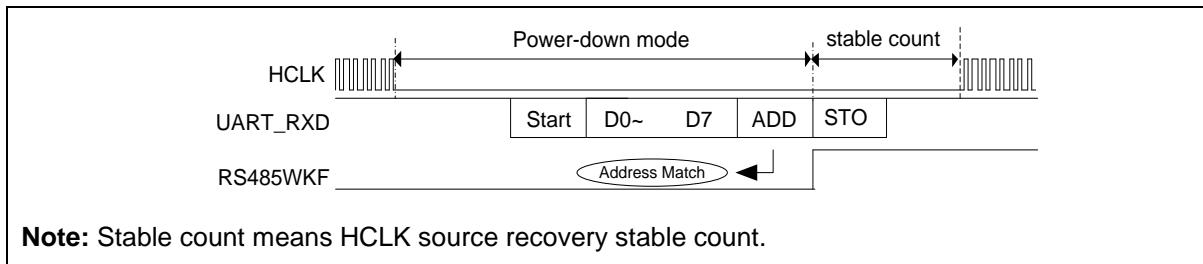

Figure 6.15-9 UART RS-485 AAD Mode Address Match Wake-up

Received Data FIFO Threshold Time-out Wake-up

The received data FIFO threshold time-out wake-up function is enabled by setting WKRFRTEN (UART_WKCTL[2]) and WKTOUTEN (UART_WKCTL[4]). Setting TOCNTEN (UART_INTEN[11]) to enable receiver buffer time-out counter. In Power-down mode, when the number of received data in RX FIFO does not reach the threshold value RFITL (UART_FIFO[7:4]) and the time-out counter equals to the time-out value TOIC (UART_TOUT[7:0]), it can wake-up the system. If the WKTOUTEN (UART_WKCTL[4]) is enabled, when the time-out counter equals to the time-out value TOIC (UART_TOUT[7:0]) that cause the Received Data FIFO threshold time-out wake-up wake-up flag TOUTWKF (UART_WKSTS[4]) is generated. The Received Data FIFO threshold time-out wake-up is shown in Figure 6.15-10.

Note: The UART controller clock source should be selected as LXT in Power-down mode to receive data.

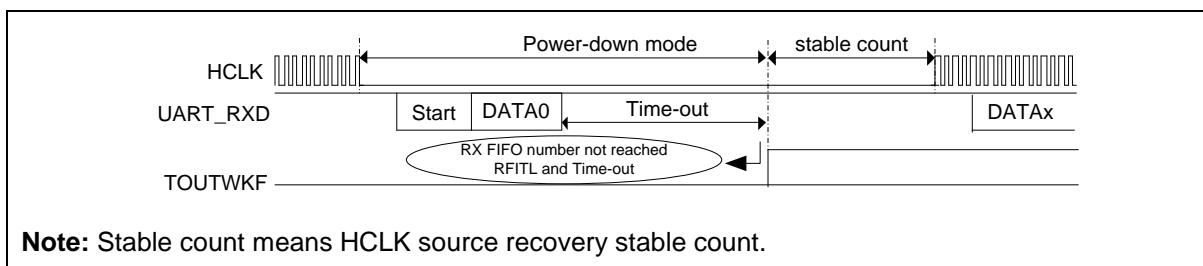

Figure 6.15-10 UART Received Data FIFO threshold time-out wake-up

6.15.5.6 UART Controller Interrupt and Status

Each UART controller supports ten types of interrupts including:

- Receive Data Available Interrupt (RDAINT)
- Transmit Holding Register Empty Interrupt (THERINT)
- Transmitter Empty Interrupt (TXENDIF)
- Receive Line Status Interrupt (RLSINT)
 - Break Interrupt Flag (BIF)
 - Framing Error Flag (FEF)
 - Parity Error Flag (PEF)
 - RS-485 Address Byte Detect Flag (ADDRDETF)
- MODEM Status Interrupt (MODEMINT)
 - Detect nCTS State Change Flag (CTSDETF)
- Receiver Buffer Time-out Interrupt (RXTOINT)
- Buffer Error Interrupt (BUFERRINT)

- TX Overflow Error Interrupt Flag (TXOVIF)
- RX Overflow Error Interrupt Flag (RXOVIF)
- LIN Bus Interrupt (LININT)
 - LIN Break Detection Flag (BRKDETF)
 - Bit Error Detect Status Flag (BITEF)
 - LIN Slave ID Parity Error Flag (SLVIDPEF)
 - LIN Slave Header Error Flag (SLVHEF)
 - LIN Slave Header Detection Flag (SLVHDETF)
- Wake-up Interrupt (WKINT)
 - nCTS Wake-up Flag (CTSWKF)
 - Incoming Data Wake-up Flag (DATWKF)
 - Received Data FIFO Reached Threshold Wake-up Flag (RFRTWKF)
 - RS-485 Address Match (AAD mode) Wake-up Flag (RS485WKF)
 - Received Data FIFO Threshold Time-out Wake-up Flag (TOUTWKF)
- Auto-Baud Rate Interrupt (ABRINT)
 - Auto-baud Rate Detect Interrupt Flag (ABRDIF)
 - Auto-baud Rate Detect Time-out Interrupt Flag (ABRDTOIF)

Table 6.15-9 describes the interrupt sources and flags. The interrupt is generated when the interrupt flag is generated and the interrupt enable bit is set. User must clear the interrupt flag after the interrupt is generated.

Interrupt Source	Interrupt Indicator	Interrupt Enable Bit	Interrupt Flag	Flag Caused By	Flag Cleared By
Receive Data Available Interrupt	RDAINT	RDAIEN	RDAIF	N/A	Read UART_DAT
Transmit Register Empty Interrupt	Holding THERINT	THREIEN	THREIF	N/A	Write UART_DAT
Transmitter Empty Interrupt	Empty TXENDINT	TXENDIEN	TXENDIF	N/A	Write UART_DAT
Receive Line Status Interrupt	Line RLSINT	Status RLSIEN	RLSIF	RLSIF = BIF RLSIF = FEF RLSIF = PEF RLSIF = ADDRDETF	Write '1' to BIF Write '1' to FEF Write '1' to PEF Write '1' to ADDRDETF
Modem Status Interrupt	MODEMINT	MODEMIEN	MODEMIF	MODEMIF = CTSDETF	Write '1' to CTSDETF
Receiver Buffer Time-out Interrupt	RXTOINT	RXTOIEN	RXTOIF	N/A	Read UART_DAT
Buffer Error Interrupt	BUFERRINT	BUFERRIEN	BUFERRIF	BUFERRIF = TXOVIF BUFERRIF = RXOVIF	Write '1' to TXOVIF Write '1' to RXOVIF

LIN Bus Interrupt	LININT	LINIEN	LINIF	LINIF = BRKDETF	Write '1' to LINIF and Write '1' to BRKDETF	
				LINIF = BITEF	Write '1' to LINIF and Write '1' to BITEF	
				LINIF = SLVIDPEF	Write '1' to LINIF and Write '1' to SLVIDPEF	
				LINIF = SLVHEF	Write '1' to LINIF and Write '1' to SLVHEF	
				LINIF = SLVHDETF	Write '1' to LINIF and Write '1' to SLVHDETF	
Wake-up Interrupt	WKINT	WKIEN	WKIF	WKIF = CTSWKF	Write '1' to CTSWKF	
				WKIF = DATWKF	Write '1' to DATWKF	
				WKIF = RFRTWKF	Write '1' to RFRTWKF	
				WKIF = RS485WKF	Write '1' to RS485WKF	
				WKIF = TOUTWKF	Write '1' to TOUTWKF	
Auto-Baud Interrupt	Rate	ABRINT	ABRIEN	ABRIF	ABRIF = ABRDIF	Write '1' to ABRDIF
					ABRIF = ABRDTOIF	Write '1' to ABRDTOIF

Table 6.15-9 UART controller Interrupt Source and Flag List

6.15.5.7 UART Function Mode

The UART controller provides UART function (Setting FUNCSEL (UART_FUNCSEL [1:0]) to '00' to enable UART function mode). The UART baud rate is up to 1 Mbps.

The UART provides full-duplex and asynchronous communications. The transmitter and receiver contain 16 bytes FIFO for payloads. User can program receiver buffer trigger level and receiver buffer time-out detection for receiver. The transmitting data delay time between the last stop and the next start bit can be programmed by setting DLY (UART_TOUT [15:8]) register. The UART supports hardware auto-flow control that provides programmable nRTS flow control trigger level. The number of data bytes in RX FIFO is equal to or greater than RTSTRGLV (UART_FIFO[19:16]), the nRTS is de-asserted.

UART Line Control Function

The UART controller supports fully programmable serial-interface characteristics by setting the UART_LINE register. User can program UART_LINE register for the word length, stop bit and parity bit setting. Table 6.15-10 and Table 6.15-11 list the UART word, stop bit length and the parity bit settings.

NSB (UART_LINE[2])	WLS (UART_LINE[1:0])	Word Length (Bit)	Stop Length (Bit)
0	00	5	1
0	01	6	1
0	10	7	1
0	11	8	1
1	00	5	1.5
1	01	6	2
1	10	7	2
1	11	8	2

Table 6.15-10 UART Line Control of Word and Stop Length Setting

Parity Type	SPE (UART_LINE[5])	EPE (UART_LINE[4])	PSS (UART_LINE[7])	PBE (UART_LINE[3])	Description
No Parity	x	x	x	0	No parity bit output.
Parity source from UART_DAT	x	x	1	1	Parity bit is generated and checked by software.
Odd Parity	0	0	0	1	Odd Parity is calculated by adding all the “1’s” in a data stream and adding a parity bit to the total bits, to make the total count an odd number.
Even Parity	0	1	0	1	Even Parity is calculated by adding all the “1’s” in a data stream and adding a parity bit to the total bits, to make the count an even number.
Forced Mask Parity	1	0	0	1	Parity bit always logic 1. Parity bit on the serial byte is set to “1” regardless of total number of “1’s” (even or odd counts).
Forced Space Parity	1	1	0	1	Parity bit always logic 0. Parity bit on the serial byte is set to “0” regardless of total number of “1’s” (even or odd counts).

Table 6.15-11 UART Line Control of Parity Bit Setting

UART Auto-Flow Control Function

The UART supports auto-flow control function that uses two signals, nCTS (clear-to-send) and nRTS (request-to-send), to control the flow of data transfer between the UART and external devices (e.g. Modem). When auto-flow is enabled, the UART is not allowed to receive data until the UART asserts nRTS to external device. When the number of bytes stored in the RX FIFO equals the value of RTSTRGLV (UART_FIFO [19:16]), the nRTS is de-asserted. The UART sends data out when UART detects nCTS is asserted from external device. If the valid asserted nCTS is not detected, the UART will not send data out. The auto flow control block diagram is shown in Figure 6.15-11.

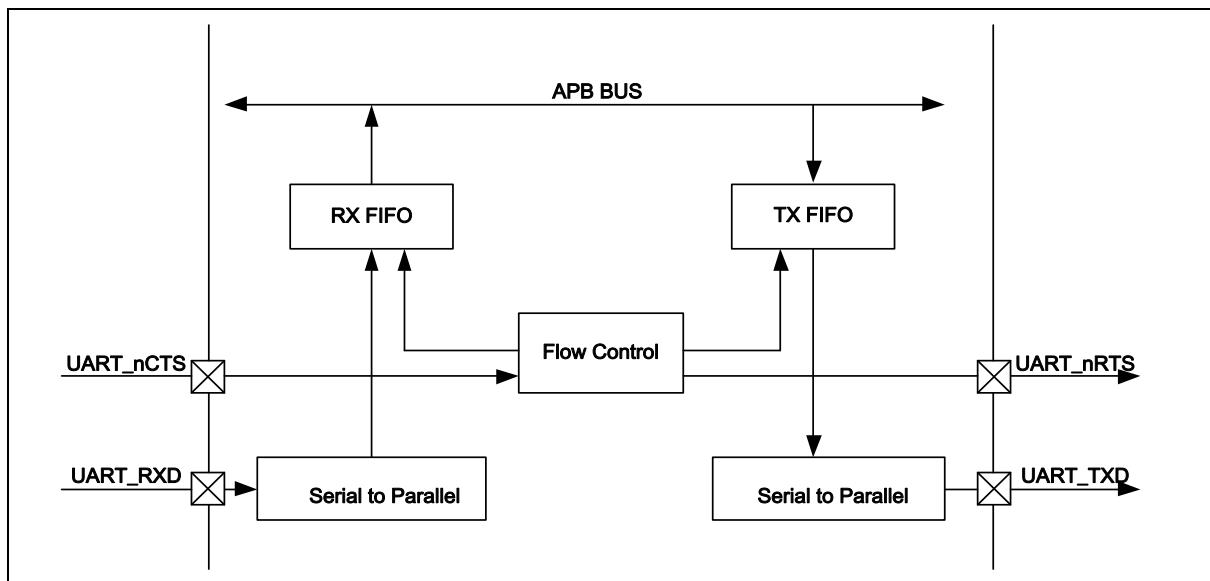

Figure 6.15-11 Auto-Flow Control Block Diagram

Figure 6.15-12 demonstrates the nCTS auto-flow control of UART function mode. User must set ATOCTSEN (UART_INTEN [13]) to enable nCTS auto-flow control function. The CTSACTLV (UART_MODEMSTS [8]) can set nCTS pin input active state. The CTSDETF (UART_MODEMSTS[0]) is set when any state change of nCTS pin input has occurred, and then TX data will be automatically transmitted from TX FIFO.

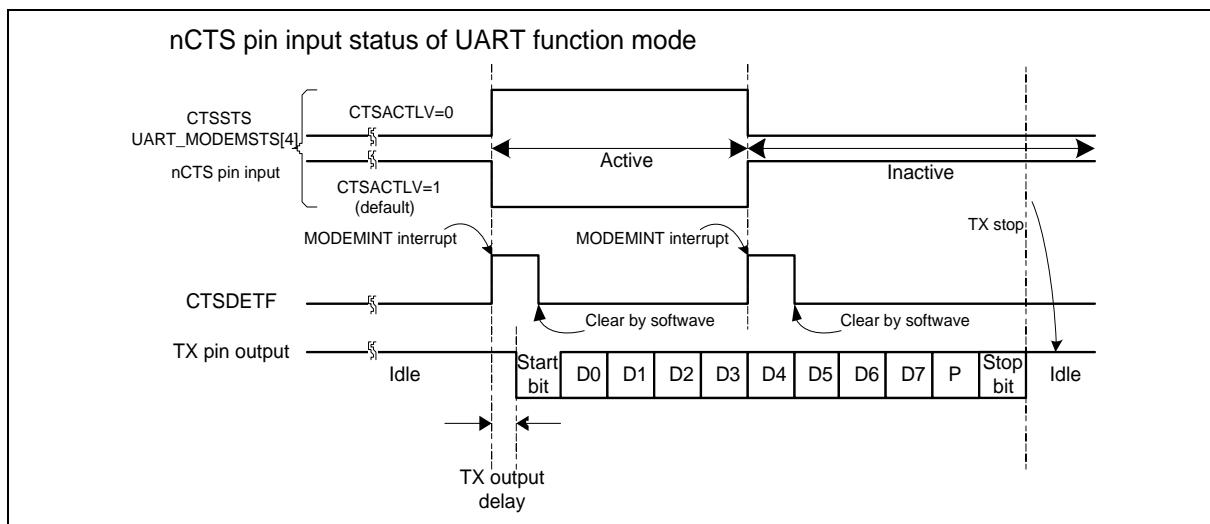

Figure 6.15-12 UART nCTS Auto-Flow Control Enabled

As shown in Figure 6.15-13, in UART nRTS auto-flow control mode (ATORTSEN(UART_INTEN[12])=1), the nRTS internal signal is controlled by UART FIFO controller with RTSTRGLV(UART_FIFO[19:16]) trigger level.

Setting RTSACTLV(UART_MODEM[9]) can control the nRTS pin output is inverse or non-inverse from nRTS signal. User can read the RTSSTS (UART_MODEM[13]) bit to get real nRTS pin output voltage logic status.

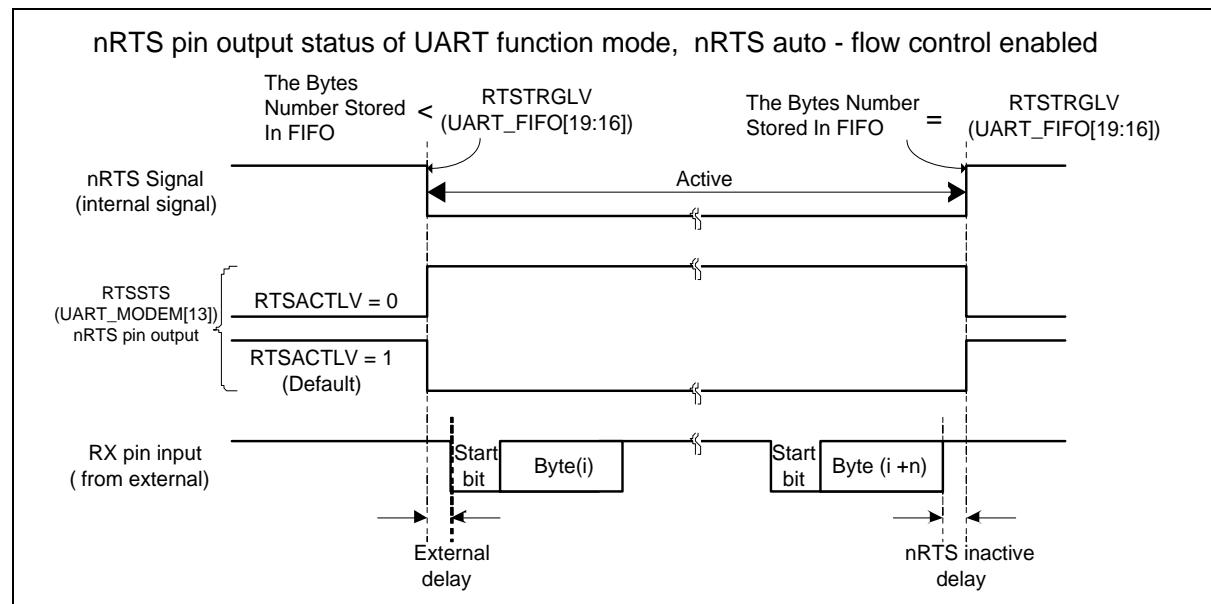

Figure 6.15-13 UART nRTS Auto-Flow Control Enabled

As shown in Figure 6.15-14, in software mode (ATORTSEN(UART_INTEN[12])=0), the nRTS flow is directly controlled by software programming of RTS(UART_MODEM[1]) control bit.

Setting RTSACTLV(UART_MODEM[9]) can control the nRTS pin output is inverse or non-inverse from RTS(UART_MODEM[1]) control bit. User can read the RTSSTS(UART_MODEM[13]) bit to get real nRTS pin output voltage logic status.

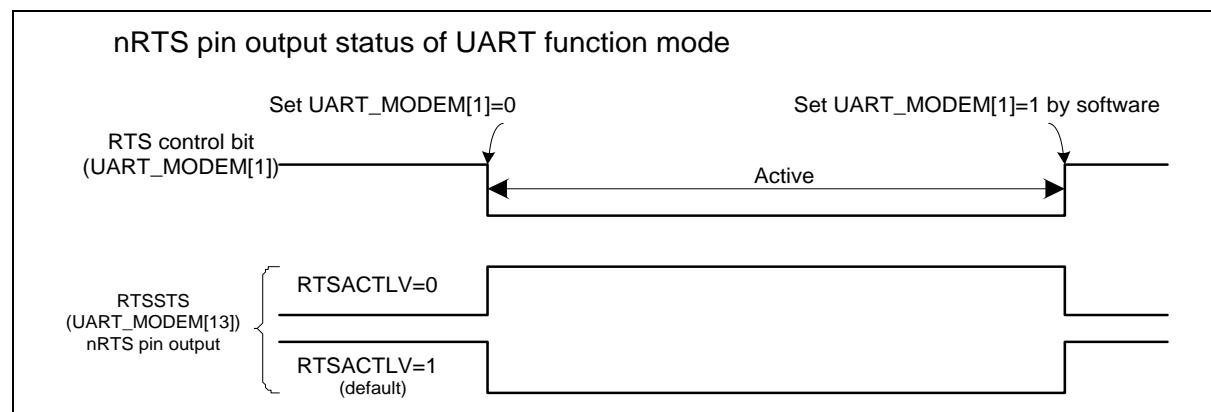

Figure 6.15-14 UART nRTS Auto-Flow with Software Control

6.15.5.8 IrDA Function Mode

The UART controller also provides Serial IrDA (SIR, Serial Infrared) function (Setting UART_FUNCSEL [1:0] to '10' to enable the IrDA function). The SIR specification defines a short-range infrared asynchronous serial transmission mode with one start bit, 8 data bits, and 1 stop bit. The maximum data rate is 115.2 kbps. The IrDA SIR block contains an IrDA SIR protocol encoder/decoder. The IrDA SIR protocol is half-duplex only. So, it cannot transmit and receive data at the same time. The IrDA SIR physical layer specifies a minimum 10 ms transfer delay between transmission and reception, and this delay feature must be implemented by software.

In IrDA mode, the BAUDM1 (UART_BAUD [29]) must be cleared.

Baud Rate = Clock / (16 * (BRD +2)), where BRD (UART_BAUD[15:0]) is Baud Rate Divider in UART_BAUD register.

Note: The tolerance of baud-rate is $\pm 5\%$ between IrDA master and IrDA slave.

The IrDA control block diagram is shown in Figure 6.15-15.

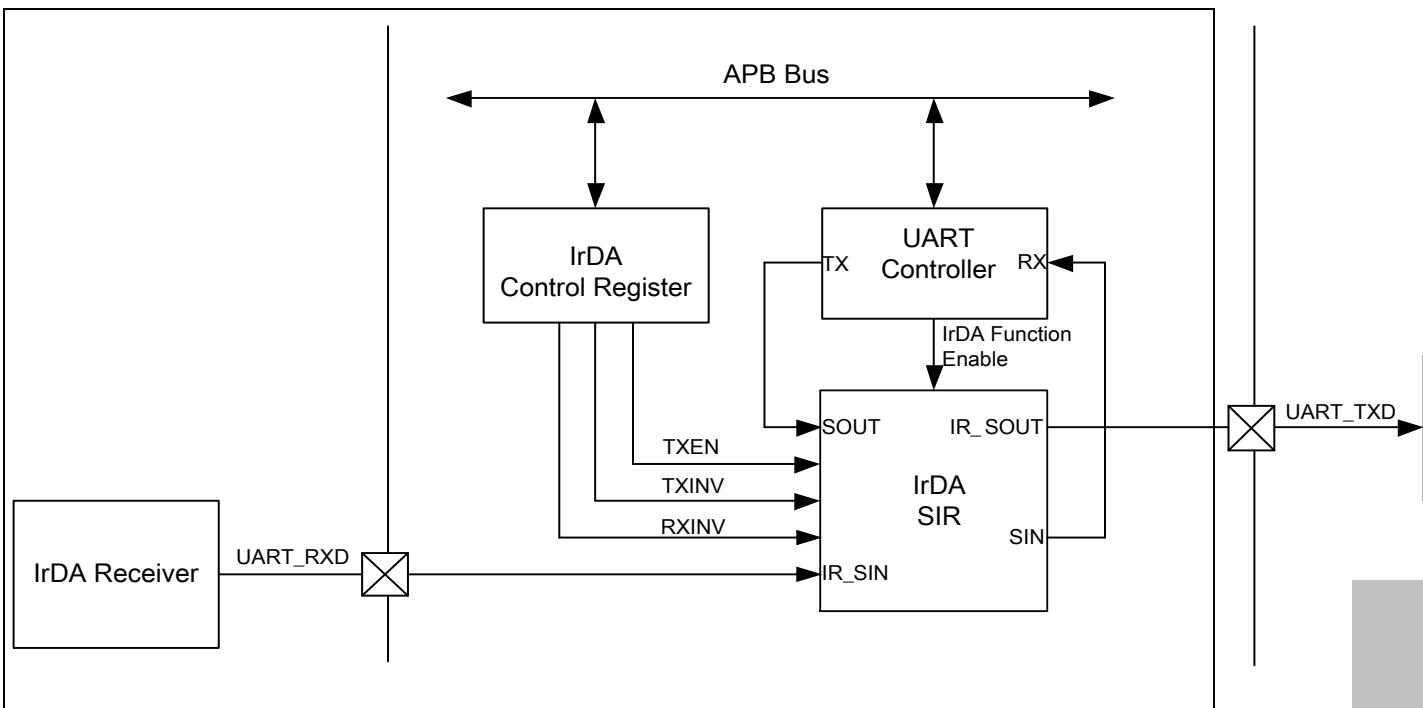

Figure 6.15-15 IrDA Control Block Diagram

IrDA SIR Transmit Encoder

The IrDA SIR Transmit Encoder modulates Non-Return-to-Zero (NRZ) transmit bit stream output from UART. The IrDA SIR physical layer specifies the use of Return-to-Zero, Inverted (RZI) modulation scheme which represents logic 0 as an infra light pulse. The modulated output pulse stream is transmitted to an external output driver and infrared light emitting diode.

The transmitted pulse width is specified as 3/16 period of baud rate.

IrDA SIR Receive Decoder

The IrDA SIR Receive Decoder demodulates the Return-to-Zero bit stream from the input detector and outputs the NRZ serial bits stream to the UART received data input.

In idle state, the decoder input is high. A start bit is detected when the decoder input is LOW. In normal operation, the RXINV (UART_IRDA[6]) is set to '1' and TXINV (UART_IRDA[5]) is set to '0'.

IrDA SIR Operation

The IrDA SIR encoder/decoder provides functionality which converts between UART data stream and half-duplex serial SIR interface. Figure 6.15-16 is IrDA encoder/decoder waveform.

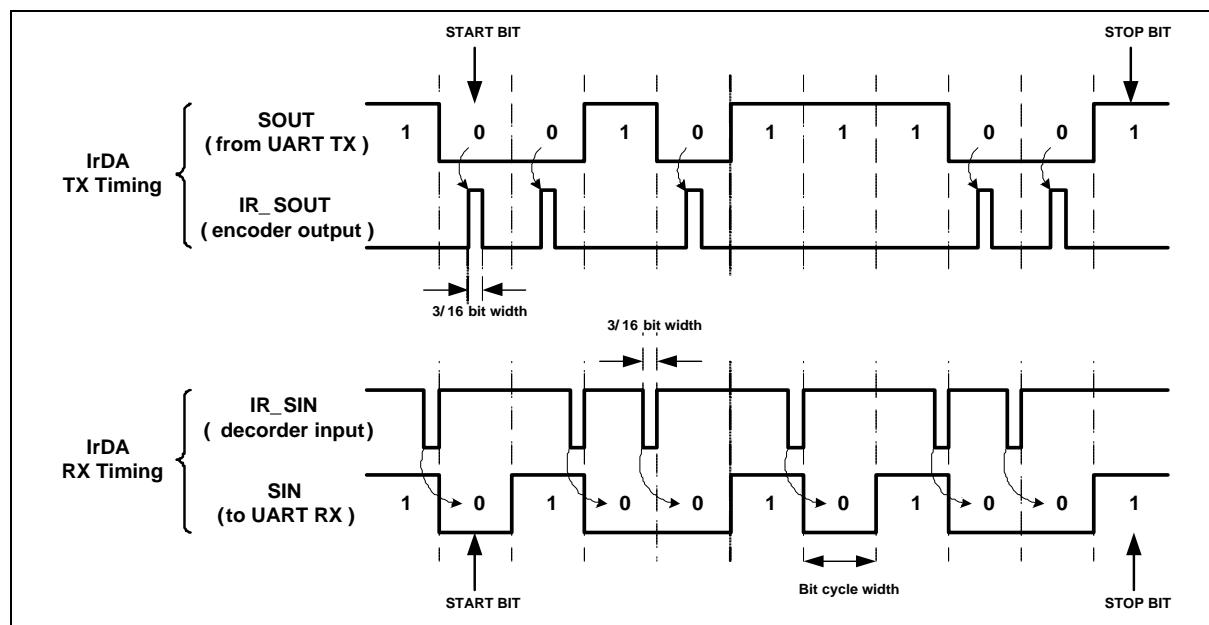

Figure 6.15-16 IrDA TX/RX Timing Diagram

6.15.5.9 LIN Function Mode (Local Interconnection Network)

The UART Controller supports LIN function. Setting FUNCSEL (UART_FUNCSEL[1:0]) to '01' to select LIN mode operation. The UART Controller supports LIN break/delimiter generation and break/delimiter detection in LIN master mode, and supports header detection and automatic resynchronization in LIN Slave mode.

Structure of LIN Frame

According to the LIN protocol, all information transmitted is packed as frames; a frame consists of a header (provided by the master task) and a response (provided by a slave task). The header (provided by the master task) consists of a break field and a sync field followed by a frame identifier (frame ID). The frame identifier uniquely defines the purpose of the frame. The slave task is appointed for providing the response associated with the frame ID. The response consists of a data field and a checksum field. Figure 6.15-17 is the structure of LIN Frame.

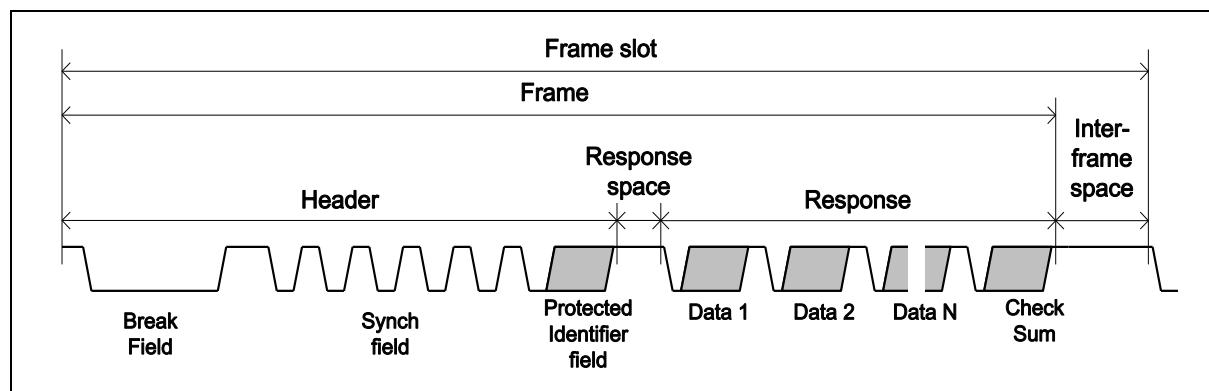

Figure 6.15-17 Structure of LIN Frame

Structure of LIN Byte

In LIN mode, each byte field is initiated by a START bit with value 0 (dominant), followed by 8 data bits and no parity bit, LSB is first and ended by 1 stop bit with value 1 (recessive) in accordance with the LIN standard. The structure of Byte is shown in Figure 6.15-18.

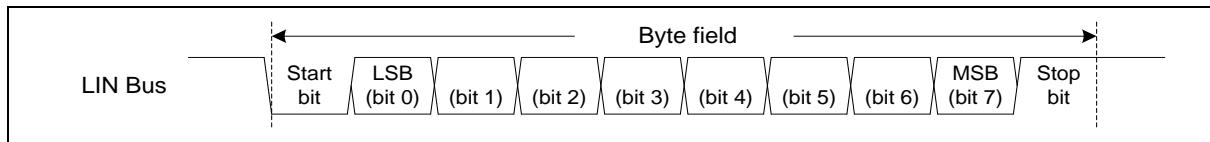

Figure 6.15-18 Structure of LIN Byte

LIN Master Mode

The UART Controller supports LIN Master mode. To enable and initialize the LIN Master mode, the following steps are necessary:

1. Set the UART_BAUD register to select the desired baud rate.
2. Set WLS (UART_LINE[1:0]) to '11' to configure the word length with 8 bits, clearing PBE (UART_LINE[3]) bit to disable parity check and clearing NSB (UART_LINE[2]) bit to configure with one stop bit.
3. Set FUNCSEL (UART_FUNCSEL[1:0]) to '01' to select LIN function mode operation.

A complete header consists of a break field and sync field followed by a frame identifier (frame ID). The UART controller can be selected header sending by three header selected modes. The header selected mode can be "break field" or "break field and sync field" or "break field, sync field and frame ID field" by setting HSEL (UART_LINCTL[23:22]). If the selected header is "break field", software must handle the following sequence to send a complete header to bus by filling sync data (0x55) and frame ID data to the UART_DAT register. If the selected header is "break field and sync field", software must handle the sequence to send a complete header to bus by filling the frame ID data to UART_DAT register, and if the selected header is "break field, sync field and frame ID field", hardware will control the header sending sequence automatically but software must filled frame ID data to PID (UART_LINCTL [31:24]). When operating in header selected mode in which the selected header is "break field, sync field and frame ID field", the frame ID parity bit can be calculated by software or hardware depending whether the IDPEN (UART_LINCTL[9]) bit is set or not.

HSEL	Break Field	Sync Field	ID Field
0	Generated by Hardware	Handled by Software	Handled by Software
1	Generated by Hardware	Generated by Hardware	Handled by Software
2	Generated by Hardware	Generated by Hardware	Generated by Hardware (But Software needs to fill ID to PID (UART_LINCTL[31:24]) first)

Table 6.15-12 LIN Header Selection in Master Mode

When UART is operated in LIN data transmission, LIN bus transfer state can be monitored by hardware or software. User can enable hardware monitoring by setting BITERREN (UART_LINCTL [12]) to "1", if the input pin (UART_RX) state is not equal to the output pin (UART_TX) state in LIN transmitter state that hardware will generate an interrupt to CPU. Software can also monitor the LIN bus transfer state by checking the read back data in UART_DAT register. The following sequence is a program sequence example.

The procedure without software error monitoring in Master mode:

1. Fill Protected Identifier to PID (UART_LINCTL[31:24]).
2. Select the hardware transmission header field including "break field + sync field + protected identifier field" by setting HSEL (UART_LINCTL [23:22]) to "10".
3. Set SENDH (UART_LINCTL[8]) bit to 1 for requesting header transmission.
4. Wait until SENDH (UART_LINCTL[8]) bit cleared by hardware.
5. Wait until TXEMPTYF (UART_FIFOSTS[28]) set to 1 by hardware.

Note1: The default setting of break field is 12 dominant bits (break field) and 1 recessive bit break/sync delimiter. Setting BRKFL (UART_LINCTL [19:16]) and BSL (UART_LINCTL[21:20]) to change the LIN break field length and break/sync delimiter length.

Note2: The default setting of break/sync delimiter length is 1-bit time and the inter-byte spaces default setting is also 1-bit time. Setting BSL (UART_LINCTL[21:20]) and DLY(UART_TOUT[15:8]) can change break/sync delimiter length and inter-byte spaces.

Note3: If the header includes the “break field, sync field and frame ID field”, software must fill frame ID to PID (UART_LINCTL[31:24]) before trigger header transmission (setting the SENDH (UART_LINCTL[8])). The frame ID parity can be generated by software or hardware depending on IDPEN (UART_LINCTL[9]) setting. If the parity generated by software with IDPEN (UART_LINCTL[9]) is set to ‘0’, software must fill 8 bit data (include 2 bit parity) in this field. If the parity generated by hardware with IDPEN (UART_LINCTL[9]) is set to ‘1’, software fills ID0-ID5 and hardware calculates P0 and P1.

Procedure with software error monitoring in Master mode:

1. Choose the hardware transmission header field to only include “break field” by setting HSEL (UART_LINCTL [23:22]) to ‘00’.
2. Enable break detection function by setting BRKDETEN (UART_LINCTL[10]).
3. Request break + break/sync delimiter transmission by setting the SENDH (UART_LINCTL[8]).
4. Wait until the BRKDETF (UART_LINSTS[8]) flag is set to “1” by hardware.
5. Request sync field transmission by writing 0x55 into UART_DAT register.
6. Wait until the RDAIF (UART_INTSTS[0]) is set to “1” by hardware and then read back the UART_DAT register.
7. Request header frame ID transmission by writing the protected identifier value to UART_DAT register.
8. Wait until the RDAIF (UART_INTSTS[0]) is set to “1” by hardware and then read back the UART_DAT register.

LIN Break and Delimiter Detection

When software enables the break detection function by setting BRKDETEN (UART_LINCTL[10]), the break detection circuit is activated. The break detection circuit is totally independent from the UART receiver.

When the break detection function is enabled, the circuit looks at the input UART_RX pin for a start signal. If UART LIN controller detects consecutive dominant is greater than 11 bits dominant followed by a recessive bit (delimiter), the BRKDETF (UART_LINSTS[8]) flag is set at the end of break field. If the LINIEN (UART_INTEN[8]) bit is set to 1, an interrupt LININT (UART_INTSTS[15]) will be generated. The behavior of the break detection and break flag are shown in Figure 6.15-19.

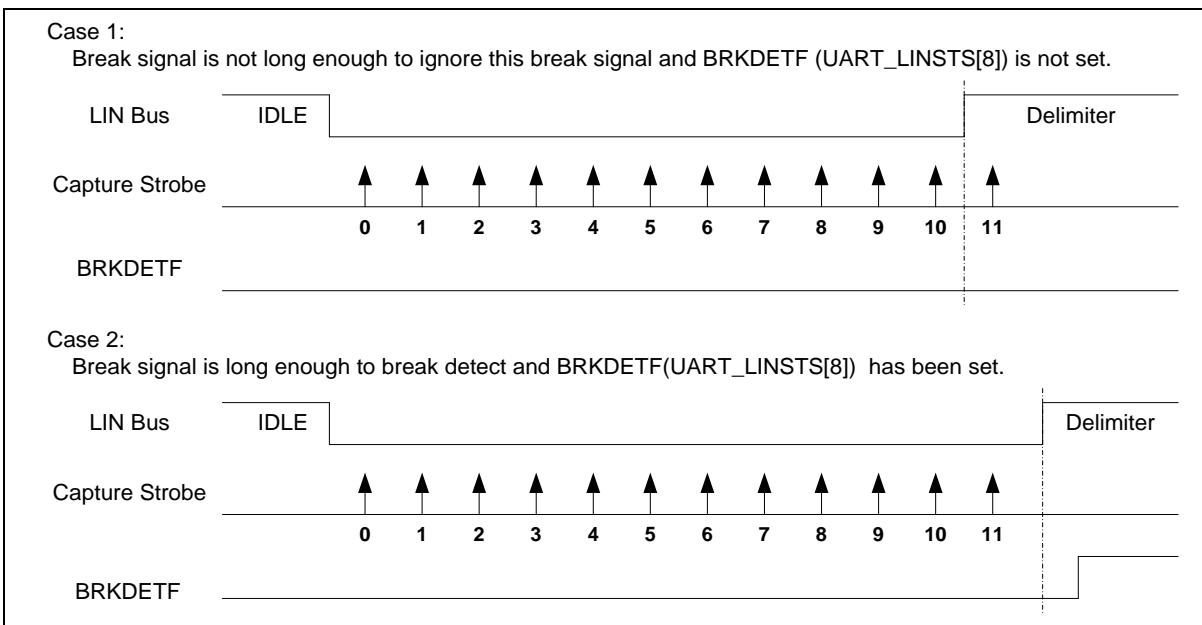

Figure 6.15-19 Break Detection in LIN Mode

LIN Frame ID and Parity Format

The LIN frame ID value in LIN function mode is shown, the frame ID parity can be generated by software or hardware depends on IDPEN (UART_LINCTL[9]).

If the parity generated by hardware (IDPEN (UART_LINCTL[9])=1), user fill ID0~ID5 (UART_LINCTL [29:24]) hardware will calculate P0 (UART_LINCTL[30]) and P1 (UART_LINCTL[31]) otherwise user must filled frame ID and parity in this field.

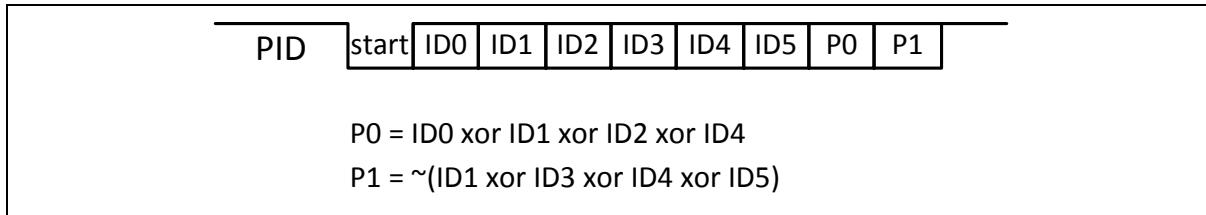

Figure 6.15-20 LIN Frame ID and Parity Format

LIN Slave Mode

The UART Controller supports LIN Slave mode. To enable and initialize the LIN Slave mode, the following steps are necessary:

1. Set the UART_BAUD register to select the desired baud rate.
2. Configure the data length to 8 bits by setting WLS (UART_LINE[1:0]) to '11' and disable parity check by clearing PBE (UART_LINE[3]) bit and configure with one stop bit by clearing NSB (UART_LINE[2]) bit.
3. Select LIN function mode by setting FUNCSEL (UART_FUNCSEL[1:0]) to '01'.
4. Enable LIN slave mode by setting the SLVEN (UART_LINCTL[0]) to 1.

LIN Header Reception

According to the LIN protocol, a slave node must wait for a valid header which comes from the master node. Next the slave task will take one of following actions (depend on the master header frame ID value).

- Receive the response.
- Transmit the response.
- Ignore the response and wait for next header.

In LIN Slave mode, user can enable the slave header detection function by setting the SLVHDEN (UART_LINCTL[1]) to detect complete frame header (receive “break field”, “sync field” and “frame ID field”). When a LIN header is received, the SLVHDETF (UART_LINSTS[0]) flag will be set. If the LINIEN (UART_INTEN[8]) bit is set to 1, an interrupt will be generated. User can enable the frame ID parity check function by setting IDPEN (UART_LINCTL[9]). If only received frame ID parity is not correct (break and sync filed are correct), the SLVIDPEF (UART_LINSTS[2]) flag is set to ‘1’. If the LINIEN(UART_INTEN[8]) is set to 1, an interrupt will be generated and SLVHDETF (UART_LINSTS[0]) is set to ‘1’. User can also put LIN in mute mode by setting MUTE (UART_LINCTL[4]) to ‘1’. This mode allows detection of headers only (break + sync + frame ID) and prevents the reception of any other characters. In order to avoid bit rate tolerance, the controller supports automatic resynchronization function to avoid clock deviation error, user can enable this feature by setting SLVAREN (UART_LINCTL[2]).

LIN Response Transmission

The LIN slave node can transmit response and receive response. When slave node is the publisher of the response, the slave node sends response by filling data to the UART_DAT register. If the slave node is the subscriber of the response, the slave node receives data from LIN bus.

LIN Header Time-out Error

The LIN slave controller contains a header time-out counter. If the entire header is not received within the maximum time limit of 57 bit times, the header error flag SLVHEF (UART_LINSTS [1]) will be set. The time-out counter is enabled at each break detect edge and stopped in the following conditions.

- A LIN frame ID field has been received.
- The header error flag asserts.
- Writing 1 to the SLVSYNCF (UART_LINSTS[3]) to re-search a new frame header.

Mute Mode and LIN Exit from Mute Mode Condition

In Mute mode, a LIN slave node will not receive any data until specified condition occurred. It allows header detection only and prevents the reception of any other characters. User can enable Mute mode by setting the MUTE (UART_LINCTL[4]) and exiting from Mute mode condition can be selected by HSEL (UART_LINCTL[23:22]).

Note: It is recommended to set LIN slave node to Mute mode after checksum transmission.

The LIN slave controller exiting from Mute mode is described as follows: If HSEL (UART_LINCTL[23:22]) is set to “break field”, when LIN slave controller detects a valid LIN break + delimiter, the controller will enable the receiver (exit from Mute mode) and subsequent data (sync data, frame ID data, response data) are received in RX FIFO.

If HSEL (UART_LINCTL[23:22]) is set to “break field and sync field”, when the LIN slave controller detects a valid LIN break + delimiter followed by a valid sync field without frame error, the controller will enable the receiver (exit from mute mode) and subsequent data(ID data, response data) are received in RX FIFO. If HSEL (UART_LINCTL[23:22]) is set to “break field, sync field and ID field”, when the LIN slave controller detects a valid LIN break + delimiter and valid sync field without frame error followed by ID data without frame error and received ID data matched PID (UART_LINCTL[31:24]) value. The controller will enable the receiver (exit from mute mode) and subsequent data (response data) are received in RX FIFO.

Slave Mode Non-automatic Resynchronization (NAR)

User can disable the automatic resynchronization function to fix the communication baud rate. When operating in Non-Automatic Resynchronization mode, software needs some initial process, and the initialization process flow of Non-Automatic Resynchronization mode is shown as follows:

1. Select the desired baud rate by setting the UART_BAUD register.
2. Select LIN function mode by setting FUNCSEL (UART_FUNCSEL[1:0]) to '01'.
3. Disable automatic resynchronization function by setting SLVAREN (UART_LINCTL[2]) is set to 0.
4. Enable LIN slave mode by setting the SLVEN (UART_LINCTL[0]) is set to 1.

Slave Mode with Automatic Resynchronization (AR)

In Automatic Resynchronization (AR) mode, the controller will adjust the baud rate generator after each sync field reception. The initialization process flow of Automatic Resynchronization mode is shown as follows:

1. Select the desired baud rate by setting the UART_BAUD register.
2. Select LIN function mode by setting UART_FUNCSEL (UART_FUNCSEL[1:0]) to '01'.
3. Enable automatic resynchronization function by setting SLVAREN (UART_LINCTL[2]) to '1'.
4. Enable LIN slave mode by setting the SLVEN (UART_LINCTL[0]) is set to '1'.

When the automatic resynchronization function is enabled, after each LIN break field, the time duration between five falling edges is sampled on peripheral clock and the result of this measurement is stored in an internal 13-bit register and the UART_BAUD register value will be automatically updated at the end of the fifth falling edge. If the measure timer (13-bit) overflows before five falling edges, then the header error flag SLVHEF (UART_LINSTS [1]) will be set.

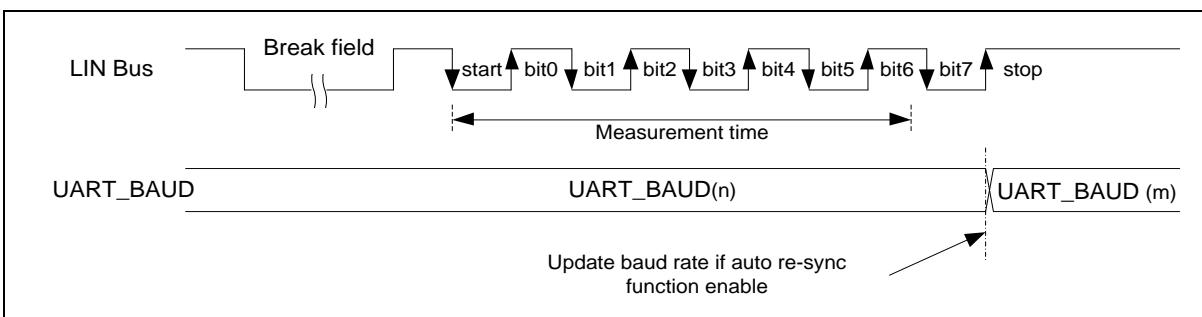

Figure 6.15-21 LIN Sync Field Measurement

When operating in Automatic Resynchronization (AR) mode, software must select the desired baud rate by setting the UART_BAUD register and hardware will store it at internal TEMP_REG register, after each LIN break field, the time duration between five falling edges is sampled on peripheral clock and the result of this measurement is stored in an internal 13-bit register BAUD_LIN and the result will be updated to UART_BAUD register automatically.

To guarantee the transmission baud rate, the baud rate generator must reload the initial value before each new break reception. The initial value is programmed by the application during initialization (TEMP_REG). User can set SLVDUEN (UART_LINCTL [3]) to enable auto reload initial baud rate value function. If the SLVDUEN (UART_LINCTL [3]) is set, when received the next character, hardware will auto reload the initial value to UART_BAUD, and when the UART_BAUD be updated, the SLVDUEN (UART_LINCTL [3]) will be cleared automatically. The behavior of LIN updated method as shown Figure 6.15-22.

Note1: It is recommended to set the SLVDUEN bit before every checksum reception.

Note2: When a header error is detected, user must write 1 to SLVSYNCF (UART_LINSTS[3]) to re-search new frame header. When writing 1 to it, hardware will reload the initial baud rate TEMP_REG and re-search new frame header.

Note3: When operating in Automatic Resynchronization mode, the baud rate setting must be operated at mode2 (BAUDM1 (UART_BAUD [29]) and BAUDM0 (UART_BAUD[28]) must be 1).

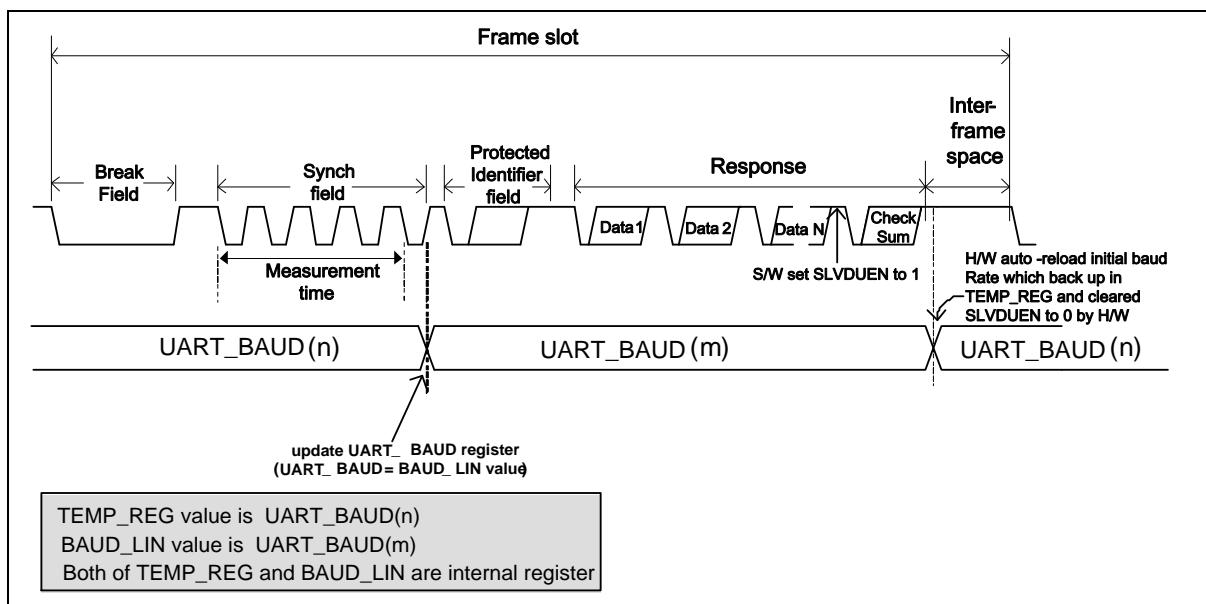

Figure 6.15-22 UART_BAUD Update Sequence in AR mode if SLVDUEN is 1

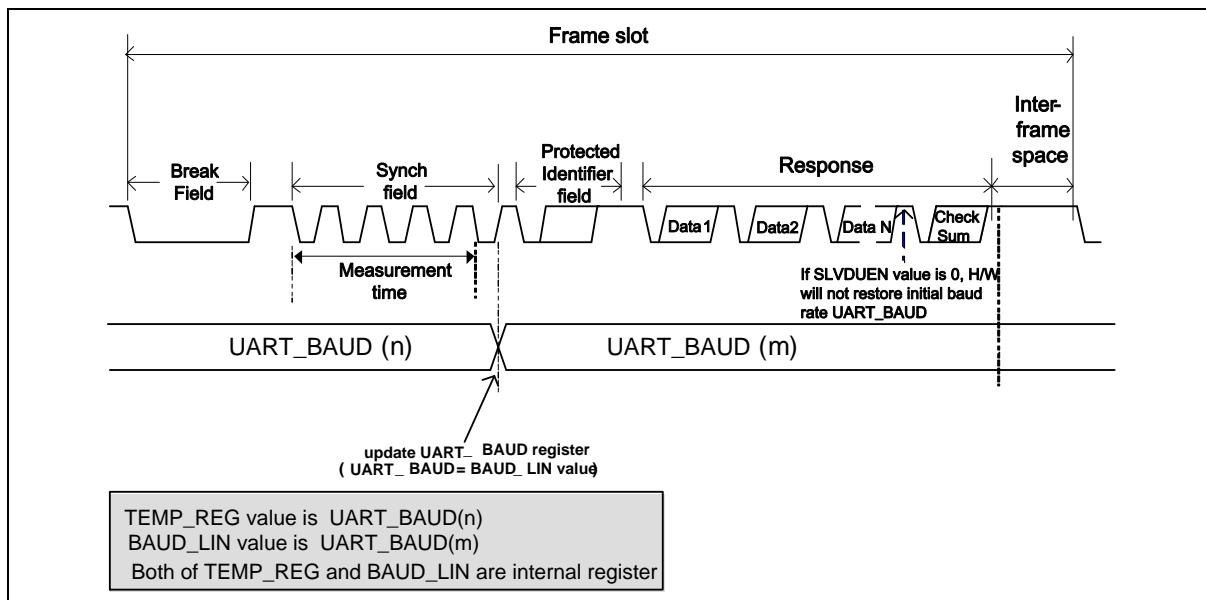

Figure 6.15-23 UART_BAUD Update Sequence in AR mode if SLVDUEN is 0

Deviation Error on the Sync Field

When operating in Automatic Resynchronization mode, the controller will check the deviation error on the sync field. The deviation error is checked by comparing the current baud rate with the received sync field. Two checks are performed in parallel.

Check1: Based on measurement between the first falling edge and the last falling edge of the sync field.

- If the difference is more than 14.84%, the header error flag SLVHEF (UART_LINSTS[1]) will be set.
- If the difference is less than 14.06%, the header error flag SLVHEF (UART_LINSTS[1]) will not be set.

- If the difference is between 14.84% and 14.06%, the header error flag SLVHEF (UART_LINSTS[1]) may either set or not.

Check2: Based on measurement of time between each falling edge of the sync field.

- If the difference is more than 18.75%, the header error flag SLVHEF (UART_LINSTS[1]) will be set.
- If the difference is less than 15.62%, the header error flag SLVHEF (UART_LINSTS[1]) will not be set.
- If the difference is between 18.75% and 15.62%, the header error flag SLVHEF (UART_LINSTS[1]) may either set or not.

Note: The deviation check is based on the current baud rate clock. Therefore, in order to guarantee correct deviation checking, the baud rate must reload the nominal value before each new break reception by setting SLVDUEN (UART_LINCTL[3]) register (It is recommend setting the SLVDUEN (UART_LINCTL[3]) bit before every checksum reception).

LIN Header Error Detection

In LIN Slave function mode, when user enables the header detection function by setting the SLVHDEN (UART_LINCTL[1]), hardware will handle the header detect flow. If the header has an error, the LIN header error flag SLVHEF (UART_LINSTS[1]) will be set and an interrupt is generated if the LINIEN (UART_INTEN[8]) bit is set. When header error is detected, user must reset the detect circuit to re-search a new frame header by writing 1 to SLVSYNCF (UART_LINSTS[3]) to re-search a new frame header.

The LIN header error flag SLVHEF (UART_LINSTS[1]) is set if one of the following conditions occurs:

- Break Delimiter is too short (less than 0.5-bit time).
- Frame error in sync field or Identifier field.
- The sync field data is not 0x55 (Non-Automatic Resynchronization mode).
- The sync field deviation error (With Automatic Resynchronization mode).
- The sync field measure time-out (With Automatic Resynchronization mode).
- LIN header reception time-out.

6.15.5.10 RS-485 Function Mode

Another alternate function of UART controller is RS-485 function (user must set UART_FUNCSEL [1:0] to '11' to enable RS-485 function), and direction control provided by nRTS pin from an asynchronous serial port. The RS-485 transceiver control is implemented by using the nRTS control signal to enable the RS-485 driver. Many characteristics of the RX and TX are same as UART in RS-485 mode.

The UART controller can be configured as an RS-485 addressable slave and the RS-485 master transmitter will identify an address character by setting the parity (9-th bit) to 1. For data characters, the parity is set to 0. Software can use UART_LINE register to control the 9-th bit (When the PBE, EPE and SPE are set, the 9-th bit is transmitted 0 and when PBE and SPE are set and EPE is cleared, the 9-th bit is transmitted 1).

The controller supports three operation modes: RS-485 Normal Multidrop Operation Mode (NMM), RS-485 Auto Address Detection Operation Mode (AAD) and RS-485 Auto Direction Control Operation Mode (AUD). Software can choose any operation mode by programming the UART_ALTCTL register, and drive the transfer delay time between the last stop bit leaving the TX FIFO and the de-assertion of by setting DLY (UART_TOUT [15:8]) register.

RS-485 Normal Multidrop Operation Mode (NMM)

In RS-485 Normal Multidrop Operation Mode (RS485NMM (UART_ALTCTL[8]) = 1), in first, software must decide the data which before the address byte be detected will be stored in RX FIFO or not. If software wants to ignore any data before address byte detected, the flow is set RXOFF (UART_FIFO

[8]) then enable RS485NMM (UART_ALTCTL [8]) and the receiver will ignore any data until an address byte is detected (bit 9 = 1) and the address byte data will be stored in the RX FIFO. If software wants to receive any data before address byte detected, the flow is disables RXOFF (UART_FIFO [8]) then enable RS485NMM (UART_ALTCTL [8]) and the receiver will received any data.

If an address byte is detected (bit 9 = 1), it will generate an interrupt to CPU and RXOFF (UART_FIFO [8]) can decide whether accepting the following data bytes are stored in the RX FIFO. If software disables receiver by setting RXOFF (UART_FIFO [8]) register, when a next address byte is detected, the controller will clear the RXOFF (UART_FIFO [8]) bit and the address byte data will be stored in the RX FIFO.

RS-485 Auto Address Detection Operation Mode (AAD)

In RS-485 Auto Address Detection Operation Mode (RS485AAD (UART_ALTCTL[9]) = 1), the receiver will ignore any data until an address byte is detected (bit 9 = 1) and the address byte data matches the ADDRMV (UART_ALTCTL[31:24]) value. The address byte data will be stored in the RX FIFO. The all received byte data will be accepted and stored in the RX FIFO until an address byte data not match the ADDRMV (UART_ALTCTL[31:24]) value.

RS-485 Auto Direction Function (AUD)

Another option function of RS-485 controllers is RS-485 auto direction control function (RS485AUD (UART_ALTCTL[10] = 1). The RS-485 transceiver control is implemented by using the nRTS control signal from an asynchronous serial port. The nRTS line is connected to the RS-485 transceiver enable pin such that setting the nRTS line to high (logic 1) enables the RS-485 transceiver. Setting the nRTS line to low (logic 0) puts the transceiver into the tri-state condition to disabled. User can set RTSACTLV in UART_MODEM register to change the nRTS driving level.

Figure 6.15-24 demonstrates the RS-485 nRTS driving level in AUD mode. The nRTS pin will be automatically driven during TX data transmission.

Setting RTSACTLV(UART_MODEM[9]) can control nRTS pin output driving level. User can read the RTSSTS(UART_MODEM[13]) bit to get real nRTS pin output voltage logic status.

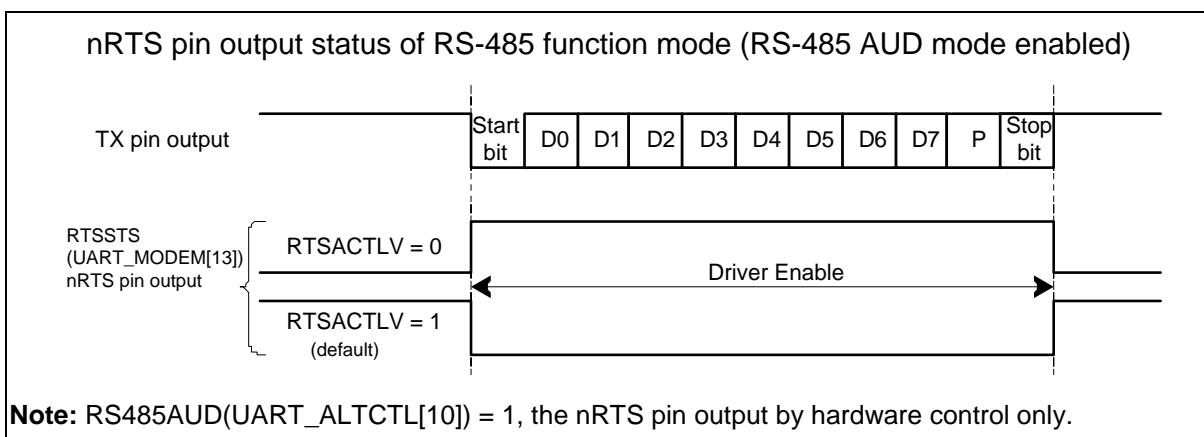

Figure 6.15-24 RS-485 nRTS Driving Level in Auto Direction Mode

Figure 6.15-25 demonstrates the RS-485 nRTS driving level in software control (RS485AUD (UART_ALTCTL[10])=0). The nRTS driving level is controlled by programing the RTS(UART_MODEM[1]) control bit.

Setting RTSACTLV (UART_MODEM[9]) can control the nRTS pin output is inverse or non-inverse from RTS(UART_MODEM[1]) control bit. User can read the RTSSTS (UART_MODEM[13]) bit to get real nRTS pin output voltage logic status. The structure of RS-485 frame is shown in Figure 6.15-26.

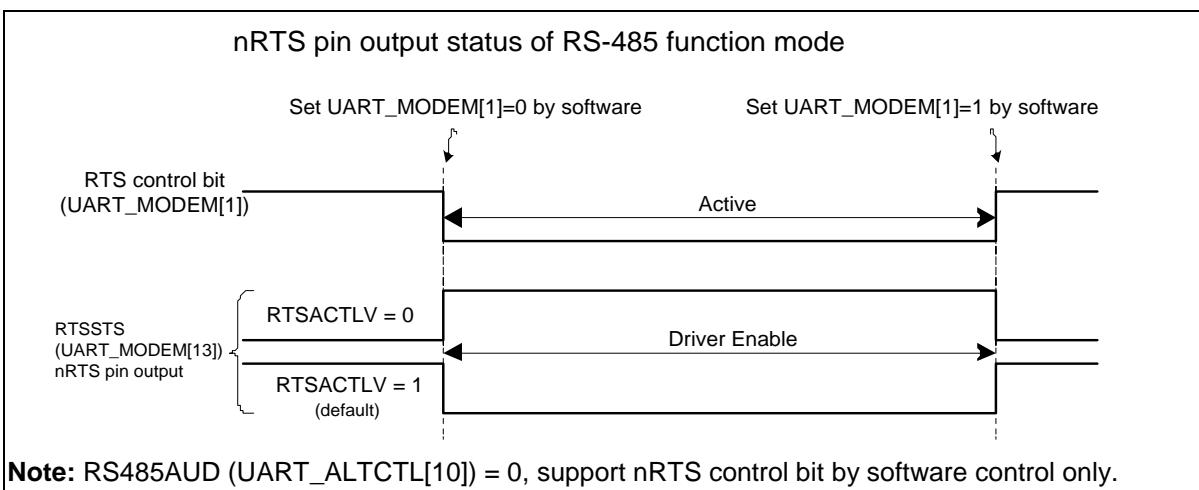

Figure 6.15-25 RS-485 nRTS Driving Level with Software Control

Programming Sequence Example:

1. Program FUNCSEL in UART_FUNCSEL to select RS-485 function.
2. Program the RXOFF (UART_FIFO[8]) to determine enable or disable the receiver RS-485 receiver.
3. Program the RS485NMM (UART_ALTCTL[8]) or RS485AAD (UART_ALTCTL[9]) mode.
4. If the RS485AAD (UART_ALTCTL[9]) mode is selected, the ADDRMRV (UART_ALTCTL[31:24]) is programmed for auto address match value.
5. Determine auto direction control by programming RS485AUD (UART_ALTCTL[10]).

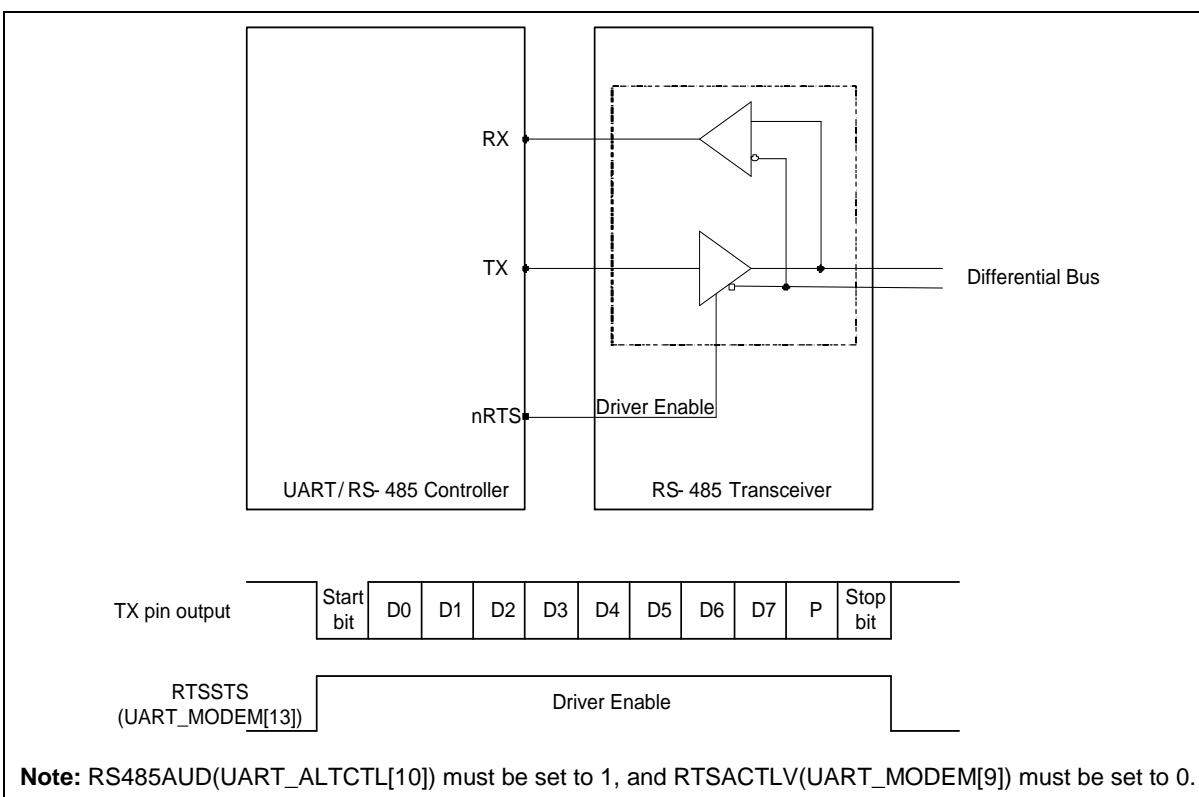

Figure 6.15-26 Structure of RS-485 Frame

6.15.5.11 PDMA Transfer Function

The UART controller supports PDMA transfer function.

By configuring PDMA parameter and set UART_DAT as the PDMA destination address. When TXPDMAEN (UART_INTEN[14]) is set to 1, the controller will issue request to PDMA controller to start the PDMA transmission process automatically.

By configuring PDMA parameter and set UART_DAT as the PDMA source address. When RXPDMAEN (UART_INTEN[15]) is set to 1, the controller will start the PDMA reception process. UART controller will issue request to PDMA controller automatically when there is data in the RX FIFO buffer.

Note: If STOPn (PDMA_STOP[n]) is set to stop UART RXPDMA task and the UART receive is not finish. UART controller will complete the transfer and stored current receive data in receive buffer. By reading RXEMPTY (UART_FIFOSTS[14]) to check there is valid data in receive buffer or not.

6.15.6 Register Map

Bits	Description	
[31:9]	Reserved	Reserved.
[8]	CTSACTLV	<p>nCTS Pin Active Level This bit defines the active level state of nCTS pin input. 0 = nCTS pin input is high level active. 1 = nCTS pin input is low level active. (Default)</p> <p>Note: Before setting this bit, TXRXDIS (UART_FUNCSEL[3]) should be set then waited for TXRXACT (UART_FIFOSTS[31]) is cleared. When the configuration is done, cleared TXRXDIS (UART_FUNCSEL[3]) to activate UART controller.</p>
[7:5]	Reserved	Reserved.
[4]	CTSSTS	<p>nCTS Pin Status (Read Only) This bit mirror from nCTS pin input of voltage logic status. 0 = nCTS pin input is low level voltage logic state. 1 = nCTS pin input is high level voltage logic state.</p> <p>Note: This bit echoes when UART controller peripheral clock is enabled, and nCTS multi-function port is selected.</p>
[3:1]	Reserved	Reserved.
[0]	CTSDETF	<p>Detect nCTS State Change Flag This bit is set whenever nCTS input has change state, and it will generate Modem interrupt to CPU when MODEMIEN (UART_INTEN [3]) is set to 1. 0 = nCTS input has not change state. 1 = nCTS input has change state.</p> <p>Note: This bit can be cleared by writing "1" to it.</p>

UART FIFO Status Register (UART_FIFOSTS)

Register	Offset	R/W	Description				Reset Value
UART_FIFOSTS x=0,1,2,3,4,5	UARTx_BA+0x18	R/W	UART FIFO Status Register				0xB040_4000

31	30	29	28	27	26	25	24
TXRXACT	Reserved	RXIDLE	TXEMPTYF	Reserved		TXOVIF	
23	22	21	20	19	18	17	16
TXFULL	TXEMPTY	TXPTR					
15	14	13	12	11	10	9	8
RXFULL	RXEMPTY	RXPTR					
7	6	5	4	3	2	1	0
Reserved	BIF	FEF	PEF	ADDRDETF	ABRDTOIF	ABRDIF	RXOVIF

Bits	Description
[31]	TXRXACT TX and RX Active Status (Read Only) This bit indicates TX and RX are active or inactive. 0 = TX and RX are inactive. 1 = TX and RX are active. (Default) Note: When TXRXDIS (UART_FUNCSEL[3]) is set and both TX and RX are in idle state, this bit is cleared. The UART controller can not transmit or receive data at this moment. Otherwise this bit is set.
[30]	Reserved.
[29]	RXIDLE RX Idle Status (Read Only) This bit is set by hardware when RX is idle. 0 = RX is busy. 1 = RX is idle. (Default)
[28]	TXEMPTYF Transmitter Empty Flag (Read Only) This bit is set by hardware when TX FIFO (UART_DAT) is empty and the STOP bit of the last byte has been transmitted. 0 = TX FIFO is not empty or the STOP bit of the last byte has been not transmitted. 1 = TX FIFO is empty and the STOP bit of the last byte has been transmitted. Note: This bit is cleared automatically when TX FIFO is not empty or the last byte transmission has not completed.
[27:25]	Reserved.
[24]	TXOVIF TX Overflow Error Interrupt Flag If TX FIFO (UART_DAT) is full, an additional write to UART_DAT will cause this bit to logic 1. 0 = TX FIFO is not overflow. 1 = TX FIFO is overflow. Note: This bit can be cleared by writing "1" to it.
[23]	TXFULL Transmitter FIFO Full (Read Only)

		This bit indicates TX FIFO full or not. 0 = TX FIFO is not full. 1 = TX FIFO is full. Note: This bit is set when the number of usage in TX FIFO Buffer is equal to 16, otherwise it is cleared by hardware.
[22]	TXEMPTY	Transmitter FIFO Empty (Read Only) This bit indicates TX FIFO empty or not. 0 = TX FIFO is not empty. 1 = TX FIFO is empty. Note: When the last byte of TX FIFO has been transferred to Transmitter Shift Register, hardware sets this bit high. It will be cleared when writing data into UART_DAT (TX FIFO not empty).
[21:16]	TXPTR	TX FIFO Pointer (Read Only) This field indicates the TX FIFO Buffer Pointer. When CPU writes one byte into UART_DAT, TXPTR increases one. When one byte of TX FIFO is transferred to Transmitter Shift Register, TXPTR decreases one. The Maximum value shown in TXPTR is 15. When the using level of TX FIFO Buffer equal to 16, the TXFULL bit is set to 1 and TXPTR will show 0. As one byte of TX FIFO is transferred to Transmitter Shift Register, the TXFULL bit is cleared to 0 and TXPTR will show 15.
[15]	RXFULL	Receiver FIFO Full (Read Only) This bit initiates RX FIFO full or not. 0 = RX FIFO is not full. 1 = RX FIFO is full. Note: This bit is set when the number of usage in RX FIFO Buffer is equal to 16, otherwise it is cleared by hardware.
[14]	RXEMPTY	Receiver FIFO Empty (Read Only) This bit initiate RX FIFO empty or not. 0 = RX FIFO is not empty. 1 = RX FIFO is empty. Note: When the last byte of RX FIFO has been read by CPU, hardware sets this bit high. It will be cleared when UART receives any new data.
[13:8]	RXPTR	RX FIFO Pointer (Read Only) This field indicates the RX FIFO Buffer Pointer. When UART receives one byte from external device, RXPTR increases one. When one byte of RX FIFO is read by CPU, RXPTR decreases one. The Maximum value shown in RXPTR is 15. When the using level of RX FIFO Buffer equal to 16, the RXFULL bit is set to 1 and RXPTR will show 0. As one byte of RX FIFO is read by CPU, the RXFULL bit is cleared to 0 and RXPTR will show 15.
[7]	Reserved	Reserved.
[6]	BIF	Break Interrupt Flag This bit is set to logic 1 whenever the received data input (RX) is held in the “spacing state” (logic 0) for longer than a full word transmission time (that is, the total time of “start bit” + data bits + parity + stop bits). 0 = No Break interrupt is generated. 1 = Break interrupt is generated. Note: This bit can be cleared by writing “1” to it.
[5]	FEF	Framing Error Flag This bit is set to logic 1 whenever the received character does not have a valid “stop bit” (that is, the stop bit following the last data bit or parity bit is detected as logic 0). 0 = No framing error is generated.

		1 = Framing error is generated. Note: This bit can be cleared by writing "1" to it.
[4]	PEF	Parity Error Flag This bit is set to logic 1 whenever the received character does not have a valid "parity bit". 0 = No parity error is generated. 1 = Parity error is generated. Note: This bit can be cleared by writing "1" to it.
[3]	ADDRDETF	RS-485 Address Byte Detect Flag 0 = Receiver detects a data that is not an address bit (bit 9 ='0'). 1 = Receiver detects a data that is an address bit (bit 9 ='1'). Note1: This field is used for RS-485 function mode and ADDRDEN (UART_ALTCTL[15]) is set to 1 to enable Address detection mode. Note2: This bit can be cleared by writing "1" to it.
[2]	ABRDTOIF	Auto-baud Rate Detect Time-out Interrupt Flag This bit is set to logic "1" in Auto-baud Rate Detect mode when the baud rate counter is overflow. 0 = Auto-baud rate counter is underflow. 1 = Auto-baud rate counter is overflow. Note: This bit can be cleared by writing "1" to it.
[1]	ABRDIF	Auto-baud Rate Detect Interrupt Flag This bit is set to logic "1" when auto-baud rate detect function is finished. 0 = Auto-baud rate detect function is not finished. 1 = Auto-baud rate detect function is finished. Note: This bit can be cleared by writing "1" to it.
[0]	RXOVIF	RX Overflow Error Interrupt Flag This bit is set when RX FIFO overflow. If the number of bytes of received data is greater than RX_FIFO (UART_DAT) size 16 bytes, this bit will be set. 0 = RX FIFO is not overflow. 1 = RX FIFO is overflow. Note: This bit can be cleared by writing "1" to it.

UART Interrupt Status Register (UART_INTSTS)

LINIF	WKIF	BUFERRIF	RXTOIF	MODEMIF	RLSIF	THREIF	RDAIF

Bits	Description
[31]	ABRINT Auto-baud Rate Interrupt Indicator (Read Only) This bit is set if ABRIEN (UART_INTEN[18]) and ABRIF (UART_ALTCTL[17]) are both set to 1. 0 = No Auto-baud Rate interrupt is generated. 1 = The Auto-baud Rate interrupt is generated.
[30]	TXENDINT Transmitter Empty Interrupt Indicator (Read Only) This bit is set if TXENDIEN (UART_INTEN[22]) and TXENDIF(UART_INTSTS[22]) are both set to 1. 0 = No Transmitter Empty interrupt is generated. 1 = Transmitter Empty interrupt is generated.
[29]	HWBUFEINT PDMA Mode Buffer Error Interrupt Indicator (Read Only) This bit is set if BUFERRIEN (UART_INTEN[5]) and HWBUFEIF (UART_INTSTS[21]) are both set to 1. 0 = No buffer error interrupt is generated in PDMA mode. 1 = Buffer error interrupt is generated in PDMA mode.
[28]	HWTOINT PDMA Mode RX Time-out Interrupt Indicator (Read Only) This bit is set if RXTOIEN (UART_INTEN[4]) and HWTOIF(UART_INTSTS[20]) are both set to 1. 0 = No RX time-out interrupt is generated in PDMA mode. 1 = RX time-out interrupt is generated in PDMA mode.
[27]	HWMODINT PDMA Mode MODEM Status Interrupt Indicator (Read Only) This bit is set if MODEMIEN (UART_INTEN[3]) and HWMODIF(UART_INTSTS[19]) are both set to 1. 0 = No Modem interrupt is generated in PDMA mode. 1 = Modem interrupt is generated in PDMA mode.
[26]	HWRLSINT PDMA Mode Receive Line Status Interrupt Indicator (Read Only) This bit is set if RLSIEN (UART_INTEN[2]) and HWRLSIF(UART_INTSTS[18]) are both set to 1.

		0 = No RLS interrupt is generated in PDMA mode. 1 = RLS interrupt is generated in PDMA mode.
[25:23]	Reserved	Reserved.
[22]	TXENDIF	<p>Transmitter Empty Interrupt Flag</p> <p>This bit is set when TX FIFO (UART_DAT) is empty and the STOP bit of the last byte has been transmitted (TXEMPTYF (UART_FIFOSTS[28]) is set). If TXENDIEN (UART_INTEN[22]) is enabled, the Transmitter Empty interrupt will be generated.</p> <p>0 = No transmitter empty interrupt flag is generated. 1 = Transmitter empty interrupt flag is generated.</p> <p>Note: This bit is cleared automatically when TX FIFO is not empty or the last byte transmission has not completed.</p>
[21]	HWBUFEIF	<p>PDMA Mode Buffer Error Interrupt Flag (Read Only)</p> <p>This bit is set when the TX or RX FIFO overflows (TXOVIF (UART_FIFOSTS [24]) or RXOVIF (UART_FIFOSTS[0]) is set). When BUERRIF (UART_INTSTS[5]) is set, the transfer maybe is not correct. If BUERRIEN (UART_INTEN [5]) is enabled, the buffer error interrupt will be generated.</p> <p>0 = No buffer error interrupt flag is generated in PDMA mode. 1 = Buffer error interrupt flag is generated in PDMA mode.</p> <p>Note: This bit is cleared when both TXOVIF (UART_FIFOSTS[24])) and RXOVIF (UART_FIFOSTS[0]) are cleared.</p>
[20]	HWTOIF	<p>PDMA Mode RX Time-out Interrupt Flag (Read Only)</p> <p>This bit is set when the RX FIFO is not empty and no activities occurred in the RX FIFO and the time-out counter equal to TOIC (UART_TOUT[7:0]). If RXTOIEN (UART_INTEN [4]) is enabled, the RX time-out interrupt will be generated .</p> <p>0 = No RX time-out interrupt flag is generated in PDMA mode. 1 = RX time-out interrupt flag is generated in PDMA mode.</p> <p>Note: This bit is read only and user can read UART_DAT (RX is in active) to clear it.</p>
[19]	HWMODIF	<p>PDMA Mode MODEM Interrupt Flag (Read Only)</p> <p>This bit is set when the nCTS pin has state change (CTSDETF (UART_MODEMSTS [0] =1)). If MODEMIEN (UART_INTEN [3]) is enabled, the Modem interrupt will be generated.</p> <p>0 = No Modem interrupt flag is generated in PDMA mode. 1 = Modem interrupt flag is generated in PDMA mode.</p> <p>Note: This bit is read only and reset to 0 when the bit CTSDETF (UART_MODEMSTS[0]) is cleared by writing 1 on CTSDETF (UART_MODEMSTS [0]).</p>
[18]	HWRLSIF	<p>PDMA Mode Receive Line Status Flag (Read Only)</p> <p>This bit is set when the RX receive data have parity error, frame error or break error (at least one of 3 bits, BIF (UART_FIFOSTS[6]), FEF (UART_FIFOSTS[5]) and PEF (UART_FIFOSTS[4]) is set). If RLSIEN (UART_INTEN [2]) is enabled, the RLS interrupt will be generated.</p> <p>0 = No RLS interrupt flag is generated in PDMA mode. 1 = RLS interrupt flag is generated in PDMA mode.</p> <p>Note1: In RS-485 function mode, this field include "receiver detect any address byte received address byte character (bit9 = '1') bit".</p> <p>Note2: In UART function mode, this bit is read only and reset to 0 when all bits of BIF(UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]) and PEF(UART_FIFOSTS[4]) are cleared.</p> <p>Note3: In RS-485 function mode, this bit is read only and reset to 0 when all bits of BIF(UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]), PEF(UART_FIFOSTS[4]) and ADDRDETF (UART_FIFOSTS[3]) are cleared.</p>
[17:16]	Reserved	Reserved.
[15]	LININT	LIN Bus Interrupt Indicator (Read Only)

		This bit is set if LINIEN (UART_INTEN[8]) and LINIF(UART_INTSTS[7]) are both set to 1. 0 = No LIN Bus interrupt is generated. 1 = The LIN Bus interrupt is generated.
[14]	WKINT	UART Wake-up Interrupt Indicator (Read Only) This bit is set if WKIEN (UART_INTEN[6]) and WKIF (UART_INTSTS[6]) are both set to 1. 0 = No UART wake-up interrupt is generated. 1 = UART wake-up interrupt is generated.
[13]	BUFERRINT	Buffer Error Interrupt Indicator (Read Only) This bit is set if BUFERRIEN(UART_INTEN[5]) and BUFERRIF(UART_INTSTS[5]) are both set to 1. 0 = No buffer error interrupt is generated. 1 = Buffer error interrupt is generated.
[12]	RXTOINT	RX Time-out Interrupt Indicator (Read Only) This bit is set if RXTOIEN (UART_INTEN[4]) and RXTOIF(UART_INTSTS[4]) are both set to 1. 0 = No RX time-out interrupt is generated. 1 = RX time-out interrupt is generated.
[11]	MODEMINT	MODEM Status Interrupt Indicator (Read Only) This bit is set if MODEMIEN(UART_INTEN[3]) and MODEMIF(UART_INTSTS[3]) are both set to 1 0 = No Modem interrupt is generated. 1 = Modem interrupt is generated..
[10]	RLSINT	Receive Line Status Interrupt Indicator (Read Only) This bit is set if RLSIEN (UART_INTEN[2]) and RLSIF(UART_INTSTS[2]) are both set to 1. 0 = No RLS interrupt is generated. 1 = RLS interrupt is generated.
[9]	THREINT	Transmit Holding Register Empty Interrupt Indicator (Read Only) This bit is set if THREIEN (UART_INTEN[1]) and THREIF(UART_INTSTS[1]) are both set to 1. 0 = No THRE interrupt is generated. 1 = THRE interrupt is generated.
[8]	RDAINT	Receive Data Available Interrupt Indicator (Read Only) This bit is set if RDIAIEN (UART_INTEN[0]) and RDIAIF (UART_INTSTS[0]) are both set to 1. 0 = No RDA interrupt is generated. 1 = RDA interrupt is generated.
[7]	LINIF	LIN Bus Interrupt Flag This bit is set when LIN slave header detect (SLVHDETF (UART_LINSTS[0] =1)), LIN break detect (BRKDETF(UART_LINSTS[8]=1)), bit error detect (BITEF(UART_LINSTS[9]=1)), LIN slave ID parity error (SLVIDPEF(UART_LINSTS[2] = 1)) or LIN slave header error detect (SLVHEF (UART_LINSTS[1])). If LINIEN (UART_INTEN [8]) is enabled the LIN interrupt will be generated. 0 = None of SLVHDETF, BRKDETF, BITEF, SLVIDPEF and SLVHEF is generated. 1 = At least one of SLVHDETF, BRKDETF, BITEF, SLVIDPEF and SLVHEF is generated. Note: This bit is cleared when SLVHDETF(UART_LINSTS[0]), BRKDETF(UART_LINSTS[8]), BITEF(UART_LINSTS[9]), SLVIDPEF (UART_LINSTS[2]) and SLVHEF(UART_LINSTS[1]) all are cleared and software writing '1' to

		LINIF(UART_INTSTS[7]).
[6]	WKIF	<p>UART Wake-up Interrupt Flag (Read Only) This bit is set when TOUTWKF (UART_WKSTS[4]), RS485WKF (UART_WKSTS[3]), RFRTWKF (UART_WKSTS[2]), DATWKF (UART_WKSTS[1]) or CTSWKF(UART_WKSTS[0]) is set to 1. 0 = No UART wake-up interrupt flag is generated. 1 = UART wake-up interrupt flag is generated.</p> <p>Note: This bit is cleared if all of TOUTWKF, RS485WKF, RFRTWKF, DATWKF and CTSWKF are cleared to 0 by writing 1 to the corresponding interrupt flag.</p>
[5]	BUFERRIF	<p>Buffer Error Interrupt Flag (Read Only) This bit is set when the TX FIFO or RX FIFO overflows (TXOVIF (UART_FIFOSTS[24]) or RXOVIF (UART_FIFOSTS[0]) is set). When BUFERRIEN (UART_INTEN [5]) is set, the transfer is not correct. If BUFERRIEN (UART_INTEN [5]) is enabled, the buffer error interrupt will be generated. 0 = No buffer error interrupt flag is generated. 1 = Buffer error interrupt flag is generated.</p> <p>Note: This bit is cleared if both of RXOVIF(UART_FIFOSTS[0]) and TXOVIF(UART_FIFOSTS[24]) are cleared to 0 by writing 1 to RXOVIF(UART_FIFOSTS[0]) and TXOVIF(UART_FIFOSTS[24]).</p>
[4]	RXTOIF	<p>RX Time-out Interrupt Flag (Read Only) This bit is set when the RX FIFO is not empty and no activities occurred in the RX FIFO and the time-out counter equal to TOIC (UART_TOUT[7:0]). If RXTOIEN (UART_INTEN [4]) is enabled, the RX time-out interrupt will be generated. 0 = No RX time-out interrupt flag is generated. 1 = RX time-out interrupt flag is generated.</p> <p>Note: This bit is read only and user can read UART_DAT (RX is in active) to clear it.</p>
[3]	MODEMIF	<p>MODEM Interrupt Flag (Read Only) This bit is set when the nCTS pin has state change (CTSDETF (UART_MODEMSTS[0]) = 1). If MODEMIEN (UART_INTEN [3]) is enabled, the Modem interrupt will be generated. 0 = No Modem interrupt flag is generated. 1 = Modem interrupt flag is generated.</p> <p>Note: This bit is read only and reset to 0 when bit CTSDETF is cleared by a write 1 on CTSDETF(UART_MODEMSTS[0]).</p>
[2]	RLSIF	<p>Receive Line Interrupt Flag (Read Only) This bit is set when the RX receive data have parity error, frame error or break error (at least one of 3 bits, BIF(UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]) and PEF(UART_FIFOSTS[4]), is set). If RLSIEN (UART_INTEN [2]) is enabled, the RLS interrupt will be generated. 0 = No RLS interrupt flag is generated. 1 = RLS interrupt flag is generated.</p> <p>Note1: In RS-485 function mode, this field is set include "receiver detect and received address byte character (bit9 = '1') bit". At the same time, the bit of ADDRDETF (UART_FIFOSTS[3]) is also set.</p> <p>Note2: This bit is read only and reset to 0 when all bits of BIF (UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]) and PEF(UART_FIFOSTS[4]) are cleared.</p> <p>Note3: In RS-485 function mode, this bit is read only and reset to 0 when all bits of BIF (UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]), PEF(UART_FIFOSTS[4]) and ADDRDETF (UART_FIFOSTS[3]) are cleared</p>
[1]	THREIF	<p>Transmit Holding Register Empty Interrupt Flag This bit is set when the last data of TX FIFO is transferred to Transmitter Shift Register. If THREIEN (UART_INTEN[1]) is enabled, the THRE interrupt will be generated. 0 = No THRE interrupt flag is generated.</p>

		<p>1 = THRE interrupt flag is generated.</p> <p>Note: This bit is read only and it will be cleared when writing data into UART_DAT (TX FIFO not empty).</p>
[0]	RDAIF	<p>Receive Data Available Interrupt Flag</p> <p>When the number of bytes in the RX FIFO equals the RFITL then the RDAIF(UART_INTSTS[0]) will be set. If RDAIEN (UART_INTEN [0]) is enabled, the RDA interrupt will be generated.</p> <p>0 = No RDA interrupt flag is generated.</p> <p>1 = RDA interrupt flag is generated.</p> <p>Note: This bit is read only and it will be cleared when the number of unread bytes of RX FIFO drops below the threshold level (RFITL(UART_FIFO[7:4])).</p>

UART Time-out Register (UART_TOUT)

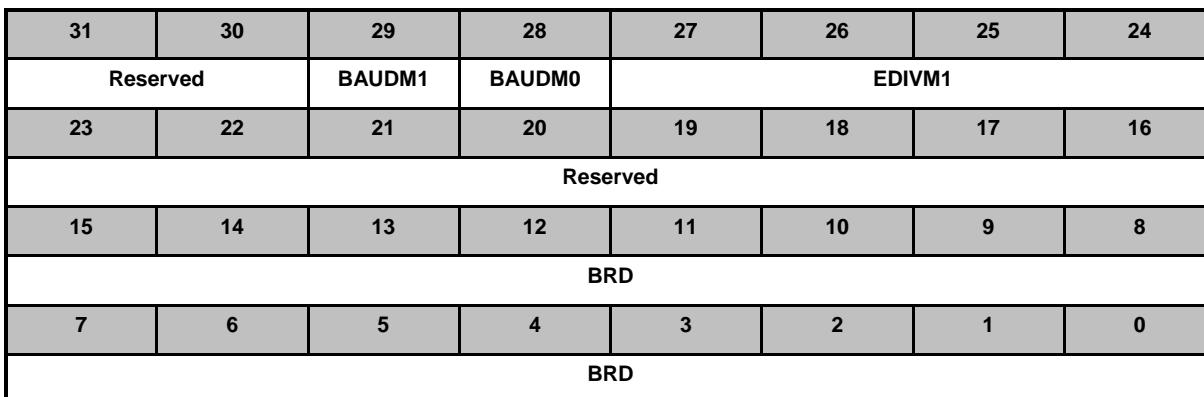

Register	Offset	R/W	Description	Reset Value
UART_TOUT x=0,1,2,3,4,5	UARTx_BA+0x20	R/W	UART Time-out Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
DLY							
7	6	5	4	3	2	1	0
TOIC							

Bits	Description	
[31:16]	Reserved	Reserved.
[15:8]	DLY	TX Delay Time Value This field is used to programming the transfer delay time between the last stop bit and next start bit. The unit is bit time.
[7:0]	TOIC	Time-out Interrupt Comparator The time-out counter resets and starts counting (the counting clock = baud rate) whenever the RX FIFO receives a new data word if time out counter is enabled by setting TOCNTEN (UART_INTEN[11]). Once the content of time-out counter is equal to that of time-out interrupt comparator (TOIC (UART_TOUT[7:0])), a receiver time-out interrupt (RXTOINT(UART_INTSTS[12])) is generated if RXTOIEN (UART_INTEN [4]) enabled. A new incoming data word or RX FIFO empty will clear RXTOIF (UART_INTSTS[4]). In order to avoid receiver time-out interrupt generation immediately during one character is being received, TOIC value should be set between 40 and 255. So, for example, if TOIC is set with 40, the time-out interrupt is generated after four characters are not received when 1 stop bit and no parity check is set for UART transfer.

UART Baud Rate Divider Register (UART_BAUD)

Register	Offset	R/W	Description	Reset Value
UART_BAUD x=0,1,2,3,4,5	UARTx_BA+0x24	R/W	UART Baud Rate Divider Register	0x0F00_0000

Bits	Description	
[31:30]	Reserved	Reserved.
[29]	BAUDM1	BAUD Rate Mode Selection Bit 1 This bit is baud rate mode selection bit 1. UART provides three baud rate calculation modes. This bit combines with BAUDM0 (UART_BAUD[28]) to select baud rate calculation mode. The detail description is shown in Table 6.15-4. Note: In IrDA mode must be operated in mode 0.
[28]	BAUDM0	BAUD Rate Mode Selection Bit 0 This bit is baud rate mode selection bit 0. UART provides three baud rate calculation modes. This bit combines with BAUDM1 (UART_BAUD[29]) to select baud rate calculation mode. The detail description is shown in Table 6.15-4.
[27:24]	EDIVM1	Extra Divider for BAUD Rate Mode 1 This field is used for baud rate calculation in mode 1 and has no effect for baud rate calculation in mode 0 and mode 2. The detail description is shown in Table 6.15-4.
[23:16]	Reserved	Reserved.
[15:0]	BRD	Baud Rate Divider The field indicates the baud rate divider. This filed is used in baud rate calculation. The detail description is shown in Table 6.15-4.

ADDRDEN	Reserved			RS485AUD	RS485AAD	RS485NMM	
7	6	5	4	3	2	1	0
LINTXEN	LINRXEN	Reserved		BRKFL			

Bits	Description	
[31:24]	ADDRMV	Address Match Value This field contains the RS-485 address match values. Note: This field is used for RS-485 auto address detection mode.
[23:21]	Reserved	Reserved.
[20:19]	ABRDBITS	Auto-baud Rate Detect Bit Length 00 = 1-bit time from Start bit to the 1st rising edge. The input pattern shall be 0x01. 01 = 2-bit time from Start bit to the 1st rising edge. The input pattern shall be 0x02. 10 = 4-bit time from Start bit to the 1st rising edge. The input pattern shall be 0x08. 11 = 8-bit time from Start bit to the 1st rising edge. The input pattern shall be 0x80. Note : The calculation of bit number includes the START bit.
[18]	ABRDEN	Auto-baud Rate Detect Enable Bit 0 = Auto-baud rate detect function Disabled. 1 = Auto-baud rate detect function Enabled. Note : This bit is cleared automatically after auto-baud detection is finished.
[17]	ABRIF	Auto-baud Rate Interrupt Flag (Read Only) This bit is set when auto-baud rate detection function finished or the auto-baud rate counter was overflow and if ABRIEN(UART_INTEN [18]) is set then the auto-baud rate interrupt will be generated. 0 = No auto-baud rate interrupt flag is generated. 1 = Auto-baud rate interrupt flag is generated. Note: This bit is read only, but it can be cleared by writing "1" to ABRDTOIF (UART_FIFOSTS[2]) and ABRDIF(UART_FIFOSTS[1]).
[16]	Reserved	Reserved.
[15]	ADDRDEN	RS-485 Address Detection Enable Bit This bit is used to enable RS-485 Address Detection mode. 0 = Address detection mode Disabled.

		1 = Address detection mode Enabled. Note: This bit is used for RS-485 any operation mode.
[14:11]	Reserved	Reserved.
[10]	RS485AUD	RS-485 Auto Direction Function (AUD) 0 = RS-485 Auto Direction Operation function (AUD) Disabled. 1 = RS-485 Auto Direction Operation function (AUD) Enabled. Note: It can be active with RS-485_AAD or RS-485_NMM operation mode.
[9]	RS485AAD	RS-485 Auto Address Detection Operation Mode (AAD) 0 = RS-485 Auto Address Detection Operation mode (AAD) Disabled. 1 = RS-485 Auto Address Detection Operation mode (AAD) Enabled. Note: It cannot be active with RS-485_NMM operation mode.
[8]	RS485NMM	RS-485 Normal Multi-drop Operation Mode (NMM) 0 = RS-485 Normal Multi-drop Operation mode (NMM) Disabled. 1 = RS-485 Normal Multi-drop Operation mode (NMM) Enabled. Note: It cannot be active with RS-485_AAD operation mode.
[7]	LINTXEN	LIN TX Break Mode Enable Bit 0 = LIN TX Break mode Disabled. 1 = LIN TX Break mode Enabled. Note: When TX break field transfer operation finished, this bit will be cleared automatically.
[6]	LINRXEN	LIN RX Enable Bit 0 = LIN RX mode Disabled. 1 = LIN RX mode Enabled.
[5:4]	Reserved	Reserved.
[3:0]	BRKFL	UART LIN Break Field Length This field indicates a 4-bit LIN TX break field count. Note1: This break field length is BRKFL + 1. Note2: According to LIN spec, the reset value is 0xC (break field length = 13).

UART Function Select Register (UART_FUNCSEL)

Register	Offset	R/W	Description				Reset Value
UART_FUNCSEL x=0,1,2,3,4,5	UARTx_BA+0x30	R/W	UART Function Select Register				0x0000_0000

Reserved			BITERREN	LINRXOFF	BRKDETEN	IDPEN	SENDH
7	6	5	4	3	2	1	0
Reserved			MUTE	SLVDUEN	SLVAREN	SLVHDEN	SLVEN

Bits	Description	
[31:24]	PID	<p>LIN PID Bits This field contains the LIN frame ID value in LIN function mode, and the frame ID parity can be generated by software or hardware depends on IDPEN (UART_LINCTL[9]) = 1. If the parity generated by hardware, user fill ID0~ID5 (PID [29:24]), hardware will calculate P0 (PID[30]) and P1 (PID[31]), otherwise user must filled frame ID and parity in this field.</p> <p>Note1: User can fill any 8-bit value to this field and the bit 24 indicates ID0 (LSB first). Note2: This field can be used for LIN master mode or slave mode.</p>
[23:22]	HSEL	<p>LIN Header Select 00 = The LIN header includes “break field”. 01 = The LIN header includes “break field” and “sync field”. 10 = The LIN header includes “break field”, “sync field” and “frame ID field”. 11 = Reserved.</p> <p>Note: This bit is used to master mode for LIN to send header field (SENDH (UART_LINCTL [8]) = 1) or used to slave to indicates exit from mute mode condition (MUTE (UART_LINCTL[4] = 1)).</p>
[21:20]	BSL	<p>LIN Break/Sync Delimiter Length 00 = The LIN break/sync delimiter length is 1-bit time. 01 = The LIN break/sync delimiter length is 2-bit time. 10 = The LIN break/sync delimiter length is 3-bit time. 11 = The LIN break/sync delimiter length is 4-bit time.</p> <p>Note: This bit used for LIN master to sending header field.</p>
[19:16]	BRKFL	<p>LIN Break Field Length This field indicates a 4-bit LIN TX break field count.</p> <p>Note1: These registers are shadow registers of BRKFL (UART_ALTCTL[3:0]), User can read/write it by setting BRKFL (UART_ALTCTL[3:0]) or BRKFL (UART_LINCTL[19:16]).</p> <p>Note2: This break field length is BRKFL + 1.</p> <p>Note3: According to LIN spec, the reset value is 12 (break field length = 13).</p>
[15:13]	Reserved	Reserved.

[12]	BITERREN	Bit Error Detect Enable Bit 0 = Bit error detection function Disabled. 1 = Bit error detection function Enabled. Note: In LIN function mode, when occur bit error, the BITEF (UART_LINSTS[9]) flag will be asserted. If the LINIEN (UART_INTEN[8]) = 1, an interrupt will be generated.
[11]	LINRXOFF	LIN Receiver Disable Bit If the receiver is enabled (LINRXOFF (UART_LINCTL[11]) = 0), all received byte data will be accepted and stored in the RX FIFO, and if the receiver is disabled (LINRXOFF (UART_LINCTL[11] = 1), all received byte data will be ignore. 0 = LIN receiver Enabled. 1 = LIN receiver Disabled. Note: This bit is only valid when operating in LIN function mode (FUNCSEL (UART_FUNCSEL[1:0]) = 01).
[10]	BRKDETEN	LIN Break Detection Enable Bit When detect consecutive dominant greater than 11 bits, and are followed by a delimiter character, the BRKDETF (UART_LINSTS[8]) flag is set at the end of break field. If the LINIEN (UART_INTEN [8])=1, an interrupt will be generated. 0 = LIN break detection Disabled . 1 = LIN break detection Enabled.
[9]	IDPEN	LIN ID Parity Enable Bit 0 = LIN frame ID parity Disabled. 1 = LIN frame ID parity Enabled. Note1: This bit can be used for LIN master to sending header field (SENDH (UART_LINCTL[8])) = 1 and HSEL (UART_LINCTL[23:22]) = 10 or be used for enable LIN slave received frame ID parity checked. Note2: This bit is only used when the operation header transmitter is in HSEL (UART_LINCTL[23:22]) = 10.
[8]	SENDH	LIN TX Send Header Enable Bit The LIN TX header can be "break field" or "break and sync field" or "break, sync and frame ID field", it is depend on setting HSEL (UART_LINCTL[23:22]). 0 = Send LIN TX header Disabled. 1 = Send LIN TX header Enabled. Note1: This bit is shadow bit of LINTXEN (UART_ALTCTL [7]); user can read/write it by setting LINTXEN (UART_ALTCTL [7]) or SENDH (UART_LINCTL [8]). Note2: When transmitter header field (it may be "break" or "break + sync" or "break + sync + frame ID" selected by HSEL (UART_LINCTL[23:22]) field) transfer operation finished, this bit will be cleared automatically.
[7:5]	Reserved	Reserved.
[4]	MUTE	LIN Mute Mode Enable Bit 0 = LIN mute mode Disabled. 1 = LIN mute mode Enabled. Note: The exit from mute mode condition and each control and interactions of this field are explained in 6.15.5.9 (LIN slave mode).
[3]	SLVDUEN	LIN Slave Divider Update Method Enable Bit 0 = UART_BAUD updated is written by software (if no automatic resynchronization update occurs at the same time). 1 = UART_BAUD is updated at the next received character. User must set the bit before checksum reception. Note1: This bit only is valid in LIN slave mode (SLVEN (UART_LINCTL[0]) = 1). Note2: This bit used for LIN Slave Automatic Resynchronization mode. (for Non-Automatic Resynchronization mode, this bit should be kept cleared)

		Note3: The control and interactions of this field are explained in 6.15.5.9 (Slave mode with automatic resynchronization).
[2]	SLVAREN	LIN Slave Automatic Resynchronization Mode Enable Bit 0 = LIN automatic resynchronization Disabled. 1 = LIN automatic resynchronization Enabled. Note1: This bit only is valid in LIN slave mode (SLVEN (UART_LINCTL[0]) = 1). Note2: When operation in Automatic Resynchronization mode, the baud rate setting must be mode2 (BAUDM1 (UART_BAUD [29]) and BAUDM0 (UART_BAUD [28]) must be 1). Note3: The control and interactions of this field are explained in 6.15.5.9 (Slave mode with automatic resynchronization).
[1]	SLVHDEN	LIN Slave Header Detection Enable Bit 0 = LIN slave header detection Disabled. 1 = LIN slave header detection Enabled. Note1: This bit is only valid in LIN slave mode (SLVEN (UART_LINCTL[0]) = 1). Note2: In LIN function mode, when detect header field (break + sync + frame ID), SLVHDETF (UART_LINSTS [0]) flag will be asserted. If the LINIEN (UART_INTEN[8]) = 1, an interrupt will be generated.
[0]	SLVEN	LIN Slave Mode Enable Bit 0 = LIN slave mode Disabled. 1 = LIN slave mode Enabled.

UART LIN Status Register (UART_LINSTS)

6.16 Ethernet MAC Controller (EMAC)

6.16.1 Overview

This chip provides an Ethernet MAC Controller (EMAC) for Network application. The Ethernet MAC controller consists of IEEE 802.3/Ethernet protocol engine with internal CAM function for recognizing Ethernet MAC addresses, Transmit-FIFO, Receive-FIFO, TX/RX state machine controller, time stamping engine for IEEE 1588, Magic Packet parsing engine and status controller. The EMAC supports both the MII and RMII (Reduced MII) interface to connect with external Ethernet PHY.

6.16.2 Features

- Supports IEEE Std. 802.3 CSMA/CD protocol
- Supports Ethernet frame time stamping for IEEE Std. 1588 – 2002 protocol
- Supports both half and full duplex for 10 Mbps or 100 Mbps operation
- Supports RMII interface
- Supports MII Management function to control external Ethernet PHY
- Supports pause and remote pause function for flow control
- Supports long frame (more than 1518 bytes) and short frame (less than 64 bytes) reception
- Supports 16 entries CAM function for Ethernet MAC address recognition
- Supports Magic Packet recognition to wake system up from Power-down mode
- Supports 256 bytes transmit FIFO and 256 bytes receive FIFO
- Supports DMA function

6.16.3 Block Diagram

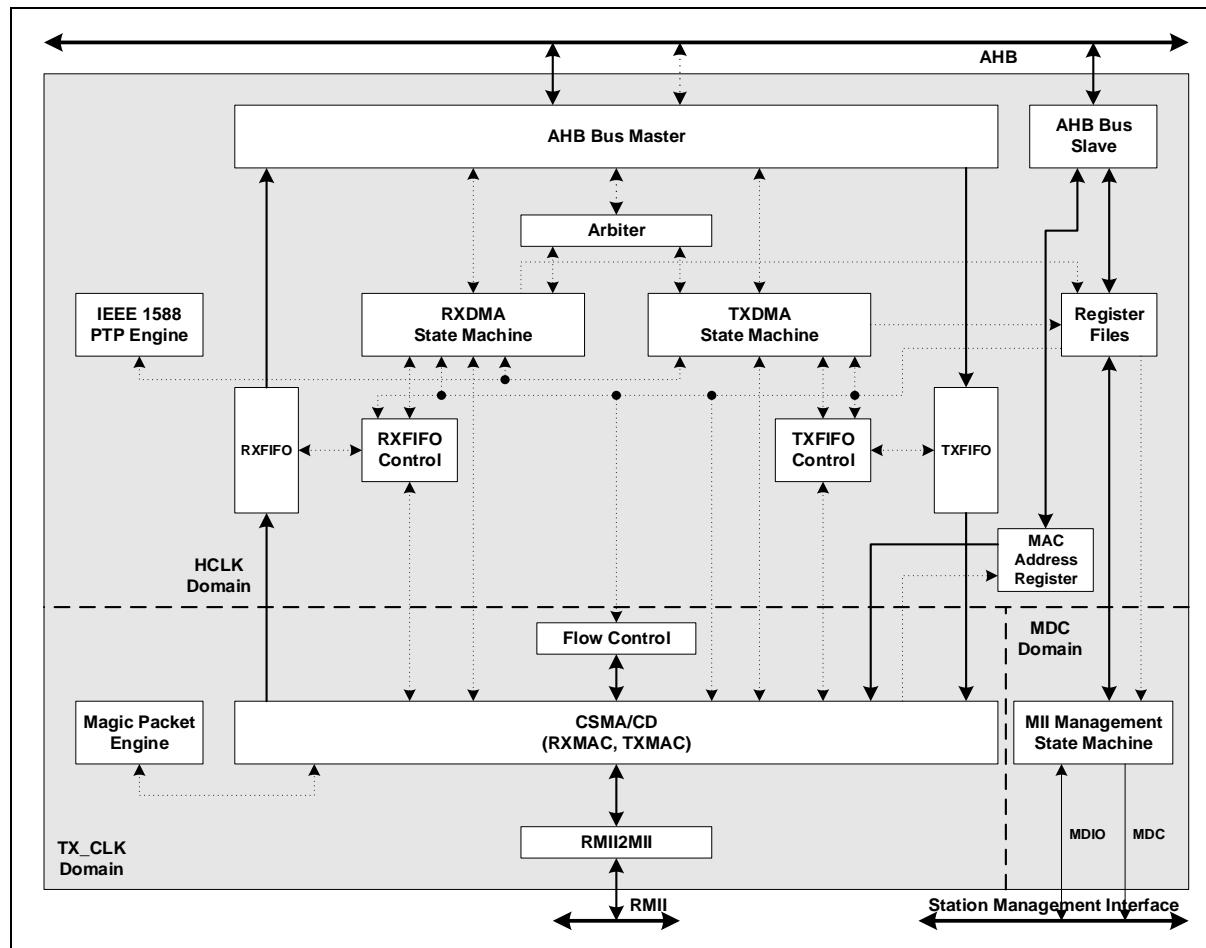

Figure 6.16-1 Ethernet MAC Controller Block Diagram

6.16.4 Basic Configuration

6.16.4.1 EMAC Basic Configuration

- Clock source Configuration
 - Select the clock divider number of MDC clock on EMACDIV (CLK_CLKDIV3[21:16]).
 - Enable EMAC clock in EMACCKEN (CLK_AHBCLK[5]).
 - Reset Configuration
 - Reset EMAC controller in EMACRST (SYS_IPRST0[5]).
 - Pin Configuration

Group	Pin Name	GPIO	MFP

6.16.5 Functional Description

6.16.5.1 Arbiter

In the EMAC, there are two different bus requests, RXREQ and TXREQ respectively. Arbiter does the arbitration between the RXREQ and TXREQ, and then decides which one can request the AHB bus. The arbitration results are shown in Table 6.16-1.

RXREQ	TXREQ	Granted
0	0	Neither TXDMA nor RXDMA granted.
0	1	TXDMA granted.
1	0	RXDMA granted.
1	1	If TXFIFO valid data byte count is less than RXFIFO free space byte count, TXDMA granted.
1	1	If RXFIFO free space byte count is less than or equal to TXFIFO valid space byte count, RXDMA granted.

Table 6.16-1 Arbiter Arbitration Results

6.16.5.2 TXDMA State Machine

The TXDMA state machine transfers data from the system memory to the internal 256 bytes transmit FIFO through the AHB master. Then, the TXDMA state machine will request the transmit MAC to send the data out. During the transmission process, the TXDMA will fetch the transmit descriptor first. Through the buffer address field of the transmit descriptor, the TXDMA fetch the frame data from the system and store it into the internal 256 bytes transmit FIFO. Then, the transmit MAC will read frame data from the transmit FIFO and send the frame out. After the finish of the frame transmission, the TXDMA updates the transmit status of current frame and write the transmit descriptor back to the system memory to indicate the frame transmission has finished.

6.16.5.3 RXDMA State Machine

The RXDMA state machine transfers data from the internal 256 bytes receiving FIFO to the system memory through AHB master. During the receiving process, the RXDMA will fetch the received descriptor first. Through the buffer address field of the received descriptor, the RXDMA will know memory space which is allocated to store the incoming frame. After the received MAC indicates there is a new incoming frame, the RXDMA starts to transfer the frame data from the internal received FIFO to the system memory. After the receiving process has finished, the RXDMA will update the receiving

status of current frame and write the received descriptor back to system memory to indicate a new incoming frame is in the system memory.

6.16.5.4 Flow Control

This block implements the flow control function while EMAC operates in the full duplex mode. The flow control function is defined in the IEEE 802.3 Std. chapter 31. The type of flow control frame defined in the IEEE 802.3 Std. is only the PAUSE frame at the moment. The control frame transmission and reception is programmable through the control registers.

To receive a control frame, software must set the bit ACP (Accept Control Packet) of register EMAC_CTL (MAC Command Register). While a PAUSE frame is received, the flow control function will pause the transmission process after the current transmitting frame has been transmitted out.

To transmit a control frame out, software must program the destination MAC address of control frame into the register pair {EMAC_CAM13M, EMAC_CAM13L}, source MAC address into the register pair {EMAC_CAM14M, EMAC_CAM14L}, and configure LENGTH, OPCODE and OPERAND of control frame into the register pair {EMAC_CAM15MSB, EMAC_CAM15LSB}, and then set the bit SDPZ (EMAC_CTL[16]). The bit SDPZ (EMAC_CTL[16]) will be cleared while the control frame has been transmitted out.

6.16.5.5 MII Management State Machine

The MII management function of EMAC is compliant to IEEE 802.3 Std. Through the MII management interface, software can access the control and status registers of the external PHY chip. Two programmable registers EMAC_MIIMDAT (MAC MII Management Data Register) and EMAC_MIIMCTL (MAC MII Management Data Control and Address Register) are for MII management function. Set the bit BUSY (EMAC_MIIMCTL[17]) will trigger the MII management state machine. After the MII management cycle is finished, the BUSY bit will be cleared automatically.

6.16.5.6 Media Access Control (MAC)

The function of Ethernet MAC fully meets the requirements defined by the IEEE802.3u specification. Figure 6.16-2 describes the frame structure and the operation of the transmission and receiving.

The transmission data frame sent from the transmit DMA will be encapsulated by the MAC before transmitting onto the MII bus. The sent data will be assembled with the preamble, the start frame delimiter (SFD), the frame check sequence and the padding for enforcing those less than 64 bytes to meet the minimum size frame and CRC sequence. The outgoing frame format will be as follows.

110101010 --- 10101010	10101011	d0	d1	d2	--	dn	Padding	CRC31	CRC30	---	CRC0
------------------------	----------	----	----	----	----	----	---------	-------	-------	-----	------

Figure 6.16-2 Ethernet Frame Format

As mentioned by the above format, the preamble is a consecutive 7-byte long with the pattern "10101010" and the SFD is a one byte 10101011 data. The padding data will be all 0 value if the sent data frame is less than 64 bytes. The padding disable function specified in the bit P of the transmit descriptor is used to control if the MAC needs to pad data at the end of frame data or not when the transmitted data frame is less than 64 bytes. The padding data will not be appended if the padding disable bit is set to be high. The bits CRC0 ... CRC31 are the 32 bits cyclic redundancy check (CRC) sequence. The CRC encoding is defined by the following polynomial specified by the IEEE802.3. This 32 bits CRC appending function will be disabled if the Inhibit CRC of the transmission descriptor is set to high.

The MAC also performs many other transmission functions specified by the IEEE802.3, including the inter-frame spacing function, collision detection, collision enforcement, collision back off and retransmission. The collision back-off timer is a function of the integer slot time, 512-bit time. The number of slot times to delay between the current transmission attempt to the next attempt is determined by a uniformly distributed random integer algorithm specified by the IEEE802.3. The MAC performs the receive functions specified by the IEEE 802.3 including the address recognition function, the frame check sequence validation, the frame disassembly, framing and collision filtering.

6.16.5.7 Time Stamping Engine for IEEE 1588

The EMAC supports a time stamping engine for IEEE Std. 1588. In this time stamping engine, a 64-bit counter implemented to generate the reference timing, the registers EMAC_TSSEC and ETSLSR.

In frame transmission, if TSEN (EMAC_TSCTL[0]) and TTSEN of TXDES 0 (TXDMA Descriptor Word 0) are both high, EMAC would store the 64-bit reference timing value to TXDES 1 (TXDMA Descriptor Word 1) and TXDES 2 (TXDMA Descriptor Word 2) when frame transmission completed.

In frame reception, if TSEN (EMAC_TSCTL[0]) is high, EMAC would store the 64-bit reference timing value to RXDES 1 (RXDMA Descriptor Word 1) and RXDES 3 (RXDMA Descriptor Word 3) when the frame reception finished.

Figure 6.16-2 describes how the 64-bit counter works to generate the reference timing.

The 64-bit counter formed by two 32-bit counters, the EMAC_TSSEC and EMAC_TSSUBSEC, a updated using the EMAC's input reference clock, the HCLK. Two difference methods, controlled by TSMODE (EMAC_TSCTL[3]), implemented to increase 32-bit EMAC_TSSUBSEC counter by value configured in register EMAC_TSINC. When TSMODE (EMAC_TSCTL[3]) is low, TSLSR counter increased in every clock. When TSMODE (EMAC_TSCTL[3]) is high, TSLSR counter increased only when accumulator is overflow.

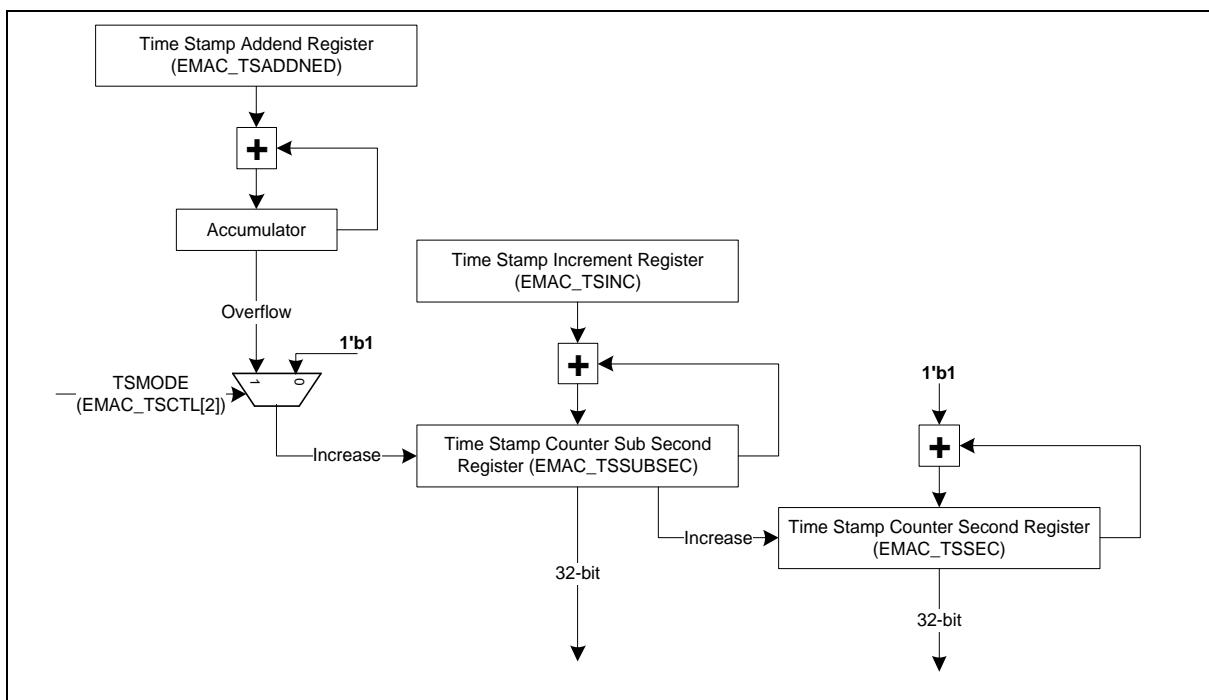

Table 6.16-2 64-bit Reference Timing Counter

6.16.5.8 Magic Packet Parsing Engine

The EMAC supports a Magic packet parsing engine for recognizing Magic packet. The Magic packet is a broadcast frame which payload includes 6 bytes of 0xFF, followed by 16 repetitions of 48-bit MAC address defined by registers EMAC_CAM0M and EMAC_CAM0L.

The WOLEN (EMAC_CTL[6]) controls if the Magic packet parsing engine enabled. If WOLEN (EMAC_CTL[6]) is high, EMAC will set bit WOLIF (EMAC_INTSTS[15]) high to indicate Magic packet received. At the same time, EMAC generates an event to wake system up from Power-down mode. If WOLIEN of register MIEN is high, EMAC generates an RX interrupt to CPU simultaneously.

6.16.5.9 DMA Descriptors Data Structure

A link-list data structure named as descriptor is used to keep the control, status and data information

of each frame. Through the descriptor, CPU and EMAC exchange the information for frame reception and transmission.

Two different descriptors defined in EMAC. One named as RXDMA descriptor for frame reception and the other named as TXDMA descriptor for frame transmission. Each RXDMA or TXDMA descriptor consists of four words. The descriptor keeps the much control, status information and the details of descriptor are described in 6.16.5.10 RXDMA descriptor data structure and 6.16.5.11 TXDMA descriptor data structure.

6.16.5.10 RXDMA Descriptor Data Structure

The RXDMA descriptor consists of four 32-bit words. The data structure of RXDMA descriptor is shown in Figure 6.16-3.

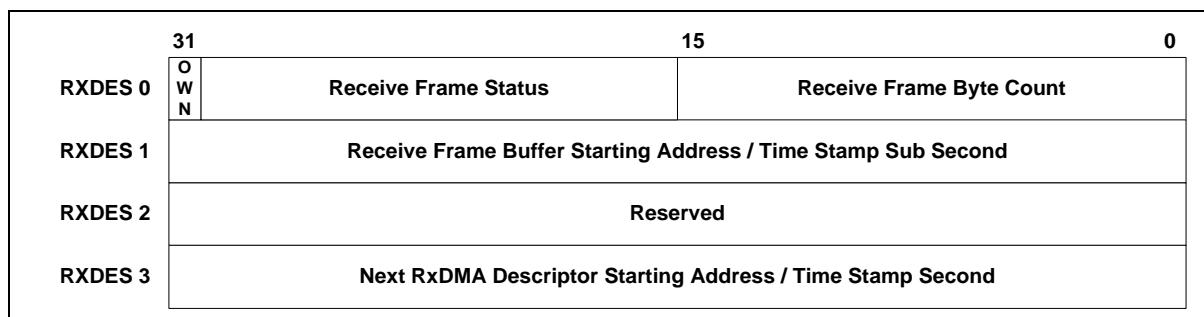

Figure 6.16-3 RXDMA Descriptor Data Structure

RXDES 0: RXDMA Descriptor Word 0

The RXDMA descriptor word 0 contains a descriptor ownership indicator, receive frame status, and receive frame byte count. The detailed description of RXDES 0 is shown below.

31	30	29	28	27	26	25	24
Owner	Reserved						
23	22	21	20	19	18	17	16
RTSAS	RPIF	ALIEIF	RXGDIF	LPIF	Reserved	CRCEIF	RXIF
15	14	13	12	11	10	9	8
RBC							
7	6	5	4	3	2	1	0
RBC							

Bits	Field	Description
[31]	Owner	Ownership The ownership field defines which one, the CPU or EMAC, is the owner of each RX descriptor. Only the owner has right to modify the RX descriptor and the others can read the RX descriptor only. If the O=1'b1 indicates the EMAC RXDMA is the owner of RX descriptor and the RX descriptor is available for frame reception. After the frame reception completed, EMAC RXDMA modified ownership field to 1'b0. If the O=1'b0 indicates the CPU is the owner of RX descriptor. After the CPU completed the frame processing, it modified the ownership field to 1'b1 and released the RX descriptor to EMAC RXDMA. 0 = The owner is CPU. 1 = The owner is EMAC.
[30:24]	Reserved	Reserved.
[23]	RTSAS	RX Time Stamp Active Status This bit is to indicate the time stamping circuit stamped this incoming frame successfully. When this bit set high, RX Descriptor Word 1 and RX Descriptor Word 3 keep the time stamp value recorded when this incoming frame is received completely. 0 = RX Descriptor Word 1 and RX Descriptor Word 3 does not keep the time stamp value. 1 = RX Descriptor Word 1 and RX Descriptor Word 3 keep the time stamp value.
[22]	RPIF	Runt Packet The RPIF indicates the frame stored in the data buffer pointed by RX descriptor is a short frame (frame length is less than 64 bytes). 0 = The frame is not a short frame. 1 = The frame is a short frame.
[21]	ALIEIF	Alignment Error The ALIEIF indicates the frame stored in the data buffer pointed by RX descriptor is not a multiple of byte. 0 = The frame is a multiple of byte. 1 = The frame is not a multiple of byte.

[20]	RXGDIF	Frame Reception Complete The RXGDIF indicates the frame reception has completed and stored in the data buffer pointed by RX descriptor. 0 = The frame reception does not complete yet. 1 = The frame reception completed.
[19]	LPIF	Long Packet Interrupt Flag The LPIF indicates the frame stored in the data buffer pointed by RX descriptor is a long frame (frame length is greater than 1518 bytes). 0 = The frame is not a long frame. 1 = The frame is a long frame.
[18]	Reserved	Reserved.
[17]	CRCEIF	CRC Error The CRCEIF indicates the frame stored in the data buffer pointed by RX descriptor incurred CRC error. 0 = The frame does not incur CRC error. 1 = The frame incurred CRC error.
[16]	RXIF	Receive Interrupt The RXIF indicates the frame stored in the data buffer pointed by RX descriptor caused an interrupt condition. 0 = The frame does not cause an interrupt. 1 = The frame caused an interrupt.
[15:0]	RBC	Receive Byte Count The RBC indicates the byte count of the frame stored in the data buffer pointed by RX descriptor. The four bytes CRC field is also included in the receive byte count. But if the STRIPCRC (EMAC_CTL[5]) is enabled, the four bytes CRC field will be excluded from the receive byte count.

RXDES 1: RXDMA Descriptor Word 1

The RXDMA descriptor word 1 contains the received frame buffer starting address or time stamp least significant 32-bit value. The detailed description of RXDES 1 is shown below.

31	30	29	28	27	26	25	24
RXBSA/TSSUBSEC							
23	22	21	20	19	18	17	16
RXBSA/TSSUBSEC							
15	14	13	12	11	10	9	8
RXBSA/TSSUBSEC							
7	6	5	4	3	2	1	0
RXBSA/TSSUBSEC							

Bits	Field	Description
[31:0]	RXBSA	Receive Buffer Starting Address The RXBSA is the buffer starting address to store the received packet.

Table 6.16-3 RXDMA Descriptor Word 1 (TSEN (EMAC_TSCTL[0]) is 0)

Bits	Field	Description
[31:0]	TSSUBSEC	Time Stamp Sub-Second If TSEN (EMAC_TSCTL[0]) enabled, Ethernet MAC controller would store time stamp least significant 32-bit value, register ETSLSR, into this field when it writes back RX Descriptor to system memory.

Table 6.16-4 RXDMA Descriptor Word 1 (TSEN (EMAC_TSCTL[0]) is 1)

RXDES 2: RXDMA Descriptor Word 2

The RXDMA descriptor word 2 currently is reserved.

NRXDSA/TSSEC							
7	6	5	4	3	2	1	0
NRXDSA/TSSEC							

Bits	Field	Description
[31:0]	NRXDSA	Next RX Descriptor Starting Address NRXDSA is the starting address of the next RX descriptor. When Ethernet MAC controller fetches the next RX descriptor, it ignores the bits [1:0] of NRXDSA.

Table 6.16-6 RXDMA Descriptor Word 3 (TSEN (EMAC_TSCTL[0]) is 0)

Bits	Field	Description
[31:0]	TSSEC	Time Stamp Second If TSEN (EMAC_TSCTL[0]) enabled, Ethernet MAC controller would store time stamp most significant 32-bit value, register ETSMR, into this field when it writes back RX Descriptor to system memory.

Table 6.16-7 RXDMA Descriptor Word 3 (TSEN (EMAC_TSCTL[0]) is 1)

6.16.5.11 TxDMA Descriptor Data Structure

The TxDMA descriptor consists of four 32-bit words. The data structure of TxDMA descriptor is shown in Figure 6.16-4.

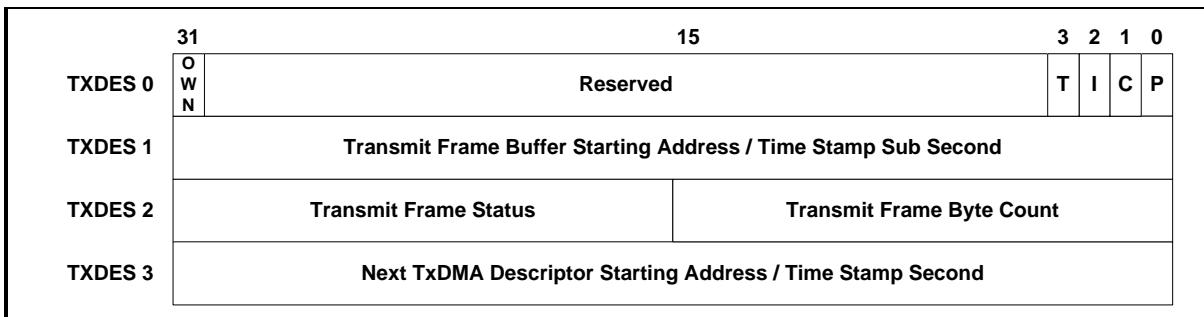

Figure 6.16-4 TxDMA Descriptor Data Structure

TXDES 0: TXDMA Descriptor Word 0

The TXDMA descriptor word 0 contains a descriptor ownership indicator. In addition, it also contains control bits for transmit frame padding, CRC append, interrupt enable and time stamping control. The detailed description of TXDES 0 is shown below.

31	30	29	28	27	26	25	24
Owner	Reserved						
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved				TTSEN	INTEN	CRCAPP	PADEN

Bits	Field	Description
[31]	Owner	Ownership The ownership field defines which one, the CPU or EMAC, is the owner of each TX descriptor. Only the owner has right to modify the TX descriptor and the other can read the TX descriptor only. If the O=1'b1 indicates the EMAC TXDMA is the owner of TX descriptor and the TX descriptor is available for frame transmission. After the frame transmission completed, EMAC TXDMA modify ownership field to 1'b0 and return the ownership of TX descriptor to CPU. If the O=1'b0 indicates the CPU is the owner of TX descriptor. After the CPU prepares new frame to wait transmission, it modifies the ownership field to 1'b1 and releases the TX descriptor to EMAC TXDMA. 0 = The owner is CPU. 1 = The owner is EMAC.
[30:4]	Reserved	Reserved.
[3]	TTSEN	TX Time Stamp Enable Bit When this bit set high and IEEE 1588 PTP function is also enabled, the embedded time stamping circuit would stamp this frame when SFD of frame is transmitted out on MII/RMII. 0 = IEEE 1588 time stamp function Disabled for this frame. 1 = IEEE 1588 time stamp function Enabled for this frame.
[2]	INTEN	Transmit Interrupt Enable Bit The INTEN controls the interrupt trigger circuit after the frame transmission completed. If the INTEN enabled, the EMAC will trigger interrupt after frame transmission completed. Otherwise, the interrupt doesn't be triggered. 0 = Frame transmission interrupt masked. 1 = Frame transmission interrupt Enabled.
[1]	CRCAPP	CRC Append The CRCAPP control the CRC append during frame transmission. If CRCAPP is enabled, the 4-bytes CRC checksum will be appended to frame at the end of frame transmission. 0 = 4-bytes CRC appending Disabled. 1 = 4-bytes CRC appending Enabled.

[0]	PADEN	Padding Enable Bit The PADEN control the PAD bits appending while the length of transmission frame is less than 60 bytes. If PADEN is enabled, EMAC does the padding automatically. 0 = PAD bits appending Disabled. 1 = PAD bits appending Enabled.

TXBSA/TSSUBSEC							

Bits	Field	Description
[31:2]	TXBSA	Transmit Buffer Starting Address The TXBSA is the starting address of buffer where transmit packet data stored.

Table 6.16-9 TXDMA Descriptor Word 1 (TSEN (EMAC_TSCTL[0]) is 0)

Bits	Field	Description
[31:0]	TSSUBSEC	Time Stamp Sub-Second If TSEN (EMAC_TSCTL[0]) and TTSEN of TX Descriptor word 0 both enabled, Ethernet MAC controller would store time stamp least significant 32-bit value, register EMAC_TSSUBSEC, into this field when it writes back TX Descriptor to system memory.

Table 6.16-10 TXDMA Descriptor Word 1 (TSEN (EMAC_TSCTL[0]) is 1)

TXDES 2: TXDMA Descriptor Word 2

The TXDMA descriptor word 2 contains transmit frame status, and transmit frame byte count. The detailed description of TXDES 2 is shown below.

31	30	29	28	27	26	25	24
COLCNT				TTSAS	SQE	TXPAUSED	TXHALT
23	22	21	20	19	18	17	16
LCIF	TXABTIF	NCSIF	EXDEFIF	TXCPIF	Reserved	DEF	TXIF
15	14	13	12	11	10	9	8
TBC							
7	6	5	4	3	2	1	0
TBC							

Bits	Field	Description
[31:28]	COLCNT	Collision Count The COLCNT indicates the how many collisions found consecutively during a packet transmission. If the packet incurred 16 consecutive collisions during transmission, the COLCNT is 0x0 and bit TXABTIF is set high.
[27]	TTSAS	TX Time Stamp Active Status This bit is to indicate the time stamping circuit stamped this frame successfully. When this bit set high, TX Descriptor Word 1 and TX Descriptor Word 3 keep the time stamp value recorded when SFD of frame is transmitted out on MII/RMII. 0 = TX Descriptor Word 1 and TX Descriptor Word 3 does not keep the time stamp value. 1 = TX Descriptor Word 1 and TX Descriptor Word 3 keep the time stamp value.
[26]	SQE	SQE Error The SQE indicates the SQE error found at end of packet transmission on 10Mbps half-duplex mode. The SQE error check will only be done while both bit SQECHKEN (EMAC_CTL[17]) is enabled and EMAC is operating on 10Mbps half-duplex mode. 0 = No SQE error found at end of packet transmission. 1 = SQE error found at end of packet transmission.
[25]	TXPAUSED	Transmission Paused The TXPAUSED indicates the next normal packet transmission process will be paused temporarily because EMAC received a PAUSE control frame, or software sets the bit SDPZ (EMAC_MCM[16]) and enables EMAC to transmit a PAUSE control frame out. 0 = Next normal packet transmission process continue normally. 1 = Next normal packet transmission process paused.
[24]	TXHALT	Transmission Halted The TXHALT indicates the next normal packet transmission process will be halted because the bit TXON (EMAC_CTL[8]) is disabled by software. 0 = Next normal packet transmission process continue normally. 1 = Next normal packet transmission process halted.

[23]	LCIF	Late Collision The LCIF indicates the collision found in the outside of 64 bytes collision window. This means after the 64 bytes of a frame has been transmitted out to the network, the collision still found. The late collision check will only be done while EMAC is operating on half-duplex mode. 0 = No collision found in the outside of 64 bytes collision window. 1 = Collision found in the outside of 64 bytes collision window.
[22]	TXABTIF	Transmission Abort The TXABTIF indicates the packet incurred 16 consecutive collisions during transmission, and then the transmission process for this packet is aborted. The transmission abort is only available while EMAC is operating on half-duplex mode. 0 = Packet does not incur 16 consecutive collisions during transmission. 1 = Packet incurred 16 consecutive collisions during transmission.
[21]	NCSIF	No Carrier Sense The NCSIF indicates the MII I/F signal CRS does not active at the start of or during the packet transmission. The NCSIF is only available while EMAC is operating on half-duplex mode. 0 = CRS signal does not active at the start of or during the packet transmission. 1 = CRS signal actives correctly.
[20]	EXDEFIF	Defer Exceed The EXDEFIF indicates the frame waiting for transmission has deferred over 0.32768ms on 100Mbps mode, or 3.2768ms on 10Mbps mode. The deferral exceed check will only be done while bit NODEF (EMAC_CTL[9]) is disabled, and EMAC is operating on half-duplex mode. 0 = Frame waiting for transmission did not defer over 0.32768ms (100Mbps) or 3.2768ms (10Mbps). 1 = Frame waiting for transmission deferred over 0.32768ms (100Mbps) or 3.2768ms (10Mbps).
[19]	TXCPIF	Transmission Complete The TXCPIF indicates the packet transmission has completed correctly. 0 = The packet transmission does not complete. 1 = The packet transmission completed.
[18]	Reserved	Reserved.
[17]	DEF	Transmission Deferred The DEF indicates the packet transmission has deferred once. The DEF is only available while EMAC is operating on half-duplex mode. 0 = Packet transmission does not defer. 1 = Packet transmission deferred once.
[16]	TXIF	Transmit Interrupt The TXIF indicates the packet transmission would trigger an interrupt condition. 0 = The packet transmission would not trigger an interrupt. 1 = The packet transmission would trigger an interrupt.
[15:0]	TBC	Transmit Byte Count The TBC indicates the byte count of the frame stored in the data buffer pointed by TX descriptor for transmission.

Table 6.16-11 TXDMA Descriptor Word 2

TXDES 3: TXDMA Descriptor Word 3

The TXDMA descriptor word 3 contains the next TXDMA descriptor starting address or time stamp most significant 32-bit value. The detailed description of TXDES 3 is shown below.

31	30	29	28	27	26	25	24
NTXDSA/TSSEC							
23	22	21	20	19	18	17	16

6.16.7 Register Description

CAM Command Register (EMAC_CAMCTL)

The EMAC supports CAM function for destination MAC address recognition. The EMAC_CAMCTL control the CAM comparison function, and unicast, multicast, and broadcast packet reception.

Register	Offset	R/W	Description					Reset Value
EMAC_CAMCTL	EMAC_BA+0x000	R/W	CAM Comparison Control Register					0x0000_0000

Bits	Description	
[31:5]	Reserved	Reserved.
[4]	CMPEN	CAM Compare Enable Bit The CMPEN controls the enable of CAM comparison function for destination MAC address recognition. If software wants to receive a packet with specific destination MAC address, configures the MAC address into CAM 12~0, then enables that CAM entry and set CMPEN to 1. 0 = CAM comparison function for destination MAC address recognition Disabled. 1 = CAM comparison function for destination MAC address recognition Enabled.
[3]	COMPEN	Complement CAM Comparison Enable Bit The COMPEN controls the complement of the CAM comparison result. If the CMPEN and COMPEN are both enabled, the incoming packet with specific destination MAC address configured in CAM entry will be dropped. And the incoming packet with destination MAC address does not configured in any CAM entry will be received. 0 = Complement CAM comparison result Disabled. 1 = Complement CAM comparison result Enabled.
[2]	ABP	Accept Broadcast Packet The ABP controls the broadcast packet reception. If ABP is enabled, EMAC receives all incoming packet its destination MAC address is a broadcast address. 0 = EMAC receives packet depends on the CAM comparison result. 1 = EMAC receives all broadcast packets.
[1]	AMP	Accept Multicast Packet The AMP controls the multicast packet reception. If AMP is enabled, EMAC receives all incoming packet its destination MAC address is a multicast address. 0 = EMAC receives packet depends on the CAM comparison result. 1 = EMAC receives all multicast packets.

[0]	AUP	Accept Unicast Packet The AUP controls the unicast packet reception. If AUP is enabled, EMAC receives all incoming packet its destination MAC address is a unicast address. 0 = EMAC receives packet depends on the CAM comparison result. 1 = EMAC receives all unicast packets.

CAMCMR Setting and Comparison Results

Table 6.16-14 is the address recognition result in different CAMCMR configuration. The column Result shows the incoming packet type that can pass the address recognition in specific CAM configuration. The C, U, M and B represents the:

C: Indicates the destination MAC address of incoming packet has been configured in CAM entry.

U: Indicates the incoming packet is a unicast packet.

M: Indicates the incoming packet is a multicast packet.

B: Indicates the incoming packet is a broadcast packet.

[x]	CAMxEN	<p>CAM Entry X Enable Bit</p> <p>The CAMxEN controls the validation of CAM entry x.</p> <p>The CAM entry 13, 14 and 15 are for PAUSE control frame transmission. If software wants to transmit a PAUSE control frame out to network, the enable bits of these three CAM entries all must be enabled first.</p> <p>0 = CAM entry x Disabled. 1 = CAM entry x Enabled.</p>

CAM Entry Register (EMAC_CAMxMSB, x = 0, 1, 2..14)

The EMAC is equipped with 16 CAM entries. In these 16 CAM entries, 13 entries (entry 0~12) are to keep destination MAC address for packet recognition, and the other 3 entries (entry 13~15) are for PAUSE control frame transmission. Each CAM entry consists of 6 bytes. Consequently, 2 registers are used for each CAM entry.

For packet recognition, a register pair {EMAC_CAMxMSB, ECAMxL} represents a CAM entry and can keep a destination MAC address. The corresponding CAM enable bit CAMxEN (ECAM_CAMEN[x]) is also needed to be enabled. The x can be the 0 to 12.

The register pairs {EMAC_CAM13M, EMAC_CAM13L}, {EMAC_CAM14M, EMAC_CAM14L} and {EMAC_CAM15MSB, EMAC_CAM15LSB} are used for flow control function.

Register	Offset	R/W	Description	Reset Value

Bits	Description	
[31:24]	OPERAND	Pause Parameter In the PAUSE control frame, an OPERAND field defined and controls how much time the destination Ethernet MAC Controller paused. The unit of the OPERAND is a slot time, the 512-bit time.
[23:0]	Reserved	Reserved.

Transmit Descriptor Link List Start Address Register (EMAC_TXDSA)

The TX descriptor defined in EMAC is a link-list data structure. The EMAC_TXDSA keeps the starting address of this link-list. In other words, the EMAC_TXDSA keeps the starting address of the 1st TX descriptor. EMAC_TXDSA must be configured by software before the bit TXON (EMAC_CTL[8]) is enabled.

Register	Offset	R/W	Description					Reset Value
EMAC_TXDSA	EMAC_BA+0x088	R/W	Transmit Descriptor Link List Start Address Register					0xFFFF_FFFC

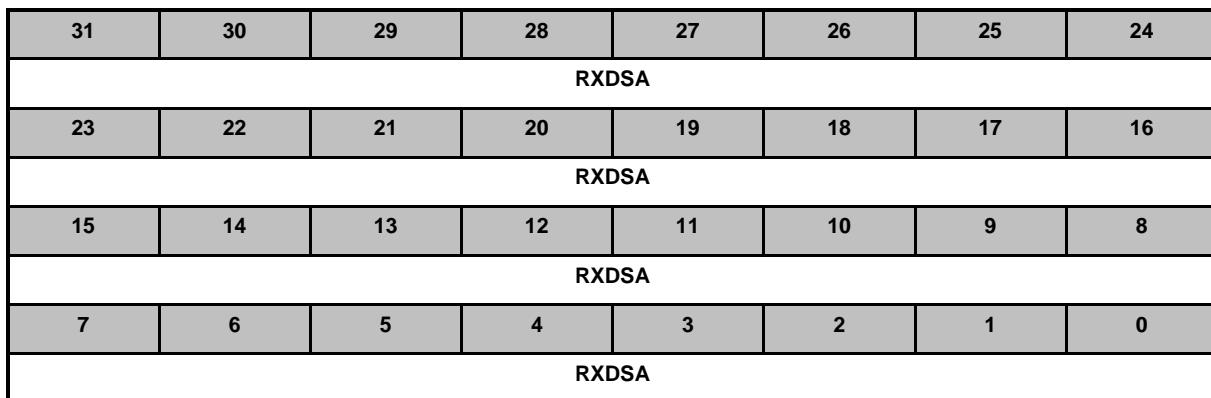

Bits	Description	
[31:0]	TXDSA	Transmit Descriptor Link-list Start Address The TXDSA keeps the start address of transmit descriptor link-list. If the software enables the bit TXON (EMAC_CTL[8]), the content of TXDSA will be loaded into the current transmit descriptor start address register (EMAC_CTXDSA). The TXDSA does not need to be updated by EMAC. During the operation, EMAC will ignore the bits [1:0] of TXDSA. This means that TX descriptors must locate at word boundary memory address.

Receive Descriptor Link List Start Address Register (EMAC_RXDSA)

The RX descriptor defined in EMAC is a link-list data structure. The EMAC_RXDSA keeps the starting address of this link-list. In other words, the EMAC_RXDSA keeps the starting address of the 1st RX descriptor. EMAC_RXDSA must be configured by software before the bit RXON (EMAC_CTL[0]) is enabled.

Register	Offset	R/W	Description					Reset Value
EMAC_RXDSA	EMAC_BA+0x08C	R/W	Receive Descriptor Link List Start Address Register					0xFFFF_FFFC

Bits	Description	
[31:0]	RXDSA	Receive Descriptor Link-list Start Address The RXDSA keeps the start address of receive descriptor link-list. If the S/W enables the bit RXON (EMAC_CTL[0]), the content of RXDSA will be loaded into the current receive descriptor start address register (EMAC_CRXDSA). The RXDSA does not be updated by EMAC. During the operation, EMAC will ignore the bits [1:0] of RXDSA. This means that RX descriptors must locate at word boundary memory address.

MAC Control Register (EMAC_CTL)

The EMAC_CTL provides the control information for EMAC. Some command settings affect both frame transmission and reception, such as bit FUDUP (EMAC_CTL[18]), the full/half duplex mode selection, or bit OPMODE (EMAC_CTL[20]), the 100/10M bps mode selection. Some command settings control frame transmission and reception separately, like bit TXON (EMAC_CTL[8]) and RXON (EMAC_CTL[0]).

Register	Offset	R/W	Description				Reset Value
EMAC_CTL	EMAC_BA+0x090	R/W	MAC Control Register				0x0040_0000

Reserved							NODEF
7	6	5	4	3	2	1	0
Reserved	WOLEN	STRIPCRC	AEP	ACP	ARP	ALP	RXON

Bits	Description	
[31:25]	Reserved	Reserved.
[24]	RST	Software Reset The RST implements a reset function to make the EMAC return default state. The RST is a self-clear bit. This means after the software reset finished, the RST will be cleared automatically. Enable RST can also reset all control and status registers, exclusive of the control bits RMIIEN (EMAC_CTL[22]), and OPMODE (EMAC_CTL[20]). The EMAC re-initial is necessary after the software reset completed. 0 = Software reset completed. 1 = Software reset Enabled.
[23]	Reserved	Reserved.
[22]	RMIIEN	RMII Mode Enable Bit This bit controls if Ethernet MAC controller connected with off-chip Ethernet PHY by MII interface or RMII interface. The RST (EMAC_CTL[24]) would not affect RMIIEN value. 0 = Ethernet MAC controller RMII mode Disabled. 1 = Ethernet MAC controller RMII mode Enabled. Note: This field must keep 1.
[21]	Reserved	Reserved.
[20]	OPMODE	Operation Mode Selection The OPMODE defines that if the EMAC is operating on 10M or 100M bps mode. The RST (EMAC_CTL[24]) would not affect OPMODE value. 0 = EMAC operates in 10Mbps mode. 1 = EMAC operates in 100Mbps mode.

[19]	RMIIRXCTL	RMII RX Control The RMIIRXCTL control the receive data sample in RMII mode. It's necessary to set this bit high when RMIIEN (EMAC_CTL[22]) is high. 0 = RMII RX control Disabled. 1 = RMII RX control Enabled.
[18]	FUDUP	Full Duplex Mode Selection The FUDUP controls that if EMAC is operating on full or half duplex mode. 0 = EMAC operates in half duplex mode. 1 = EMAC operates in full duplex mode.
[17]	SQECHKEN	SQE Checking Enable Bit The SQECHKEN controls the enable of SQE checking. The SQE checking is only available while EMAC is operating on 10M bps and half duplex mode. In other words, the SQECHKEN cannot affect EMAC operation, if the EMAC is operating on 100M bps or full duplex mode. 0 = SQE checking Disabled while EMAC is operating in 10Mbps and Half Duplex mode. 1 = SQE checking Enabled while EMAC is operating in 10Mbps and Half Duplex mode.
[16]	SDPZ	Send PAUSE Frame The SDPZ controls the PAUSE control frame transmission. If S/W wants to send a PAUSE control frame out, the CAM entry 13, 14 and 15 must be configured first and the corresponding CAM enable bit of CAMEN register also must be set. Then, set SDPZ to 1 enables the PAUSE control frame transmission. The SDPZ is a self-clear bit. This means after the PAUSE control frame transmission has completed, the SDPZ will be cleared automatically. It is recommended that only enabling SNDPAUSE while EMAC is operating in Full Duplex mode. 0 = PAUSE control frame transmission completed. 1 = PAUSE control frame transmission Enabled.
[15:10]	Reserved	Reserved.
[9]	NODEF	No Deferral The NODEF controls the enable of deferral exceed counter. If NODEF is set to high, the deferral exceed counter is disabled. The NODEF is only useful while EMAC is operating on half duplex mode. 0 = The deferral exceed counter Enabled. 1 = The deferral exceed counter Disabled.
[8]	TXON	Frame Transmission ON The TXON controls the normal packet transmission of EMAC. If the TXON is set to high, the EMAC starts the packet transmission process, including the TX descriptor fetching, packet transmission and TX descriptor modification. It is must to finish EMAC initial sequence before enable TXON. Otherwise, the EMAC operation is undefined. If the TXON is disabled during EMAC is transmitting a packet out, the EMAC stops the packet transmission process after the current packet transmission finished. 0 = Packet transmission process stopped. 1 = Packet transmission process started.
[7]	Reserved	Reserved.

[6]	WOLEN	Wake on LAN Enable Bit The WOLEN high enables the functionality that Ethernet MAC controller checked if the incoming packet is Magic Packet and wakeup system from Power-down mode. If incoming packet was a Magic Packet and the system was in Power-down, the Ethernet MAC controller would generate a wakeup event to wake system up from Power-down mode. 0 = Wake-up by Magic Packet function Disabled. 1 = Wake-up by Magic Packet function Enabled.
[5]	STRIPCRC	Strip CRC Checksum The STRIPCRC controls if the length of incoming packet is calculated with 4 bytes CRC checksum. If the STRIPCRC is set to high, 4 bytes CRC checksum is excluded from length calculation of incoming packet. 0 = The 4 bytes CRC checksum is included in packet length calculation. 1 = The 4 bytes CRC checksum is excluded in packet length calculation.
[4]	AEP	Accept CRC Error Packet The AEP controls the EMAC accepts or drops the CRC error packet. If the AEP is set to high, the incoming packet with CRC error will be received by EMAC as a good packet. 0 = Ethernet MAC controller dropped the CRC error packet. 1 = Ethernet MAC controller received the CRC error packet.
[3]	ACP	Accept Control Packet The ACP controls the control frame reception. If the ACP is set to high, the EMAC will accept the control frame. Otherwise, the control frame will be dropped. It is recommended that S/W only enable ACP while EMAC is operating on full duplex mode. 0 = Ethernet MAC controller dropped the control frame. 1 = Ethernet MAC controller received the control frame.
[2]	ARP	Accept Runt Packet The ARP controls the runt packet, which length is less than 64 bytes, reception. If the ARP is set to high, the EMAC will accept the runt packet. Otherwise, the runt packet will be dropped. 0 = Ethernet MAC controller dropped the runt packet. 1 = Ethernet MAC controller received the runt packet.
[1]	ALP	Accept Long Packet The ALP controls the long packet, which packet length is greater than 1518 bytes, reception. If the ALP is set to high, the EMAC will accept the long packet. Otherwise, the long packet will be dropped. 0 = Ethernet MAC controller dropped the long packet. 1 = Ethernet MAC controller received the long packet.
[0]	RXON	Frame Reception ON The RXON controls the normal packet reception of EMAC. If the RXON is set to high, the EMAC starts the packet reception process, including the RX descriptor fetching, packet reception and RX descriptor modification. It is necessary to finish EMAC initial sequence before enable RXON. Otherwise, the EMAC operation is undefined. If the RXON is disabled during EMAC is receiving an incoming packet, the EMAC stops the packet reception process after the current packet reception finished. 0 = Packet reception process stopped. 1 = Packet reception process started.

MII Management Data Register (EMAC_MIIMDAT)

The EMAC provides MII management function to access the control and status registers of the external PHY. The EMAC_MIIMDAT register is used to store the data that will be written into the registers of external PHY for write command or the data that is read from the registers of external PHY for read command.

Register	Offset	R/W	Description				Reset Value
EMAC_MIIMDAT	EMAC_BA+0x094	R/W	MII Management Data Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
DATA							
7	6	5	4	3	2	1	0
DATA							

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	DATA	MII Management Data The DATA is the 16 bits data that will be written into the registers of external PHY for MII Management write command or the data from the registers of external PHY for MII Management read command.

MII Management Control and Address Register (EMAC_MIIMCTL)

The EMAC provides MII management function to access the control and status registers of the external PHY. The EMAC_MIIMCTL register is used to keep the MII management command information, like the register address, external PHY address, MDC clocking rate, read/write etc.

Register	Offset	R/W	Description				Reset Value
EMAC_MIIMCTL	EMAC_BA+0x098	R/W	MII Management Control and Address Register				0x0090_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved				MDCON	PREAMSP	BUSY	WRITE
15	14	13	12	11	10	9	8
Reserved			PHYADDR				
7	6	5	4	3	2	1	0
Reserved			PHYREG				

Bits	Description	
[31:20]	Reserved	Reserved.
[19]	MDCON	MDC Clock ON The MDC controls the MDC clock generation. If the MDCON is set to high, the MDC clock is turned on. 0 = MDC clock off. 1 = MDC clock on.
[18]	PREAMSP	Preamble Suppress The PREAMSP controls the preamble field generation of MII management frame. If the PREAMSP is set to high, the preamble field generation of MII management frame is skipped. 0 = Preamble field generation of MII management frame not skipped. 1 = Preamble field generation of MII management frame skipped.
[17]	BUSY	Busy Bit The BUSY controls the enable of the MII management frame generation. If S/W wants to access registers of external PHY, it set BUSY to high and EMAC generates the MII management frame to external PHY through MII Management I/F. The BUSY is a self-clear bit. This means the BUSY will be cleared automatically after the MII management command finished. 0 = MII management command generation finished. 1 = MII management command generation Enabled.
[16]	WRITE	Write Command The Write defines the MII management command is a read or write. 0 = MII management command is a read command. 1 = MII management command is a write command.
[15:13]	Reserved	Reserved.

[12:8]	PHYADDR	PHY Address The PHYADDR keeps the address to differentiate which external PHY is the target of the MII management command.
[7:5]	Reserved	Reserved.
[4:0]	PHYREG	PHY Register Address The PHYREG keeps the address to indicate which register of external PHY is the target of the MII management command.

MII Management Function Frame Format

In IEEE Std. 802.3 clause 22.2.4, the MII management function is defined. The MII management function is used for the purpose of controlling the PHY and gathering status from the PHY. The MII management frame format is shown as follow.

	Management Frame Fields							
	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
READ	1...1	01	10	AAAAAA	RRRRR	Z0	DDDDDDDDDDDDDDDDDD	Z
WRITE	1...1	01	01	AAAAAA	RRRRR	10	DDDDDDDDDDDDDDDDDD	Z

Table 6.16-15 MII Management Frame Format

MII Management Function Configure Sequence

Read	Write
<ol style="list-style-type: none"> Set appropriate EMAC_MDCCR. Set PHYADDR and PHYREG. Set Write to 1b0 Set bit BUSY (EMAC_MIIMCTL[17]) to 1b1 to send a MII management frame out. Wait BUSY (EMAC_MIIMCTL[17]) to become 1b0. Read data from EMAC_MIIMDAT register. Finish the read command. 	<ol style="list-style-type: none"> Write data to EMAC_MIIMDAT register Set appropriate EMAC_MDCCR. Set PHYADDR and PHYREG. Set Write to 1b1 Set bit BUSY (EMAC_MIIMCTL[17]) to 1b1 to send a MII management frame out. Wait BUSY (EMAC_MIIMCTL[17]) to become 1b0. Finish the write command.

Table 6.16-16 MII Management Function Configure Sequence

FIFO Threshold Control Register (EMAC FIFOCTL)

The EMAC_FIFOCTL defines the high and low threshold of internal FIFOs, including TXFIFO and RXFIFO. The threshold of internal FIFOs is related to EMAC request generation and when the frame transmission starts. The EMAC_FIFOCTL also defines the burst length of AHB bus cycle for system memory access.

Register	Offset	R/W	Description				Reset Value
EMAC_FIFOCTL	EMAC_BA+0x09C	R/W	FIFO Threshold Control Register				0x0000_0101

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved		BURSTLEN			Reserved		
15	14	13	12	11	10	9	8
Reserved						TXFIFOTH	
7	6	5	4	3	2	1	0
Reserved						RXFIFOTH	

Bits	Description	
[31:22]	Reserved	Reserved.
[21:20]	BURSTLEN	DMA Burst Length This defines the burst length of AHB bus cycle while EMAC accesses system memory. 00 = 4 words. 01 = 8 words. 10 = 16 words. 11 = 16 words.
[19:10]	Reserved	Reserved.
[9:8]	TXFIFOTH	TXFIFO Low Threshold The TXFIFOTH controls when TxDMA requests internal arbiter for data transfer between system memory and TXFIFO. The TXFIFOTH defines not only the low threshold of TXFIFO, but also the high threshold. The high threshold is the twice of low threshold always. During the packet transmission, if the TXFIFO reaches the high threshold, the TxDMA stops generate request to transfer frame data from system memory to TXFIFO. If the frame data in TXFIFO is less than low threshold, TxDMA starts to transfer frame data from system memory to TXFIFO. The TXFIFOTH also defines when the TXMAC starts to transmit frame out to network. The TXMAC starts to transmit the frame out while the TXFIFO first time reaches the high threshold during the transmission of the frame. If the frame data length is less than TXFIFO high threshold, the TXMAC starts to transmit the frame out after the frame data are all inside the TXFIFO. 00 = Undefined. 01 = TXFIFO low threshold is 64B and high threshold is 128B. 10 = TXFIFO low threshold is 80B and high threshold is 160B. 11 = TXFIFO low threshold is 96B and high threshold is 192B.
[7:2]	Reserved	Reserved.

[1:0]	RXFIFOTH	RXFIFO Low Threshold The RXFIFOTH controls when RXDMA requests internal arbiter for data transfer between RXFIFO and system memory. The RXFIFOTH defines not only the high threshold of RXFIFO, but also the low threshold. The low threshold is the half of high threshold always. During the packet reception, if the RXFIFO reaches the high threshold, the RXDMA starts to transfer frame data from RXFIFO to system memory. If the frame data in RXFIFO is less than low threshold, RXDMA stops to transfer the frame data to system memory. 00 = Depend on the burst length setting. If the burst length is 8 words, high threshold is 8 words, too. 01 = RXFIFO high threshold is 64B and low threshold is 32B. 10 = RXFIFO high threshold is 128B and low threshold is 64B. 11 = RXFIFO high threshold is 192B and low threshold is 96B.
-------	----------	--

Transmit Start Demand Register (EMAC_TXST)

S/W issues a write command to EMAC_TXST register to make TxDMA to leave Halt state and continue the frame transmission.

Register	Offset	R/W	Description				Reset Value
EMAC_TXST	EMAC_BA+0x0A0	W	Transmit Start Demand Register				Undefined

31	30	29	28	27	26	25	24
TXST							
23	22	21	20	19	18	17	16
TXST							
15	14	13	12	11	10	9	8
TXST							
7	6	5	4	3	2	1	0
TXST							

Bits	Description	
[31:0]	TXST	Transmit Start Demand If the TX descriptor is not available for use of TxDMA after the TXON (EMAC_CTL[8]) is enabled, the FSM (Finite State Machine) of TxDMA enters the Halt state and the frame transmission is halted. After the S/W has prepared the new TX descriptor for frame transmission, it must issue a write command to EMAC_TXST register to make TxDMA to leave Halt state and continue the frame transmission. The EMAC_TXST is a write only register and read from this register is undefined. The write to EMAC_TXST register takes effect only when TxDMA stayed at Halt state.

Receive Start Demand Register (EMAC_RXST)

S/W issues a write command to EMAC_RXST register to make RXDMA to leave Halt state and continue the frame reception.

Register	Offset	R/W	Description				Reset Value
EMAC_RXST	EMAC_BA+0x0A ₄	W	Receive Start Demand Register				Undefined

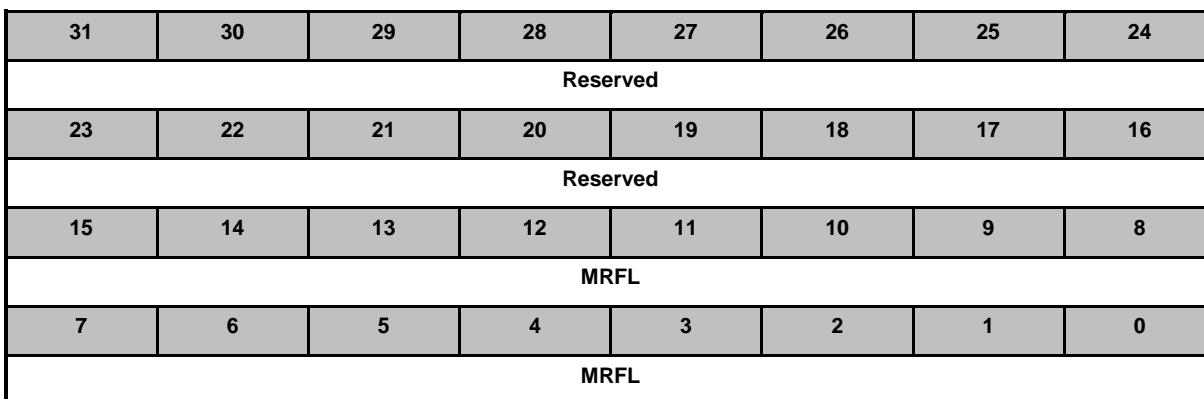

31	30	29	28	27	26	25	24
RXST							
23	22	21	20	19	18	17	16
RXST							
15	14	13	12	11	10	9	8
RXST							
7	6	5	4	3	2	1	0
RXST							

Bits	Description	
[31:0]	RXST	Receive Start Demand If the RX descriptor is not available for use of RXDMA after the RXON (EMAC_CTL[0]) is enabled, the FSM (Finite State Machine) of RXDMA enters the Halt state and the frame reception is halted. After the S/W has prepared the new RX descriptor for frame reception, it must issue a write command to EMAC_RXST register to make RXDMA to leave Halt state and continue the frame reception. The EMAC_RXST is a write only register and read from this register is undefined. The write to EMAC_RXST register take effect only when RXDMA stayed at Halt state.

Maximum Receive Frame Control Register (EMAC_MRFL)

The EMAC_MRFL defines the maximum frame length for a received frame that can be stored in the system memory. It is recommended that only use this register while S/W wants to receive a frame which length is greater than 1518 bytes.

Register	Offset	R/W	Description					Reset Value
EMAC_MRFL	EMAC_BA+0x0A8	R/W	Maximum Receive Frame Control Register					0x0000_0800

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	MRFL	<p>Maximum Receive Frame Length</p> <p>The MRFL defines the maximum frame length for received frame. If the frame length of received frame is greater than MRFL, and bit MFLEIEN (EMAC_INTEN[8]) is also enabled, the bit MFLEIF (EMAC_INTSTS[8]) is set and the RX interrupt is triggered.</p> <p>It is recommended that only use MRFL to qualify the length of received frame while S/W wants to receive a frame which length is greater than 1518 bytes.</p>

MAC Interrupt Enable Register (EMAC_INTEN)

The EMAC_INTEN controls the enable of EMAC interrupt status to generate interrupt. Two interrupts, RXIF for frame reception and TXIF for frame transmission, are generated from EMAC to CPU.

Register	Offset	R/W	Description				Reset Value
EMAC_INTEN	EMAC_BA+0x0AC	R/W	MAC Interrupt Enable Register				0x0000_0000

31	30	29	28	27	26	25	24

MPCOVIEN	RPIEN	ALIEIEN	RXGDIEN	LPIEN	RXOVIEN	CRCEIEN	RXIEN

Bits	Description	
[31:29]	Reserved	Reserved.
[28]	TSALMIEN	Time Stamp Alarm Interrupt Enable Bit The TSALMIEN controls the TSALMIF (EMAC_INTSTS[28]) interrupt generation. If TSALMIF (EMAC_INTSTS[28]) is set, and both TSALMIEN and TXIEN (EMAC_INTEN[16]) enabled, the EMAC generates the TX interrupt to CPU. If TSALMIEN or TXIEN (EMAC_INTEN[16]) disabled, no TX interrupt generated to CPU even the TXTSALMIF (EMAC_INTEN[28]) is set. 0 = TXTSALMIF (EMAC_INTSTS[28]) trigger TX interrupt Disabled. 1 = TXTSALMIF (EMAC_INTSTS[28]) trigger TX interrupt Enabled.
[27:25]	Reserved	Reserved.
[24]	TXBEIEN	Transmit Bus Error Interrupt Enable Bit The TXBEIEN controls the TXBEIF (EMAC_INTSTS[24]) interrupt generation. If TXBEIF (EMAC_INTSTS[24]) is set, and both TXBEIEN and TXIEN (EMAC_INTEN[16]) are enabled, the EMAC generates the TX interrupt to CPU. If TXBEIEN or TXIEN (EMAC_INTEN[16]) is disabled, no TX interrupt is generated to CPU even the TXBEIF (EMAC_INTSTS[24]) is set. 0 = TXBEIF (EMAC_INTSTS[24]) trigger TX interrupt Disabled. 1 = TXBEIF (EMAC_INTSTS[24]) trigger TX interrupt Enabled.
[23]	TDUIEN	Transmit Descriptor Unavailable Interrupt Enable Bit The TDUIEN controls the TDUIF (EMAC_INTSTS[23]) interrupt generation. If TDUIF (EMAC_INTSTS[23]) is set, and both TDUIEN and TXIEN (EMAC_INTEN[16]) are enabled, the EMAC generates the TX interrupt to CPU. If TDUIEN or TXIEN (EMAC_INTEN[16]) is disabled, no TX interrupt is generated to CPU even the TDUIF (EMAC_INTSTS[23]) is set. 0 = TDUIF (EMAC_INTSTS[23]) trigger TX interrupt Disabled. 1 = TDUIF (EMAC_INTSTS[23]) trigger TX interrupt Enabled.

[22]	LCIEN	Late Collision Interrupt Enable Bit The LCIEN controls the LCIF (EMAC_INTSTS[22]) interrupt generation. If LCIEN (EMAC_INTSTS[22]) is set, and both LCIEN and TXIEN (EMAC_INTEN[16]) are enabled, the EMAC generates the TX interrupt to CPU. If LCIEN or TXIEN (EMAC_INTEN[16]) is disabled, no TX interrupt is generated to CPU even the LCIF (EMAC_INTSTS[22]) is set. 0 = LCIF (EMAC_INTSTS[22]) trigger TX interrupt Disabled. 1 = LCIF (EMAC_INTSTS[22]) trigger TX interrupt Enabled.
[21]	TXABTIEN	Transmit Abort Interrupt Enable Bit The TXABTIEN controls the TXABTIF (EMAC_INTSTS[21]) interrupt generation. If TXABTIF (EMAC_INTSTS[21]) is set, and both TXABTIEN and TXIEN (EMAC_INTEN[16]) are enabled, the EMAC generates the TX interrupt to CPU. If TXABTIEN or TXIEN (EMAC_INTEN[16]) is disabled, no TX interrupt is generated to CPU even the TXABTIF (EMAC_INTSTS[21]) is set. 0 = TXABTIF (EMAC_INTSTS[21]) trigger TX interrupt Disabled. 1 = TXABTIF (EMAC_INTSTS[21]) trigger TX interrupt Enabled.
[20]	NCSIEN	No Carrier Sense Interrupt Enable Bit The NCSIEN controls the NCSIF (EMAC_INTSTS[20]) interrupt generation. If NCSIEN (EMAC_INTSTS[20]) is set, and both NCSIEN and TXIEN (EMAC_INTEN[16]) are enabled, the EMAC generates the TX interrupt to CPU. If NCSIEN or TXIEN (EMAC_INTEN[16]) is disabled, no TX interrupt is generated to CPU even the NCSIEN (EMAC_INTSTS[20]) is set. 0 = NCSIEN (EMAC_INTSTS[20]) trigger TX interrupt Disabled. 1 = NCSIEN (EMAC_INTSTS[20]) trigger TX interrupt Enabled.
[19]	EXDEFIEN	Defer Exceed Interrupt Enable Bit The EXDEFIEN controls the EXDEFIF (EMAC_INTSTS[19]) interrupt generation. If EXDEFIF (EMAC_INTSTS[19]) is set, and both EXDEFIEN and TXIEN (EMAC_INTEN[16]) are enabled, the EMAC generates the TX interrupt to CPU. If EXDEFIEN or TXIEN (EMAC_INTEN[16]) is disabled, no TX interrupt is generated to CPU even the EXDEFIF (EMAC_INTSTS[19]) is set. 0 = EXDEFIF (EMAC_INTSTS[19]) trigger TX interrupt Disabled. 1 = EXDEFIF (EMAC_INTSTS[19]) trigger TX interrupt Enabled.
[18]	TXCPIEN	Transmit Completion Interrupt Enable Bit The TXCPIEN controls the TXCPIF (EMAC_INTSTS[18]) interrupt generation. If TXCPIF (EMAC_INTSTS[18]) is set, and both TXCPIEN and TXIEN (EMAC_INTEN[16]) are enabled, the EMAC generates the TX interrupt to CPU. If TXCPIEN or TXIEN (EMAC_INTEN[16]) is disabled, no TX interrupt is generated to CPU even the TXCPIF (EMAC_INTSTS[18]) is set. 0 = TXCPIF (EMAC_INTSTS[18]) trigger TX interrupt Disabled. 1 = TXCPIF (EMAC_INTSTS[18]) trigger TX interrupt Enabled.
[17]	TXUDIEN	Transmit FIFO Underflow Interrupt Enable Bit The TXUDIEN controls the TXUDIF (EMAC_INTSTS[17]) interrupt generation. If TXUDIF (EMAC_INTSTS[17]) is set, and both TXUDIEN and TXIEN (EMAC_INTEN[16]) are enabled, the EMAC generates the TX interrupt to CPU. If TXUDIEN or TXIEN (EMAC_INTEN[16]) is disabled, no TX interrupt is generated to CPU even the TXUDIF (EMAC_INTSTS[17]) is set. 0 = TXUDIF (EMAC_INTSTS[17]) TX interrupt Disabled. 1 = TXUDIF (EMAC_INTSTS[17]) TX interrupt Enabled.

[16]	TXIEN	Transmit Interrupt Enable Bit The TXIEN controls the TX interrupt generation. If TXIEN is enabled and TXIF (EMAC_INTSTS[16]) is high, EMAC generates the TX interrupt to CPU. If TXIEN is disabled, no TX interrupt is generated to CPU even any status bit of EMAC_INTSTS[24:17] set and the corresponding bit of EMAC_INTEN is enabled. In other words, if S/W wants to receive TX interrupt from EMAC, this bit must be enabled. And, if S/W doesn't want to receive any TX interrupt from EMAC, disables this bit. 0 = TXIF (EMAC_INTSTS[16]) is masked and TX interrupt generation Disabled. 1 = TXIF (EMAC_INTSTS[16]) is not masked and TX interrupt generation Enabled.
[15]	WOLIEN	Wake on LAN Interrupt Enable Bit The WOLIEN controls the WOLIF (EMAC_INTSTS[15]) interrupt generation. If WOLIF (EMAC_INTSTS[15]) is set, and both WOLIEN and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If WOLIEN or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the WOLIF (EMAC_INTSTS[15]) is set. 0 = WOLIF (EMAC_INTSTS[15]) trigger RX interrupt Disabled. 1 = WOLIF (EMAC_INTSTS[15]) trigger RX interrupt Enabled.
[14]	CFRIEN	Control Frame Receive Interrupt Enable Bit The CFRIEN controls the CFRIF (EMAC_INTSTS[14]) interrupt generation. If CFRIF (EMAC_INTSTS[14]) is set, and both CFRIEN and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If CFRIEN or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the CFRIF (EMAC_INTSTS[14]) register is set. 0 = CFRIF (EMAC_INTSTS[14]) trigger RX interrupt Disabled. 1 = CFRIF (EMAC_INTSTS[14]) trigger RX interrupt Enabled.
[13:12]	Reserved	Reserved.
[11]	RXBEIEN	Receive Bus Error Interrupt Enable Bit The RXBEIEN controls the RXBEIF (EMAC_INTSTS[11]) interrupt generation. If RXBEIF (EMAC_INTSTS[11]) is set, and both RXBEIEN and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If RXBEIEN or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the RXBEIF (EMAC_INTSTS[11]) is set. 0 = RXBEIF (EMAC_INTSTS[11]) trigger RX interrupt Disabled. 1 = RXBEIF (EMAC_INTSTS[11]) trigger RX interrupt Enabled.
[10]	RDUIEN	Receive Descriptor Unavailable Interrupt Enable Bit The RDUIEN controls the RDUIF (EMAC_INTSTS[10]) interrupt generation. If RDUIF (EMAC_INTSTS[10]) is set, and both RDUIEN and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If RDUIEN or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the RDUIF (EMAC_MIOSTA[10]) register is set. 0 = RDUIF (EMAC_INTSTS[10]) trigger RX interrupt Disabled. 1 = RDUIF (EMAC_INTSTS[10]) trigger RX interrupt Enabled.
[9]	DENIEN	DMA Early Notification Interrupt Enable Bit The DENIEN controls the DENIF (EMAC_INTSTS[9]) interrupt generation. If DENIF (EMAC_INTSTS[9]) is set, and both DENIEN and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If DENIEN or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the DENIF (EMAC_INTSTS[9]) is set. 0 = TDENIF (EMAC_INTSTS[9]) trigger RX interrupt Disabled. 1 = TDENIF (EMAC_INTSTS[9]) trigger RX interrupt Enabled.

[8]	MFLEIEN	Maximum Frame Length Exceed Interrupt Enable Bit The MFLEIEN controls the MFLEIF (EMAC_INTSTS[8]) interrupt generation. If MFLEIF (EMAC_INTSTS[8]) is set, and both MFLEIEN and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If MFLEIEN or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the MFLEIF (EMAC_INTSTS[8]) is set. 0 = MFLEIF (EMAC_INTSTS[8]) trigger RX interrupt Disabled. 1 = MFLEIF (EMAC_INTSTS[8]) trigger RX interrupt Enabled.
[7]	MPCOVIEN	Miss Packet Counter Overrun Interrupt Enable Bit The MPCOVIEN controls the MPCOVIF (EMAC_INTSTS[7]) interrupt generation. If MPCOVIF (EMAC_INTSTS[7]) is set, and both MPCOVIEN and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If MPCOVIEN or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the MPCOVIF (EMAC_INTSTS[7]) is set. 0 = MPCOVIF (EMAC_INTSTS[7]) trigger RX interrupt Disabled. 1 = MPCOVIF (EMAC_INTSTS[7]) trigger RX interrupt Enabled.
[6]	RPIEN	Runt Packet Interrupt Enable Bit The RPIEN controls the RPIF (EMAC_INTSTS[6]) interrupt generation. If RPIF (EMAC_INTSTS[6]) is set, and both RPIEN and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If RPIEN or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the RPIF (EMAC_INTSTS[6]) is set. 0 = RPIF (EMAC_INTSTS[6]) trigger RX interrupt Disabled. 1 = RPIF (EMAC_INTSTS[6]) trigger RX interrupt Enabled.
[5]	ALIEIEN	Alignment Error Interrupt Enable Bit The ALIEIEN controls the ALIEIF (EMAC_INTSTS[5]) interrupt generation. If ALIEIF (EMAC_INTSTS[5]) is set, and both ALIEIEN and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If ALIEIEN or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the ALIEIF (EMAC_INTSTS[5]) is set. 0 = ALIEIF (EMAC_INTSTS[5]) trigger RX interrupt Disabled. 1 = ALIEIF (EMAC_INTSTS[5]) trigger RX interrupt Enabled.
[4]	RXGDIEN	Receive Good Interrupt Enable Bit The RXGDIEN controls the RXGDFIF (EMAC_INTSTS[4]) interrupt generation. If RXGDFIF (EMAC_INTSTS[4]) is set, and both RXGDIEN and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If RXGDIEN or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the RXGDFIF (EMAC_INTSTS[4]) is set. 0 = RXGDFIF (EMAC_INTSTS[4]) trigger RX interrupt Disabled. 1 = RXGDFIF (EMAC_INTSTS[4]) trigger RX interrupt Enabled.
[3]	LPIEN	Long Packet Interrupt Enable Bit The LPIEN controls the LPIF (EMAC_INTSTS[3]) interrupt generation. If LPIF (EMAC_INTSTS[3]) is set, and both LPIEN and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If LPIEN or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the LPIF (EMAC_INTSTS[3]) is set. 0 = LPIF (EMAC_INTSTS[3]) trigger RX interrupt Disabled. 1 = LPIF (EMAC_INTSTS[3]) trigger RX interrupt Enabled.
[2]	RXOVien	Receive FIFO Overflow Interrupt Enable Bit The RXOVien controls the RXOVIF (EMAC_INTSTS[2]) interrupt generation. If RXOVIF (EMAC_INTSTS[2]) is set, and both RXOVien and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If RXOVien or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the RXOVIF (EMAC_INTSTS[2]) is set. 0 = RXOVIF (EMAC_INTSTS[2]) trigger RX interrupt Disabled. 1 = RXOVIF (EMAC_INTSTS[2]) trigger RX interrupt Enabled.

[1]	CRCEIEN	CRC Error Interrupt Enable Bit The CRCEIEN controls the CRCEIF (EMAC_INTSTS[1]) interrupt generation. If CRCEIEN (EMAC_INTSTS[1]) is set, and both CRCEIEN and RXIEN (EMAC_INTEN[0]) are enabled, the EMAC generates the RX interrupt to CPU. If CRCEIEN or RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated to CPU even the CRCEIF (EMAC_INTSTS[1]) is set. 0 = CRCEIF (EMAC_INTSTS[1]) trigger RX interrupt Disabled. 1 = CRCEIF (EMAC_INTSTS[1]) trigger RX interrupt Enabled.
[0]	RXIEN	Receive Interrupt Enable Bit The RXIEN controls the RX interrupt generation. If RXIEN is enabled and RXIF (EMAC_INTSTS[0]) is high, EMAC generates the RX interrupt to CPU. If RXIEN is disabled, no RX interrupt is generated to CPU even any status bit EMAC_INTSTS[15:1] is set and the corresponding bit of EMAC_INTEN is enabled. In other words, if S/W wants to receive RX interrupt from EMAC, this bit must be enabled. And, if S/W doesn't want to receive any RX interrupt from EMAC, disables this bit. 0 = RXIF (EMAC_INTSTS[0]) is masked and RX interrupt generation Disabled. 1 = RXIF (EMAC_INTSTS[0]) is not masked and RX interrupt generation Enabled.

MAC Interrupt Status Register (EMAC_INTSTS)

The EMAC_INTSTS keeps much EMAC statuses, such as frame transmission, reception status and internal FIFO status. The statuses kept in EMAC_INTSTS will trigger the reception or transmission interrupt. The EMAC_INTSTS is a write clear register and write 1 to corresponding bit clears the status and also clears the interrupt.

Register	Offset	R/W	Description				Reset Value
EMAC_INTSTS	EMAC_BA+0x0B0	R/W	MAC Interrupt Status Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved			TSALMIF	Reserved			TXBEIF
23	22	21	20	19	18	17	16
TDUIF	LCIF	TXABTIF	NCSIF	EXDEFIF	TXCPIF	TXUDIF	TXIF
15	14	13	12	11	10	9	8
WOLIF	CFRIF	Reserved		RXBEIF	RDUIF	DENIF	MFLEIF
7	6	5	4	3	2	1	0
MPCOVIF	RPIF	ALIEIF	RXGdif	LPIF	RXOVIF	CRCEIF	RXIF

Bits	Description	
[31:29]	Reserved	Reserved.
[28]	TSALMIF	Time Stamp Alarm Interrupt The TSALMIF high indicates the EMAC_TSSEC register value equals to EMAC_ALMSEC register and EMAC_TSSUBSEC register value equals to register EMAC_ALMSUBSEC. If TSALMIF is high and TSALMIEN (EMAC_INTEN[28]) enabled, the TXIF will be high. Write 1 to this bit clears the TSALMIF status. 0 = EMAC_TSSEC did not equal EMAC_ALMSEC or EMAC_TSSUBSEC did not equal EMAC_ALMSUBSEC. 1 = EMAC_TSSEC equals EMAC_ALMSEC and EMAC_TSSUBSEC equals EMAC_ALMSUBSEC.
[27:25]	Reserved	Reserved.
[24]	TXBEIF	Transmit Bus Error Interrupt The TXBEIF high indicates the memory controller replies ERROR response while EMAC access system memory through TXDMA during packet transmission process. Reset EMAC is recommended while TXBEIF status is high. If the TXBEIF is high and TXBEIEN (EMAC_INTEN[24]) is enabled, the TXIF will be high. Write 1 to this bit clears the TXBEIF status. 0 = No ERROR response is received. 1 = ERROR response is received.

[23]	TDUIF	<p>Transmit Descriptor Unavailable Interrupt</p> <p>The TDUIF high indicates that there is no available TX descriptor for packet transmission and TxDMA will stay at Halt state. Once, the TxDMA enters the Halt state, S/W must issues a write command to TSDR register to make TxDMA leave Halt state while new TX descriptor is available.</p> <p>If the TDUIF is high and TDUIEN (EMAC_INTEN[23]) is enabled, the TXIF will be high. Write 1 to this bit clears the TDUIF status.</p> <p>0 = TX descriptor is available. 1 = TX descriptor is unavailable.</p>
[22]	LCIF	<p>Late Collision Interrupt</p> <p>The LCIF high indicates the collision occurred in the outside of 64 bytes collision window. This means after the 64 bytes of a frame has been transmitted out to the network, the collision still occurred. The late collision check will only be done while EMAC is operating on half-duplex mode. If the LCIF is high and LCIEN (EMAC_INTEN[22]) is enabled, the TXIF will be high. Write 1 to this bit clears the LCIF status.</p> <p>0 = No collision occurred in the outside of 64 bytes collision window. 1 = Collision occurred in the outside of 64 bytes collision window.</p>
[21]	TXABTIF	<p>Transmit Abort Interrupt</p> <p>The TXABTIF high indicates the packet incurred 16 consecutive collisions during transmission, and then the transmission process for this packet is aborted. The transmission abort is only available while EMAC is operating on half-duplex mode.</p> <p>If the TXABTIF is high and TXABTIEN (EMAC_INTEN[21]) is enabled, the TXIF will be high. Write 1 to this bit clears the TXABTIF status.</p> <p>0 = Packet does not incur 16 consecutive collisions during transmission. 1 = Packet incurred 16 consecutive collisions during transmission.</p>
[20]	NCSIF	<p>No Carrier Sense Interrupt</p> <p>The NCSIF high indicates the MII I/F signal CRS does not active at the start of or during the packet transmission. The NCSIF is only available while EMAC is operating on half-duplex mode. If the NCSIEN (EMAC_INTEN[20]) is enabled, the TXIF will be high. Write 1 to this bit clears the NCSIF status.</p> <p>0 = CRS signal actives correctly. 1 = CRS signal does not active at the start of or during the packet transmission.</p>
[19]	EXDEFIF	<p>Defer Exceed Interrupt</p> <p>The EXDEFIF high indicates the frame waiting for transmission has deferred over 0.32768ms on 100Mbps mode, or 3.2768ms on 10Mbps mode. The deferral exceed check will only be done while bit NODEF of MCMDR is disabled, and EMAC is operating on half-duplex mode.</p> <p>If the EXDEFIF is high and EXDEFIEN (EMAC_INTEN[19]) is enabled, the TXIF will be high. Write 1 to this bit clears the EXDEFIF status.</p> <p>0 = Frame waiting for transmission has not deferred over 0.32768ms (100Mbps) or 3.2768ms (10Mbps). 1 = Frame waiting for transmission has deferred over 0.32768ms (100Mbps) or 3.2768ms (10Mbps).</p>
[18]	TXCPIF	<p>Transmit Completion Interrupt</p> <p>The TXCPIF indicates the packet transmission has completed correctly.</p> <p>If the TXCPIF is high and TXCPIEN (EMAC_INTEN[18]) is enabled, the TXIF will be high. Write 1 to this bit clears the TXCPIF status.</p> <p>0 = The packet transmission not completed. 1 = The packet transmission has completed.</p>

[17]	TXUDIF	Transmit FIFO Underflow Interrupt The TXUDIF high indicates the TXFIFO underflow occurred during packet transmission. While the TXFIFO underflow occurred, the EMAC will retransmit the packet automatically without S/W intervention. If the TXFIFO underflow occurred often, it is recommended that modify TXFIFO threshold control, the TXFIFOTH of FFTCR register, to higher level. If the TXUDIF is high and TXUDIEN (EMAC_INTEN[17]) is enabled, the TXIF will be high. Write 1 to this bit clears the TXUDIF status. 0 = No TXFIFO underflow occurred during packet transmission. 1 = TXFIFO underflow occurred during packet transmission.
[16]	TXIF	Transmit Interrupt The TXIF indicates the TX interrupt status. If TXIF high and its corresponding enable bit, TXIEN (EMAC_INTEN[16]), is also high indicates the EMAC generates TX interrupt to CPU. If TXIF is high but TXIEN (EMAC_INTEN[16]) is disabled, no TX interrupt is generated. The TXIF is logic OR result of bit logic AND result of EMAC_INTSTS[28:17] and EMAC_INTEN[28:17]. In other words, if any bit of EMAC_INTSTS[28:17] is high and its corresponding enable bit in EMAC_INTEN[28:17] is also enabled, the TXIF will be high. Because the TXIF is a logic OR result, clears EMAC_INTSTS[28:17] makes TXIF be cleared, too. 0 = No status bit in EMAC_INTSTS[28:17] is set or no enable bit in EMAC_INTEN[28:17] is enabled. 1 = At least one status in EMAC_INTSTS[28:17] is set and its corresponding enable bit in EMAC_INTEN[28:17] is enabled, too.
[15]	WOLIF	Wake on LAN Interrupt Flag The WOLIF high indicates EMAC receives a Magic Packet. The CFRIF only available while system is in Power-down mode and WOLEN is set high. If the WOLIF is high and WOLIEN (EMAC_INTEN[15]) is enabled, the RXIF will be high. Write 1 to this bit clears the WOLIF status. 0 = The EMAC does not receive the Magic Packet. 1 = The EMAC receives a Magic Packet.
[14]	CFRIF	Control Frame Receive Interrupt The CFRIF high indicates EMAC receives a flow control frame. The CFRIF only available while EMAC is operating on full duplex mode. If the CFRIF is high and CFRIEN (EMAC_INTEN[14]) is enabled, the RXIF will be high. Write 1 to this bit clears the CFRIF status. 0 = The EMAC does not receive the flow control frame. 1 = The EMAC receives a flow control frame.
[13:12]	Reserved	Reserved.
[11]	RXBEIF	Receive Bus Error Interrupt The RXBEIF high indicates the memory controller replies ERROR response while EMAC access system memory through RXDMA during packet reception process. Reset EMAC is recommended while RXBEIF status is high. If the RXBEIF is high and RXBEIEN (EMAC_INTEN[11]) is enabled, the RXIF will be high. Write 1 to this bit clears the RXBEIF status. 0 = No ERROR response is received. 1 = ERROR response is received.

[10]	RDUIF	Receive Descriptor Unavailable Interrupt The RDUIF high indicates that there is no available RX descriptor for packet reception and RXDMA will stay at Halt state. Once, the RXDMA enters the Halt state, S/W must issues a write command to RSDR register to make RXDMA leave Halt state while new RX descriptor is available. If the RDUIF is high and RDUIEN (EMAC_INTEN[10]) is enabled, the RXIF will be high. Write 1 to this bit clears the RDUIF status. 0 = RX descriptor is available. 1 = RX descriptor is unavailable.
[9]	DENIF	DMA Early Notification Interrupt The DENIF high indicates the EMAC has received the LENGTH field of the incoming packet. If the DENIF is high and DENIENI (EMAC_INTEN[9]) is enabled, the RXIF will be high. Write 1 to this bit clears the DENIF status. 0 = The LENGTH field of incoming packet has not received yet. 1 = The LENGTH field of incoming packet has received.
[8]	MFLEIF	Maximum Frame Length Exceed Interrupt Flag The MFLEIF high indicates the length of the incoming packet has exceeded the length limitation configured in DMARFC register and the incoming packet is dropped. If the MFLEIF is high and MFLEIEN (EMAC_INTEN[8]) is enabled, the RXIF will be high. Write 1 to this bit clears the MFLEIF status. 0 = The length of the incoming packet does not exceed the length limitation configured in DMARFC. 1 = The length of the incoming packet has exceeded the length limitation configured in DMARFC.
[7]	MPCOVIF	Missed Packet Counter Overrun Interrupt Flag The MPCOVIF high indicates the MPCNT, Missed Packet Count, has overflow. If the MPCOVIF is high and MPCOVIEN (EMAC_INTEN[7]) is enabled, the RXIF will be high. Write 1 to this bit clears the MPCOVIF status. 0 = The MPCNT has not rolled over yet. 1 = The MPCNT has rolled over yet.
[6]	RPIF	Runt Packet Interrupt The RPIF high indicates the length of the incoming packet is less than 64 bytes and the packet is dropped. If the ARP (EMAC_CTL[2]) is set, the short packet is regarded as a good packet and RPIF will not be set. If the RPIF is high and RPIEN (EMAC_INTEN[6]) is enabled, the RXIF will be high. Write 1 to this bit clears the RPIF status. 0 = The incoming frame is not a short frame or S/W wants to receive a short frame. 1 = The incoming frame is a short frame and dropped.
[5]	ALIEIF	Alignment Error Interrupt The ALIEIF high indicates the length of the incoming frame is not a multiple of byte. If the ALIEIF is high and ALIEIEN (EMAC_INTEN[5]) is enabled, the RXIF will be high. Write 1 to this bit clears the ALIEIF status. 0 = The frame length is a multiple of byte. 1 = The frame length is not a multiple of byte.
[4]	RXGDIF	Receive Good Interrupt The RXGDIF high indicates the frame reception has completed. If the RXGDIEN (EAMC_MIEN[4]) is enabled, the RXIF will be high. Write 1 to this bit clears the RXGDIF status. 0 = The frame reception has not complete yet. 1 = The frame reception has completed.

[3]	LPIF	Long Packet Interrupt Flag The LPIF high indicates the length of the incoming packet is greater than 1518 bytes and the incoming packet is dropped. If the ALP (EMAC_CTL[1]) is set, the long packet will be regarded as a good packet and LPIF will not be set. If the LPIF is high and LPIEN (EMAC_INTEN[3]) is enabled, the RXIF will be high. Write 1 to this bit clears the LPIF status. 0 = The incoming frame is not a long frame or S/W wants to receive a long frame. 1 = The incoming frame is a long frame and dropped.
[2]	RXOVIF	Receive FIFO Overflow Interrupt The RXOVIF high indicates the RXFIFO overflow occurred during packet reception. While the RXFIFO overflow occurred, the EMAC drops the current receiving packet. If the RXFIFO overflow occurred often, it is recommended that modify RXFIFO threshold control, the RXFIFOTH of FFTCR register, to higher level. If the RXOVIF is high and RXOVIEN (EMAC_INTEN[2]) is enabled, the RXIF will be high. Write 1 to this bit clears the RXOVIF status. 0 = No RXFIFO overflow occurred during packet reception. 1 = RXFIFO overflow occurred during packet reception.
[1]	CRCEIF	CRC Error Interrupt The CRCEIF high indicates the incoming packet incurred the CRC error and the packet is dropped. If the AEP (EMAC_CTL[4]) is set, the CRC error packet will be regarded as a good packet and CRCEIF will not be set. If the CRCEIF is high and CRCEIEN (EMAC_INTEN[1]) is enabled, the RXIF will be high. Write 1 to this bit clears the CRCEIF status. 0 = The frame does not incur CRC error. 1 = The frame incurred CRC error.
[0]	RXIF	Receive Interrupt The RXIF indicates the RX interrupt status. If RXIF high and its corresponding enable bit, RXIEN (EMAC_INTEN[0]), is also high indicates the EMAC generates RX interrupt to CPU. If RXIF is high but RXIEN (EMAC_INTEN[0]) is disabled, no RX interrupt is generated. The RXIF is logic OR result of bit logic AND result of EMAC_INTSTS[15:1] and EMAC_INTEN[15:1]. In other words, if any bit of EMAC_INTSTS[15:1] is high and its corresponding enable bit in EMAC_INTEN[15:1] is also enabled, the RXIF will be high. Because the RXIF is a logic OR result, clears EMAC_INTSTS[15:1] makes RXIF be cleared, too. 0 = No status bit in EMAC_INTSTS[15:1] is set or no enable bit in EMAC_INTEN[15:1] is enabled. 1 = At least one status in EMAC_INTSTS[15:1] is set and its corresponding enable bit in EMAC_INTEN[15:1] is enabled, too.

MAC General Status Register (EMAC_GENSTS)

The EMAC_GENSTS also keeps the statuses of EMAC. But the statuses in the EMAC_GENSTS will not trigger any interrupt. The EMAC_GENSTS is a write clear register and write 1 to corresponding bit clears the status.

Register	Offset	R/W	Description				Reset Value
EMAC_GENSTS	EMAC_BA+0x0B4	R/W	MAC General Status Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved			RPSTS	TXHALT	SQE	TXPAUSED	DEF
7	6	5	4	3	2	1	0
COLCNT				Reserved	RXFFULL	RXHALT	CFR

Bits	Description	
[31:13]	Reserved	Reserved.
[12]	RPSTS	Remote Pause Status The RPSTS indicates that remote pause counter down counting actives. After Ethernet MAC controller sent PAUSE frame out successfully, it starts the remote pause counter down counting. When this bit high, it's predictable that remote Ethernet MAC controller wouldn't start the packet transmission until the down counting done. 0 = Remote pause counter down counting done. 1 = Remote pause counter down counting actives.
[11]	TXHALT	Transmission Halted The TXHALT high indicates the next normal packet transmission process will be halted because the bit TXON (EMAC_CTL[8]) is disabled by S/W. 0 = Next normal packet transmission process will go on. 1 = Next normal packet transmission process will be halted.
[10]	SQE	Signal Quality Error The SQE high indicates the SQE error found at end of packet transmission on 10Mbps half-duplex mode. The SQE error check will only be done while both bit SQECHKEN (EMAC_CTL[17]) is enabled and EMAC is operating on 10Mbps half-duplex mode. 0 = No SQE error found at end of packet transmission. 1 = SQE error found at end of packet transmission.
[9]	TXPAUSED	Transmission Paused The TXPAUSED high indicates the next normal packet transmission process will be paused temporally because EMAC received a PAUSE control frame. 0 = Next normal packet transmission process will go on. 1 = Next normal packet transmission process will be paused.

[8]	DEF	Deferred Transmission The DEF high indicates the packet transmission has deferred once. The DEF is only available while EMAC is operating on half-duplex mode. 0 = Packet transmission does not defer. 1 = Packet transmission has deferred once.
[7:4]	COLCNT	Collision Count The COLCNT indicates that how many collisions occurred consecutively during a packet transmission. If the packet incurred 16 consecutive collisions during transmission, the COLCNT will be 4'h0 and bit TXABTIF will be set to 1.
[3]	Reserved	Reserved.
[2]	RXFFULL	RXFIFO Full The RXFFULL indicates the RXFIFO is full due to four 64-byte packets are kept in RXFIFO and the following incoming packet will be dropped. 0 = The RXFIFO is not full. 1 = The RXFIFO is full and the following incoming packet will be dropped.
[1]	RXHALT	Receive Halted The RXHALT high indicates the next normal packet reception process will be halted because the bit RXON of MCMDR is disabled by S/W. 0 = Next normal packet reception process will go on. 1 = Next normal packet reception process will be halted.
[0]	CFR	Control Frame Received The CFRIF high indicates EMAC receives a flow control frame. The CFRIF only available while EMAC is operating on full duplex mode. 0 = The EMAC does not receive the flow control frame. 1 = The EMAC receives a flow control frame.

Missed Packet Count Register (EMAC_MPCNT)

The EMAC_MPCNT keeps the number of packets that were dropped due to various types of receive errors. The EMAC_MPCNT is a read clear register. In addition, S/W also can write an initial value to EMAC_MPCNT and the missed packet counter will start counting from that initial value. If the missed packet counter is overflow, the MPCOVIF (EMAC_INTSTS[7]) will be set.

Register	Offset	R/W	Description				Reset Value
EMAC_MPCNT	EMAC_BA+0x0B8	R/W	Missed Packet Count Register				0x0000_7FFF

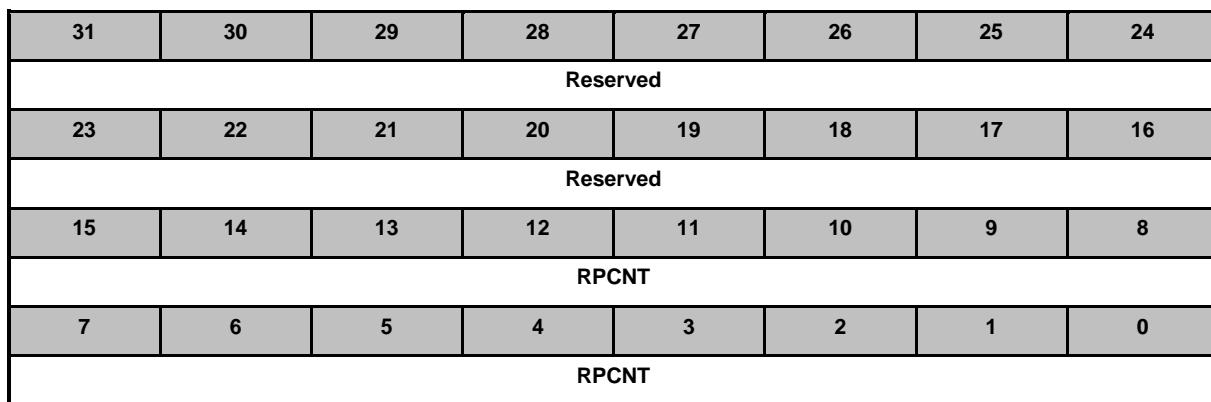

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
MPCNT							
7	6	5	4	3	2	1	0
MPCNT							

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	MPCNT	Miss Packet Count The MPCNT indicates the number of packets that were dropped due to various types of receive errors. The following type of receiving error makes missed packet counter increase: <ol style="list-style-type: none"> 1. Incoming packet is incurred RXFIFO overflow. 2. Incoming packet is dropped due to RXON is disabled. 3. Incoming packet is incurred CRC error.

MAC Receive Pause Count Register (EMAC_RPCNT)

The EMAC supports the PAUSE control frame reception and recognition. If EMAC received a PAUSE control frame, the OPERAND field of the PAUSE control frame will be extracted and stored in the EMAC_RPCNT register. The EMAC_RPCNT register will keep the same while TX of EMAC is pausing due to the PAUSE control frame is received. The EMAC_RPCNT is read only and write to this register has no effect.

Register	Offset	R/W	Description					Reset Value
EMAC_RPCNT	EMAC_BA+0x0BC	R	MAC Receive Pause Count Register					0x0000_0000

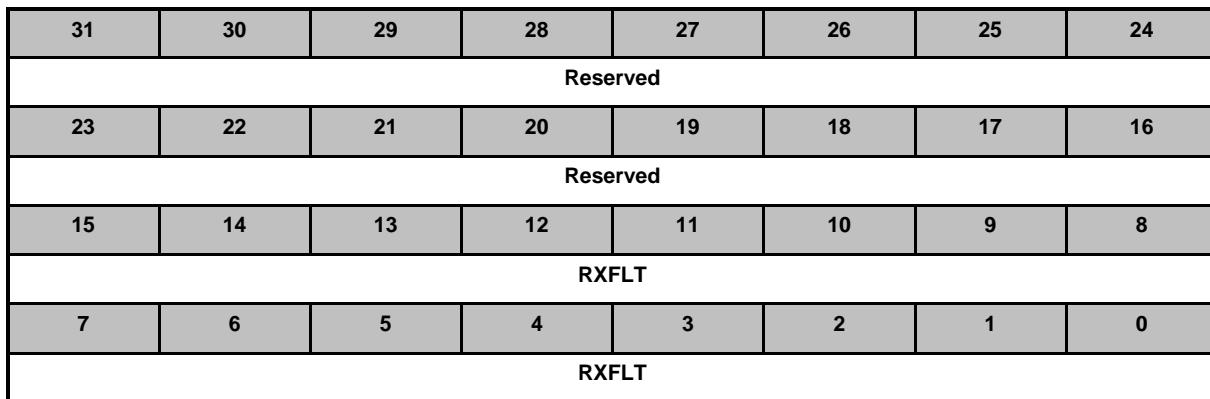

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	RPCNT	MAC Receive Pause Count The RPCNT keeps the OPERAND field of the PAUSE control frame. It indicates how many slot time (512-bit time) the TX of EMAC will be paused.

DMA Receive Frame Status Register (EMAC_FRSTS)

The EMAC_FRSTS is used to keep the LENGTH field of each incoming Ethernet packet.

Register	Offset	R/W	Description				Reset Value
EMAC_FRSTS	EMAC_BA+0x0C8	R/W	DMA Receive Frame Status Register				0x0000_0000

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	RXFLT	Receive Frame LENGTH The RXFLT keeps the LENGTH field of each incoming Ethernet packet. If the bit DENIEN (EMAC_INTEN[9]) is enabled and the LENGTH field of incoming packet has received, the bit DENIF (EMAC_INTSTS[9]) will be set and trigger interrupt. And, the content of LENGTH field will be stored in RXFLT.

Current Transmit Descriptor Start Address Register (EMAC_CTXDSA)

Register	Offset	R/W	Description					Reset Value
EMAC_CTXDSA	EMAC_BA+0x0CC	R	Current Transmit Descriptor Start Address Register					0x0000_0000

31	30	29	28	27	26	25	24
CTXDSA

6.17 Smart Card Host Interface (SC)

6.17.1 Overview

The Smart Card Interface controller (SC controller) is based on ISO/IEC 7816-3 standard and fully compliant with PC/SC Specifications. It also provides status of card insertion/removal.

6.17.2 Features

- ISO 7816-3 T = 0, T = 1 compliant
- EMV2000 compliant
- Three ISO 7816-3 ports
- Separates receive/transmit 4 byte entry FIFO for data payloads
- Programmable transmission clock frequency
- Programmable receiver buffer trigger level
- Programmable guard time selection (11 ETU ~ 267 ETU)
- One 24-bit timer and two 8-bit timers for Answer to Request (ATR) and waiting times processing
- Supports auto direct / inverse convention function
- Supports transmitter and receiver error retry and error number limiting function
- Supports hardware activation sequence process, and the time between PWR on and CLK start is configurable
- Supports hardware warm reset sequence process
- Supports hardware deactivation sequence process
- Supports hardware auto deactivation sequence when detected the card removal
- Supports UART mode
 - Full duplex, asynchronous communications
 - Separates receiving / transmitting 4 bytes entry FIFO for data payloads
 - Supports programmable baud rate generator
 - Supports programmable receiver buffer trigger level
 - Programmable transmitting data delay time between the last stop bit leaving the TX-FIFO and the de-assertion by setting EGT (SCn_EGT[7:0])
 - Programmable even, odd or no parity bit generation and detection
 - Programmable stop bit, 1- or 2- stop bit generation

6.17.3 Block Diagram

The SC clock control and block diagram are shown in SC Clock Control Diagram (7-bit Pre-scale Counter in Clock Controller) and SC Controller Block Diagram. The SC controller is completely asynchronous design with two clock domains, PCLK and engine clock. Note that the PCLK should be higher than or equal to the frequency of engine clock.

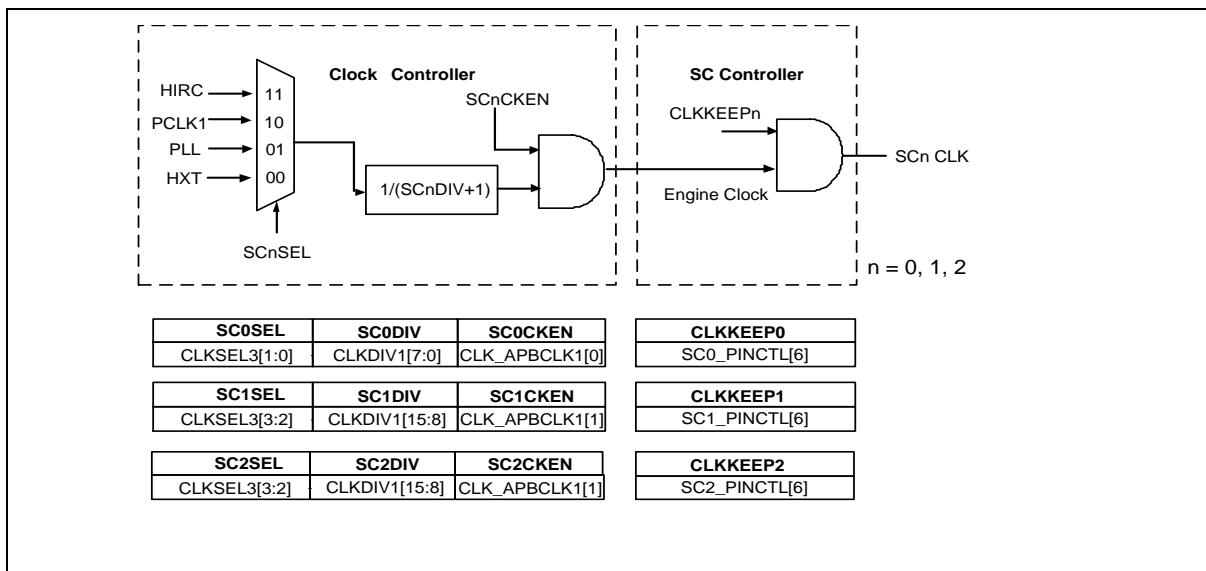

Figure 6.17-1 SC Clock Control Diagram (7-bit Pre-scale Counter in Clock Controller)

6.17.5 Functional Description

Basically, the smart card interface acts as a half-duplex asynchronous communication port and its data format is composed of ten consecutive bits which is shown in SC Data Character.

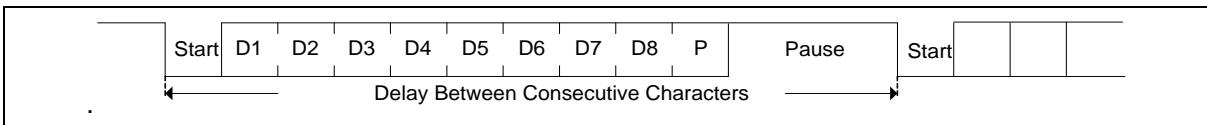

Figure 6.17-3 SC Data Character

The Smart Card Interface controller supports hardware activation, warm reset and deactivation sequence. The activation, warm reset and deactivation sequence are shown as follows.

6.17.5.1 Smart card pin configuration

The Smart Card Interface pin status can be observed by polling following registers.

1. SCn_RST is a output pin. Its status can be observed by RSTSTS (SCn_PINCTL[18]). Programming RSTEN (SCn_PINCTL[1]) '0' or '1' can drive this output pin low or high.
2. SCn_PWR is a output pin. Its status can be observed by PWRSTS (SCn_PINCTL[17]). Programming PWREN (SCn_PINCTL[0]) to '0' or '1' can drive this output pin low or high. PWRINV (SCn_PINCTL[11]) can inverse the SCn_PWR output. User must select PWRINV (SCn_PINCTL[11]) before smart card is enabled by SCEN (SCn_CTL[0]).
3. SCn_DATA is a bidirectional pin, DATASTS(SCn_PINCTL[16]) shows the pin status when SC is receiving data. programming SCDATA (SCn_PINCTL[9]) to '0' or '1' can drive this pin output low or high.
4. SCn_CLK is a output pin. It outputs Smart card clock SCn CLK. Programming CLKKEEP (SCn_PINCTL[6]) '0' or '1' to disable or enable this pin. Programming CSTOPLV (SCn_PINCTL[5]) can determine the SCn_CLK is stopped at high or low when this pin is disable.
5. SCn_CD(Card Detect Pin) state represent the status of the card is inserted or not. SCn_CD pin status can be observed by CDPINSTS(SC_CDPINSTS[13]). SCn_CD related function can be set by CDLV(SC_CTL[26]), CDDBSEL(SC_CTL[25:24]), CDIF(SC_INTSTS[7]), CDIEN(SC_INTEN[7]).
6. CDLV(SC_CTL[26]) determines what kind of pin level change represents the card insertion. CDDBSEL(SC_CTL[25:24]) determines the de-bounce cycles. When the card status CINSERT (SCn_STATUS[12]) or CREMOVE (SCn_STATUS[11]) is detected, CDIF will set to 1. If CDIEN is enable, SC will deliver a interrupt to CPU when CDIF is set to 1. Card Detect Pin is remmoned setting before enable SC.

6.17.5.2 Activation, Warm Reset and Deactivation Sequence

Activation

The activation sequence is shown in Figure 6.17-4:

1. Set SCn_RST to low by programming RSTEN (SCn_PINCTL[1]) to '0', and wait SYNC (SCn_PINCTL[31]) is cleared to 0.
2. Set SCn_PWR at high level by programming PWREN (SCn_PINCTL[0]) to '1' and SCn_DATA at high level (reception mode) by programming SCDATA (SCn_PINCTL[9]) to '1', and wait SYNC(SCn_PINCTL[31]) is cleared to 0.
3. Enable SCn_CLK clock by programming CLKKEEP (SCn_PINCTL[6]) to '1', and wait SYNC(SCn_PINCTL[31]) is cleared to 0.

4. De-assert SCn_RST to high by programming RSTEN (SCn_PINCTL[1]) to '1', and wait SYNC(SCn_PINCTL[31]) is cleared to 0.

The activation sequence can be controlled in two ways. The procedure is shown as follows:

- Software Timing Control:

Set SCn_PINCTL and SCn_TMRCTLx ($x = 0, 1, 2$) to process the activation sequence. SCn_PWR, SCn_CLK, SCn_RST and SCn_DATA pin state can be programmed by SCn_PINCTL. The programming method is shown in activation sequence. The activation sequence timing can be controlled by setting SCn_TMRCTLx ($x = 0, 1, 2$). This programming procedure provides user with a flexible timing setting for activation sequence.

- Hardware Timing Control:

Set ACTEN (SCn_ALTCTL[3]) to '1' and the interface will perform the activation sequence by hardware. The SCn_PWR to SCn_CLK start (T1) and SCn_CLK_start to SCn_RST assert (T2) can be selected by programming INITSEL (SCn_ALTCTL[9:8]). The SCn_PWR to SCn_CLK length can be configure by setting T1EXT(SCn_ACTCTL[4:0]). This programming procedure provides user with a simple setting for activation sequence. During the hardware activation, RX receive is disabled and can not receive data.

The following is activation control sequence in hardware activation mode:

1. Set activation timing by setting INITSEL (SCn_ALTCTL[9:8]).
2. Timer0 can be selected by setting TMRSEL (SCn_CTL[14:13]) is 11.
3. Set operation mode OPMODE (SCn_TMRCTL0[27:24]) to 0011 and give an Answer to Request (ATR) value by setting CNT (SCn_TMRCTL0[23:0]) register.
4. When hardware de-asserts SCn_RST to high, hardware will generator an interrupt INITIF (SCn_INTSTS[8]) to CPU at the same time if INITIEN (SCn_INTEN[8]) is 1.
5. If the Timer0 decreases the counter to "0" (started from SCn_RST de-assert) and the card does not response ATR before that time, hardware will generate an interrupt flag TMR0IF (SCn_INTSTS[3]).

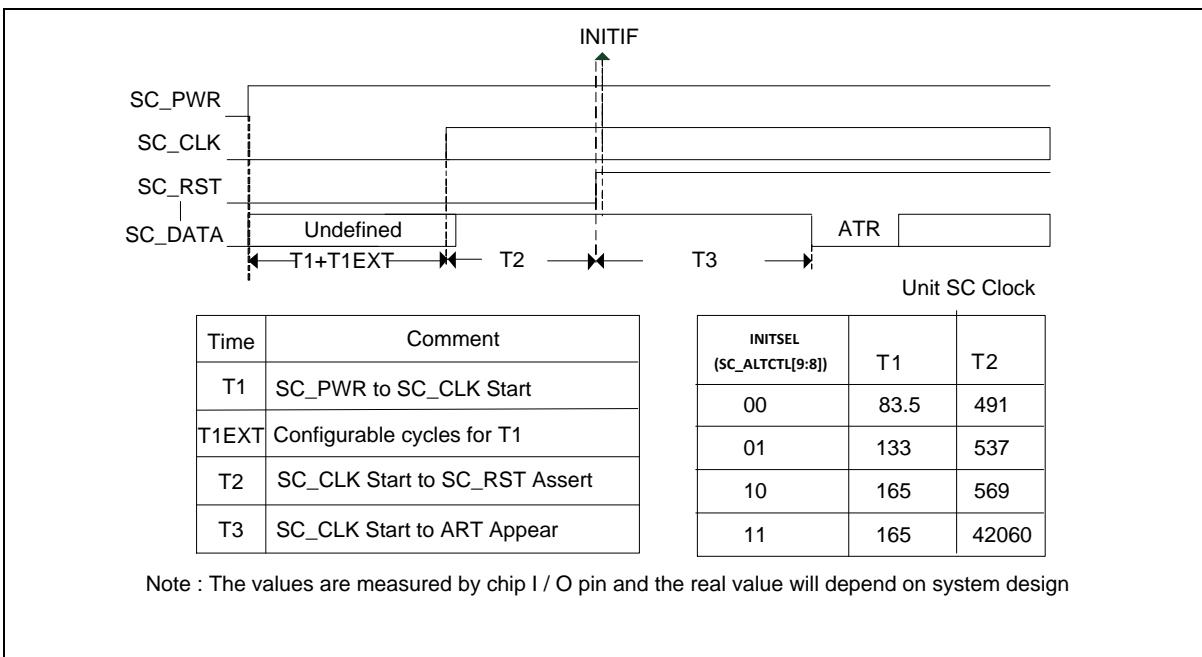

Figure 6.17-4 SC Activation Sequence

Warm Reset

The warm reset sequence is shown in Figure 6.17-5 :

1. Set SCn_RST to low by programming RSTEN (SCn_PINCTL[1]) to '0', and wait SYNC(SCn_PINCTL[31]) is cleared to 0.
2. Set SCn_DATA to high by programming SCDATA (SCn_PINCTL[9]) to '1', and wait SYNC(SCn_PINCTL[31]) is cleared to 0.
3. Set SCn_RST to high by programming RSTEN (SCn_PINCTL[1]) to '1', and wait SYNC(SCn_PINCTL[31]) is cleared to 0.

The warm reset sequence can be controlled in two ways. The procedure is shown as follows.

- Software Timing Control:

Set SCn_PINCTL and SCn_TMRCTLx ($x = 0, 1, 2$) to process the warm reset sequence. The SCn_RST and SCn_DATA pin state can be programmed by SCn_PINCTL. The warm reset sequence timing can be controlled by setting SCn_TMRCTLx ($x = 0, 1, 2$). This programming procedure provides user with a flexible timing setting for warm reset sequence.

- Hardware Timing Control:

Set WARSTEN (SCn_ALTCTL[4]) to '1' and the interface will perform the warm reset sequence by hardware. The SCn_RST to SCn_DATA reception mode (T4) and SCn_DATA reception mode to SCn_RST assert (T5) can be selected by programming INITSEL (SCn_ALTCTL[9:8]). This programming procedure provides user with a simple setting for warm reset sequence. During the hardware warm reset, RX receive is disabled and can not receive data.

The following is the warm reset control sequence by hardware:

1. Set warm reset timing by setting INITSEL (SCn_ALTCTL[9:8]).
2. Select Timer0 by setting TMRSEL (SCn_CTL[14:13]) to 11.
3. Set operation mode OPMODE (SCn_TMRCTL0[27:24]) to 0011 and give an Answer to

Request (ATR) value by setting CNT (SCn_TMRCTL0[23:0]) register.

4. Set CNTENO (SCn_ALTCTL[5]) and WARSTEN (SCn_ALTCTL[4]) to start counting.
5. When hardware de-asserts SCn_RST to high, hardware will generate an interrupt INITIF (SCn_INTSTS[8]) to CPU at the same time if INITIEN (SCn_INTEN[8]) is 1.
6. If the Timer0 decreases the counter to '0' (start from SCn_RST) and the card does not response ATR before that time, hardware will generate an interrupt flag TMR0IF (SCn_INTSTS[3]).

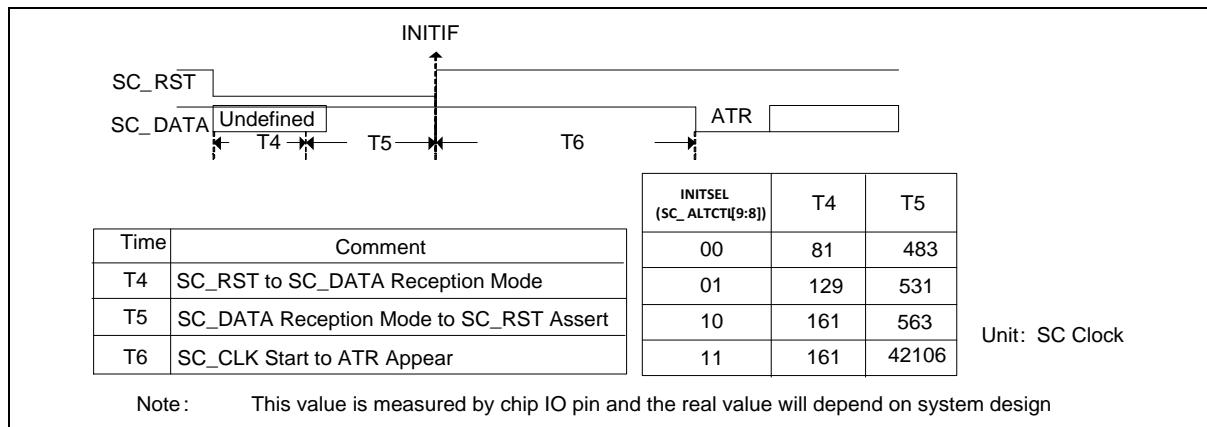

Figure 6.17-5 SC Warm Reset Sequence

Deactivation

The deactivation sequence is shown in Figure 6.17-6.

1. Set SCn_RST to low by programming RSTEN (SCn_PINCTL[1]) to '0', wait SYNC(SCn_PINCTL[31]) is cleared to 0.
 1. Stop SCn_CLK by programming CLKKEEP (SCn_PINCTL[6]) to '0', wait SYNC(SCn_PINCTL[31]) is cleared to 0.
 2. Set SCn_DATA to low by programming SCDATA (SCn_PINCTL[9]) to '0', wait SYNC(SCn_PINCTL[31]) is cleared to 0.
 3. Deactivate SCn_PWR by programming PWREN (SCn_PINCTL[0]) to '0', wait SYNC(SCn_PINCTL[31]) is cleared to 0.

The deactivation sequence can be controlled in two ways. The procedure is shown as follows.

- Software Timing Control:

Set SCn_PINCTL and SCn_TMRCTL0 to process the deactivation sequence. SCn_PWR, SCn_CLK, SC.n_RST and SCn_DATA pin state can be programmed by SCn_PINCTL. The deactivation sequence timing can be controlled by setting SCn_TMRCTL0. This programming procedure provides user with a flexible timing setting for deactivation sequence.

- Hardware Timing Control:

DACTEN (SCn_ALTCTL[2]) to '1' and the interface will perform the deactivation sequence by hardware. The Deactivation Trigger to SCn_RST low (T7), SMC_RST low to SCn_CLK (T8) and stop SCn_CLK to stop SCn_PWR (T9) time can be selected by programming INITSEL (SCn_ALTCTL[9:8]). This programming procedure provides user with a simple setting for deactivation sequence.

When hardware de-asserts SCn_PWR to low, the SC controller will generate an interrupt INITIF (SCn_INTSTS[8]) to CPU at the same time if INITIEN (SCn_INTEN[8]) is 1.

The SC controller also supports auto deactivation sequence when the card removal detection is

enabled by setting ADACEN (SCn_ALTCTL[11]).

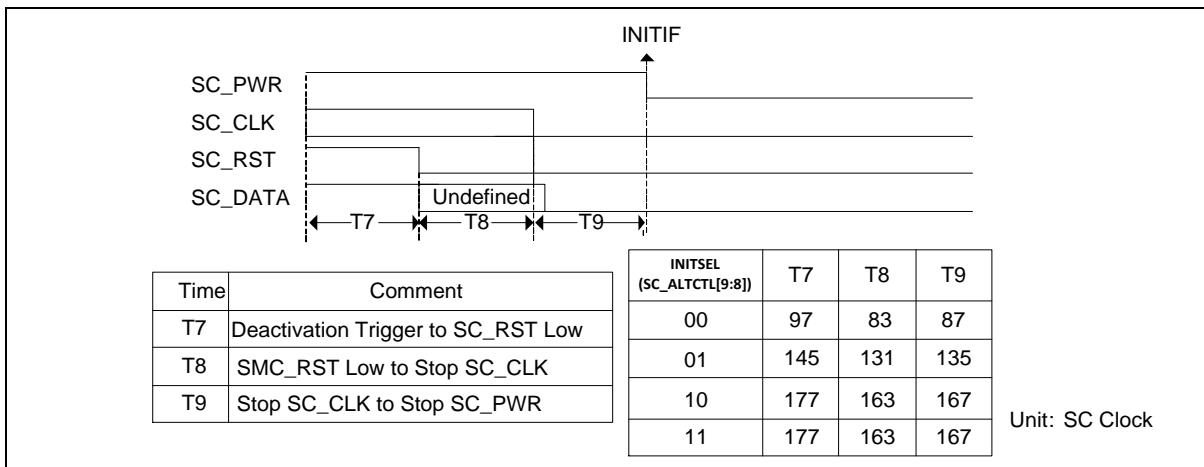

Figure 6.17-6 SC Deactivation Sequence

6.17.5.3 Basic Operation Flow

Basic operation flow of smartcard can be referenced from ISO 7816-3 & EMV.

The Program Sequence Flow is shown as follows:

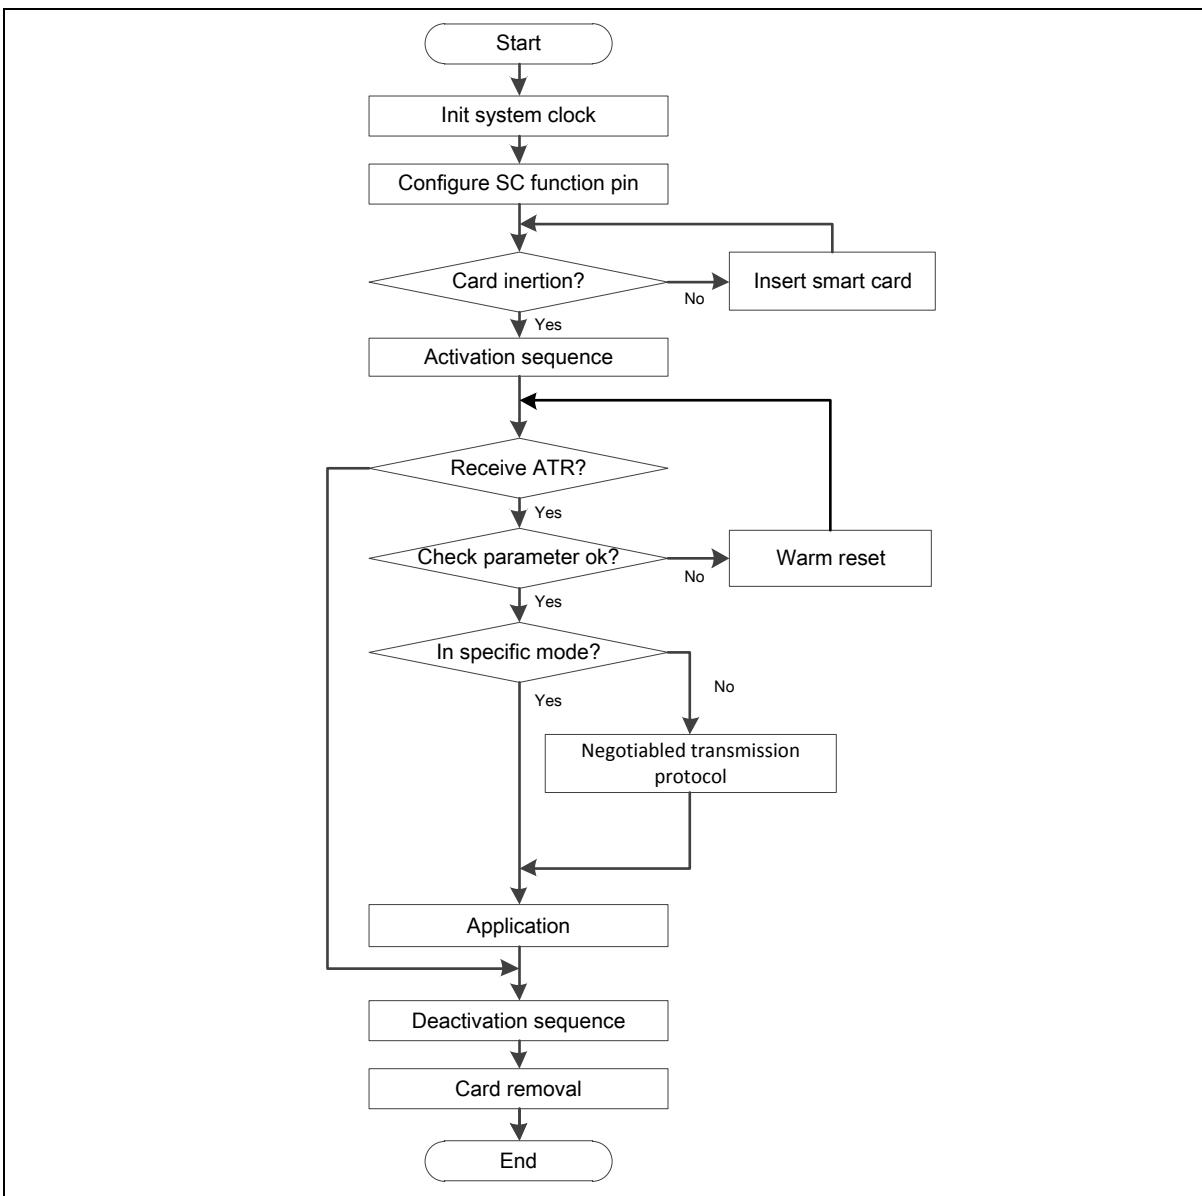

Figure 6.17-7 Basic Operation Flow

6.17.5.4 Initial Character TS

According to ISO 7816-3, the initial character TS has two possible patterns shown in Figure 6.17-8. If the TS pattern is 1100_0000, it is inverse convention. When decoded by inverse convention, the conveyed byte is equal to 0x3F. If the TS pattern is 1101_1100, it is direct convention. When decoded by direct convention, the conveyed byte is equal to 0x3B. User can set AUTOSEN (SCn_CTL[3]) and then the operating convention will be decided by hardware. User can also set the CONSEL (SCn_CTL[5:4]) register (set to '00' or '11') to change the operating convention after SC received TS of answer to request (ATR).

If auto convention function is enabled by setting AUTOSEN (SCn_CTL[3]) register, the setting step must be done before Answer to Request (ATR) state and the received first data must be 0x3B or 0x3F. After hardware received first data and stored it at SCn_DAT, the hardware will decide the convention and change the CONSEL (SCn_CTL[5:4]) register automatically. If the received first data is neither 0x3B nor 0x3F, ACERRIF (SCn_INTSTS[10] Auto Convention Error Interrupt Status Flag) will be set and the hardware will generate an interrupt to CPU if ACERRIEN (SCn_INTEN[10]) is 1.

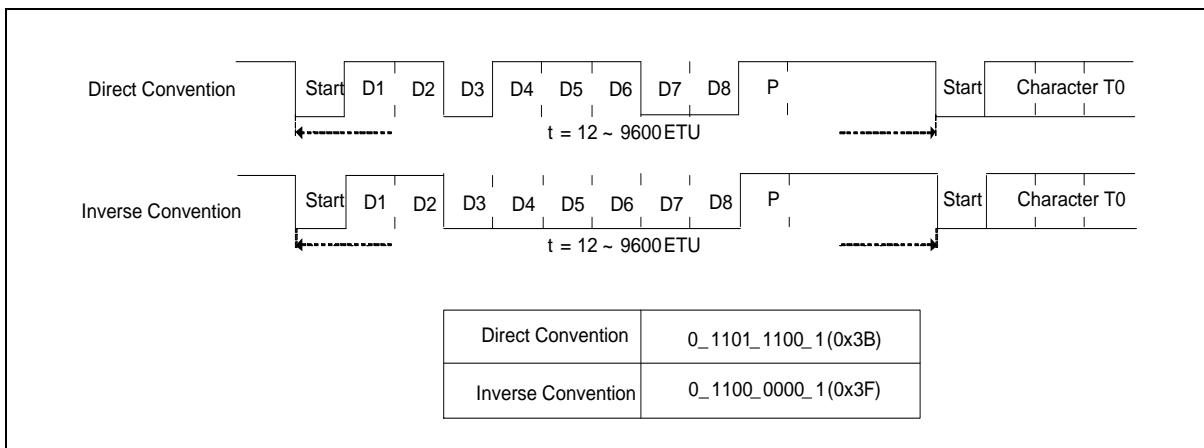

Figure 6.17-8 Initial Character TS

6.17.5.5 Transfer Data Flow and Data Buffer Status

After setting initial sequence, SC can start transferring data which format is corresponding to ISO 7816-3. Set ETURDIV(SC_ETUCTL[11:0]) to 273 to make ETU(Element Timing Unit) meet ISO 7816-3. Writing data to SC_DAT, SC will send out an 8-bit data to smart card. Reading data from SC_DAT, SC will return an 8-bit received data from smart card.

Data buffer status show in SC_STATUS. TXPOINT(SC_STATUS[26:24]) and RXPOINT(SC_STATUS[18:16]) represent how many data in transmit buffer and received buffer. TXEMPTY(SC_STATUS[9]), TXFULL(SC_STATUS[10]), TXOV(SC_STATUS[8]), RXEMPTY(SC_STATUS[1]), RXFULL(SC_STATUS[2]), RXOV(SC_STATUS[0]), represent the transmitted/received buffer status is full, empty, or overflow. SC even can generate interrupt for the transmit buffer empty situation by setting TBEIEN(SCn_INTEN[1]) flag. After interrupt is generated, it can be clear by writing 1 to TBEIF(SCn_INTSTS[1]). SC can decide to transfer data or not by polling these status.

TX and RX can be disabled separately by setting TXOFF(SC_CTL[2]) and RXOFF(SC_CTL[1]). TXACT(SC_STATUS[31]) and RXACT(SC_STATUS[23]) represent the TX transfer/RX transfer is active or not.

6.17.5.6 Receiver Buffer Time-out

The time-out down counter resets and starts counting whenever the RX buffer received a new data. Once the counter decrease to 1 and no new data is received or CPU does not read data by reading SCn_DAT, a receiver time-out flag RXTOIF (SCn_INTSTS[9]) will be set, and hardware will generate an interrupt to CPU when RXTOIEN (SCn_INTEN[9]) is enabled.

6.17.5.7 Error Signal and Character Repetition

According to ISO 7816-3 T=0 mode description, as shown in Figure 6.17-9, if the receiver receives a wrong parity bit, it will pull the SCn_DAT to low by 1.5 bit period to inform the transmitter parity error. Then the transmitter will retransmit the character. The SC interface controller supports hardware error detection function in receiver and supports hardware re-transmit function in transmitter.

User can enable re-transmit function by setting TXRTYEN (SCn_CTL[23]). User can also define the retry (re-transmit) number limitation in TXRTY (SCn_CTL[22:20]). If the re-transmit number is between 1 and TXRTY, TXRERR (SCn_STATUS[29]) flag will be set by hardware. The re-transmit number is up to TXRTY +1 and if the re-transmit number is equal to TXRTY +1, TXOVERR (SCn_STATUS[30]) flag will be set by hardware and if TERRIEN (SCn_INTEN[2]) is enabled, SC controller will generate a transfer error interrupt to CPU, and TERRIF (SCn_INTSTS[2]) flag will also be set.

User can also enable re-received function by setting RXRTYEN (SCn_CTL[19]).The received retry number limitation is defined in RXRTY (SCn_CTL[18:16]). If the re-received number is between 1 and RXRTY, RXRERR (SCn_STATUS[21]) flag will be set by hardware. The receiver retry number is up to RXRTY +1, if the number of received errors by receiver is equal to RXRTY +1, receiver will receive this error data to buffer and RXOVERR (SCn_STATUS[22]) flag will be set by hardware and if TERRIEN (SCn_INTEN[2]) is enabled, SC controller will generate a transfer error interrupt to CPU, and TERRIF (SC_INTSTS[2]) flag will also be set.

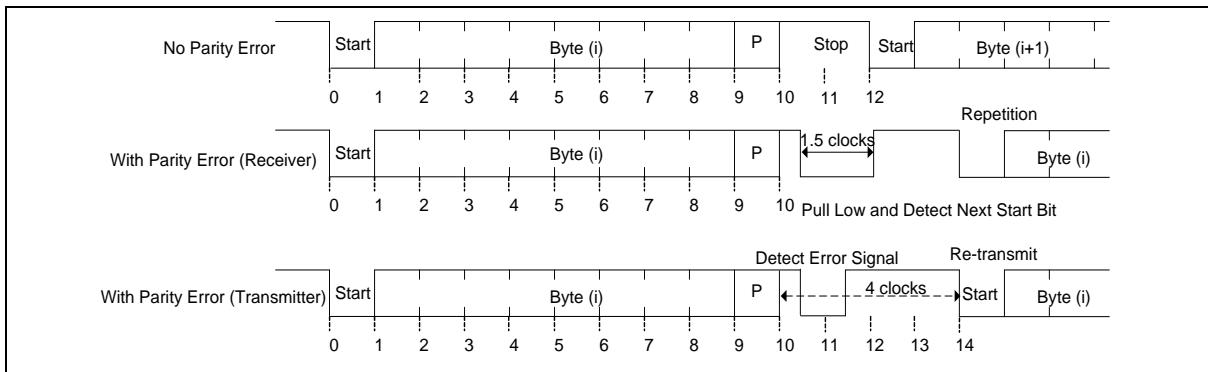

Figure 6.17-9 SC Error Signal

6.17.5.8 Internal Timer Operation Mode

The smart card interface includes a 24-bit time-out counter and two 8 bit time-out counters. These counters help the controller in processing different real-time interval. Each counter can be set to start counting once the trigger enable bit (CNTENx in SCn_ALTCTL[7:5], x = 0, 1, 2) has been written or a START bit has been detected.

The following is the programming flow:

1. Enable counter by setting TMRSEL (SCn_CTL[14:13]) to 11.
2. Select operation mode OPMODE (SCn_TMRCTLx[27:24], x = 0, 1, 2).
3. Give a count value CNT for Timer0, Timer1 and Timer2 by setting CNT0(SCn_TMRCTL0[23:0]), CNT1(SCn_TMRCTL1[7:0]) and CNT2(SCn_TMRCTL2[7:0] register).
4. Set CNTEN0 (SCn_ALTCTL [5]), CNTEN1 (SCn_ALTCTL [6]) or CNTEN2 (SCn_ALTCTL [7]) to enable timer. ACTSTS0(SCn_ALTCTL[13]), ACTSTS1(SCn_ALTCTL[14]) and ACTSTS2(SCn_ALTCTL[15]) represent the status that timer is enable or not.
5. Wait until the counting condition is satisfied, the timer start counting.
6. When internal timer counter satisfied interrupt conditions in different modes and TMR0IEN(SCn_INTEN[3]), TMR1IEN(SCn_INTEN[4]), TMR2IEN(SCn_INTEN[5]) are enable, SC will generate a interrupt to CPU.

The SCn_TMRCTL0, SCn_TMRCTL1 and SCn_TMRCTL2 timer operation mode are listed in Table 6.17-3.

Note1: Only Timer0 (SCn_TMRCTL0 register) supports mode 0011.

Note2: START bit can only be detected when Tx or Rx is idle or finish the last transmission.

OPMODE (SCn_TMRCTLx[27:24]), X = 0, 1, 2)	Operation Mode Description	
0000	The down counter is started when CNTENx (SCn_ALTCTL[7:5]) enabled and ended when counter time-out. The time-out counter value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.	
	Start	Start counting when CNTENx (SCn_ALTCTL[7:5]) enabled.
	End	When the down counter equals 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and clear CNTENx (SCn_ALTCTL[7:5]) automatically.
0001	The down counter is started when the first START bit (reception or transmission) detected and ended when counter time-out. It takes 2 ETU to detect first START bit after writing data to Tx or receiving data from Rx. The time-out counter value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.	
	Start	Start counting when the first START bit (reception or transmission) detected after CNTENx (SCn_ALTCTL[7:5]) set to 1.
	End	When the down counter equals 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and clear CNTENx (SCn_ALTCTL[7:5]) automatically.
0010	The down counter is started when the first START bit (reception) detected and ended when counter time-out . It takes 2 ETU to detect first START bit after receiving data from Rx. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.	
	Start	Start counting when the first START bit (reception) detected bit after CNTENx (SCn_ALTCTL[7:5]) set to 1.
	End	When the down counter equals 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and clear CNTENx (SCn_ALTCTL[7:5]) automatically.
0011	The down counter is only used for hardware activation, warm reset sequence to measure ATR timing. The timing starts when SCn_RST de-assertion and ends when ATR response received or time-out. If the counter decreases to 0 before ATR response received, hardware will set TMR0IF (SCn_INTSTS[3]) and generate an interrupt to CPU if TMR0IEN (SCn_INTEN[3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0]) +1.	
	Start	Start counting when SCn_RST de-assertion after CNTEN0 (SCn_ALTCTL[5]) set to 1. It is only used for hardware activation, warm reset mode.
	End	When the down counter equals 0 before ATR response received, hardware will set TMR0IF and clear CNTEN0 (SCn_ALTCTL[5]) automatically. When ATR received and down counter does not equal to 0, hardware will clear CNTEN0 (SCn_ALTCTL[5]) automatically.
0100	Start	Start down counter counting when CNTENx (SCn_ALTCTL[7:5]) enabled.
	Recount & reload	When ACTSTSx (SCn_ALTCTL[15:13]) is 1, user can change CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL0[7:0], SCn_TMRCTL0[7:0]) value at any time. It will reload the last value which is filled into the CNT(SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) before the counter count to 0. Only when the down counter equals 0, counter reload the CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) value and start to recount.
	Interrupt	If the counter decreases to 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and generate an interrupt to CPU if TMRxIEN (SCn_INTEN[5:3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.
	End	The down counter stopped when use clears CNTENx (SCn_ALTCTL[7:5]) bit.

	Start	The down counter is started when the first START bit (reception or transmission) detected after CNTEXn (SCn_ALTCTL[7:5]) set to 1. It takes 2 ETU to detect START bit after writing data to Tx or receiving data from Rx.
0101	Reload	When ACTSTSx (SCn_ALTCTL[15:13]) is 1, user can change CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL0[7:0], SCn_TMRCTL0[7:0]) value at any time. It will reload the last value which is filled into the CNT(SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) before the counter count to 0. Only when the down counter equals 0, counter will reload the CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) value.
	Recount	After down counter reloads the CNT value, timer counter starts to recount only when the next START bit is detected.
	Interrupt	If the counter decreases to 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and generate an interrupt to CPU if TMRxEN (SCn_INTEN[5:3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.
	End	The down counter stopped when user clears CNTEXn (SCn_ALTCTL[7:5]) bit.
	Start	The down counter is started when the first START bit (reception) detected after CNTEXn (SCn_ALTCTL[7:5]) set to 1. It takes 2 ETU to detect START bit after writing data to Tx or receiving data from Rx.
0110	Reload	When ACTSTSx (SCn_ALTCTL[15:13]) is 1, user can change CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL0[7:0], SCn_TMRCTL0[7:0]) value at any time. It will reload the last value which is filled into the CNT(SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) before the counter counts to 0. Only when the down counter equals 0, counter reload the CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) value.
	Recount	After the down counter reloads the CNT value, timer counter starts to recount only when the next START bit is detected.
	Interrupt	If the counter decreases to 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and generate an interrupt to CPU if TMRxEN (SCn_INTEN[5:3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0])+1.
	End	The down counter stopped when user clears CNTEXn (SCn_ALTCTL[7:5]) bit.
	Start	The down counter is started when the first START bit (reception or transmission) detected after CNTEXn (SCn_ALTCTL[7:5]) set to 1. It takes 2 ETU to detect START bit after writing data to Tx or receiving data from Rx.
0111	Reload &recount	Only when the next START bit is detected, counter will reload the new value of CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) and recount.
	Interrupt	If the counter decreases to 0 before the next START bit detected, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and generate an interrupt to CPU if TMRxEN (SCn_INTEN[5:3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.
	End	The down counter stopped when user clears CNTEXn (SCn_ALTCTL[7:5]) bit.
	Start	The down counter starts counting when user sets CNTEXn (SCn_ALTCTL[7:5]) bit and it will count to time-out.
1111	Reload &recount	Only when the next START bit is detected, counter will reload the new value of CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) and recount.
	Interrupt	If the counter decreases to 0 before the next START bit detected, hardware will generate time-out interrupt flag TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]). The time-out value will be CNTx (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0]),

	SCn_TMRCTL2[7:0]) +1.
End	The down counter stopped when user clears CNTENx (SCn_ALTCTL[7:5]) bit.

Table 6.17-3 Timer0/Timer1/Timer2 Operation Mode

6.17.5.9 Block Guard Time and Extra Guard Time

Block guard time means the minimum interval between the leading edges of two consecutive characters between different transfer directions. This field indicates the counter for the bit length of block guard time. According to ISO7816-3, in T = 0 mode, user must fill 15 (real block guard time = 16.5) to this field; in T = 1 mode, user must fill 21 (real block guard time = 22.5) to it.

In transmit direction, the smart card sends data to smart card host controller, first. After the period is greater than BGT (SCn_CTL[12:8]), the smart card host controller begin to send the data.

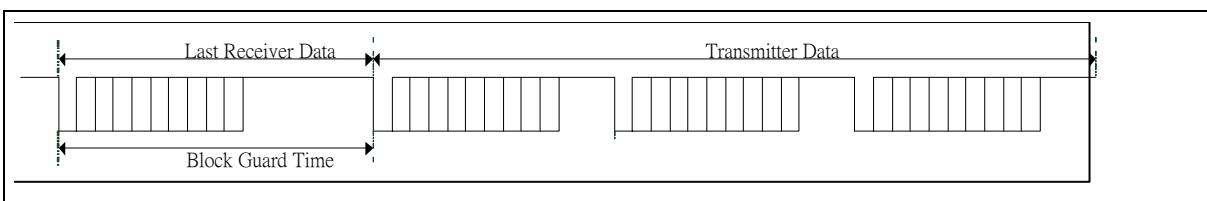

Figure 6.17-10 Transmit Direction Block Guard Time Operation

In receive direction, the smart card host controller sends data to smart card, first. If the smart card responses data to smart card host controller at the time which is less than BGT (SCn_CTL[12:8]), the block guard time interrupt BGTIF (SC_INTSTS[6]) is generated when RXBGTEN (SCn_ALTCTL[12]) and BGTIEN(SCn_INTEN[6]) is enabled.

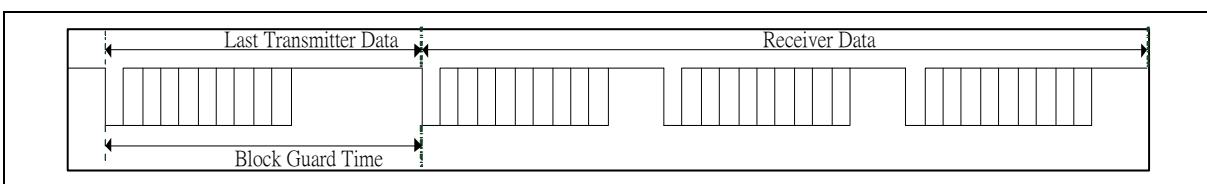

Figure 6.17-11 Receive Direction Block Guard Time Operation

Extra Guard Time is EGT (SCn_EGT[7:0]), it only affects the data transmitted by smart card interface, the format is shown as Figure 6.17-12Figure 6.17-11.

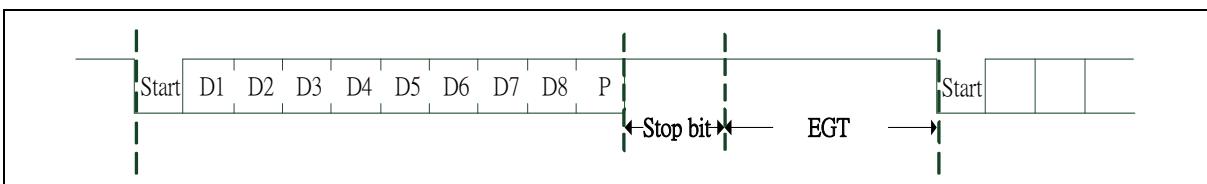

Figure 6.17-12 Extra Guard Time Operation

6.17.5.10 UART Mode

When the UARLEN (SCn_UARTCTL[0]) bit is set, the Smart Card Interface controller can also be used as basic UART function. The following is the program example for UART mode.

- Programming example:

1. Set UARTEN (SCn_UARTCTL[0]) bit to enter UART mode.
2. Do user reset by setting RXRST (SCn_ALTCTL[1]) and TXRST(SCn_ALTCTL[0]) bit to ensure that all state machine return idle state.
3. Fill “0” to CONSEL (SCn_CTL[5:4]) and AUTOSEN (SCn_CTL[3]) field. In UART mode, those fields must be “0”.
4. Select the UART baud rate by setting ETURDIV (SCn_ETUCTL[11:0]) fields. For example, if smartcard module clock is 12 MHz and target baud rate is 115200 bps, ETURDIV should fill with $((12000000 / 115200) - 1)$.
5. Select the data format include data length (by setting WLS (SCn_UARTCTL[5:4])), parity format (by setting OPE (SCn_UARTCTL[7]) and PBOFF (SCn_UARTCTL[6])) and stop bit length (by setting NSB (SCn_CTL[15] or EGT (SCn_EGT[7:0])).
6. Select the receiver buffer number trigger level by setting RXTRGLV (SCn_CTL[7:6]) field and select the receiver buffer time-out interval by setting RFTM (SCn_RXTOOUT[8:0]) field.
7. Write the SCn_DAT (SCn_DAT[7:0]) (TX) register or read the SCn_DAT (SCn_DAT[7:0]) (RX) register can perform UART function.

6.17.6 Register Map

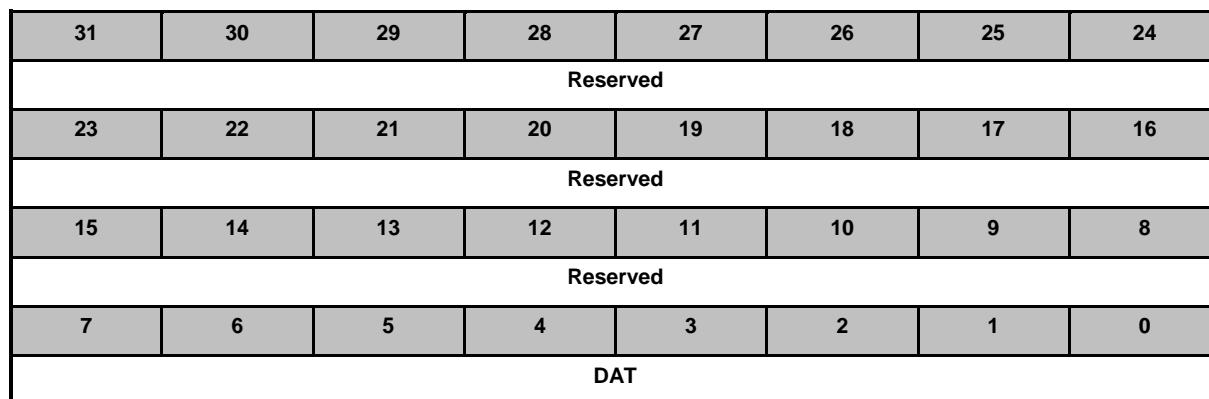

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
SC Base Address:

6.17.7 Register Description

SC Receive/Transmit Holding Buffer Register (SC_DAT)

Register	Offset	R/W	Description					Reset Value
SC_DAT	SCn_BA+0x00	R/W	SC Receive/Transmit Holding Buffer Register					0xFFFF_FFFF

Bits	Description	
[31:8]	Reserved	Reserved.
[7:0]	DAT	<p>Receive/Transmit Holding Buffer</p> <p>Write Operation: By writing data to DAT, the SC will send out an 8-bit data.</p> <p>Note: If SCEN (SCn_CTL[0]) is not enabled, DAT cannot be programmed.</p> <p>Read Operation: By reading DAT, the SC will return an 8-bit received data.</p>

SC Control Register (SC_CTL)

Register	Offset	R/W	Description				Reset Value
SC_CTL	SCn_BA+0x04	R/W	SC Control Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved	SYNC	Reserved			CDLV	CDDBSEL	
23	22	21	20	19	18	17	16
TXRTYEN	TXRTY			RXRTYEN	RXRTY		
15	14	13	12	11	10	9	8
NSB	TMRSEL		BGT				
7	6	5	4	3	2	1	0
RXTRGLV		CONSEL		AUTOCEN	TXOFF	RXOFF	SCEN

Bits	Description	
[31]	Reserved	Reserved.
[30]	SYNC	<p>SYNC Flag Indicator (Read Only)</p> <p>Due to synchronization, user should check this bit before writing a new value to RXRTY and TXRTY fields.</p> <p>0 = Synchronizing is completion, user can write new data to RXRTY and TXRTY.</p> <p>1 = Last value is synchronizing.</p>
[29:27]	Reserved	Reserved.
[26]	CDLV	<p>Card Detect Level Selection</p> <p>0 = When hardware detects the card detect pin (SCn_CD) from high to low, it indicates a card is detected.</p> <p>1 = When hardware detects the card detect pin (SCn_CD) from low to high, it indicates a card is detected.</p> <p>Note: User must select card detect level before Smart Card controller enabled.</p>
[25:24]	CDDBSEL	<p>Card Detect De-bounce Selection</p> <p>This field indicates the card detect de-bounce selection.</p> <p>00 = De-bounce sample card insert once per 384 (128 * 3) SC module clocks and de-bounce sample card removal once per 128 SC module clocks.</p> <p>Other configurations are reserved.</p>
[23]	TXRTYEN	<p>TX Error Retry Enable Bit</p> <p>This bit enables transmitter retry function when parity error has occurred.</p> <p>0 = TX error retry function Disabled.</p> <p>1 = TX error retry function Enabled.</p>
[22:20]	TXRTY	<p>TX Error Retry Count Number</p> <p>This field indicates the maximum number of transmitter retries that are allowed when parity error has occurred.</p> <p>Note1: The real retry number is TXRTY + 1, so 8 is the maximum retry number.</p> <p>Note2: This field cannot be changed when TXRTYEN enabled. The change flow is to disable TXRTYEN first and then fill in new retry value.</p>

[19]	RXRTYEN	RX Error Retry Enable Bit This bit enables receiver retry function when parity error has occurred. 0 = RX error retry function Disabled. 1 = RX error retry function Enabled. Note: User must fill in the RXRTY value before enabling this bit.
[18:16]	RXRTY	RX Error Retry Count Number This field indicates the maximum number of receiver retries that are allowed when parity error has occurred Note1: The real retry number is RXRTY + 1, so 8 is the maximum retry number. Note2: This field cannot be changed when RXRTYEN enabled. The change flow is to disable RXRTYEN first and then fill in new retry value.
[15]	NSB	Stop Bit Length This field indicates the length of stop bit. 0 = The stop bit length is 2 ETU. 1 = The stop bit length is 1 ETU. Note1: The default stop bit length is 2. SC and UART adopts NSB to program the stop bit length. Note2: In UART mode, RX can receive the data sequence in 1 stop bit or 2 stop bits with NSB is set to 0.
[14:13]	TMRSEL	Timer Channel Selection 00 = All internal timer function Disabled. 11 = Internal 24 bit timer and two 8 bit timers Enabled. User can configure them by setting SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0] and SCn_TMRCTL2[7:0]. Other configurations are reserved
[12:8]	BGT	Block Guard Time (BGT) Block guard time means the minimum interval between the leading edges of two consecutive characters between different transfer directions. This field indicates the counter for the bit length of block guard time. According to ISO 7816-3, in T = 0 mode, user must fill 15 (real block guard time = 16.5) to this field; in T = 1 mode, user must fill 21 (real block guard time = 22.5) to it. Note: The real block guard time is BGT + 1.
[7:6]	RXTRGLV	Rx Buffer Trigger Level When the number of bytes in the receiving buffer equals the RXTRGLV, the RDAIF will be set. If RDAIEN (SCn_INTEN[0]) is enabled, an interrupt will be generated to CPU. 00 = Rx Buffer Trigger Level with 01 bytes. 01 = Rx Buffer Trigger Level with 02 bytes. 10 = Rx Buffer Trigger Level with 03 bytes. 11 = Reserved.
[5:4]	CONSEL	Convention Selection 00 = Direct convention. 01 = Reserved. 10 = Reserved. 11 = Inverse convention. Note: If AUTOSEN (SCn_CTL[3]) is enabled, this field is ignored.
[3]	AUTOCEN	Auto Convention Enable Bit This bit is used for enable auto convention function. 0 = Auto-convention Disabled. 1 = Auto-convention Enabled.

		If user enables auto convention function, the setting step must be done before Answer to Reset (ATR) state and the first data must be 0x3B or 0x3F. After hardware received first data and stored it at buffer, hardware will decide the convention and change the CONSEL (SCn_CTL[5:4]) bits automatically when received first data is 0x3B or 0x3F. If received first byte is 0x3B, TS is direct convention, CONSEL (SCn_CTL[5:4]) will be set to 00 automatically, otherwise the TS is inverse convention, and CONSEL (SCn_CTL[5:4]) will be set to 11. If the first data is not 0x3B or 0x3F, hardware will set ACERRIF (SCn_INTSTS[10]) and generate an interrupt to CPU when ACERRIEN (SCn_INTEN[10]) is enabled.
[2]	TXOFF	TX Transition Disable Control Bit This bit is used for disable Tx transition function. 0 = The transceiver Enabled. 1 = The transceiver Disabled.
[1]	RXOFF	RX Transition Disable Control Bit This bit is used for disable Rx transition function. 0 = The receiver Enabled. 1 = The receiver Disabled. Note: If AUTOSEN (SCn_CTL[3]) is enabled, this field is ignored.
[0]	SCEN	SC Controller Enable Bit Set this bit to 1 to enable SC operation. If this bit is cleared, 0 = SC will force all transition to IDLE state. 1 = SC controller is enabled and all function can work correctly. Note: SCEN must be set to 1 before filling in other SC registers, or smart card will not work properly.

SC Alternate Control Register (SC_ALTCTL)

Register	Offset	R/W	Description				Reset Value
SC_ALTCTL	SCn_BA+0x08	R/W	SC Alternate Control Register				0x0000_0000

31	30	29	28	27	26	25	24
SYNC	Reserved						
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
ACTSTS2	ACTSTS1	ACTSTS0	RXBGTEN	ADACEN	Reserved	INITSEL	
7	6	5	4	3	2	1	0
CNTEN2	CNTEN1	CNTEN0	WARSTEN	ACTEN	DACTEN	RXRST	TXRST

Bits	Description	
[31]	SYNC	SYNC Flag Indicator (Read Only) Due to synchronization, user should check this bit when writing a new value to SCn_ALTCTL register. 0 = Synchronizing is completion, user can write new data to SCn_ALTCTL register. 1 = Last value is synchronizing.
[30:16]	Reserved	Reserved.
[15]	ACTSTS2	Internal Timer2 Active Status (Read Only) This bit indicates the timer counter status of timer2. 0 = Timer2 is not active. 1 = Timer2 is active. Note: Timer2 is active does not always mean timer2 is counting the CNT (SCn_TMRCTL2[7:0]).
[14]	ACTSTS1	Internal Timer1 Active Status (Read Only) This bit indicates the timer counter status of timer1. 0 = Timer1 is not active. 1 = Timer1 is active. Note: Timer1 is active does not always mean timer1 is counting the CNT (SCn_TMRCTL1[7:0]).
[13]	ACTSTS0	Internal Timer0 Active Status (Read Only) This bit indicates the timer counter status of timer0. 0 = Timer0 is not active. 1 = Timer0 is active. Note: Timer0 is active does not always mean timer0 is counting the CNT (SCn_TMRCTL0[23:0]).
[12]	RXBGTEN	Receiver Block Guard Time Function Enable Bit This bit enables the receiver block guard time function. 0 = Receiver block guard time function Disabled. 1 = Receiver block guard time function Enabled.

[11]	ADACEN	Auto Deactivation When Card Removal This bit is used for enable hardware auto deactivation when smart card is removed. 0 = Auto deactivation Disabled. 1 = Auto deactivation Enabled. Note: When the card is removed, hardware will stop any process and then do deactivation sequence if this bit is set. If auto deactivation process completes, hardware will set INITIF (SCn_INTSTS[8]) also.
[10]	Reserved	Reserved.
[9:8]	INITSEL	Initial Timing Selection This fields indicates the initial timing of hardware activation, warm-reset or deactivation. The unit of initial timing is SC module clock. Activation: refer to SC Activation Sequence in Figure 6.17-54. Warm-reset: refer to Warm-Reset Sequence in Figure 6.17-55. Deactivation: refer to Deactivation Sequence in Figure 6.17-56. Note: When set activation and warm reset in Timer0 operation mode 0011, it may have deviation at most 128 SC module clock cycles.
[7]	CNTEN2	Internal Timer2 Start Enable Bit This bit enables Timer 2 to start counting. User can fill 0 to stop it and set 1 to reload and count. The counter unit is ETU base. 0 = Stops counting. 1 = Start counting. Note1: This field is used for internal 8 bit timer when TMRSEL (SCn_CTL[14:13]) is 11 only. Do not fill in CNTEN2 when TMRSEL (SCn_CTL[14:13]) is not equal to 11. Note2: If the operation mode is not in auto-reload mode (SCn_TMRCTL2[26] = 0), this bit will be auto-cleared by hardware. Note3: If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.
[6]	CNTEN1	Internal Timer1 Start Enable Bit This bit enables Timer 1 to start counting. User can fill 0 to stop it and set 1 to reload and count. The counter unit is ETU base. 0 = Stops counting. 1 = Start counting. Note1: This field is used for internal 8 bit timer when TMRSEL(SCn_CTL[14:13]) is 11 only. Do not fill CNTEN1 when TMRSEL (SCn_CTL[14:13]) is not equal to 11. Note2: If the operation mode is not in auto-reload mode (SCn_TMRCTL1[26] = 0), this bit will be auto-cleared by hardware. Note3: If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.
[5]	CNTEN0	Internal Timer0 Start Enable Bit This bit enables Timer 0 to start counting. User can fill 0 to stop it and set 1 to reload and count. The counter unit is ETU base. 0 = Stops counting. 1 = Start counting. Note1: This field is used for internal 24 bit timer when TMRSEL (SCn_CTL[14:13]) is 11 only. Note2: If the operation mode is not in auto-reload mode (SCn_TMRCTL0[26] = 0), this bit will be auto-cleared by hardware. Note3: If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.
[4]	WARSTEN	Warm Reset Sequence Generator Enable Bit This bit enables SC controller to initiate the card by warm reset sequence. 0 = No effect. 1 = Warm reset sequence generator Enabled.

		<p>Note1: When the warm reset sequence completed, this bit will be cleared automatically and the INITIF (SCn_INTSTS[8]) will be set to 1.</p> <p>Note2: This field will be cleared by TXRST (SCn_ALTCTL[0]) and RXRST (SCn_ALTCTL[1]). Thus, do not fill in this bit WARSTEN, TXRST and RXRST at the same time.</p> <p>Note3: If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p> <p>Note4: During the warm reset sequence, RX is disabled automatically and can not receive data. After the warm reset sequence completion, RXOFF (SCn_CTL[1]) keeps the state before perform warm reset sequence.</p>
[3]	ACTEN	<p>Activation Sequence Generator Enable Bit</p> <p>This bit enables SC controller to initiate the card by activation sequence.</p> <p>0 = No effect.</p> <p>1 = Activation sequence generator Enabled.</p> <p>Note1: When the activation sequence completed, this bit will be cleared automatically and the INITIF (SCn_INTSTS[8]) will be set to 1.</p> <p>Note2: This field will be cleared by TXRST (SCn_ALTCTL[0]) and RXRST (SCn_ALTCTL[1]). Thus, do not fill in this bit ACTEN, TXRST and RXRST at the same time.</p> <p>Note3: If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p> <p>Note4: During the activation sequence, RX is disabled automatically and can not receive data. After the activation sequence completion, RXOFF (SCn_CTL[1]) keeps the state before hardware activation.</p>
[2]	DACTEN	<p>Deactivation Sequence Generator Enable Bit</p> <p>This bit enables SC controller to initiate the card by deactivation sequence.</p> <p>0 = No effect.</p> <p>1 = Deactivation sequence generator Enabled.</p> <p>Note1: When the deactivation sequence completed, this bit will be cleared automatically and the INITIF (SCn_INTSTS[8]) will be set to 1.</p> <p>Note2: This field will be cleared by TXRST (SCn_ALTCTL[0]) and RXRST (SCn_ALTCTL[1]). Thus, do not fill in this bit DACTEN, TXRST and RXRST at the same time.</p> <p>Note3: If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[1]	RXRST	<p>Rx Software Reset</p> <p>When RXRST is set, all the bytes in the receive buffer and Rx internal state machine will be cleared.</p> <p>0 = No effect.</p> <p>1 = Reset the Rx internal state machine and pointers.</p> <p>Note: This bit will be auto cleared after reset is complete.</p>
[0]	TXRST	<p>TX Software Reset</p> <p>When TXRST is set, all the bytes in the transmit buffer and TX internal state machine will be cleared.</p> <p>0 = No effect.</p> <p>1 = Reset the TX internal state machine and pointers.</p> <p>Note: This bit will be auto cleared after reset is complete.</p>

SC Extra Guard Time Register (SC_EGT)

Register	Offset	R/W	Description	Reset Value
SC_EGT	SCn_BA+0x0C	R/W	SC Extra Guard Time Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
EGT							

Bits	Description	
[31:8]	Reserved	Reserved.
[7:0]	EGT	<p>Extra Guard Time</p> <p>This field indicates the extra guard time value.</p> <p>Note: The extra guard time unit is ETU base.</p>

SC Receiver Buffer Time-out Register (SC_RXTOUT)

Register	Offset	R/W	Description	Reset Value
SC_RXTOUT	SCn_BA+0x10	R/W	SC Receive Buffer Time-out Counter Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
RFTM							

Bits	Description	
[31:9]	Reserved	Reserved.
[8:0]	RFTM	<p>SC Receiver FIFO Time-out Counter</p> <p>The time-out down counter resets and starts counting whenever the RX buffer received a new data. Once the counter decrease to 1 and no new data is received or CPU does not read data by reading SCn_DAT, a receiver time-out flag RXTOIF (SCn_INTSTS[9]) will be set, and hardware will generate an interrupt to CPU when RXTOIEN (SCn_INTEN[9]) is enabled.</p> <p>Note1: The counter unit is ETU based and the interval of time-out is RFTM + 0.5.</p> <p>Note2: Filling in all 0 to this field indicates to disable this function.</p>

SC Element Time Unit Control Register (SC_ETUCTL)

Register	Offset	R/W	Description				Reset Value
SC_ETUCTL	SCn_BA+0x14	R/W	SC Element Time Unit Control Register				0x0000_0173

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved				ETURDIV			
7	6	5	4	3	2	1	0
ETURDIV							

Bits	Description	
[31:12]	Reserved	Reserved.
[11:0]	ETURDIV	ETU Rate Divider The field is used for ETU clock rate divider. The real ETU is ETURDIV + 1. Note: User can configure this field, but this field must be greater than 0x04.

SC Interrupt Enable Control Register (SC_INTEN)

Register	Offset	R/W	Description				Reset Value
SC_INTEN	SCn_BA+0x18	R/W	SC Interrupt Enable Control Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved					ACERRIEN	RXTOIEN	INITIEN
7	6	5	4	3	2	1	0
CDIEN	BGTIEN	TMR2IEN	TMR1IEN	TMR0IEN	TERRIEN	TBEIEN	RDAIEN

Bits	Description	
[31:11]	Reserved	Reserved.
[10]	ACERRIEN	Auto Convention Error Interrupt Enable Bit This field is used to enable auto-convention error interrupt. 0 = Auto-convention error interrupt Disabled. 1 = Auto-convention error interrupt Enabled.
[9]	RXTOIEN	Receiver Buffer Time-out Interrupt Enable Bit This field is used to enable receiver buffer time-out interrupt. 0 = Receiver buffer time-out interrupt Disabled. 1 = Receiver buffer time-out interrupt Enabled.
[8]	INITIEN	Initial End Interrupt Enable Bit This field is used to enable activation (ACTEN (SCn_ALTCTL[3] = 1)), deactivation (DACTEN (SCn_ALTCTL[2] = 1)) and warm reset (WARSTEN (SCn_ALTCTL [4])) sequence complete interrupt. 0 = Initial end interrupt Disabled. 1 = Initial end interrupt Enabled.
[7]	CDIEN	Card Detect Interrupt Enable Bit This field is used to enable card detect interrupt. The card detect status is CDPINSTS (SCn_STATUS[13]). 0 = Card detect interrupt Disabled. 1 = Card detect interrupt Enabled.
[6]	BGTIEN	Block Guard Time Interrupt Enable Bit This field is used to enable block guard time interrupt in receive direction. 0 = Block guard time interrupt Disabled. 1 = Block guard time interrupt Enabled. Note: This bit is valid only for receive direction block guard time.
[5]	TMR2IEN	Timer2 Interrupt Enable Bit This field is used to enable Timer2 interrupt function.

		0 = Timer2 interrupt Disabled. 1 = Timer2 interrupt Enabled.
[4]	TMR1IEN	Timer1 Interrupt Enable Bit This field is used to enable the Timer1 interrupt function. 0 = Timer1 interrupt Disabled. 1 = Timer1 interrupt Enabled.
[3]	TMR0IEN	Timer0 Interrupt Enable Bit This field is used to enable Timer0 interrupt function. 0 = Timer0 interrupt Disabled. 1 = Timer0 interrupt Enabled.
[2]	TERRIEN	Transfer Error Interrupt Enable Bit This field is used to enable transfer error interrupt. The transfer error states is at SCn_STATUS register which includes receiver break error BEF (SCn_STATUS[6]), frame error FEF (SCn_STATUS[5]), parity error PEF (SCn_STATUS[4]), receive buffer overflow error RXOV (SCn_STATUS[0]), transmit buffer overflow error TXOV (SCn_STATUS[8]), receiver retry over limit error RXOVERR (SCn_STATUS[22]) and transmitter retry over limit error TXOVERR (SCn_STATUS[30]). 0 = Transfer error interrupt Disabled. 1 = Transfer error interrupt Enabled.
[1]	TBEIEN	Transmit Buffer Empty Interrupt Enable Bit This field is used to enable transmit buffer empty interrupt. 0 = Transmit buffer empty interrupt Disabled. 1 = Transmit buffer empty interrupt Enabled.
[0]	RDAIEN	Receive Data Reach Interrupt Enable Bit This field is used to enable received data reaching trigger level RXTRGLV (SCn_CTL[7:6]) interrupt. 0 = Receive data reach trigger level interrupt Disabled. 1 = Receive data reach trigger level interrupt Enabled.

SC Interrupt Status Register (SC_INTSTS)

Register	Offset	R/W	Description				Reset Value
SC_INTSTS	SCn_BA+0x1C	R/W	SC Interrupt Status Register				0x0000_0002

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved					ACERRIF	RXTOIF	INITIF
7	6	5	4	3	2	1	0
CDIF	BGTIF	TMR2IF	TMR1IF	TMR0IF	TERRIF	TBEIF	RDAIF

Bits	Description	
[31:11]	Reserved	Reserved.
[10]	ACERRIF	Auto Convention Error Interrupt Status Flag This field indicates auto convention sequence error. 0 = Received TS at ATR state is 0x3B or 0x3F. 1 = Received TS at ATR state is neither 0x3B nor 0x3F. Note: This bit can be cleared by writing 1 to it.
[9]	RXTOIF	Receive Buffer Time-out Interrupt Status Flag (Read Only) This field is used for indicate receive buffer time-out interrupt status flag. 0 = Receive buffer time-out interrupt did not occur. 1 = Receive buffer time-out interrupt occurred. Note: This bit is read only, user must read all receive buffer remaining data by reading SCn_DAT register to clear it.
[8]	INITIF	Initial End Interrupt Status Flag This field is used for activation (ACTEN (SCn_ALTCTL[3])), deactivation (DACTEN (SCn_ALTCTL[2])) and warm reset (WARSTEN (SCn_ALTCTL[4])) sequence interrupt status flag. 0 = Initial sequence is not complete. 1 = Initial sequence is completed. Note: This bit can be cleared by writing 1 to it.
[7]	CDIF	Card Detect Interrupt Status Flag (Read Only) This field is used for card detect interrupt status flag. The card detect status is CINSERT (SCn_STATUS[12]) and CREMOVE (SCn_STATUS[11]). 0 = Card detect event did not occur. 1 = Card detect event occurred. Note: This bit is read only, user must to clear CINSERT or CREMOVE status to clear it.
[6]	BGTIF	Block Guard Time Interrupt Status Flag This field is used for indicate block guard time interrupt status flag in receive direction. 0 = Block guard time interrupt did not occur.

		1 = Block guard time interrupt occurred. Note1: This bit is valid only when RXBGTE (SCn_ALTCTL[12]) is enabled. Note2: This bit can be cleared by writing 1 to it.
[5]	TMR2IF	Timer2 Interrupt Status Flag This field is used for Timer2 interrupt status flag. 0 = Timer2 interrupt did not occur. 1 = Timer2 interrupt occurred. Note: This bit can be cleared by writing 1 to it.
[4]	TMR1IF	Timer1 Interrupt Status Flag This field is used for Timer1 interrupt status flag. 0 = Timer1 interrupt did not occur. 1 = Timer1 interrupt occurred. Note: This bit can be cleared by writing 1 to it.
[3]	TMR0IF	Timer0 Interrupt Status Flag This field is used for Timer0 interrupt status flag. 0 = Timer0 interrupt did not occur. 1 = Timer0 interrupt occurred. Note: This bit can be cleared by writing 1 to it.
[2]	TERRIF	Transfer Error Interrupt Status Flag This field is used for transfer error interrupt status flag. The transfer error states is at SCn_STATUS register which includes receiver break error BEF (SCn_STATUS[6]), frame error FEF (SCn_STATUS[5], parity error PEF (SCn_STATUS[4] and receive buffer overflow error RXOV (SCn_STATUS[0]), transmit buffer overflow error TXOV (SCn_STATUS[8]), receiver retry over limit error RXOVERR (SCn_STATUS[22] or transmitter retry over limit error TXOVERR (SCn_STATUS[30]). 0 = Transfer error interrupt did not occur. 1 = Transfer error interrupt occurred. Note1: This field is the status flag of BEF, FEF, PEF, RXOV, TXOV, RXOVERR or TXOVERR. Note2: This bit can be cleared by writing 1 to it.
[1]	TBEIF	Transmit Buffer Empty Interrupt Status Flag (Read Only) This field is used for transmit buffer empty interrupt status flag. 0 = Transmit buffer is not empty. 1 = Transmit buffer is empty. Note: This bit is read only. If user wants to clear this bit, user must write data to DAT (SCn_DAT[7:0]) and then this bit will be cleared automatically.
[0]	RDAIF	Receive Data Ready Interrupt Status Flag (Read Only) This field is used for received data reaching trigger level RXTRGLV (SCn_CTL[7:6]) interrupt status flag. 0 = Number of receive buffer is less than RXTRGLV setting. 1 = Number of receive buffer data equals the RXTRGLV setting. Note: This bit is read only. If user reads data from SCn_DAT and receiver buffer data byte number is less than RXTRGLV, this bit will be cleared automatically.

SC Transfer Status Register (SC_STATUS)

Register	Offset	R/W	Description				Reset Value
SC_STATUS	SCn_BA+0x20	R/W	SC Transfer Status Register				0x0000_X202

31	30	29	28	27	26	25	24
TXACT	TXOVERR	TXRERR	Reserved		TXPOINT		
23	22	21	20	19	18	17	16
RXACT	RXOVERR	RXRERR	Reserved		RXPOINT		
15	14	13	12	11	10	9	8
Reserved		CDPINSTS	CINSERT	CREMOVE	TXFULL	TXEMPTY	TXOV
7	6	5	4	3	2	1	0
Reserved	BEF	FEF	PEF	Reserved	RFULL	REMPY	RXOV

Bits	Description	
[31]	TXACT	<p>Transmit in Active Status Flag (Read Only) This bit indicates Tx transmit status. 0 = This bit is cleared automatically when Tx transfer is finished or the last byte transmission has completed. 1 = Transmit is active and this bit is set by hardware when Tx transfer is in active and the STOP bit of the last byte has not been transmitted.</p>
[30]	TXOVERR	<p>Transmitter over Retry Error This bit is used for transmitter retry counts over than retry number limitation. 0 = Transmitter retries counts is less than TXRTY (SCn_CTL[22:20]) + 1. 1 = Transmitter retries counts is equal or over to TXRTY (SCn_CTL[22:20]) + 1. Note: This bit can be cleared by writing 1 to it.</p>
[29]	TXRERR	<p>Transmitter Retry Error This bit is used for indicate transmitter error retry and set by hardware.. 0 = No Tx retry transfer. 1 = Tx has any error and retries transfer. Note1: This bit can be cleared by writing 1 to it. Note2: This bit is a flag and cannot generate any interrupt to CPU.</p>
[28:27]	Reserved	Reserved.
[26:24]	TXPOINT	<p>Transmit Buffer Pointer Status (Read Only) This field indicates the Tx buffer pointer status. When CPU writes data into SCn_DAT, TXPOINT increases one. When one byte of Tx buffer is transferred to transmitter shift register, TXPOINT decreases one.</p>
[23]	RXACT	<p>Receiver in Active Status Flag (Read Only) This bit indicates Rx transfer status. 0 = This bit is cleared automatically when Rx transfer is finished. 1 = This bit is set by hardware when Rx transfer is in active.</p>
[22]	RXOVERR	Receiver over Retry Error

		This bit is used for receiver retry counts over than retry number limitation. 0 = Receiver retries counts is less than RXRTY (SCn_CTL[18:16]) + 1. 1 = Receiver retries counts is equal or over than RXRTY (SCn_CTL[18:16]) + 1. Note1: This bit can be cleared by writing 1 to it. Note2: If CPU enables receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.
[21]	RXRERR	Receiver Retry Error This bit is used for receiver error retry and set by hardware. 0 = No Rx retry transfer. 1 = Rx has any error and retries transfer. Note1: This bit can be cleared by writing 1 to it. Note2: This bit is a flag and cannot generate any interrupt to CPU. Note3: If CPU enables receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.
[20:19]	Reserved	Reserved.
[18:16]	RXPOINT	Receive Buffer Pointer Status (Read Only) This field indicates the Rx buffer pointer status. When SC controller receives one byte from external device, RXPOINT increases one. When one byte of Rx buffer is read by CPU, RXPOINT decreases one.
[15:14]	Reserved	Reserved.
[13]	CDPINSTS	Card Detect Pin Status (Read Only) This bit is the pin status of SCn_CD. 0 = The SCn_CD pin state at low. 1 = The SCn_CD pin state at high.
[12]	CINSERT	Card Insert Status of SCn_CD Pin This bit is set whenever card has been inserted. 0 = No effect. 1 = Card insert. Note1: This bit can be cleared by writing "1" to it. Note2: The card detect function will start after SCEN (SCn_CTL[0]) set.
[11]	CREMOVE	Card Removal Status of SCn_CD Pin This bit is set whenever card has been removal. 0 = No effect. 1 = Card removed. Note1: This bit can be cleared by writing "1" to it. Note2: Card detect function will start after SCEN (SCn_CTL[0]) set.
[10]	TXFULL	Transmit Buffer Full Status Flag (Read Only) This bit indicates Tx buffer full or not. 0 = Tx buffer count is less than 4. 1 = Tx buffer count equals to 4.
[9]	TXEMPTY	Transmit Buffer Empty Status Flag (Read Only) This bit indicates TX buffer empty or not. 0 = Tx buffer is not empty. 1 = Tx buffer is empty, it means the last byte of Tx buffer has been transferred to Transmitter Shift Register. Note: This bit will be cleared when writing data into DAT (SCn_DAT[7:0]).
[8]	TXOV	Transmit Overflow Error Interrupt Status Flag

		<p>This bit is set when Tx buffer overflow.</p> <p>0 = Tx buffer is not overflow.</p> <p>1 = Tx buffer is overflow when Tx buffer is full and an additional write operation to DAT (SCn_DAT[7:0]).</p> <p>Note: This bit can be cleared by writing 1 to it.</p>
[7]	Reserved	Reserved.
[6]	BEF	<p>Receiver Break Error Status Flag</p> <p>This bit is set to logic 1 whenever the received data input (Rx) held in the "spacing state" (logic 0) is longer than a full word transmission time (that is, the total time of "start bit" + "data bits" + "parity bit" + "stop bits").</p> <p>0 = Receiver break error flag did not occur.</p> <p>1 = Receiver break error flag occurred.</p> <p>Note1: This bit can be cleared by writing 1 to it.</p> <p>Note2: If CPU sets receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[5]	FEF	<p>Receiver Frame Error Status Flag</p> <p>This bit is set to logic 1 whenever the received character does not have a valid "stop bit" (that is, the stop bit following the last data bit or parity bit is detected as logic 0).</p> <p>0 = Receiver frame error flag did not occur.</p> <p>1 = Receiver frame error flag occurred.</p> <p>Note1: This bit can be cleared by writing 1 to it.</p> <p>Note2: If CPU sets receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[4]	PEF	<p>Receiver Parity Error Status Flag</p> <p>This bit is set to logic 1 whenever the received character does not have a valid "parity bit".</p> <p>0 = Receiver parity error flag did not occur.</p> <p>1 = Receiver parity error flag occurred.</p> <p>Note1: This bit can be cleared by writing 1 to it.</p> <p>Note2: If CPU sets receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[3]	Reserved	Reserved.
[2]	RXFULL	<p>Receive Buffer Full Status Flag (Read Only)</p> <p>This bit indicates Rx buffer full or not.</p> <p>0 = Rx buffer count is less than 4.</p> <p>1 = Rx buffer count equals to 4.</p>
[1]	RXEMPTY	<p>Receive Buffer Empty Status Flag (Read Only)</p> <p>This bit indicates Rx buffer empty or not.</p> <p>0 = Rx buffer is not empty.</p> <p>1 = Rx buffer is empty, it means the last byte of Rx buffer has read from DAT (SCn_DAT[7:0]) by CPU.</p>
[0]	RXOV	<p>Receive Overflow Error Status Flag</p> <p>This bit is set when Rx buffer overflow.</p> <p>0 = Rx buffer is not overflow.</p> <p>1 = Rx buffer is overflow when the number of received bytes is greater than Rx buffer size (4 bytes).</p> <p>Note: This bit can be cleared by writing 1 to it.</p>

SC Pin Control State Register (SC_PINCTL)

Register	Offset	R/W	Description				Reset Value
SC_PINCTL	SCn_BA+0x24	R/W	SC Pin Control State Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved	SYNC	Reserved					
23	22	21	20	19	18	17	16
Reserved				RSTSTS	PWRSTS	DATASTS	
15	14	13	12	11	10	9	8
Reserved				PWRINV	Reserved	SCDATA	Reserved
7	6	5	4	3	2	1	0
Reserved	CLKKEEP	Reserved				RSTEN	PWREN

Bits	Description	
[31]	Reserved	Reserved.
[30]	SYNC	SYNC Flag Indicator (Read Only) Due to synchronization, user should check this bit when writing a new value to SCn_PINCTL register. 0 = Synchronizing is completion, user can write new data to SCn_PINCTL register. 1 = Last value is synchronizing.
[29:19]	Reserved	Reserved.
[18]	RSTSTS	SCn_RST Pin Status (Read Only) This bit is the pin status of SCn_RST. 0 = SCn_RST pin is low. 1 = SCn_RST pin is high.
[17]	PWRSTS	SCn_PWR Pin Status (Read Only) This bit is the pin status of SCn_PWR. 0 = SCn_PWR pin to low. 1 = SCn_PWR pin to high.
[16]	DATASTS	SCn_DATA Pin Status (Read Only) This bit is the pin status of SCn_DATA. 0 = The SCn_DATA pin status is low. 1 = The SCn_DATA pin status is high.
[15:12]	Reserved	Reserved.
[11]	PWRINV	SCn_PWR Pin Inverse This bit is used for inverse the SCn_PWR pin. There are four kinds of combination for SCn_PWR pin setting by PWRINV (SCn_PINCTL[11]) and PWREN (SCn_PINCTL[0]). PWRINV (SCn_PINCTL[11]) is bit 1 and PWREN (SCn_PINCTL[0]) is bit 0 and all conditions as below list, 00 = SCn_PWR pin is 0.

		<p>01 = SCn_PWR pin is 1. 10 = SCn_PWR pin is 1. 11 = SCn_PWR pin is 0.</p> <p>Note: User must select PWRINV (SCn_PINCTL[11]) before smart card is enabled by SCEN (SCn_CTL[0]).</p>
[10]	Reserved	Reserved.
[9]	SCDATA	<p>SCn_DATA Pin Signal This bit is the signal status of SCn_DATA but user can drive SCn_DATA pin to high or low by setting this bit. 0 = Drive SCn_DATA pin to low. 1 = Drive SCn_DATA pin to high. Read this field to get SCn_DATA signal status. 0 = SCn_DATA signal status is low. 1 = SCn_DATA signal status is high.</p> <p>Note: When SC is at activation, warm reset or deactivation mode, this bit will be changed automatically. Thus, do not fill in this field when SC is in these modes.</p>
[8:7]	Reserved	Reserved.
[6]	CLKKEEP	<p>SC Clock Enable Bit 0 = SC clock generation Disabled. 1 = SC clock always keeps free running.</p> <p>Note: When operating in activation, warm reset or deactivation mode, this bit will be changed automatically. Thus, do not fill in this field when operating in these modes.</p>
[5:2]	Reserved	Reserved.
[1]	RSTEN	<p>SCn_RST Pin Signal User can set RSTEN (SCn_PINCTL[1]) to decide SCn_RST pin is in high or low level. Write this field to drive SCn_RST pin. 0 = Drive SCn_RST pin to low. 1 = Drive SCn_RST pin to high. Read this field to get SCn_RST signal status. 0 = SCn_RST signal status is low. 1 = SCn_RST signal status is high.</p> <p>Note: When operating at activation, warm reset or deactivation mode, this bit will be changed automatically. Thus, do not fill in this field when operating in these modes.</p>
[0]	PWREN	<p>SCn_PWR Pin Signal User can set PWRINV (SCn_PINCTL[11]) and PWREN (SCn_PINCTL[0]) to decide SCn_PWR pin is in high or low level. Write this field to drive SCn_PWR pin Refer PWRINV (SCn_PINCTL[11]) description for programming SCn_PWR pin voltage level. Read this field to get SCn_PWR signal status. 0 = SCn_PWR signal status is low. 1 = SCn_PWR signal status is high.</p> <p>Note: When operating at activation, warm reset or deactivation mode, this bit will be changed automatically. Thus, do not fill in this field when operating in these modes</p>

SC Timer0 Control Register (SC_TMRCTL0)

Register	Offset	R/W	Description					Reset Value
SC_TMRCTL0	SCn_BA+0x28	R/W	SC Internal Timer0 Control Register					0x0000_0000

6.18 I²S Controller (I²S)

6.18.1 Overview

The I²S controller consists of I²S protocol to interface with external audio CODEC. Two 16-level depth FIFO for reading path and writing path respectively are capable of handling 8/16/24/32 bits audio data sizes. A PDMA controller handles the data movement between FIFO and memory.

6.18.2 Features

- Supports Master mode and Slave mode
- Capable of handling 8, 16, 24 and 32 bits data sizes in each audio channel
- Supports monaural and stereo audio data
- Supports I²S protocols: Philips standard, MSB-justified, and LSB-justified data format
- Supports PCM protocols: PCM standard, MSB-justified, and LSB-justified data format
- PCM protocol supports TDM multi-channel transmission in one audio sample, and the number of data channel can be set as 2, 4, 6, or 8
- Provides two 16-level FIFO data buffers, one for transmitting and the other for receiving
- Generates interrupt requests when buffer levels cross a programmable boundary
- Supports two PDMA requests, one for transmitting and the other for receiving

Table 6.18-2 Pin Configuration of I²S Controller

6.18.5 Functional Description

6.18.5.1 I²S Clock

The I²S controller has four clock sources selected by I2S0SEL (CLK_CLKSEL3[17:16]). The I²S clock rate must be slower than or equal to system clock rate.

Figure 6.18-3 I²S Clock Control Diagram

6.18.5.2 Master/Slave Interface

The I²S function can operate as master or slave mode by setting SLAVE (I²S_CTL0[8]) to communicate with other I²S slave or master. The serial bus clock I²S_BCLK is permanently generated by the master even though there is no transferring data bit at the moment. The word select signal I²S_LRCLK is also generated by the master and it indicates the beginning of a new data word and the targeted audio channel. Both the I²S_LRCLK and the transmitting data change synchronously to the falling edges of I²S_BCLK.

In some applications, especially for Audio-ADC or Audio-DAC, a master clock signal, I²S_MCLK, is required with a fixed phase relation to the I²S_BCLK. The I²S_MCLK is enabled by MCLKEN (I²S_CTL0[15]). In Master mode, the I²S_MCLK, I²S_BCLK, I²S_LRCLK is output to device slave. And if in slave mode, the I²S_MCLK is output to master, and I²S_BCLK or I²S_LRCLK is input from master.

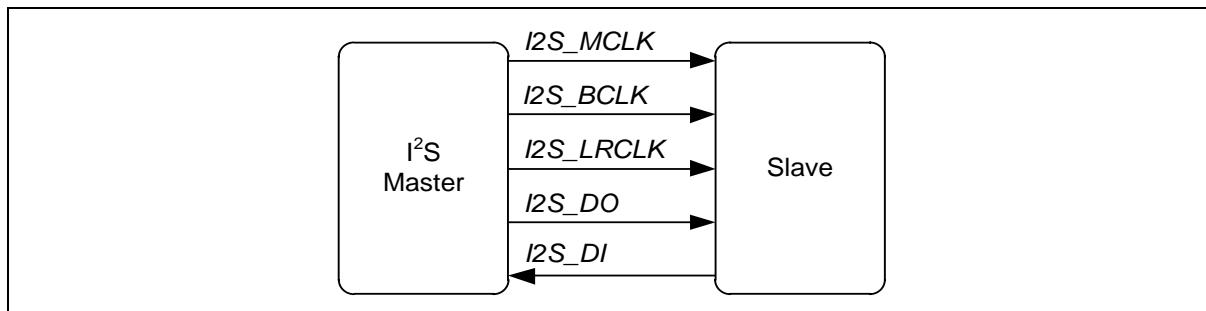

Figure 6.18-4 Master Mode Interface Block Diagram

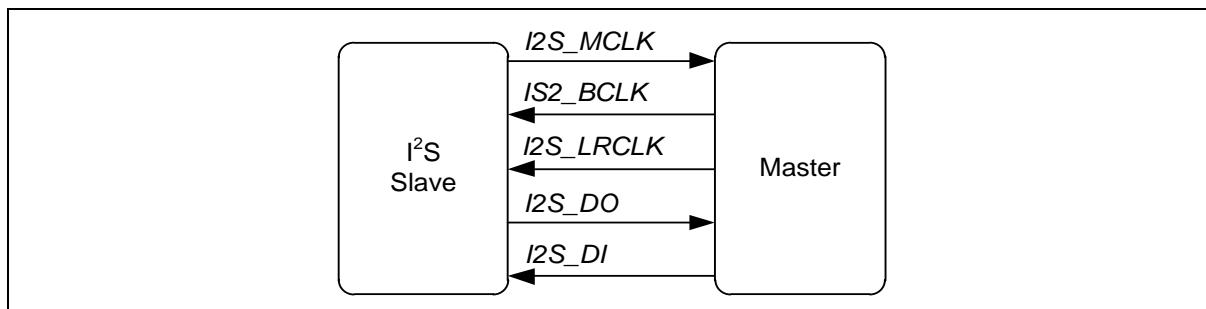

Figure 6.18-5 Slave Mode Interface Block Diagram

6.18.5.3 I²S Operation

The I²S controller supports MSB-justified, LSB-justified, and I²S Philips standard data format. The

I²S_LRCLK signal indicates which audio channel is in transferring. The bit count of an audio channel is defined by CHWIDTH (I²S_CTL0[29:28]), and the bit-width of data word in an audio channel is determined by DATWIDTH (I²S_CTL0[5:4]). If CHWIDTH (I²S_CTL0[29:28]) is less than DATWIDTH (I²S_CTL0[5:4]), the hardware will set the channel bit-width to be same as data bit-width. However, there will be redundant zero bits in each audio channel if CHWIDTH (I²S_CTL0[29:28]) is greater than DATWIDTH (I²S_CTL0[5:4]).

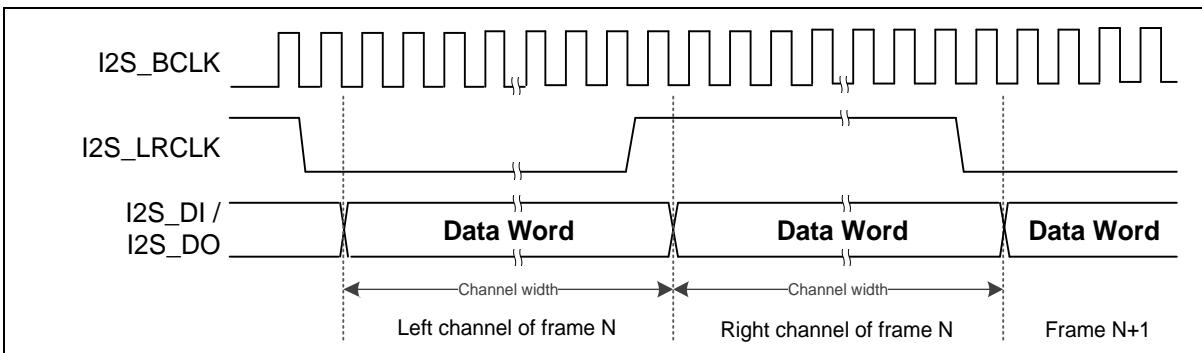

Figure 6.18-6 I²S Channel Width and Data Width ($\text{CHWIDTH} \leq \text{DATWIDTH}$)

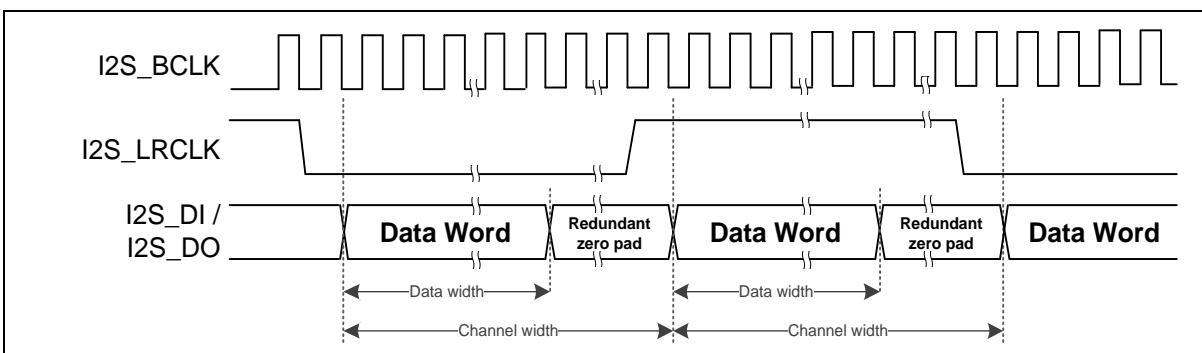

Figure 6.18-7 I²S Channel Width and Data Width ($\text{CHWIDTH} > \text{DATWIDTH}$)

The transferring data sequence is always started from the MSB (most significant bit) to the LSB (least significant bit). As shown in Figure 6.18-8, transmitting data are read at rising edge of I²S_BCLK and sent out at falling edge of I²S_BCLK in I²S protocol. In I²S data format, the MSB is sent and latched at the next falling edge of I²S_BCLK cycle after the transition of I²S_LRCLK. In MSB justified data format, the I²S_LRCLK changes the polarity at the transmitting of the first data bit (MSB) in each audio channel. In LSB justified data format, the LSB is sent and latched at the last I²S_BCLK cycle of an audio channel. The MSB justified and LSB justified data format of I²S protocol can be selected by FORMAT (I²S_CTL0[26:24]).

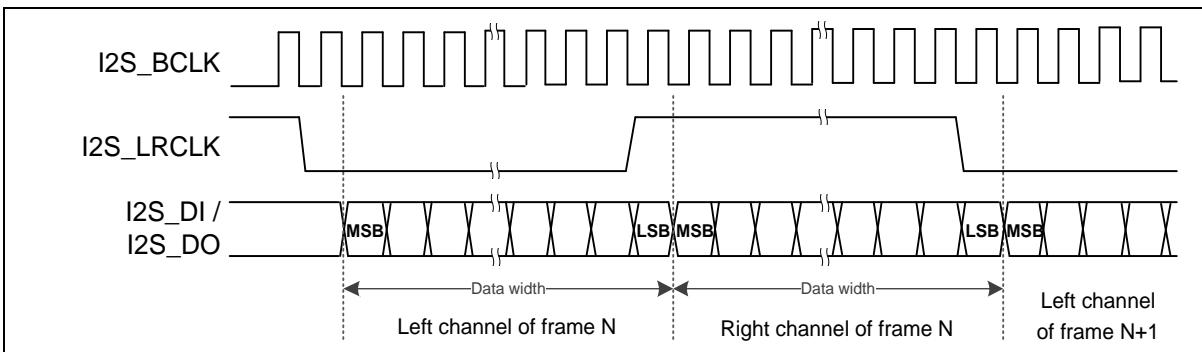

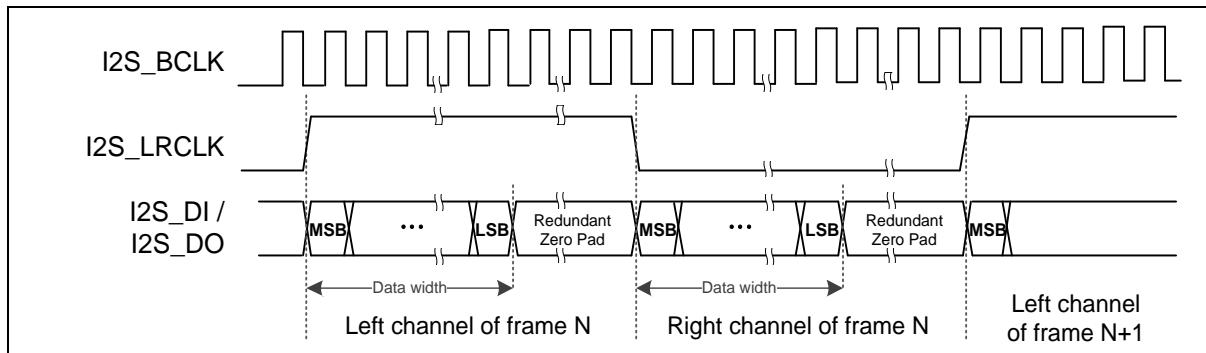

Figure 6.18-8 I²S Data Format Timing Diagram (FORMAT = 0x0 ; CHWIDTH≤DATWIDTH)

Figure 6.18-9 MSB Justified Data Format (FORMAT = 0x1 ; CHWIDTH > DATWIDTH)

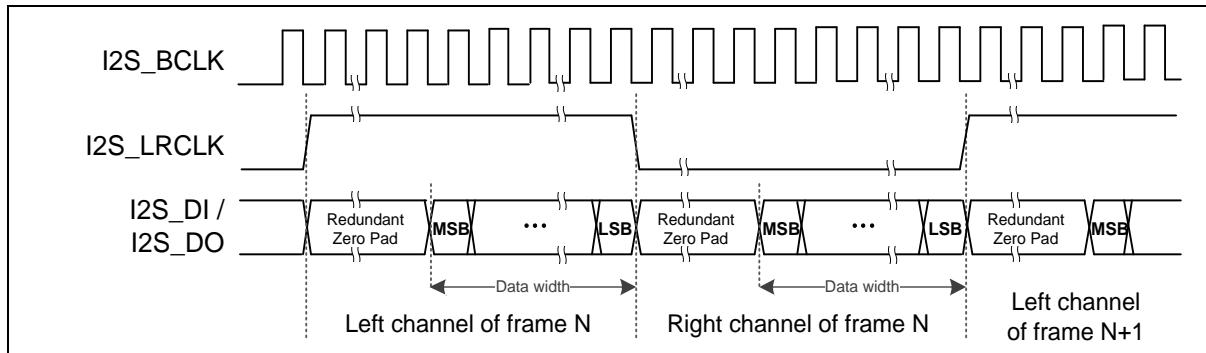

Figure 6.18-10 LSB Justified Data Format (FORMAT = 0x2 ; CHWIDTH > DATWIDTH)

The I²S controller also supports PCM audio transmission which can be selected by FORMAT (I2S_CTL0[26:24]). In PCM protocol, the function of I2S_LRCLK is simply to identify the beginning of an audio sample (or audio frame) and it is always indicated by the rising edge of the pulse. Therefore, the I2S_LRCLK in PCM protocol may be also called “frame start” or “frame sync” signal. In master device, there are two common representations for the width of the frame start pulse which can use PCMSYNC (I2S_CTL0[27]) to choose: One is equivalent to the period of a channel width and the other is equivalent to a single period of the I2S_BCLK.

Same as I²S protocol, the DATWIDTH (I2S_CTL0[5:4]) and CHWIDTH (I2S_CTL0[29:28]) can be used to configure the data bit-width and channel bit-width in PCM protocol. Besides, FORMAT (I2S_CTL0[26:24]) can also be used to select the different data formats of PCM standard mode, PCM with MSB justified, and PCM with LSB justified data format.

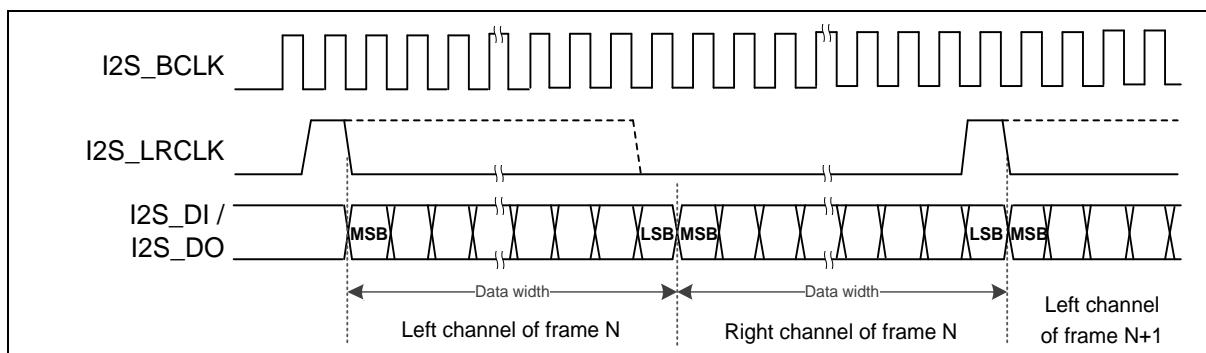

Figure 6.18-11 Standard PCM Audio Timing Diagram (FORMAT = 0x4 ; CHWIDTH≤DATWIDTH)

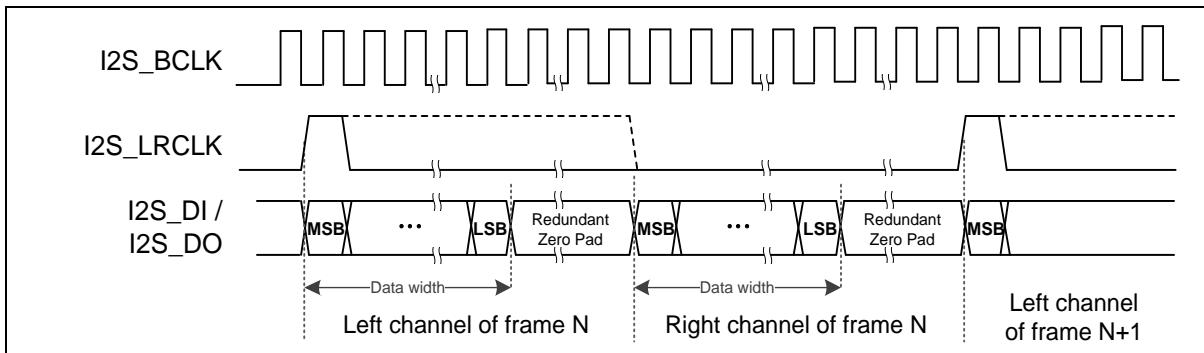

Figure 6.18-12 PCM with MSB Justified Data Format (FORMAT = 0x5 ; CHWIDTH > DATWIDTH)

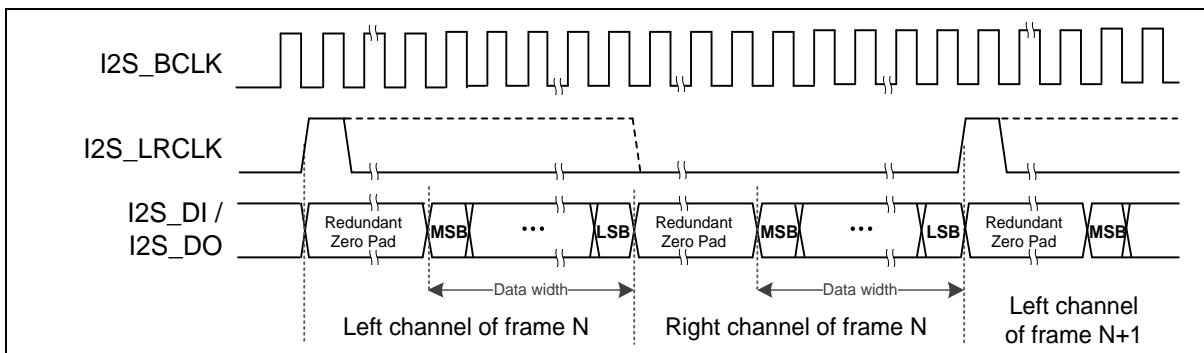

Figure 6.18-13 PCM with LSB Justified Data Format (FORMAT = 0x6 ; CHWIDTH > DATWIDTH)

6.18.5.4 TDM Multi-channel Transmission

The PCM mode in this I²S controller also supports TDM transmission. The Time Division Multiplexed (TDM) method allows multiple channels of audio data to be transmitted on a single data line. The TDM interface is similar to the 2-channel PCM audio interface with the exception that more audio channels are transmitted within a sample frame which is defined by a period of the I2S_LRCLK. The channel number of TDM interface is typically 4, 6, or 8 and it is selected by TDMCHNUM (I2S_CTL0[31:30]).

Same as previous I²S and PCM descriptions, each channel block is comprised of the audio data word followed by a sufficient number of zero data bits to complete one channel block. The bit-width of data word and channel block are defined by DATWIDTH (I2S_CTL0[5:4]) and CHWIDTH (I2S_CTL0[29:28]) respectively. Note that the TDM PCM mode supports 16-bit, 24-bit, 32-bit audio data word (excluding 8-bit data), and the hardware will set the bit-width of transmitting data as 16-bit if DATWIDTH (I2S_CTL0[5:4]) is 0x0. The pulse width of frame start signal is also selected by PCMSYNC (I2S_CTL0[27]).

The examples of 6-channel TDM transmission with 24-bit audio data in 32-bit channel block are shown in Figure 6.18-14. In 2-channel audio interface, the first and second audio channels are called as left-channel and right-channel (or channel0 and channel1). In TDM multi-channel application, the first and second audio channels are called as channel0 and channel1.

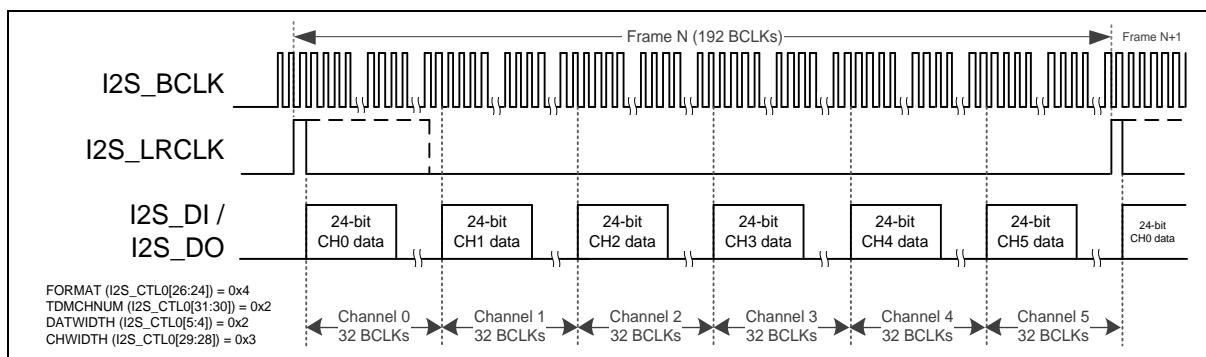

Figure 6.18-14 TDM 6-channel Audio Format with 24-bit Data in 32-bit Channel Block (PCM Standard Data Format; FORMAT=0x4)

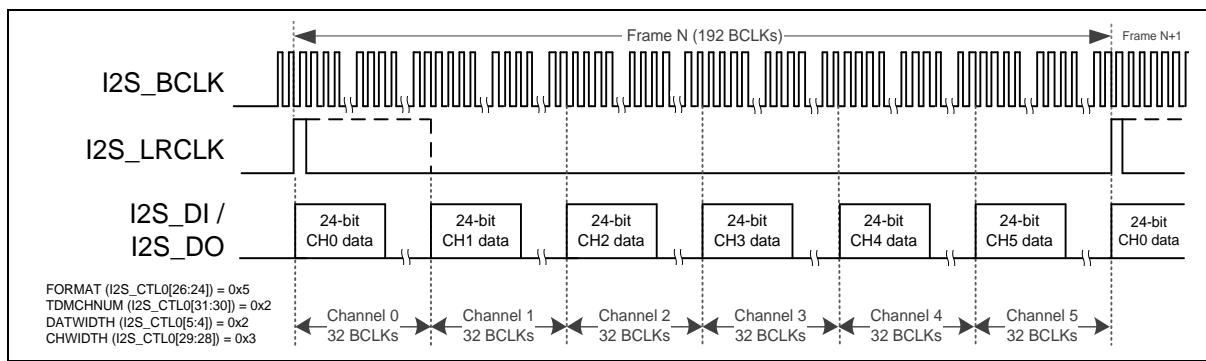

Figure 6.18-15 TDM 6-channel Audio Format with 24-bit Data in 32-bit Channel Block (PCM with MSB Justified; FORMAT=0x5)

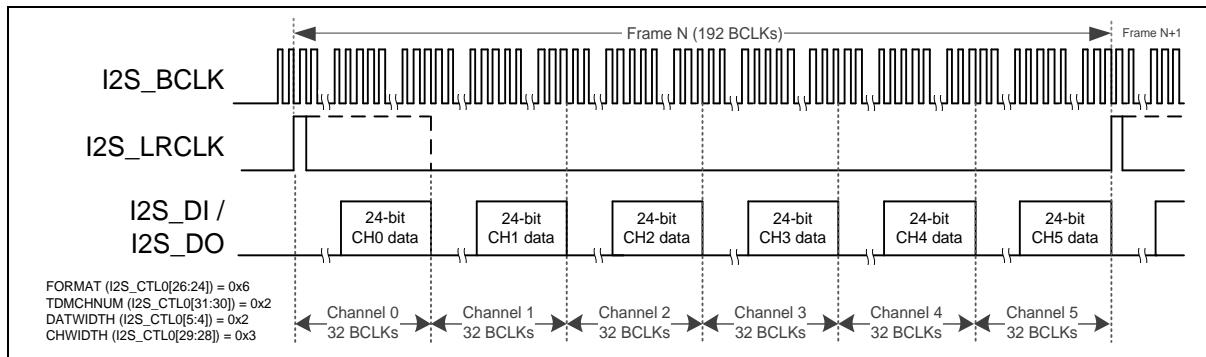

Figure 6.18-16 TDM 6-channel Audio Format with 24-bit Data in 32-bit Channel Block (PCM with LSB Justified; FORMAT=0x6)

6.18.5.5 Zero Crossing

When playing the audio by I²S controller, the output transmitting data comes from the memory by PDMA or by CPU. However, there may be some pop noise which induces the uncomfortable hearing if the playing sound volume is changed greatly by user. The zero-crossing event of audio data means the playing sound is relatively silent at the moment. Therefore, the zero-cross interrupt can be used for the indication of gain level adjustment in order to prevent the huge variance of sound volume.

If zero-cross detection of individual audio channel is enabled by the corresponding control bit from CH0ZCEN to CH7ZCEN (I²S_CTL1[0] to I²S_CTL1[7]), the hardware will detect the next transferring data word of the corresponding audio channel whether it is 0 or its MSB has been changed. If zero value or MSB (sign bit) changing of the transmitting audio data has been detected while zero-cross

detection is enabled, the hardware will set the corresponding status bit from CH0ZCIF to CH7ZCIF (I2S_STATUS1[0] to I2S_STATUS1[7]) for the audio channel and then keep the output audio data silent (all data bit zero) automatically until the corresponding event status bit is cleared by software.

Therefore, if user wants to modify the audio playing gain, users can enable the zero crossing interrupt function, CH0ZCIEN to CH7ZCIEN (I2S_IEN[16:23]), to indicate the zero crossing time and to change the audio gain. This will reduce the pop noise.

6.18.5.6 PDMA Mode

The I²S function can use PDMA function for transmitting or receiving data access. If the PDMA function of transmitting data is enabled by TXPDMAEN (I2S_CTL0[20]), the I²S controller will generate the request signal and then get transmitting audio data from memory by PDMA IP automatically while TX FIFO is not full. If the PDMA function of receiving data is enabled by RXPDMAEN (I2S_CTL0[21]), the I²S controller will generate the request signal and then the receiving data will be moved into memory by PDMA hardware automatically while the RX FIFO is not empty. Therefore, using PDMA function will save the CPU loading to service other functions.

6.18.5.7 I²S Interrupt Sources

The I²S controller supports zero-cross interrupt of individual audio channel, transmit FIFO threshold level interrupt, transmit FIFO overflow interrupt and transmit FIFO underflow interrupt in transmit operation. In receive operation, it supports receive FIFO threshold level interrupt, receive FIFO overflow interrupt and receive FIFO underflow interrupt. When I²S interrupt occurs, user can check I2STXINT (I2S_STATUS0[2]) and I2SRXINT (I2S_STATUS0[1]) flags to recognize the interrupt sources.

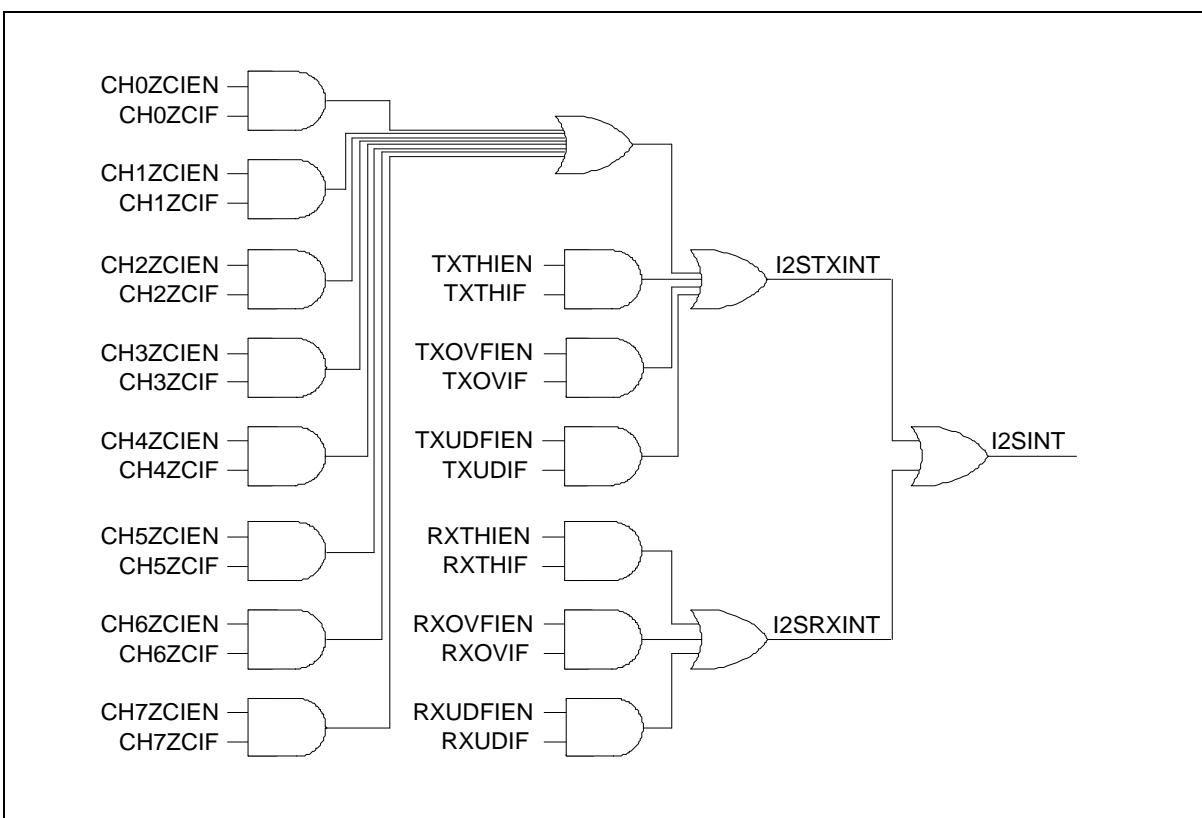

Figure 6.18-17 I²S Interrupts

6.18.5.8 FIFO Operation

In 2-channel I²S or PCM protocol, the bit-width of audio data in a channel block can be 8, 16, 24, or 32 bits. The memory arrangements of audio data for various settings are shown in Figure 6.18-18.

If CHWIDTH < DATWIDTH, the hardware will set the real channel length as the bit-width of audio data which is defined by DATWIDTH.</p> <p>00 = The bit-width of each audio channel is 8-bit. 01 = The bit-width of each audio channel is 16-bit. 10 = The bit-width of each audio channel is 24-bit. 11 = The bit-width of each audio channel is 32-bit.</p>
[27]	<p>PCMSYNC</p> <p>PCM Synchronization Pulse Length Selection</p> <p>This bit field is used to select the high pulse length of frame synchronization signal in PCM protocol</p> <p>0 = One BCLK period. 1 = One channel period.</p> <p>Note: This bit is only available in master mode</p>

[26:24]	FORMAT	Data Format Selection 000 = I ² S standard data format. 001 = I ² S with MSB justified. 010 = I ² S with LSB justified. 011 = Reserved. 100 = PCM standard data format. 101 = PCM with MSB justified. 110 = PCM with LSB justified. 111 = Reserved.
[23]	RXLCH	Receive Left Channel Enable Bit When monaural format is selected (MONO = 1), I ² S will receive channel1 data if RXLCH is set to 0, and receive channel0 data if RXLCH is set to 1. 0 = Receive channel1 data in MONO mode. 1 = Receive channel0 data in MONO mode.
[22]	Reserved	Reserved.
[21]	RXPDMAEN	Receive PDMA Enable Bit 0 = Receive PDMA function Disabled. 1 = Receive PDMA function Enabled.
[20]	TXPDMAEN	Transmit PDMA Enable Bit 0 = Transmit PDMA function Disabled. 1 = Transmit PDMA function Enabled.
[19]	RXFBCLR	Receive FIFO Buffer Clear 0 = No Effect. 1 = Clear RX FIFO. Note1: Write 1 to clear receive FIFO, internal pointer is reset to FIFO start point, and RXCNT (I2S_STATUS1[20:16]) returns 0 and receive FIFO becomes empty. Note2: This bit is cleared by hardware automatically, read it return 0.
[18]	TXFBCLR	Transmit FIFO Buffer Clear 0 = No Effect. 1 = Clear TX FIFO. Note1: Write 1 to clear transmit FIFO, internal pointer is reset to FIFO start point, and TXCNT (I2S_STATUS1[12:8]) returns 0 and transmit FIFO becomes empty but data in transmit FIFO is not changed. Note2: This bit is clear by hardware automatically, read it return 0.
[17:16]	Reserved	Reserved.
[15]	MCLKEN	Master Clock Enable Bit If MCLKEN is set to 1, I ² S controller will generate master clock on I2S_MCLK pin for external audio devices. 0 = Master clock Disabled. 1 = Master clock Enabled.
[14:9]	Reserved	Reserved.

[8]	SLAVE	<p>Slave Mode Enable Bit 0 = Master mode. 1 = Slave mode.</p> <p>Note: I²S can operate as master or slave. For Master mode, I2S_BCLK and I2S_LRCLK pins are output mode and send out bit clock to Audio CODEC chip. In Slave mode, I2S_BCLK and I2S_LRCLK pins are input mode and I2S_BCLK and I2S_LRCLK signals are received from outer Audio CODEC chip.</p>
[7]	ORDER	<p>Stereo Data Order in FIFO In 8-bit/16-bit data width, this bit is used to select whether the even or odd channel data is stored in higher byte. In 24-bit data width, this is used to select the left/right alignment method of audio data which is stored in data memory consisted of 32-bit FIFO entries.</p> <p>0 = Even channel data at high byte in 8-bit/16-bit data width. LSB of 24-bit audio data in each channel is aligned to right side in 32-bit FIFO entries.</p> <p>1 = Even channel data at low byte in 8-bit/16-bit data width. MSB of 24-bit audio data in each channel is aligned to left side in 32-bit FIFO entries.</p>
[6]	MONO	<p>Monaural Data Control 0 = Data is stereo format. 1 = Data is monaural format.</p> <p>Note: When chip records data, RXLCH (I2S_CTL0[23]) indicates which channel data will be saved if monaural format is selected.</p>
[5:4]	DATWIDTH	<p>Data Width This bit field is used to define the bit-width of data word in each audio channel</p> <p>00 = The bit-width of data word is 8-bit. 01 = The bit-width of data word is 16-bit. 10 = The bit-width of data word is 24-bit. 11 = The bit-width of data word is 32-bit.</p>
[3]	MUTE	<p>Transmit Mute Enable Bit 0 = Transmit data is shifted from buffer. 1 = Send zero on transmit channel.</p>
[2]	RXEN	<p>Receive Enable Bit 0 = Data receiving Disabled. 1 = Data receiving Enabled.</p>
[1]	TXEN	<p>Transmit Enable Bit 0 = Data transmission Disabled. 1 = Data transmission Enabled.</p>
[0]	I2SEN	<p>I²S Controller Enable Bit 0 = I²S controller Disabled. 1 = I²S controller Enabled.</p>

I²S Control Register 1 (I²S_CTL1)

Bits	Description	
[31:26]	Reserved	Reserved.
[25]	PB16ORD	<p>FIFO Read/Write Order in 16-bit Width of Peripheral Bus</p> <p>When PBWIDTH = 1, the data FIFO will be increased or decreased by two peripheral bus access. This bit is used to select the order of FIFO access operations to meet the 32-bit transmitting/receiving FIFO entries.</p> <p>0 = Low 16-bit read/write access first. 1 = High 16-bit read/write access first.</p> <p>Note: This bit is available while PBWIDTH = 1.</p>
[24]	PBWIDTH	<p>Peripheral Bus Data Width Selection</p> <p>This bit is used to choice the available data width of APB bus. It must be set to 1 while PDMA function is enable and it is set to 16-bit transmission mode</p> <p>0 = 32 bits data width. 1 = 16 bits data width.</p> <p>Note1: If PBWIDTH=1, the low 16 bits of 32-bit data bus are available.</p> <p>Note2: If PBWIDTH=1, the transmitting FIFO level will be increased after two FIFO write operations.</p> <p>Note3: If PBWIDTH=1, the receiving FIFO level will be decreased after two FIFO read operations.</p>
[23:20]	Reserved	Reserved.
[19:16]	RXTH	<p>Receive FIFO Threshold Level</p> <p>0000 = 1 data word in receive FIFO. 0001 = 2 data words in receive FIFO. 0010 = 3 data words in receive FIFO. 1110 = 15 data words in receive FIFO. 1111 = 16 data words in receive FIFO.</p> <p>Note: When received data word number in receive buffer is larger than threshold level then RXTHIF (I²S_STATUS0[10]) flag is set.</p>

[15:12]	Reserved	Reserved.
[11:8]	TXTH	<p>Transmit FIFO Threshold Level</p> <p>0000 = 0 data word in transmit FIFO.</p> <p>0001 = 1 data word in transmit FIFO.</p> <p>0010 = 2 data words in transmit FIFO.</p> <p>....</p> <p>1110 = 14 data words in transmit FIFO.</p> <p>1111 = 15 data words in transmit FIFO.</p> <p>Note: If remain data word number in transmit FIFO less or equal to than threshold level then TXTHIF (I2S_STATUS0[18]) flag is set.</p>
[7]	CH7ZCEN	<p>Channel7 Zero-cross Detect Enable Bit</p> <p>0 = channel7 zero-cross detect Disabled.</p> <p>1 = channel7 zero-cross detect Enabled.</p> <p>Note1: This bit is available while multi-channel PCM mode and TDMCHNUM (I2S_CTL0[31:30]) = 0x3.</p> <p>Note2: If this bit is set to 1, when channel7 data sign bit change or next shift data bits are all 0 then CH7ZCIF (I2S_STATUS1[7]) flag is set to 1.</p> <p>Note3: If CH7ZCIF flag is set to 1, the channel7 will be mute.</p>
[6]	CH6ZCEN	<p>Channel6 Zero-cross Detect Enable Bit</p> <p>0 = channel6 zero-cross detect Disabled.</p> <p>1 = channel6 zero-cross detect Enabled.</p> <p>Note1: This bit is available while multi-channel PCM mode and TDMCHNUM (I2S_CTL0[31:30]) = 0x3.</p> <p>Note2: If this bit is set to 1, when channel6 data sign bit change or next shift data bits are all 0 then CH6ZCIF(I2S_STATUS1[6]) flag is set to 1.</p> <p>Note3: If CH6ZCIF flag is set to 1, the channel6 will be mute.</p>
[5]	CH5ZCEN	<p>Channel5 Zero-cross Detect Enable Bit</p> <p>0 = channel5 zero-cross detect Disabled.</p> <p>1 = channel5 zero-cross detect Enabled.</p> <p>Note1: This bit is available while multi-channel PCM mode and TDMCHNUM (I2S_CTL0[31:30]) = 0x2, 0x3.</p> <p>Note2: If this bit is set to 1, when channel5 data sign bit change or next shift data bits are all 0 then CH5ZCIF(I2S_STATUS1[5]) flag is set to 1.</p> <p>Note3: If CH5ZCIF flag is set to 1, the channel5 will be mute.</p>
[4]	CH4ZCEN	<p>Channel4 Zero-cross Detect Enable Bit</p> <p>0 = channel4 zero-cross detect Disabled.</p> <p>1 = channel4 zero-cross detect Enabled.</p> <p>Note1: This bit is available while multi-channel PCM mode and TDMCHNUM (I2S_CTL0[31:30]) = 0x2, 0x3.</p> <p>Note2: If this bit is set to 1, when channel4 data sign bit change or next shift data bits are all 0 then CH4ZCIF(I2S_STATUS1[4]) flag is set to 1.</p> <p>Note3: If CH4ZCIF flag is set to 1, the channel4 will be mute.</p>
[3]	CH3ZCEN	<p>Channel3 Zero-cross Detect Enable Bit</p> <p>0 = channel3 zero-cross detect Disabled.</p> <p>1 = channel3 zero-cross detect Enabled.</p> <p>Note1: This bit is available while multi-channel PCM mode and TDMCHNUM (I2S_CTL0[31:30]) = 0x1, 0x2, 0x3.</p> <p>Note2: If this bit is set to 1, when channel3 data sign bit change or next shift data bits are all 0 then CH3ZCIF(I2S_STATUS1[3]) flag is set to 1.</p> <p>Note3: If CH3ZCIF flag is set to 1, the channel3 will be mute.</p>

[2]	CH2ZCEN	Channel2 Zero-cross Detect Enable Bit 0 = channel2 zero-cross detect Disabled. 1 = channel2 zero-cross detect Enabled. Note1: This bit is available while multi-channel PCM mode and TDMCHNUM(I2S_CTL0[31:30]) = 0x1, 0x2, 0x3. Note2: If this bit is set to 1, when channel2 data sign bit change or next shift data bits are all 0 then CH2ZCIF(I2S_STATUS1[2]) flag is set to 1. Note3: If CH2ZCIF flag is set to 1, the channel2 will be mute.
[1]	CH1ZCEN	Channel1 Zero-cross Detect Enable Bit 0 = channel1 zero-cross detect Disabled. 1 = channel1 zero-cross detect Enabled. Note1: Channel1 also means right audio channel while I2S (FORMAT[2]=0) or 2-channel PCM mode. Note2: If this bit is set to 1, when channel1 data sign bit change or next shift data bits are all 0 then CH1ZCIF(I2S_STATUS1[1]) flag is set to 1. Note3: If CH1ZCIF flag is set to 1, the channel1 will be mute.
[0]	CH0ZCEN	Channel0 Zero-cross Detection Enable Bit 0 = channel0 zero-cross detect Disabled. 1 = channel0 zero-cross detect Enabled. Note1: Channel0 also means left audio channel while I2S (FORMAT[2]=0) or 2-channel PCM mode. Note2: If this bit is set to 1, when channel0 data sign bit change or next shift data bits are all 0 then CH0ZCIF(I2S_STATUS1[0]) flag is set to 1. Note3: If CH0ZCIF flag is set to 1, the channel0 will be mute.

I²S Clock Divider (I²S_CLKDIV)

Register	Offset	R/W	Description	Reset Value

15	14	13	12	11	10	9	8
Reserved			RXEMPTY	RXFULL	RXTHIF	RXOVIF	RXUDIF
7	6	5	4	3	2	1	0
Reserved		DATACH			I ² STXINT	I ² SRXINT	I ² SINT

Bits	Description	
[31:22]	Reserved	Reserved.
[21]	TXBUSY	<p>Transmit Busy (Read Only) 0 = Transmit shift buffer is empty. 1 = Transmit shift buffer is busy. Note: This bit is cleared to 0 when all data in transmit FIFO and shift buffer is shifted out. And set to 1 when 1st data is load to shift buffer.</p>
[20]	TXEMPTY	<p>Transmit FIFO Empty (Read Only) This bit reflect data word number in transmit FIFO is 0 0 = Not empty. 1 = Empty.</p>
[19]	TXFULL	<p>Transmit FIFO Full (Read Only) This bit reflect data word number in transmit FIFO is 16 0 = Not full. 1 = Full.</p>
[18]	TXTHIF	<p>Transmit FIFO Threshold Interrupt Flag (Read Only) 0 = Data word(s) in FIFO is larger than threshold level. 1 = Data word(s) in FIFO is less than or equal to threshold level. Note: When data word(s) in transmit FIFO is less than or equal to threshold value set in TXTH (I²S_CTL1[11:8]) the TXTHIF bit becomes to 1. It keeps at 1 till TXCNT (I²S_STATUS1[12:8]) is larger than TXTH (I²S_CTL1[11:8]) after software write TXFIFO register.</p>
[17]	TXOVIF	<p>Transmit FIFO Overflow Interrupt Flag 0 = No overflow. 1 = Overflow. Note1: Write data to transmit FIFO when it is full and this bit set to 1 Note2: Write 1 to clear this bit to 0.</p>

[16]	TXUDIF	Transmit FIFO Underflow Interrupt Flag 0 = No underflow. 1 = Underflow. Note1: This bit will be set to 1 when shift logic hardware read data from transmitting FIFO and the filling data level in transmitting FIFO is not enough for one audio frame. Note2: Write 1 to clear this bit to 0.
[15:13]	Reserved	Reserved.
[12]	RXEMPTY	Receive FIFO Empty (Read Only) 0 = Not empty. 1 = Empty. Note: This bit reflects data words number in receive FIFO is 0
[11]	RXFULL	Receive FIFO Full (Read Only) 0 = Not full. 1 = Full. Note: This bit reflects data words number in receive FIFO is 16.
[10]	RXTHIF	Receive FIFO Threshold Interrupt Flag (Read Only) 0 = Data word(s) in FIFO is less than or equal to threshold level. 1 = Data word(s) in FIFO is larger than threshold level. Note: When data word(s) in receive FIFO is larger than threshold value set in RXTH (I2S_CTL1[19:16]) the RXTHIF bit becomes to 1. It keeps at 1 till RXCNT (I2S_STATUS1[20:16]) is less than or equal to RXTH (I2S_CTL1[19:16]) after software read RXFIFO register.
[9]	RXOVIF	Receive FIFO Overflow Interrupt Flag 0 = No overflow occur. 1 = Overflow occur. Note1: When receive FIFO is full and receive hardware attempt to write data into receive FIFO then this bit is set to 1, data in 1st buffer is overwritten. Note2: Write 1 to clear this bit to 0.
[8]	RXUDIF	Receive FIFO Underflow Interrupt Flag 0 = No underflow occur. 1 = Underflow occur. Note1: When receive FIFO is empty, and software reads the receive FIFO again. This bit will be set to 1, and it indicates underflow situation occurs. Note2: Write 1 to clear this bit to 0
[7:6]	Reserved	Reserved.
[5:3]	DATACh	Transmission Data Channel (Read Only) This bit fields are used to indicate which audio channel is current transmit data belong. 000 = channel0 (means left channel while 2-channel I2S/PCM mode). 001 = channel1 (means right channel while 2-channel I2S/PCM mode). 010 = channel2 (available while 4-channel TDM PCM mode). 011 = channel3 (available while 4-channel TDM PCM mode). 100 = channel4 (available while 6-channel TDM PCM mode). 101 = channel5 (available while 6-channel TDM PCM mode). 110 = channel6 (available while 8-channel TDM PCM mode). 111 = channel7 (available while 8-channel TDM PCM mode).

[2]	I2STXINT	I²S Transmit Interrupt (Read Only) 0 = No transmit interrupt. 1 = Transmit interrupt.
[1]	I2SRXINT	I²S Receive Interrupt (Read Only) 0 = No receive interrupt. 1 = Receive interrupt.
[0]	I2SINT	I²S Interrupt Flag (Read Only) 0 = No I ² S interrupt. 1 = I ² S interrupt. Note: It is wire-OR of I2STXINT and I2SRXINT bits.

6.19 Serial Peripheral Interface (SPI)

6.19.1 Overview

The Serial Peripheral Interface (SPI) applies to synchronous serial data communication and allows full duplex transfer. Devices communicate in Master/Slave mode with the 4-wire bi-direction interface. The M480 series contains up to four sets of SPI controllers performing a serial-to-parallel conversion on data received from a peripheral device, and a parallel-to-serial conversion on data transmitted to a peripheral device. Each SPI controller can be configured as a master or a slave device and supports the PDMA function to access the data buffer. Each SPI controller also supports I²S mode to connect external audio CODEC.

6.19.2 Features

- SPI Mode
 - Up to four sets of SPI controllers
 - Supports Master or Slave mode operation
 - Master mode up to 100 MHz and Slave mode up to 100 MHz (when chip works at V_{DD} = 2.7~3.6V)
 - Configurable bit length of a transaction word from 8 to 32-bit
 - Provides separate 4-level depth transmit and receive FIFO buffers
 - Supports MSB first or LSB first transfer sequence
 - Supports Byte Reorder function
 - Supports Byte or Word Suspend mode
 - Supports PDMA transfer
 - Supports one data channel half-duplex transfer
 - Supports receive-only mode
- I²S Mode
 - Supports Master or Slave
 - Capable of handling 8-, 16-, 24- and 32-bit word sizes
 - Each provides two 4-level FIFO data buffers, one for transmitting and the other for receiving
 - Supports monaural and stereo audio data
 - Supports PCM mode A, PCM mode B, I²S and MSB justified data format
 - Supports two PDMA requests, one for transmitting and the other for receiving

	QSPIx	SPIx
Dual/Quad I/O Mode	V	X
Two-bit Transfer Mode	V	X

6.19.3 Block Diagram

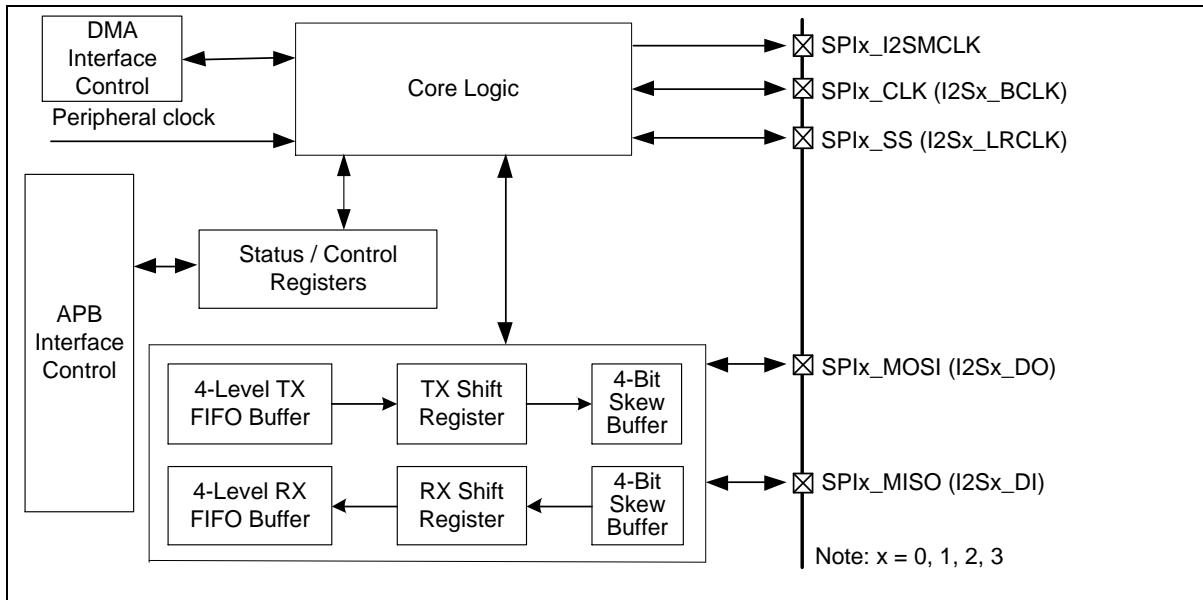

Figure 6.19-1 SPI Block Diagram

TX FIFO Buffer:

The transmit FIFO buffer is a 4-level depth, 32-bit wide, first-in, first-out register buffer. The data can be written to the transmit FIFO buffer in advance through software by writing the SPIx_TX register. In SPI mode, the transmit FIFO will be configured as 8-level while data length is set as 8~16 bits.

RX FIFO Buffer:

The receive FIFO buffer is also a 4-level depth, 32-bit wide, first-in, first-out register buffer. The receive control logic will store the receive data to this buffer. The FIFO buffer data can be read from SPIx_RX register by software. In SPI mode, the receive FIFO will be configured as 8-level while data length is set as 8~16 bits.

TX Shift Register:

The transmit shift register is a 32-bit wide register buffer. The transmit data is loaded from the TX FIFO buffer and shifted out bit-by-bit to the skew buffer.

RX Shift Register:

The receive shift register is also a 32-bit wide register buffer. The receive data is shift in bit-by-bit from the skew buffer and is loaded into RX FIFO buffer when a transaction done.

Skew Buffer:

The skew buffer is a 4-level 1-bit buffer. There are two skew buffers in transmitting and received side. In received side, it is used to shift bits into RX shift register from SPI bus. In transmitting side, it is used to shift bits into SPI bus from TX shift register.

6.19.4 Basic Configuration

6.19.4.1 SPI0 Basic Configuration

- Clock source Configuration
 - Select the source of SPI0 peripheral clock on SPI0SEL (CLK_CLKSEL2[5:4]).

- Enable SPI0 peripheral clock in SPI0CKEN (CLK_APBCLK0[13]).
- Reset Configuration
 - Reset SPI0 controller in SPI0RST (SYS_IPRST1[13]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
SPI0	SPI0_CLK	PA.2, PB.14, PD.2	MFP4
		PF.8	MFP5
	SPI0_I2SMCLK	PA.4, PC.14, PD.13	MFP4
		PF.10	MFP5
		PB.0	MFP8
		PB.11	MFP9
	SPI0_MISO	PA.1, PB.13, PD.1	MFP4
		PF.7	MFP5

SPI/I²S (SPI0~SPI3) Interface Controller Pin description is shown as follows:

Pin	SPI Mode	I ² S Mode
SPIx_SS	SPI slave selection pin	I ² S left/right channel synchronization clock pin (I2Sx_LRCLK)
SPIx_CLK	SPI clock pin	I ² S bit clock pin (I2Sx_BCLK)

SPIx_MISO	SPI master input or slave output pin	I ² S data input pin (I2Sx_DI)
SPIx_MOSI	SPI master output or slave input pin	I ² S data output pin (I2Sx_DO)
SPIx_I2SMCLK	Not available	I ² S Master clock output pin

Table 6.19-1 SPI/I²S Interface Controller Pin Description (SPI0~SPI3)

6.19.5 Functional Description

6.19.5.1 Terminology

SPI Peripheral Clock and SPI Bus Clock

The SPI controller needs the peripheral clock to drive the SPI logic unit to perform the data transfer. The peripheral clock rate is determined by the settings of clock divisor (SPIx_CLKDIV) and the clock source which can be HXT, PLL, PCLK or HIRC. SPIxSEL of CLK_CLKSEL2 register determines the clock source of the peripheral clock. The DIVIDER (SPIx_CLKDIV[8:0]) setting determines the divisor of the clock rate calculation.

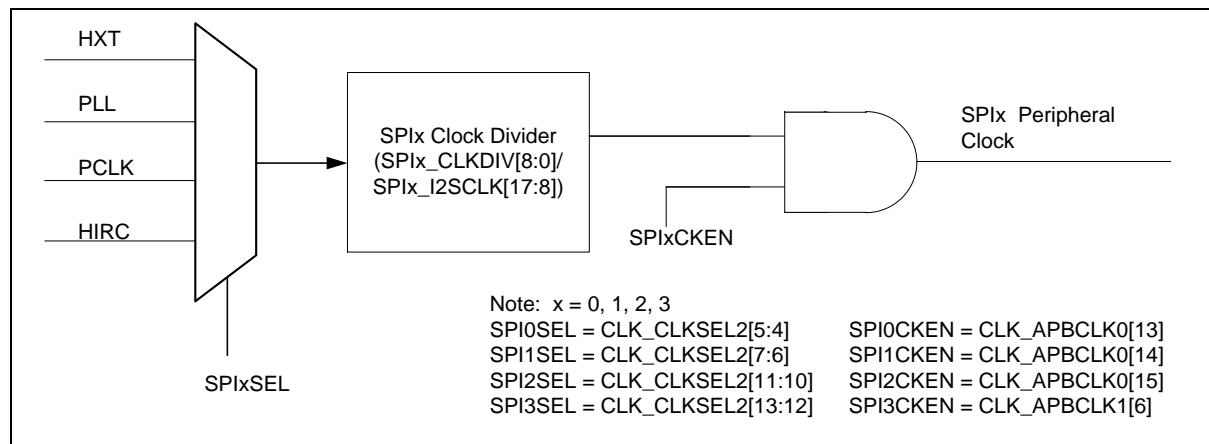

Figure 6.19-2 SPI Peripheral Clock

In Master mode, the frequency of the SPI bus clock is equal to the peripheral clock rate. In general, the SPI bus clock is denoted as SPI clock. In Slave mode, the SPI bus clock is provided by a master device. The frequency of SPI peripheral clock cannot be faster than the system clock rate regardless of Master or Slave mode. If the clock source of peripheral clock is not system clock, the frequency of SPI peripheral clock shall be slower than the system clock frequency regardless of Master or Slave mode.

In I²S mode, the peripheral clock rate is equal to I²S bit clock rate determined by SPIx_I2SCLK register.

Master/Slave mode

The SPI controllers can be set as Master or Slave mode by setting the SLAVE (SPIx_CTL[18]) to communicate with the off-chip SPI slave or master device. The HALFDPX (SPIx_CTL[14]) can be used to select the full-duplex or half-duplex in SPI transmission. The application block diagrams in Master and Slave mode are shown below.

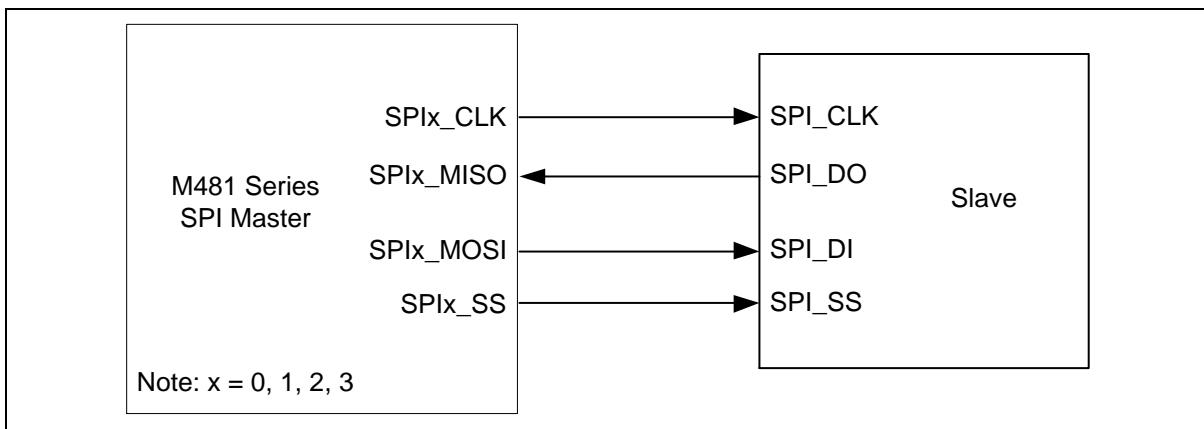

Figure 6.19-3 SPI Full-Duplex Master Mode Application Block Diagram

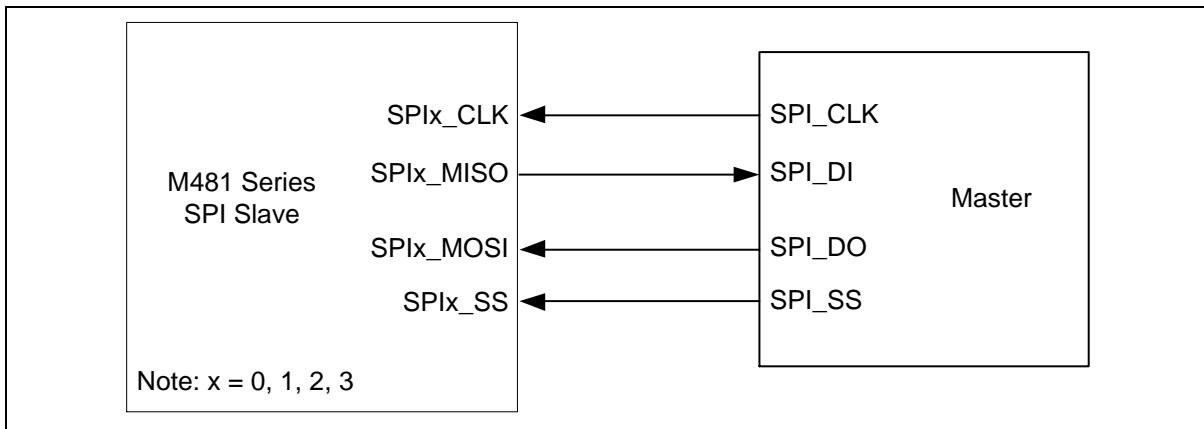

Figure 6.19-4 SPI Full-Duplex Slave Mode Application Block Diagram

Slave Selection

In Master mode, the SPI controller can drive off-chip slave device through the slave select output pin SPI_x_SS. In Slave mode, the off-chip master device drives the slave selection signal from the SPI_x_SS input port to this SPI controller. The duration between the slave select active edge and the first SPI clock input shall over 3 SPI peripheral clock cycles of slave.

In Master/Slave mode, the active state of slave selection signal can be programmed to low or high active in SSACTPOL (SPI_x_SSCTL[2]). The selection of slave select conditions depends on what type of device is connected. In Slave mode, to recognize the inactive state of the slave selection signal, the inactive period of the slave selection signal must be larger than or equal to 3 peripheral clock cycles between two successive transactions.

Timing Condition

The CLKPOL (SPI_x_CTL[3]) defines the SPI clock idle state. If CLKPOL = 1, the output SPI clock is idle at high state; if CLKPOL = 0, it is idle at low state.

TXNEG (SPI_x_CTL[2]) defines the data transmitted out either on negative edge or on positive edge of SPI clock. RXNEG (SPI_x_CTL[1]) defines the data received either on negative edge or on positive edge of SPI clock.

Note: The settings of TXNEG and RXNEG are mutual exclusive. In other words, do not transmit and receive data at the same clock edge.

Transmit/Receive Bit Length

The bit length of a transaction word is defined in DWIDTH (SPI_x_CTL[12:8]) and can be configured up

to 32-bit length in a transaction word for transmitting and receiving.

When SPI controller finishes a transaction, i.e. receives or transmits a specific count of bits defined in DWIDTH (SPIx_CTL[12:8]), the unit transfer interrupt flag will be set to 1.

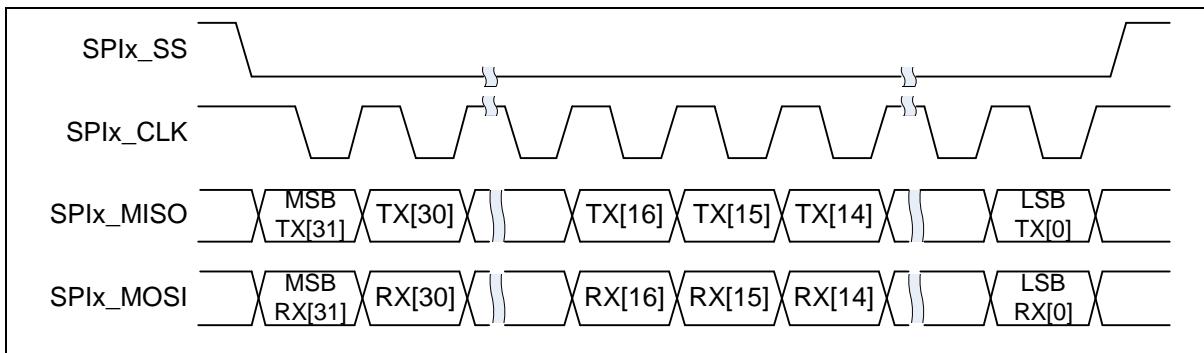

Figure 6.19-5 32-bit in One Transaction

LSB/MSB First

LSB (SPIx_CTL[13]) defines the bit transfer sequence in a transaction. If the LSB (SPIx_CTL[13]) is set to 1, the transfer sequence is LSB first. The bit 0 will be transferred firstly. If the LSB (SPIx_CTL[13]) is cleared to 0, the transfer sequence is MSB first.

Suspend Interval

SUSPITV (SPIx_CTL[7:4]) provides a configurable suspend interval, 0.5 ~ 15.5 SPI clock periods, between two successive transaction words in Master mode. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value of SUSPITV is 0x3 (3.5 SPI clock cycles).

6.19.5.2 Automatic Slave Selection

In Master mode, if AUTOSS (SPIx_SSCTL[3]) is set, the slave selection signal will be generated automatically and output to the SPIx_SS pin according to whether SS (SPIx_SSCTL[0]) is enabled or not. The slave selection signal will be set to active state by the SPI controller when the SPI data transfer is started by writing to FIFO. It will be set to inactive state when SPI bus is idle. If SPI bus is not idle, i.e. TX FIFO, TX shift register or TX skew buffer is not empty, the slave selection signal will be set to inactive state between transactions if the value of SUSPITV (SPIx_CTL[7:4]) is greater than or equal to 3.

In Master mode, if the value of SUSPITV is less than 3 and the AUTOSS is set as 1, the slave selection signal will be kept at active state between two successive transactions.

If the AUTOSS bit is cleared, the slave selection output signal will be determined by the SS setting. The active state of the slave selection output signal is specified in SSACTPOL (SPIx_SSCTL[2]).

The duration between the slave selection signal active edge and the first SPI bus clock edge is 1 SPI bus clock cycle and the duration between the last SPI bus clock and the slave selection signal inactive edge is 1.5 SPI bus clock cycle.

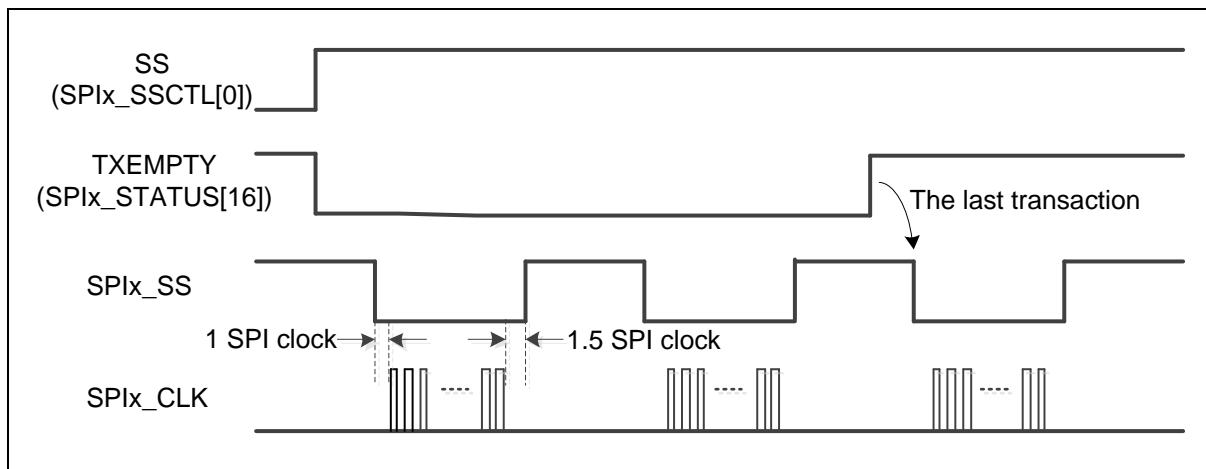

Figure 6.19-6 Automatic Slave Selection (SSACTPOL = 0, SUSPITV > 0x2)

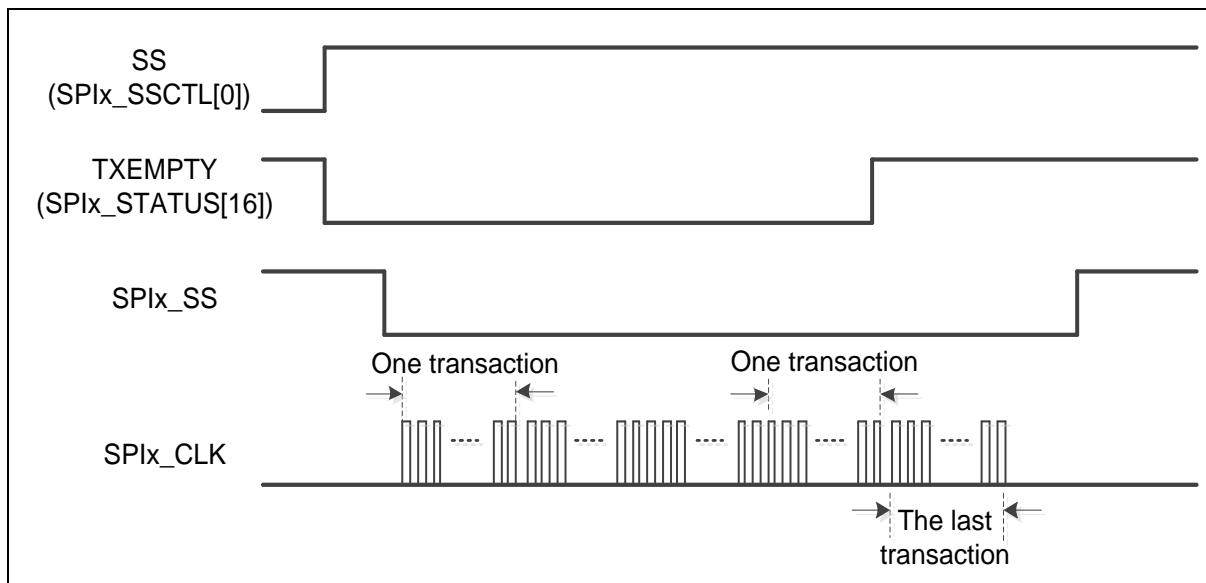

Figure 6.19-7 Automatic Slave Selection (SSACTPOL = 0, SUSPITV < 0x3)

6.19.5.3 Byte Reorder and Suspend Function

When the transfer is set as MSB first (LSB = 0) and the REORDER (SPIx_CTL[19]) is set to 1, the data stored in the TX buffer and RX buffer will be rearranged in the order as [Byte0, Byte1, Byte2, Byte3] in 32-bit transfer (DWIDTH = 0). The sequence of transmitted/received data will be Byte0, Byte1, Byte2, and then Byte3. If the DWIDTH is set as 24-bit transfer mode, the data in TX buffer and RX buffer will be rearranged as [unknown byte, Byte0, Byte1, Byte2]. The SPI controller will transmit/receive data with the sequence of Byte0, Byte1 and then Byte2. Each byte will be transmitted/received with MSB first. The rule of 16-bit mode is the same as above. Byte Reorder function is only available when DWIDTH is configured as 16, 24, and 32 bits.

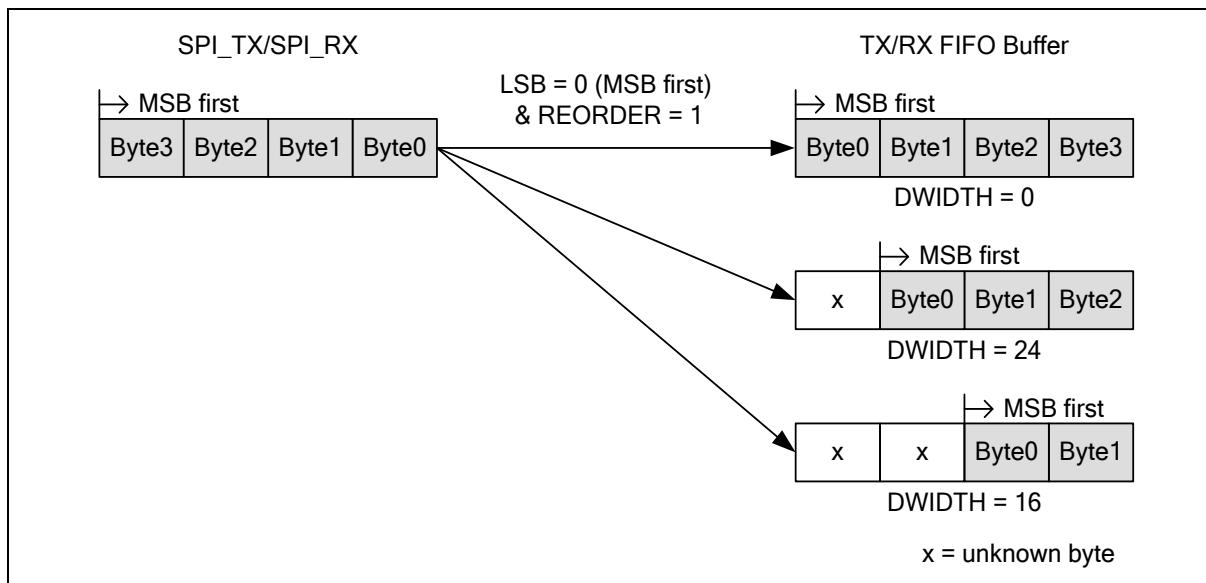

Figure 6.19-8 Byte Reorder Function

In Master mode, if REORDER (SPIx_CTL[19]) is set to 1, a suspend interval of 0.5 ~ 15.5 SPI clock periods will be inserted by hardware between two successive bytes in a transaction word. The suspend interval is configured in SUSPITV (SPIx_CTL[7:4]).

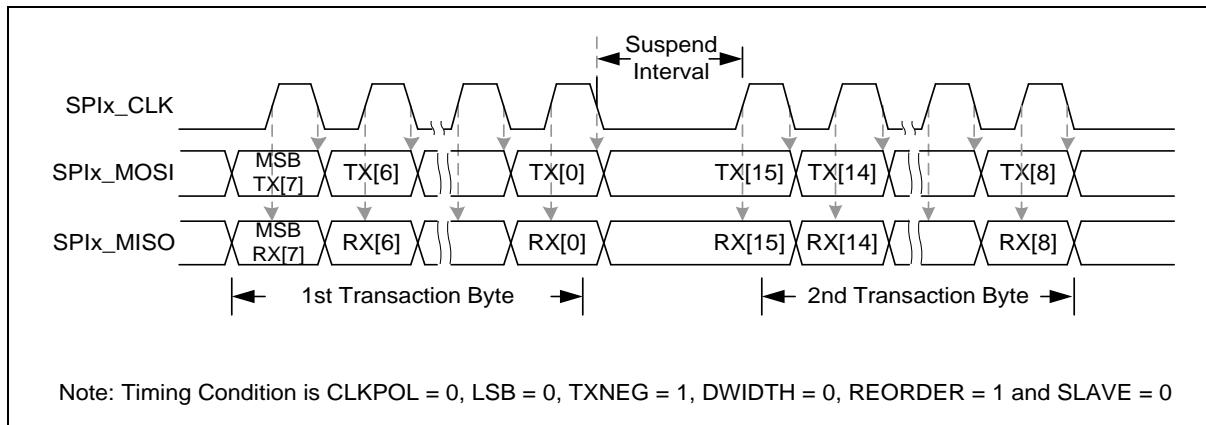

Figure 6.19-9 Timing Waveform for Byte Suspend

6.19.5.4 Half-Duplex Communication

The SPI controller can communicate in half-duplex mode by setting HALFDPX (SPIx_CTL[14]) bit. In half-duplex mode, there is only one data line for receiving or transmitting data direction which is defined by DATDIR (SPIx_CTL[20]). In half-duplex configuration, the SPIx_MISO pin is free for other applications and it can be configured as GPIO. Enabling or disabling the control bit HALFDPX (SPIx_CTL[14]) will produce TXFBCLR (SPIx_FIFOCTL[9]) and RXFBCLR (SPIx_FIFOCTL[8]) at the same time automatically.

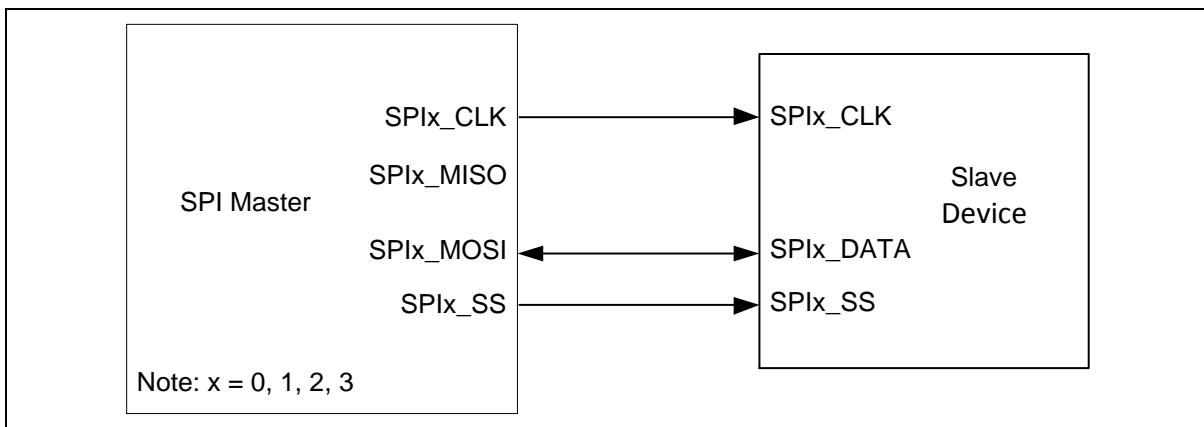

Figure 6.19-10 SPI Half-Duplex Master Mode Application Block Diagram

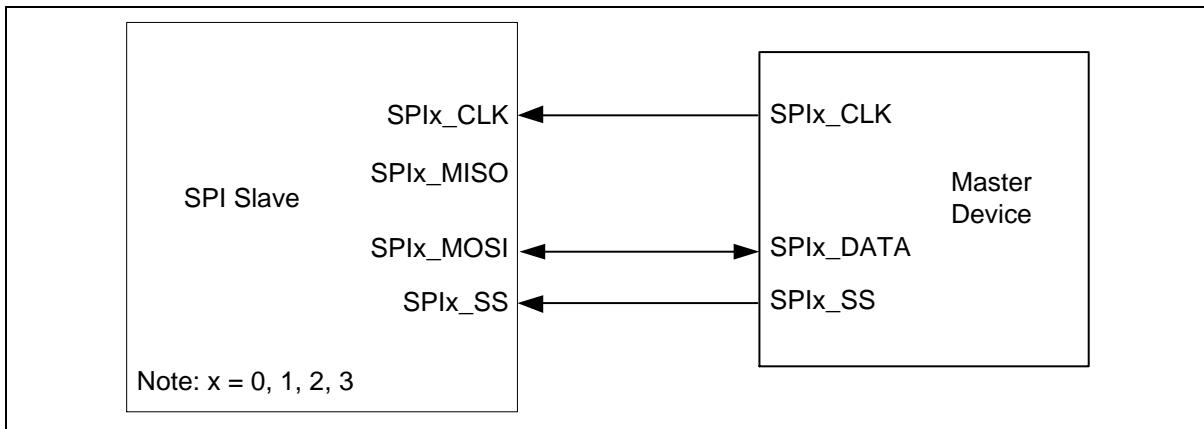

Figure 6.19-11 SPI Half-Duplex Slave Mode Application Block Diagram

6.19.5.5 Receive-Only Mode

In SPI Master device, it can communicate in receive-only mode by setting RXONLY (SPIx_CTL[15]). In this configuration, the SPI Master device will generate SPI bus clock continuously as long as the receive-only mode is enabled for receiving data bit from SPI slave device. If AUTOSS (SPIx_SSCTL[3]) is enabled in receive-only mode, SPI Master will keep activating the slave select signal.

The remaining SPIx_MOSI pin of SPI Master device is not used for communication and can be configured as GPIO. The status BUSY (SPIx_STATUS[0]) will be asserted in receive-only mode due to the generation of SPI bus clock. Entering this mode will produce the TXFBCLR (SPIx_FIFOCTL[9]) and RXFBCLR (SPIx_FIFOCTL[8]) at the same time automatically. After enabling this mode, the output SPI bus clock will be sent out in 6 peripheral clock cycles. In this mode, the data which has been written into transmit FIFO will be loaded into transmit shift register and sent out.

6.19.5.6 PDMA Transfer Function

SPI controller supports PDMA transfer function.

When TXPDMAEN (SPIx_PDMACTL[0]) is set to 1, the controller will issue request to PDMA controller to start the PDMA transmission process automatically.

When RXPDMAEN (SPIx_PDMACTL[1]) is set to 1, the controller will start the PDMA reception process. SPI controller will issue request to PDMA controller automatically when there is data in the RX FIFO buffer.

Note: SPI supports single request PDMA (Read/Write) only, burst request PDMA is not supported.

6.19.5.7 FIFO Buffer Operation

The SPI controllers equip with four 32-bit wide transmit and receive FIFO buffers. The data stored in the transmit FIFO buffer will be read and sent out by the transmission control logic. If the transmit FIFO buffer is full, the TXFULL (SPIx_STATUS[17]) will be set to 1. When the SPI transmission logic unit draws out the last datum of the transmit FIFO buffer, so that the transmit FIFO buffer is empty, the TXEMPTY (SPIx_STATUS[16]) will be set to 1. Note that the TXEMPTY (SPIx_STATUS[16]) flag is set to 1 while the last transaction is still in progress. In Master mode, the BUSY (SPIx_STATUS[0]) is set to 1 when the FIFO buffer is written any data or there is any transaction on the SPI bus. (e.g. the slave selection signal is active and the SPI controller is receiving data in Slave mode). It will set to 0 when the transmit FIFO is empty and the current transaction has done. Thus, the status of BUSY (SPIx_STATUS[0]) should be checked by software to make sure whether the SPI is in idle or not.

The receive control logic will store the SPI input data into the receive FIFO buffer. There are FIFO related status bits, like RXEMPTY (SPIx_STATUS[8]) and RXFULL (SPIx_STATUS[9]), to indicate the current status of RX FIFO buffer.

The transmitting and receiving threshold can be configured by setting TXTH (SPIx_FIFOCTL[30:28]) and RXTH (SPIx_FIFOCTL[26:24]). When the count of valid data stored in transmit FIFO buffer is less than or equal to TXTH (SPIx_FIFOCTL[30:28]) setting, TXTHIF (SPIx_STATUS[18]) will be set to 1. When the count of valid data stored in receive FIFO buffer is larger than RXTH (SPIx_FIFOCTL[26:24]) setting, RXTHIF (SPIx_STATUS[10]) will be set to 1.

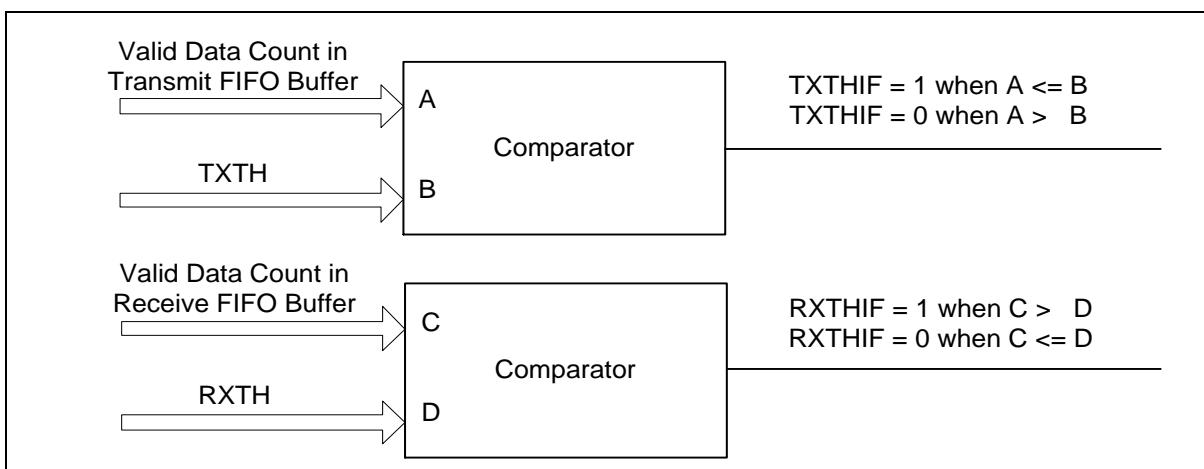

Figure 6.19-12 FIFO Threshold Comparator

In Master mode, when the first datum is written to the SPIx_TX register, the TXEMPTY flag (SPIx_STATUS[16]) will be cleared to 0. The transmission will start after 1 APB clock cycles and 6 peripheral clock cycles. User can write the next data into SPIx_TX register immediately. The SPI controller will insert a suspend interval between two successive transactions. The period of suspend interval is decided by the setting of SUSPITV (SPIx_CTL[7:4]). If the SUSPITV (SPIx_CTL[7:4]) equals 0, SPI controller can perform continuous transfer. User can write data into SPIx_TX register as long as the TXFULL (SPIx_STATUS[17]) is 0.

In the example 1 of Figure 6.19-13, it indicates the updated condition of TXEMPTY (SPIx_STATUS[16]) and the relationship among the FIFO buffer, shift register and the skew buffer. The TXEMPTY (SPIx_STATUS[16]) is set to 0 when the Data0 is written into the FIFO buffer. The Data0 will be loaded into the shift register by the core logic and the TXEMPTY (SPIx_STATUS[16]) will be to 1. The Data0 in shift register will be shift into skew buffer by bit for transmission until the transfer is done.

In the Example 2, it indicates the updated condition of TXFULL (SPIx_STATUS[17]) when there are 8 data in the FIFO buffer and the next data of Data9 does not be written into the FIFO buffer when the

TXFULL = 1.

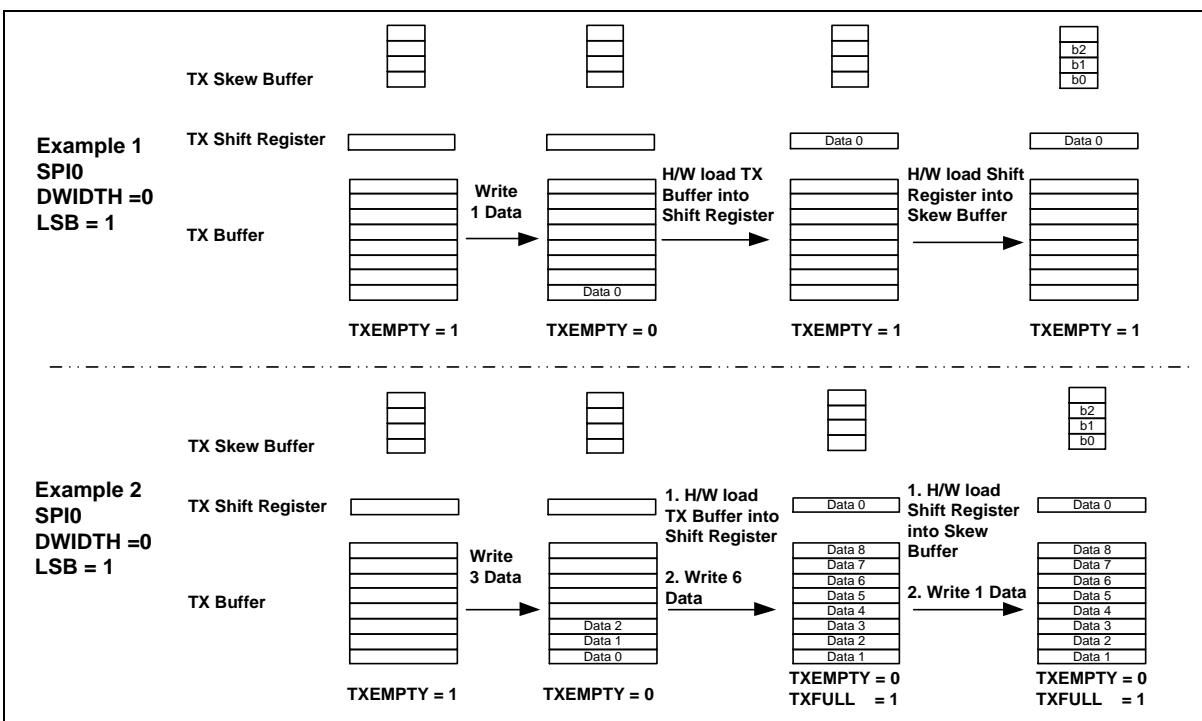

Figure 6.19-13 Transmit FIFO Buffer Example

The subsequent transactions will be triggered automatically if the transmitted data are updated in time. If the SPIx_TX register does not be updated after all data transfer are done, the transfer will stop.

In Master mode, during receiving operation, the serial data are received from SPIx_MISO pin and stored to receive FIFO buffer.

The received data (Data0's b0, b1, ...b31) is stored into skew buffer first according the serial clock (SPIx_CLK) and then it is shift into the shift register bit by bit. The core logic will load the data in shift register into FIFO buffer when the received data bit count reach the value of DWIDTH (SPIx_CTL[12:8]). The RXEMPTY (SPIx_STATUS[8]) will be cleared to 0 while the receive FIFO buffer contains unread data (see the Example 1 of Receive FIFO Buffer Example). The received data can be read by software from SPIx_RX register as long as the RXEMPTY (SPIx_STATUS[8]) is 0. If the receive FIFO buffer contains 8 unread data, the RXFULL (SPIx_STATUS[9]) will be set to 1 (see the Example 2 of Receive FIFO Buffer Example).

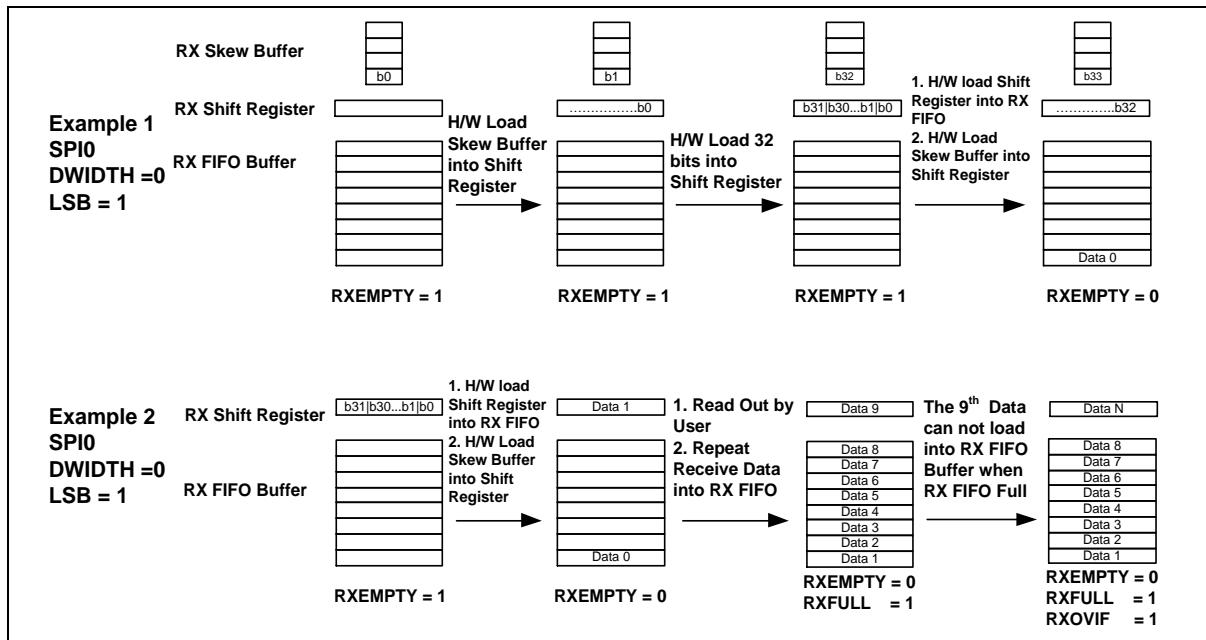

Figure 6.19-14 Receive FIFO Buffer Example

In Slave mode, during transmission operation, when data is written to the SPIx_TX register by software, the data will be loaded into transmit FIFO buffer and the TXEMPTY (SPIx_STATUS[16]) will be set to 0. The transmission will start when the slave device receives clock signal from master. Data can be written to SPIx_TX register as long as the TXFULL (SPIx_STATUS[17]) is 0. After all data have been drawn out by the SPI transmission logic unit and the SPIx_TX register is not updated by software, the TXEMPTY (SPIx_STATUS[16]) will be set to 1.

If there is no any data written to the SPIx_TX register, the transmit underflow interrupt flag, TXUFIF (SPIx_STATUS[19]) will be set to 1 when the slave selection signal is active. The output data will be held by TXUFPOL (SPIx_FIFOCTL[6]) setting during this transfer until the slave selection signal goes to inactive state. When the transmit underflow event occurs, the slave under run interrupt flag, SLVURIF (SPIx_STATUS[7]), will be set to 1 as SPIx_SS goes to inactive state.

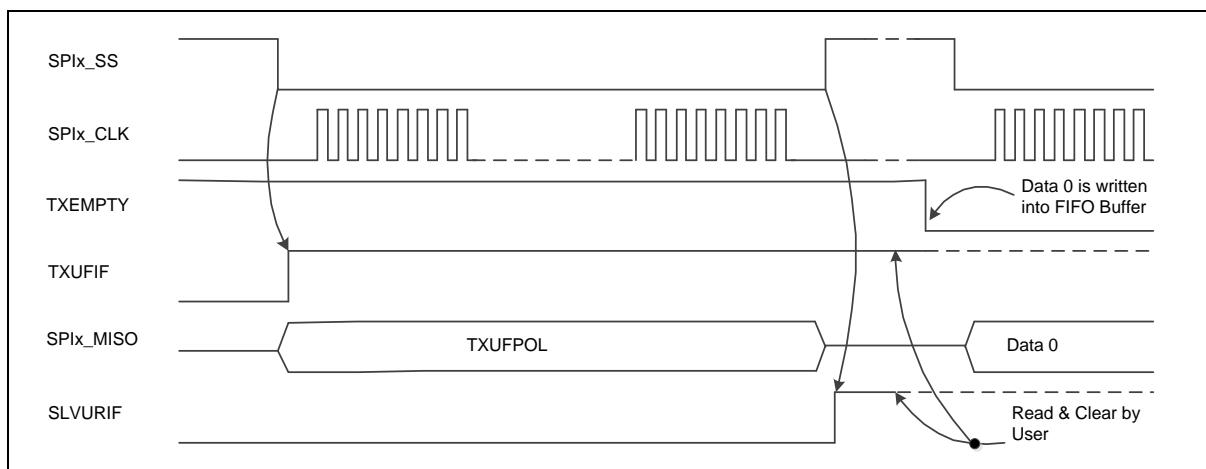

Figure 6.19-15 TX Underflow Event and Slave Under Run Event

In Slave mode, during receiving operation, the serial data is received from SPIx_MOSI pin and stored to SPIx_RX register. The reception mechanism is similar to Master mode reception operation. If the receive FIFO buffer contains 4 unread data, the RXFULL (SPIx_STATUS[9]) will be set to 1 and the

RXOVIF (SPIx_STATUS[11]) will be set to 1 if there is more serial data received from SPIx_MOSI and follow-up data will be dropped (refer to the Receive FIFO Buffer Example figure). If the receive bit count mismatch with the DWIDTH (SPIx_CTL[12:8]) when the slave selection line goes to inactive state, the SLVBEIF (SPIx_STATUS[6]) will be set to 1.

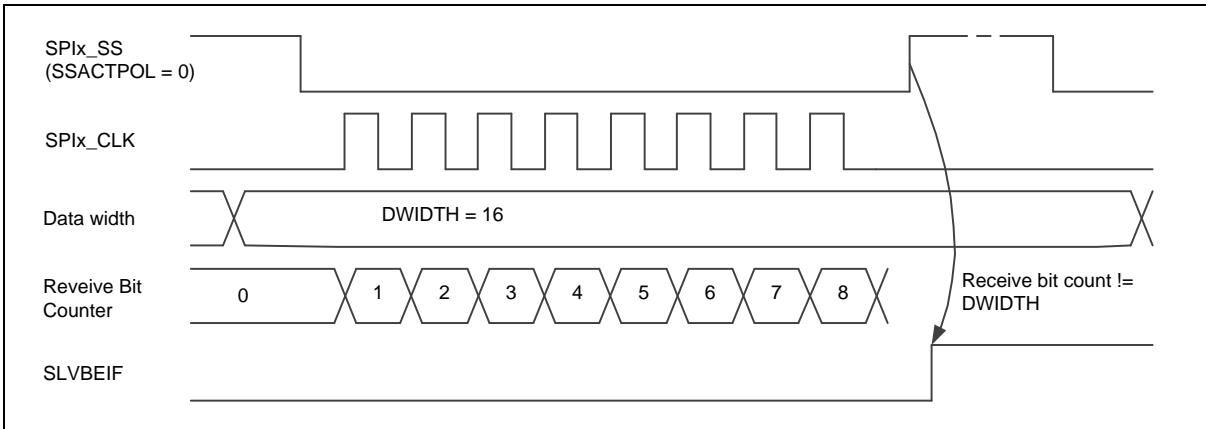

Figure 6.19-16 Slave Mode Bit Count Error

A receive time-out function is built-in in this controller. When the receive FIFO is not empty and no read operation in receive FIFO over 64 SPI peripheral clock periods in Master mode or over 576 SPI peripheral clock periods in Slave mode, the receive time-out occurs and the RXTOIF (SPIx_STATUS[12]) will be set to 1. When the receive FIFO is read by user, the time-out status will be cleared automatically.

6.19.5.8 Interrupt

- SPI unit transfer interrupt

As the SPI controller finishes a unit transfer, the unit transfer interrupt flag UNITIF (SPIx_STATUS[1]) will be set to 1. The unit transfer interrupt event will generate an interrupt to CPU if the unit transfer interrupt enable bit UNITIEN (SPIx_CTL[17]) is set. The unit transfer interrupt flag can be cleared only by writing 1 to it.

- SPI slave selection active/inactive interrupt

In Slave mode, the slave selection active/inactive interrupt flag, SSACTIF (SPIx_STATUS[2]) and SSINAIF (SPIx_STATUS[3]), will be set to 1 when the SPIEN (SPIx_CTL[0]) and SLAVE (SPIx_CTL[18]) are set to 1 and the slave selection signal goes to active/inactive state. The SPI controller will issue an interrupt if the SSINAIFEN (SPIx_SSCTL[13]) or SSACTIEN (SPIx_SSCTL[12]), are set to 1.

- Slave bit count error interrupt

In Slave mode, if the transmit/receive bit count mismatch with the DWIDTH (SPIx_CTL[12:8]) when the slave selection line goes to inactive state, the SLVBEIF (SPIx_STATUS[6]) will be set to 1. The uncompleted transaction will be dropped from TX and RX shift registers. The SPI controller will issue an interrupt if the SLVBEIEN (SPIx_SSCTL[8]) is set to 1.

Note: If the slave selection signal is active but there is no any serial clock input, the SLVBEIF (SPIx_STATUS[6]) will be set to 1 when the slave selection signal goes to inactive state.

- TX underflow interrupt

In SPI Slave mode, if there is no any data is written to the SPIx_TX register, the TXUFIF (SPIx_STATUS[19]) will be set to 1 when the slave selection signal is active. The SPI controller will issue a TX underflow interrupt if the TXUFIEN (SPIx_FIFOCTL[7]) is set to

1.

Note: If underflow event occurs in SPI Slave mode, there are two conditions which make SPI Slave mode return to idle state and then goes for next transfer: (1) set TXRST to 1 (2) slave select signal is changed to inactive state.

- Slave TX under run interrupt

If the TX underflow event occurs, the SLVURIF (SPIx_STATUS[7]) will be set to 1 when SPIx_SS goes to inactive state. The SPI controller will issue a TX under run interrupt if the SLVURIEN (SPIx_SSCTL[9]) is set to 1.

- Receive Overrun interrupt

In Slave mode, if the receive FIFO buffer contains 4 unread data, the RXFULL (SPIx_STATUS[9]) will be set to 1 and the RXOVIF (SPIx_STATUS[11]) will be set to 1 if there is more serial data is received from SPI bus and follow-up data will be dropped. The SPI controller will issue an interrupt if the RXOVIEN (SPIx_FIFOCTL[5]) is set to 1.

- Receive FIFO time-out interrupt

If there is a received data in the FIFO buffer and it is not read by software over 64 SPI peripheral clock periods in Master mode or over 576 SPI peripheral clock periods in Slave mode, it will send a RX time-out interrupt to the system if the RX time-out interrupt enable bit, RXTOIEN (SPIx_FIFOCTL[4]), is set to 1.

- Transmit FIFO interrupt

In FIFO mode, if the valid data count of the transmit FIFO buffer is less than or equal to the setting value of TXTH (SPIx_FIFOCTL[30:28]), the transmit FIFO interrupt flag TXTHIF (SPIx_STATUS[18]) will be set to 1. The SPI controller will generate a transmit FIFO interrupt to the system if the transmit FIFO interrupt enable bit, TXTHIEN (SPIx_FIFOCTL[3]), is set to 1.

- Receive FIFO interrupt

In FIFO mode, if the valid data count of the receive FIFO buffer is larger than the setting value of RXTH (SPIx_FIFOCTL[26:24]), the receive FIFO interrupt flag RXTHIF (SPIx_STATUS[10]) will be set to 1. The SPI controller will generate a receive FIFO interrupt to the system if the receive FIFO interrupt enable bit, RXTHIEN (SPIx_FIFOCTL[2]), is set to 1.

6.19.5.9 I²S Mode

The SPI0~SPI3 controllers support I²S mode with PCM mode A, PCM mode B, MSB justified and I²S data format. The bit count of an audio channel is determined by WDWIDTH (SPIx_I2SCTL[5:4]). The transfer sequence is always first from the most significant bit, MSB. Data are read on rising clock edge and are driven on falling clock edge.

In I²S data format, the MSB is sent and latched on the second clock of an audio channel. The I2Sx_LRCLK signal indicates which audio channel is in transferring.

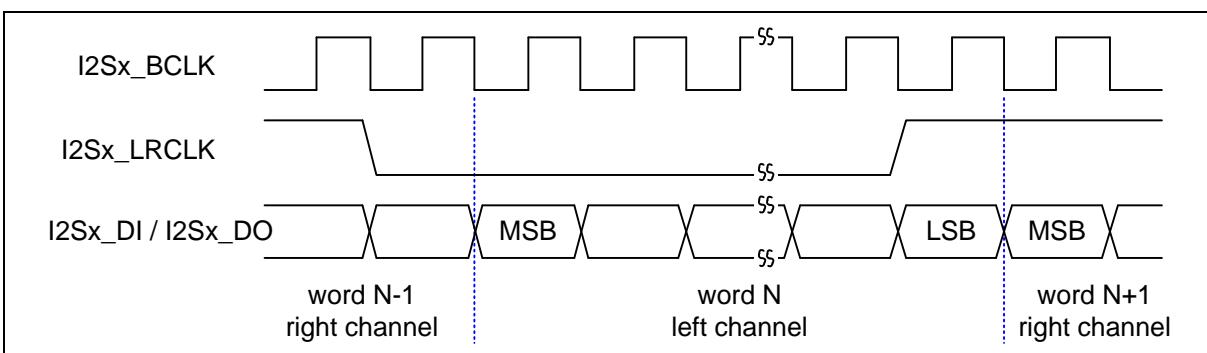

Figure 6.19-17 I²S Data Format Timing Diagram

In MSB justified data format, the MSB is sent and latched on the first clock of an audio channel.

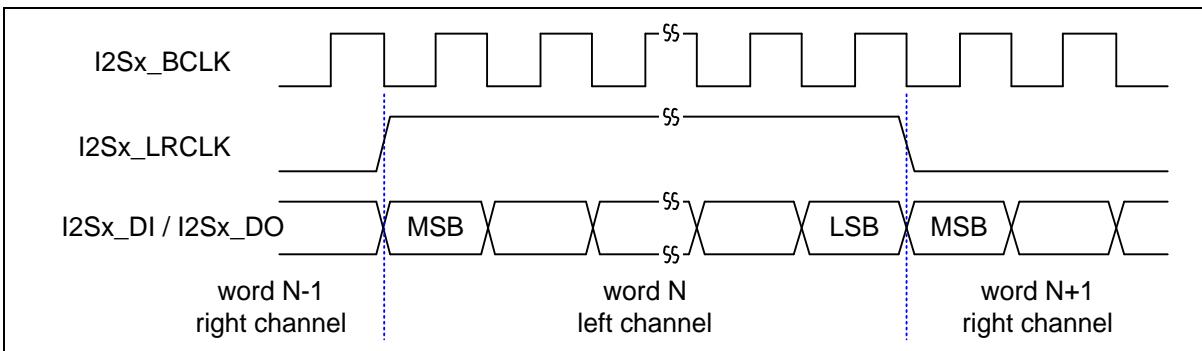

Figure 6.19-18 MSB Justified Data Format Timing Diagram

The I2Sx_LRCLK signal also supports PCM mode A and PCM mode B. The I2Sx_LRCLK signal in PCM mode indicates the beginning of an audio frame.

6.19.6 Timing Diagram

The active state of slave selection signal can be defined by setting the SSACTPOL (SPIx_SSCTL[2]). The SPI clock which is in idle state can be configured as high or low state by setting the CLKPOL (SPIx_CTL[3]). It also provides the bit length of a transaction word in DWIDTH (SPIx_CTL[12:8]), and transmitting/receiving data from MSB or LSB first in LSB (SPIx_CTL[13]). User can also select which edge of SPI clock to transmit/receive data in TXNEG/RXNEG (SPIx_CTL[2:1]). Four SPI timing diagrams for master/slave operations and the related settings are shown below.

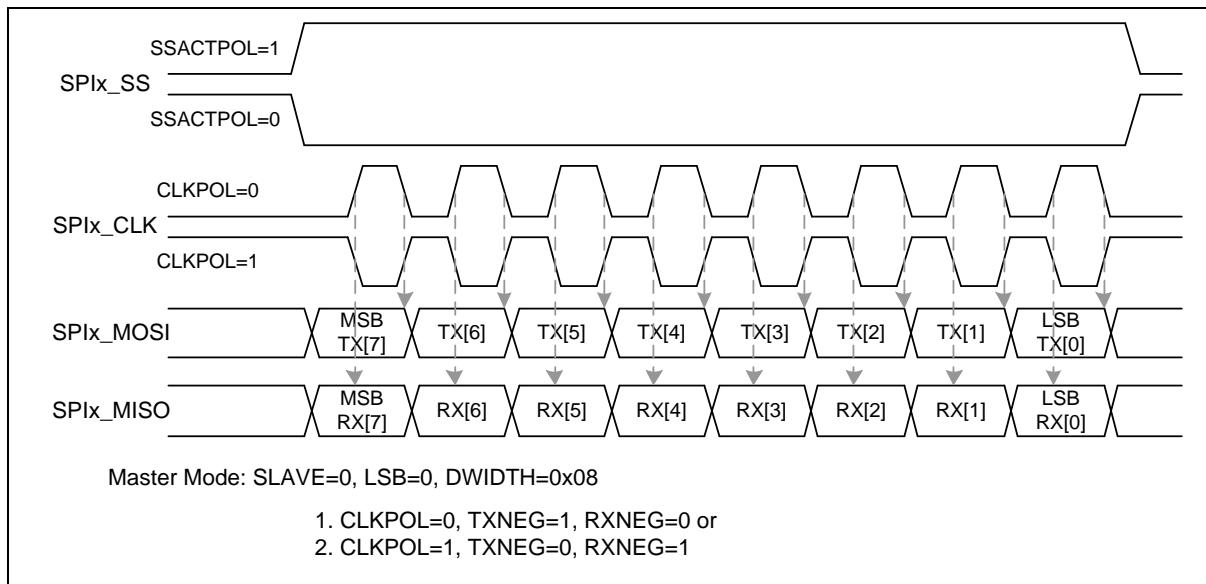

Figure 6.19-22 SPI Timing in Master Mode

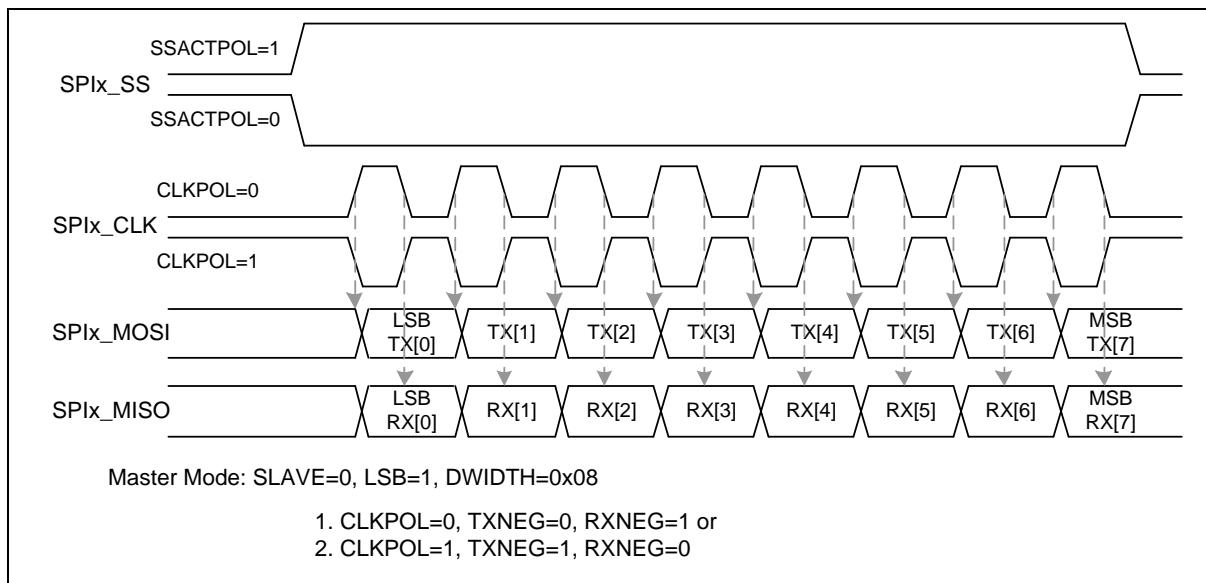

Figure 6.19-23 SPI Timing in Master Mode (Alternate Phase of SPIx_CLK)

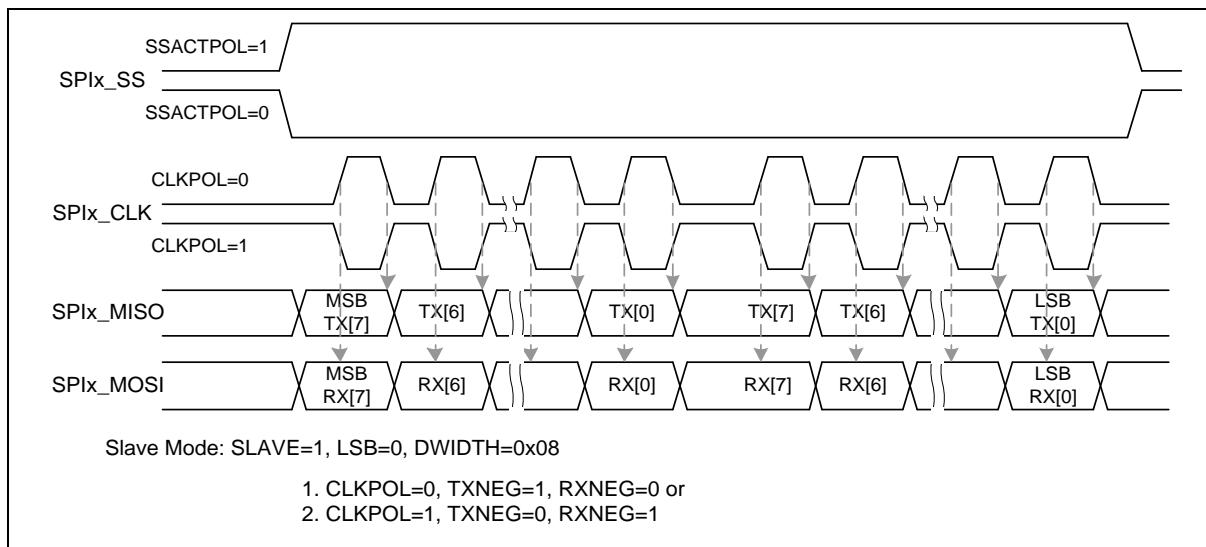

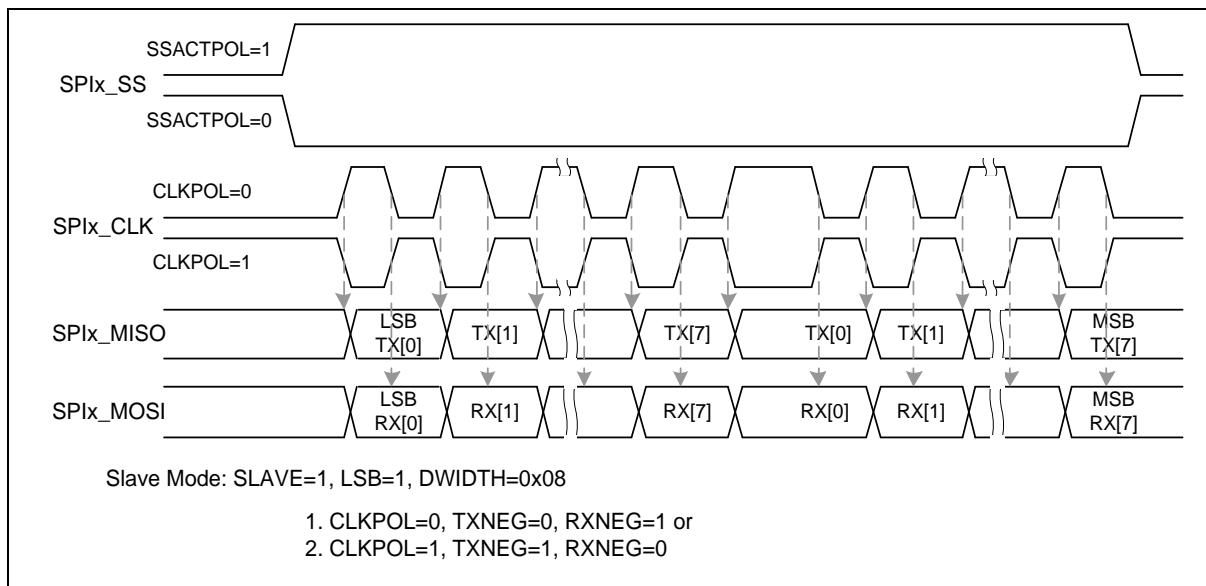

Figure 6.19-24 SPI Timing in Slave Mode

Figure 6.19-25 SPI Timing in Slave Mode (Alternate Phase of SPI_x_CLK)

6.19.7 Programming Examples

Example 1:

The SPI controller is set as a full-duplex master to access an off-chip slave device with the following specifications:

- Data bit is latched on positive edge of SPI bus clock.
- Data bit is driven on negative edge of SPI bus clock.
- Data is transferred from MSB first.
- SPI bus clock is idle at low state.
- Only one byte of data to be transmitted/received in a transaction.

- Uses the first SPI slave select pin to connect with an off-chip slave device. The slave selection signal is active low.

The operation flow is as follows:

1. Set DIVIDER (SPIx_CLKDIV [8:0]) to determine the output frequency of SPI clock.
2. Write the SPIx_SSCTL register a proper value for the related settings of Master mode:
 - 1) Clear AUTOSS (SPIx_SSCTL[3]) to 0 to disable the Automatic Slave Selection function.
 - 2) Configure slave selection signal as active low by clearing SSACTPOL (SPIx_SSCTL[2]) to 0.
 - 3) Enable slave selection signal by setting SS (SPIx_SSCTL[0]) to 1 to activate the off-chip slave device.
3. Write the related settings into the SPIx_CTL register to control the SPI master actions.
 - 1) Configure this SPI controller as master device by setting SLAVE (SPIx_CTL[18]) to 0.
 - 2) Force the SPI clock idle state at low by clearing CLKPOL (SPIx_CTL[3]) to 0.
 - 3) Select data transmitted on negative edge of SPI bus clock by setting TXNEG (SPIx_CTL[2]) to 1.
 - 4) Select data latched on positive edge of SPI bus clock by clearing RXNEG (SPIx_CTL[1]) to 0.
 - 5) Set the bit length of a transaction as 8-bit in DWIDTH bit field (SPIx_CTL[12:8] = 0x08).
 - 6) Set MSB transfer first by clearing LSB (SPIx_CTL[13]) to 0.
4. Set SPIEN (SPIx_CTL[0]) to 1 to enable the data transfer with the SPI interface.
5. If this SPI master attempts to transmit (write) one byte data to the off-chip slave device, write the byte data that will be transmitted into the SPIx_TX register.
6. Waiting for SPI interrupt if the UNITIEN (SPIx_CTL[17]) is set to 1, or just polling the unit transfer interrupt flag UNITIF (SPIx_STATUS[1]).
7. Read out the received one byte data from SPIx_RX register.
8. Go to 5) to continue another data transfer or set SS (SPIx_SSCTL[0]) to 0 to inactivate the off-chip slave device.

Example 2:

The SPI controller is set as a full-duplex slave device and connects with an off-chip master device. The off-chip master device communicates with the on-chip SPI slave controller through the SPI interface with the following specifications:

- Data bit is latched on positive edge of SPI bus clock.
- Data bit is driven on negative edge of SPI bus clock.
- Data is transferred from LSB first.
- SPI bus clock is idle at high state.
- Only one byte of data to be transmitted/received in a transaction.
- Slave selection signal is active high.

The operation flow is as follows:

1. Write the SPIx_SSCTL register a proper value for the related settings of Slave mode.
2. Select high level for the input of slave selection signal by setting SSACTPOL (SPIx_SSCTL[2]) to 1.

3. Write the related settings into the SPIx_CTL register to control this SPI slave actions
 - 1) Set the SPI controller as slave device by setting SLAVE (SPIx_CTL[18]) to 1.
 - 2) Select the SPI clock idle state at high by setting CLKPOL (SPIx_CTL[3]) to 1.
 - 3) Select data transmitted on negative edge of SPI bus clock by setting TXNEG (SPIx_CTL[2]) to 1.
 - 4) Select data latched on positive edge of SPI bus clock by clearing RXNEG (SPIx_CTL[1]) to 0.
 - 5) Set the bit length of a transaction as 8-bit in DWIDTH bit field (SPIx_CTL[12:8] = 0x08).
4. Set LSB transfer first by setting LSB (SPIx_CTL[13]) to 1.
5. Set the SPIEN (SPIx_CTL[0]) to 1. Wait for the slave select trigger input and SPI clock input from the off-chip master device to start the data transfer.
6. If this SPI slave attempts to transmit (be read) one byte data to the off-chip master device, write the byte data that will be transmitted into the SPIx_TX register.
7. If this SPI slave just only attempts to receive (be written) one byte data from the off-chip master device and does not care what data will be transmitted, the SPIx_TX register does not need to be updated by software.
8. Waiting for SPI interrupt if the UNITIEN (SPIx_CTL[17]) is set to 1, or just polling the unit transfer interrupt flag UNITIF (SPIx_STATUS[1]).
9. Read out the received one byte data from SPIx_RX register.
10. Go to 7 to continue another data transfer or stop data transfer.

6.19.8 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

6.19.9 Register Description

SPI Control Register (SPIx_CTL)

Register	Offset	R/W	Description				Reset Value
SPIx_CTL	SPIx_BA+0x00	R/W	SPI Control Register				0x0000_0034

Note: Not supported in I²S mode.

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved			DATDIR	REORDER	SLAVE	UNITIEN	Reserved
15	14	13	12	11	10	9	8
RXONLY	HALFDPX	LSB	DWIDTH				
7	6	5	4	3	2	1	0
SUSPITV				CLKPOL	TXNEG	RXNEG	SPIEN

Bits	Description	
[31:21]	Reserved	Reserved.
[20]	DATDIR	Data Port Direction Control This bit is used to select the data input/output direction in half-duplex transfer and Dual/Quad transfer 0 = SPI data is input direction. 1 = SPI data is output direction.
[19]	REORDER	Byte Reorder Function Enable Bit 0 = Byte Reorder function Disabled. 1 = Byte Reorder function Enabled. A byte suspend interval will be inserted among each byte. The period of the byte suspend interval depends on the setting of SUSPITV. Note: Byte Reorder function is only available if DWIDTH is defined as 16, 24, and 32 bits.
[18]	SLAVE	Slave Mode Control 0 = Master mode. 1 = Slave mode.
[17]	UNITIEN	Unit Transfer Interrupt Enable Bit 0 = SPI unit transfer interrupt Disabled. 1 = SPI unit transfer interrupt Enabled.
[16]	Reserved	Reserved.
[15]	RXONLY	Receive-only Mode Enable Bit (Master Only) This bit field is only available in Master mode. In receive-only mode, SPI Master will generate SPI bus clock continuously for receiving data bit from SPI slave device and assert the BUSY status. 0 = Receive-only mode Disabled. 1 = Receive-only mode Enabled.
[14]	HALFDPX	SPI Half-duplex Transfer Enable Bit This bit is used to select full-duplex or half-duplex for SPI transfer. The bit field DATDIR

		(SPIx_CTL[20]) can be used to set the data direction in half-duplex transfer. 0 = SPI operates in full-duplex transfer. 1 = SPI operates in half-duplex transfer.
[13]	LSB	Send LSB First 0 = The MSB, which bit of transmit/receive register depends on the setting of DWIDTH, is transmitted/received first. 1 = The LSB, bit 0 of the SPI TX register, is sent first to the SPI data output pin, and the first bit received from the SPI data input pin will be put in the LSB position of the RX register (bit 0 of SPI_RX).
[12:8]	DWIDTH	Data Width This field specifies how many bits can be transmitted / received in one transaction. The minimum bit length is 8 bits and can up to 32 bits. DWIDTH = 0x08 8 bits. DWIDTH = 0x09 9 bits. DWIDTH = 0x1F 31 bits. DWIDTH = 0x00 32 bits. Note: This bit field will decide the depth of TX/RX FIFO configuration in SPI mode. Therefore, changing this bit field will clear TX/RX FIFO by hardware automatically.
[7:4]	SUSPITV	Suspend Interval (Master Only) The four bits provide configurable suspend interval between two successive transmit/receive transaction in a transfer. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value is 0x3. The period of the suspend interval is obtained according to the following equation. $(\text{SUSPITV}[3:0] + 0.5) * \text{period of SPICLK clock cycle}$ Example: SUSPITV = 0x0 0.5 SPICLK clock cycle. SUSPITV = 0x1 1.5 SPICLK clock cycle. SUSPITV = 0xE 14.5 SPICLK clock cycle. SUSPITV = 0xF 15.5 SPICLK clock cycle.
[3]	CLKPOL	Clock Polarity 0 = SPI bus clock is idle low. 1 = SPI bus clock is idle high.
[2]	TXNEG	Transmit on Negative Edge 0 = Transmitted data output signal is changed on the rising edge of SPI bus clock. 1 = Transmitted data output signal is changed on the falling edge of SPI bus clock.
[1]	RXNEG	Receive on Negative Edge 0 = Received data input signal is latched on the rising edge of SPI bus clock. 1 = Received data input signal is latched on the falling edge of SPI bus clock.
[0]	SPIEN	SPI Transfer Control Enable Bit In Master mode, the transfer will start when there is data in the FIFO buffer after this bit is set to 1. In Slave mode, this device is ready to receive data when this bit is set to 1. 0 = Transfer control Disabled. 1 = Transfer control Enabled. Note: Before changing the configurations of SPIx_CTL, SPIx_CLKDIV, SPIx_SSCTL and SPIx_FIFOCNTL registers, user shall clear the SPIEN (SPIx_CTL[0]) and confirm the SPIENSTS (SPIx_STATUS[15]) is 0.

SPI Clock Divider Register (SPIx_CLKDIV)

Register	Offset	R/W	Description					Reset Value
SPIx_CLKDIV	SPIx_BA+0x04	R/W	SPI Clock Divider Register					0x0000_0000

Reserved							DIVIDER
7	6	5	4	3	2	1	0
DIVIDER							

Bits	Description	
[31:9]	Reserved	Reserved.
[8:0]	DIVIDER	<p>Clock Divider</p> <p>The value in this field is the frequency divider for generating the peripheral clock, f_{spi_eclk}, and the SPI bus clock of SPI Master. The frequency is obtained according to the following equation.</p> $f_{spi_eclk} = \frac{f_{spi_clock_src}}{(DIVIDER + 1)}$ <p>where</p> <p>$f_{spi_clock_src}$ is the peripheral clock source, which is defined in the clock control register, CLK_CLKSEL2.</p> <p>Note: Not supported in I²S mode.</p>

Note: DIVIDER should be set carefully because the peripheral clock frequency must be slower than or equal to system frequency.

SPI Slave Select Control Register (SPIx_SSCTL)

Register	Offset	R/W	Description					Reset Value
SPIx_SSCTL	SPIx_BA+0x08	R/W	SPI Slave Select Control Register					0x0000_0000

Note: Not supported in I²S mode.

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16

Reserved		SSINAIEN	SSACTIEN	Reserved		SLVURIEN	SLVBEIEN
7	6	5	4	3	2	1	0
Reserved				AUTOSS	SSACTPOL	Reserved	SS

Bits	Description	
[31:14]	Reserved	Reserved.
[13]	SSINAIEN	Slave Select Inactive Interrupt Enable Bit 0 = Slave select inactive interrupt Disabled. 1 = Slave select inactive interrupt Enabled.
[12]	SSACTIEN	Slave Select Active Interrupt Enable Bit 0 = Slave select active interrupt Disabled. 1 = Slave select active interrupt Enabled.
[11:10]	Reserved	Reserved.
[9]	SLVURIEN	Slave Mode TX Under Run Interrupt Enable Bit 0 = Slave mode TX under run interrupt Disabled. 1 = Slave mode TX under run interrupt Enabled.
[8]	SLVBEIEN	Slave Mode Bit Count Error Interrupt Enable Bit 0 = Slave mode bit count error interrupt Disabled. 1 = Slave mode bit count error interrupt Enabled.
[7:4]	Reserved	Reserved.
[3]	AUTOSS	Automatic Slave Selection Function Enable Bit (Master Only) 0 = Automatic slave selection function Disabled. Slave selection signal will be asserted/de-asserted according to SS (SPIx_SSCTL[0]). 1 = Automatic slave selection function Enabled.
[2]	SSACTPOL	Slave Selection Active Polarity This bit defines the active polarity of slave selection signal (SPIx_SS). 0 = The slave selection signal SPIx_SS is active low. 1 = The slave selection signal SPIx_SS is active high.
[1]	Reserved	Reserved.

[0]	SS	Slave Selection Control (Master Only) If AUTOSS bit is cleared to 0, 0 = set the SPIx_SS line to inactive state. 1 = set the SPIx_SS line to active state. If the AUTOSS bit is set to 1, 0 = Keep the SPIx_SS line at inactive state. 1 = SPIx_SS line will be automatically driven to active state for the duration of data transfer, and will be driven to inactive state for the rest of the time. The active state of SPIx_SS is specified in SSACTPOL (SPIx_SSCTL[2]).

Reserved						TXFBCLR	RXFBCCLR
7	6	5	4	3	2	1	0
TXUFIEN	TXUFPOL	RXOVIEN	RXTOIEN	TXTHIEN	RXTHIEN	TXRST	RXRST

Bits	Description	
[31]	Reserved	Reserved.
[30:28]	TXTH	Transmit FIFO Threshold If the valid data count of the transmit FIFO buffer is less than or equal to the TXTH setting, the TXTHIF bit will be set to 1, else the TXTHIF bit will be cleared to 0. The MSB of this bit field is only meaningful while SPI mode 8~16 bits of data length.
[27]	Reserved	Reserved.
[26:24]	RXTH	Receive FIFO Threshold If the valid data count of the receive FIFO buffer is larger than the RXTH setting, the RXTHIF bit will be set to 1, else the RXTHIF bit will be cleared to 0. The MSB of this bit field is only meaningful while SPI mode 8~16 bits of data length.
[23:10]	Reserved	Reserved.
[9]	TXFBCLR	Transmit FIFO Buffer Clear 0 = No effect. 1 = Clear transmit FIFO pointer. The TXFULL bit will be cleared to 0 and the TXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 1 system clock after it is set to 1. Note: The TX shift register will not be cleared.
[8]	RXFBCCLR	Receive FIFO Buffer Clear 0 = No effect. 1 = Clear receive FIFO pointer. The RXFULL bit will be cleared to 0 and the RXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 1 system clock after it is set to 1. Note: The RX shift register will not be cleared.
[7]	TXUFIEN	TX Underflow Interrupt Enable Bit When TX underflow event occurs in Slave mode, TXUFIF (SPIx_STATUS[19]) will be set to 1. This bit is used to enable the TX underflow interrupt. 0 = Slave TX underflow interrupt Disabled. 1 = Slave TX underflow interrupt Enabled.

[6]	TXUFFPOL	<p>TX Underflow Data Polarity</p> <p>0 = The SPI data out is keep 0 if there is TX underflow event in Slave mode. 1 = The SPI data out is keep 1 if there is TX underflow event in Slave mode.</p> <p>Note:</p> <ol style="list-style-type: none"> 1. The TX underflow event occurs if there is no any data in TX FIFO when the slave selection signal is active. 2. This bit should be set as 0 in I²S mode. 3. When TX underflow event occurs, SPIx_MISO pin state will be determined by this setting even though TX FIFO is not empty afterward. Data stored in TX FIFO will be sent through SPIx_MISO pin in the next transfer frame.
[5]	RXOVIEN	<p>Receive FIFO Overrun Interrupt Enable Bit</p> <p>0 = Receive FIFO overrun interrupt Disabled. 1 = Receive FIFO overrun interrupt Enabled.</p>
[4]	RXTOIEN	<p>Slave Receive Time-out Interrupt Enable Bit</p> <p>0 = Receive time-out interrupt Disabled. 1 = Receive time-out interrupt Enabled.</p>
[3]	TXTHIEN	<p>Transmit FIFO Threshold Interrupt Enable Bit</p> <p>0 = TX FIFO threshold interrupt Disabled. 1 = TX FIFO threshold interrupt Enabled.</p>
[2]	RXTHIEN	<p>Receive FIFO Threshold Interrupt Enable Bit</p> <p>0 = RX FIFO threshold interrupt Disabled. 1 = RX FIFO threshold interrupt Enabled.</p>
[1]	TXRST	<p>Transmit Reset</p> <p>0 = No effect. 1 = Reset transmit FIFO pointer and transmit circuit. The TXFULL bit will be cleared to 0 and the TXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 3 system clock cycles + 2 peripheral clock cycles after it is set to 1. User can read TXRXRST (SPIx_STATUS[23]) to check if reset is accomplished or not.</p> <p>Note: If TX underflow event occurs in SPI Slave mode, this bit can be used to make SPI return to idle state.</p>
[0]	RXRST	<p>Receive Reset</p> <p>0 = No effect. 1 = Reset receive FIFO pointer and receive circuit. The RXFULL bit will be cleared to 0 and the RXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 3 system clock cycles + 2 peripheral clock cycles after it is set to 1. User can read TXRXRST (SPIx_STATUS[23]) to check if reset is accomplished or not.</p>

SPI Status Register (SPIx_STATUS)

Register	Offset	R/W	Description				Reset Value
SPIx_STATUS	SPIx_BA+0x14	R/W	SPI Status Register				0x0005_0110

Note: Not supported in I²S mode.

31	30	29	28	27	26	25	24
TXCNT				RXCNT			
23	22	21	20	19	18	17	16
TXRXRST	Reserved			TXUFIF	TXTHIF	TXFULL	TXEMPTY
15	14	13	12	11	10	9	8
SPIENSTS	Reserved		RXTOIF	RXOVIF	RXTHIF	RXFULL	RXEMPTY
7	6	5	4	3	2	1	0
SLVURIF	SLVBEIF	Reserved	SSLINE	SSINAIF	SSACTIF	UNITIF	BUSY

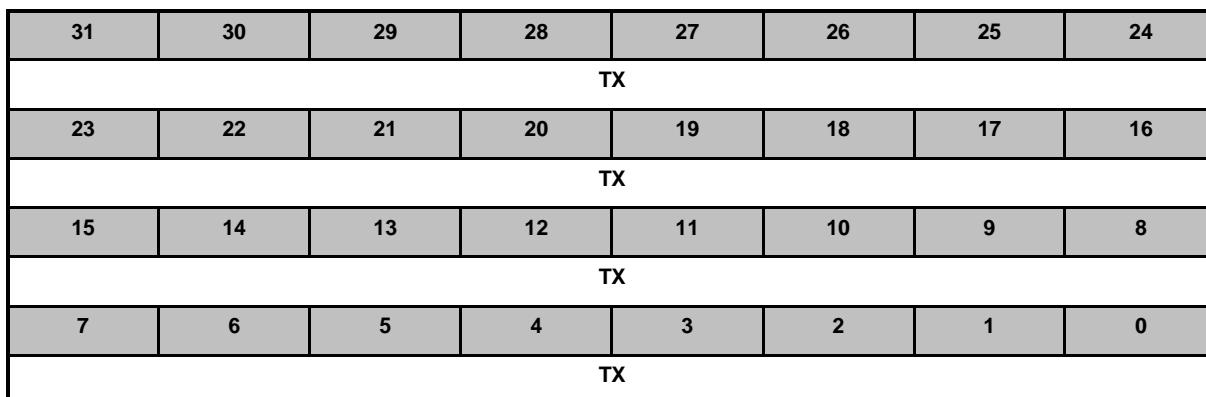

Bits	Description	
[31:28]	TXCNT	Transmit FIFO Data Count (Read Only) This bit field indicates the valid data count of transmit FIFO buffer.
[27:24]	RXCNT	Receive FIFO Data Count (Read Only) This bit field indicates the valid data count of receive FIFO buffer.
[23]	TXRXRST	TX or RX Reset Status (Read Only) 0 = The reset function of TXRST or RXRST is done. 1 = Doing the reset function of TXRST or RXRST. Note: Both the reset operations of TXRST and RXRST need 3 system clock cycles + 2 peripheral clock cycles. User can check the status of this bit to monitor the reset function is doing or done.
[22:20]	Reserved	Reserved.
[19]	TXUFIF	TX Underflow Interrupt Flag When the TX underflow event occurs, this bit will be set to 1, the state of data output pin depends on the setting of TXUFPOL. 0 = No effect. 1 = No data in Transmit FIFO and TX shift register when the slave selection signal is active. Note 1: This bit will be cleared by writing 1 to it. Note 2: If reset slave's transmission circuit when slave selection signal is active, this flag will be set to 1 after 2 peripheral clock cycles + 3 system clock cycles since the reset operation is done.
[18]	TXTHIF	Transmit FIFO Threshold Interrupt Flag (Read Only) 0 = The valid data count within the transmit FIFO buffer is larger than the setting value of TXTH. 1 = The valid data count within the transmit FIFO buffer is less than or equal to the setting value of TXTH.
[17]	TXFULL	Transmit FIFO Buffer Full Indicator (Read Only) 0 = Transmit FIFO buffer is not full.

		1 = Transmit FIFO buffer is full.
[16]	TXEMPTY	Transmit FIFO Buffer Empty Indicator (Read Only) 0 = Transmit FIFO buffer is not empty. 1 = Transmit FIFO buffer is empty.
[15]	SPIENSTS	SPI Enable Status (Read Only) 0 = SPI controller Disabled. 1 = SPI controller Enabled. Note: The SPI peripheral clock is asynchronous with the system clock. In order to make sure the SPI control logic is disabled, this bit indicates the real status of SPI controller.
[14:13]	Reserved	Reserved.
[12]	RXTOIF	Receive Time-out Interrupt Flag 0 = No receive FIFO time-out event. 1 = Receive FIFO buffer is not empty and no read operation on receive FIFO buffer over 64 SPI peripheral clock periods in Master mode or over 576 SPI peripheral clock periods in Slave mode. When the received FIFO buffer is read by software, the time-out status will be cleared automatically. Note: This bit will be cleared by writing 1 to it.
[11]	RXOVIF	Receive FIFO Overrun Interrupt Flag When the receive FIFO buffer is full, the follow-up data will be dropped and this bit will be set to 1. 0 = No FIFO is overrun. 1 = Receive FIFO is overrun. Note: This bit will be cleared by writing 1 to it.
[10]	RXTHIF	Receive FIFO Threshold Interrupt Flag (Read Only) 0 = The valid data count within the receive FIFO buffer is smaller than or equal to the setting value of RXTH. 1 = The valid data count within the receive FIFO buffer is larger than the setting value of RXTH.
[9]	RXFULL	Receive FIFO Buffer Full Indicator (Read Only) 0 = Receive FIFO buffer is not full. 1 = Receive FIFO buffer is full.
[8]	RXEMPTY	Receive FIFO Buffer Empty Indicator (Read Only) 0 = Receive FIFO buffer is not empty. 1 = Receive FIFO buffer is empty.
[7]	SLVURIF	Slave Mode TX Under Run Interrupt Flag In Slave mode, if TX underflow event occurs and the slave select line goes to inactive state, this interrupt flag will be set to 1. 0 = No Slave TX under run event. 1 = Slave TX under run event occurred. Note: This bit will be cleared by writing 1 to it.
[6]	SLVBEIF	Slave Mode Bit Count Error Interrupt Flag In Slave mode, when the slave select line goes to inactive state, if bit counter is mismatch with DWIDTH, this interrupt flag will be set to 1. 0 = No Slave mode bit count error event. 1 = Slave mode bit count error event occurred. Note: If the slave select active but there is no any bus clock input, the SLVBEIF also active when the slave select goes to inactive state. This bit will be cleared by writing 1 to it.
[5]	Reserved	Reserved.

[4]	SSLIN	Slave Select Line Bus Status (Read Only) 0 = The slave select line status is 0. 1 = The slave select line status is 1. Note: This bit is only available in Slave mode. If SSACTPOL (SPIx_SSCTL[2]) is set 0, and the SSLIN is 1, the SPI slave select is in inactive status.
[3]	SSINAIF	Slave Select Inactive Interrupt Flag 0 = Slave select inactive interrupt was cleared or not occurred. 1 = Slave select inactive interrupt event occurred. Note: Only available in Slave mode. This bit will be cleared by writing 1 to it.
[2]	SSACTIF	Slave Select Active Interrupt Flag 0 = Slave select active interrupt was cleared or not occurred. 1 = Slave select active interrupt event occurred. Note: Only available in Slave mode. This bit will be cleared by writing 1 to it.
[1]	UNITIF	Unit Transfer Interrupt Flag 0 = No transaction has been finished since this bit was cleared to 0. 1 = SPI controller has finished one unit transfer. Note: This bit will be cleared by writing 1 to it.
[0]	BUSY	Busy Status (Read Only) 0 = SPI controller is in idle state. 1 = SPI controller is in busy state. The following lists the bus busy conditions: a. SPIx_CTL[0] = 1 and TXEMPTY = 0. b. For SPI Master mode, SPIx_CTL[0] = 1 and TXEMPTY = 1 but the current transaction is not finished yet. c. For SPI Master mode, SPIx_CTL[0] = 1 and RXONLY = 1. d. For SPI Slave mode, the SPIx_CTL[0] = 1 and there is serial clock input into the SPI core logic when slave select is active. e. For SPI Slave mode, the SPIx_CTL[0] = 1 and the transmit buffer or transmit shift register is not empty even if the slave select is inactive.

SPI Data Transmit Register (SPIx_TX)

Register	Offset	R/W	Description					Reset Value
SPIx_TX	SPIx_BA+0x20	W	SPI Data Transmit Register					0x0000_0000

Bits	Description	
[31:0]	TX	<p>Data Transmit Register</p> <p>The data transmit registers pass through the transmitted data into the 4-level transmit FIFO buffers. The number of valid bits depends on the setting of DWIDTH (SPIx_CTL[12:8]) in SPI mode or WDWIDHT (SPIx_I2SCTL[5:4]) in I²S mode.</p> <p>In SPI mode, if DWIDTH is set to 0x08, the bits TX[7:0] will be transmitted. If DWIDTH is set to 0x00, the SPI controller will perform a 32-bit transfer.</p> <p>In I²S mode, if WDWIDHT (SPIx_I2SCTL[5:4]) is set to 0x2, the data width of audio channel is 24-bit and corresponding to TX[23:0]. If WDWIDHT is set as 0x0, 0x1, or 0x3, all bits of this field are valid and referred to the data arrangement in I²S mode FIFO operation section</p> <p>Note: In Master mode, SPI controller will start to transfer the SPI bus clock after 1 APB clock and 6 peripheral clock cycles after user writes to this register.</p>

SPI Data Receive Register (SPIx_RX)

Register	Offset	R/W	Description					Reset Value

[12]	RXTOIF	Receive Time-out Interrupt Flag 0 = No receive FIFO time-out event. 1 = Receive FIFO buffer is not empty and no read operation on receive FIFO buffer over 64 SPI peripheral clock period in Master mode or over 576 SPI peripheral clock period in Slave mode. When the received FIFO buffer is read by software, the time-out status will be cleared automatically. Note: This bit will be cleared by writing 1 to it.
[11]	RXOVIF	Receive FIFO Overrun Interrupt Flag When the receive FIFO buffer is full, the follow-up data will be dropped and this bit will be set to 1. Note: This bit will be cleared by writing 1 to it.
[10]	RXTHIF	Receive FIFO Threshold Interrupt Flag (Read Only) 0 = The valid data count within the receive FIFO buffer is smaller than or equal to the setting value of RXTH. 1 = The valid data count within the receive FIFO buffer is larger than the setting value of RXTH. Note: If RXTHIEN = 1 and RXTHIF = 1, the SPI/I ² S controller will generate a SPI interrupt request.
[9]	RXFULL	Receive FIFO Buffer Full Indicator (Read Only) 0 = Receive FIFO buffer is not full. 1 = Receive FIFO buffer is full.
[8]	RXEMPTY	Receive FIFO Buffer Empty Indicator (Read Only) 0 = Receive FIFO buffer is not empty. 1 = Receive FIFO buffer is empty.
[7:5]	Reserved	Reserved.
[4]	RIGHT	Right Channel (Read Only) This bit indicates the current transmit data is belong to which channel. 0 = Left channel. 1 = Right channel.
[3:0]	Reserved	Reserved.

6.20 Quad Serial Peripheral Interface (QSPI)

6.20.1 Overview

The Quad Serial Peripheral Interface (QSPI) applies to synchronous serial data communication and allows full duplex transfer. Devices communicate in Master/Slave mode with the 4-wire bi-direction interface. The M480 series contains one QSPI controller performing a serial-to-parallel conversion on data received from a peripheral device, and a parallel-to-serial conversion on data transmitted to a peripheral device.

The QSPI controller supports 2-bit Transfer mode to perform full-duplex 2-bit data transfer and also supports Dual and Quad I/O Transfer mode and the controller supports the PDMA function to access the data buffer.

6.20.2 Features

- Supports Master or Slave mode operation
- Master mode up to 100 MHz and Slave mode up to 100 MHz (when chip works at VDD = 2.7~3.6V)
- Supports 2-bit Transfer mode
- Supports Dual and Quad I/O Transfer mode
- Configurable bit length of a transaction word from 8 to 32-bit
- Provides separate 8-level depth transmit and receive FIFO buffers
- Supports MSB first or LSB first transfer sequence
- Supports Byte Reorder function
- Supports Byte or Word Suspend mode
- Supports PDMA transfer
- Supports 3-Wire, no slave selection signal, bi-direction interface
- Supports one data channel half-duplex transfer
- Supports receive-only mode

6.20.3 Block Diagram

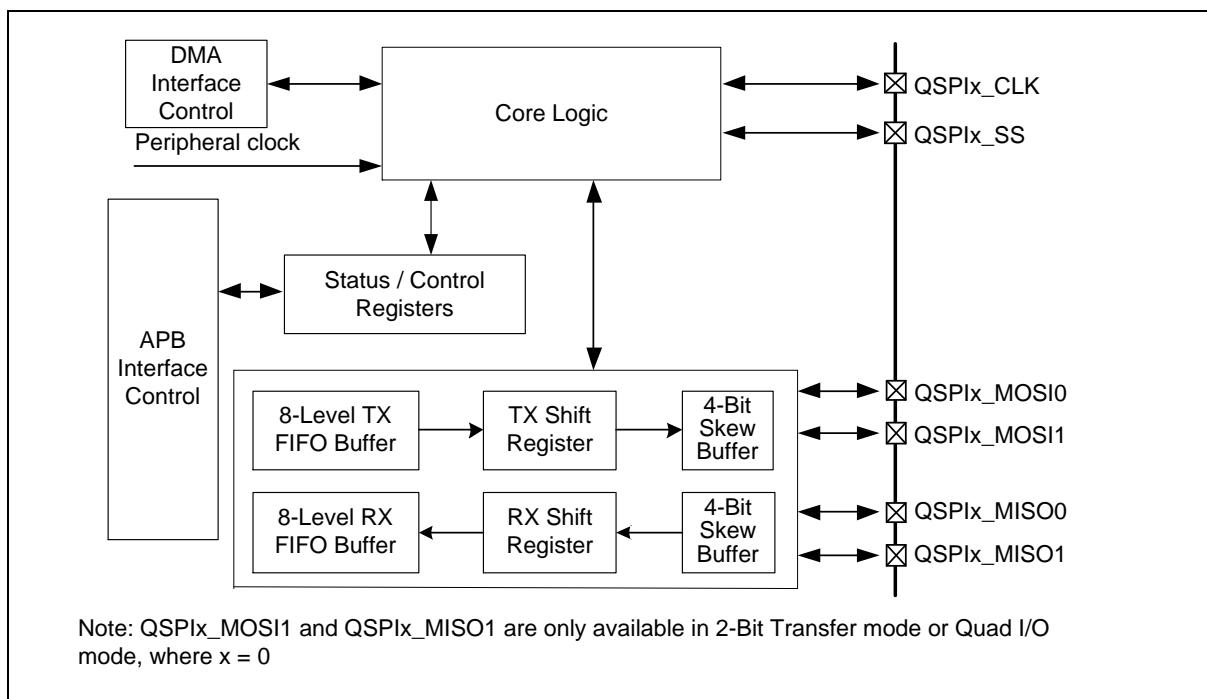

Figure 6.20-1 QSPI Block Diagram

TX FIFO Buffer:

The transmit FIFO buffer is a 8-level depth, 32-bit wide, first-in, first-out register buffer. The data can be written to the transmit FIFO buffer in advance through software by writing the QSPIx_TX register.

RX FIFO Buffer:

The receive FIFO buffer is also a 8-level depth, 32-bit wide, first-in, first-out register buffer. The receive control logic will store the receive data to this buffer. The FIFO buffer data can be read from QSPIx_RX register by software.

TX Shift Register:

The transmit shift register is a 32-bit wide register buffer. The transmit data is loaded from the TX FIFO buffer and shifted out bit-by-bit to the skew buffer.

RX Shift Register:

The receive shift register is also a 32-bit wide register buffer. The receive data is shift in bit-by-bit from the skew buffer and is loaded into RX FIFO buffer when a transaction done.

Skew Buffer:

The skew buffer is a 4-level 1-bit buffer. There are two skew buffers in transmitting and received side. In received side, it is used to shift bits into RX shift register from QSPI bus. In transmitting side, it is used to shift bits into QSPI bus from TX shift register.

6.20.4 Basic Configuration

6.20.4.1 QSPI0 Basic Configuration

- Clock source Configuration
 - Select the source of QSPI0 peripheral clock on QSPI0SEL (CLK_CLKSEL2[3:2]).
 - Enable QSPI0 peripheral clock in QSPI0CKEN (CLK_APBCLK0[12]).
- Reset Configuration

- Reset QSPI0 controller in QSPI0RST (SYS_IPRST1[12]).
- Pin Configuration

6.20.5 Functional Description

6.20.5.1 Terminology

QSPI Peripheral Clock and QSPI Bus Clock

The QSPI controller needs the peripheral clock to drive the QSPI logic unit to perform the data transfer. The peripheral clock rate is determined by the settings of clock divisor (QSPIx_CLKDIV) and the clock source which can be HXT, PLL, PCLK or HIRC. QSPIxSEL of CLK_CLKSEL2 register determines the clock source of the peripheral clock. The DIVIDER (QSPIx_CLKDIV[8:0]) setting determines the divisor of the clock rate calculation.

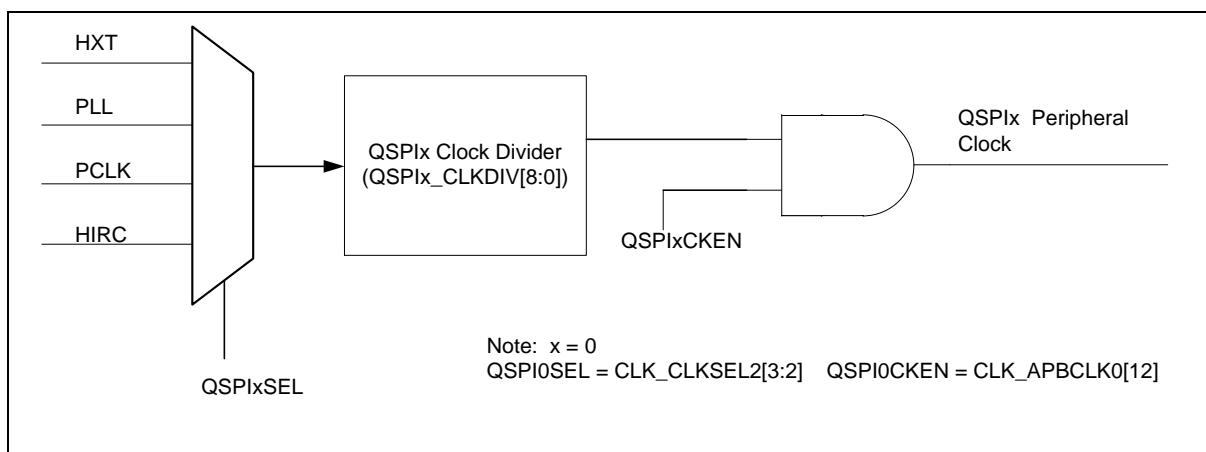

Figure 6.20-2 QSPI Peripheral Clock

In Master mode, the frequency of the QSPI bus clock is equal to the peripheral clock rate. In general,

the QSPI bus clock is denoted as QSPI clock. In Slave mode, the QSPI bus clock is provided by a master device. The frequency of QSPI peripheral clock cannot be faster than the system clock rate regardless of Master or Slave mode. If the clock source of peripheral clock is not system clock, the frequency of QSPI peripheral clock shall be slower than the system clock frequency regardless of Master or Slave mode.

Master/Slave mode

The QSPI controllers can be set as Master or Slave mode by setting the SLAVE (QSPIx_CTL[18]) to communicate with the off-chip SPI slave or master device. The HALFDPX (QSPIx_CTL[14]) can be used to select the full-duplex or half-duplex in QSPI transmission. The application block diagrams in Master and Slave mode are shown below.

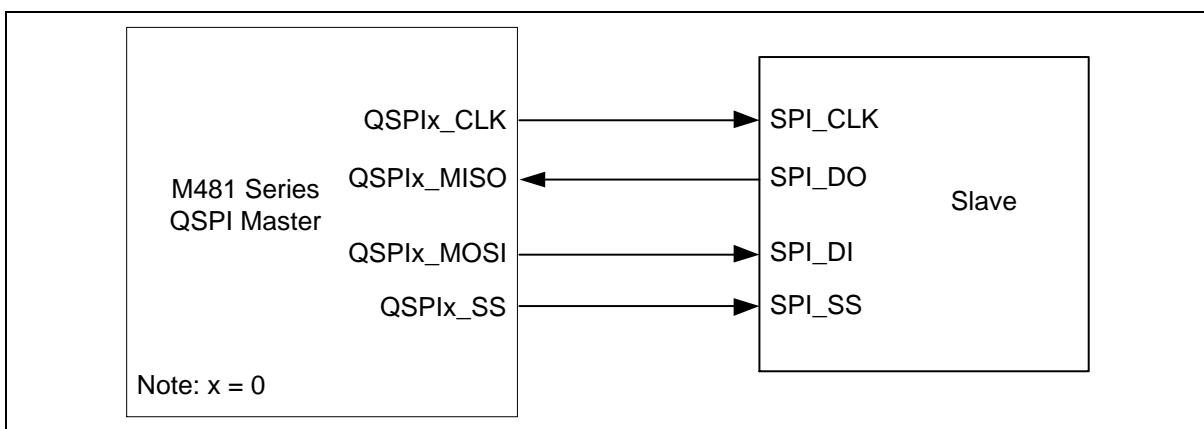

Figure 6.20-3 QSPI Full-Duplex Master Mode Application Block Diagram

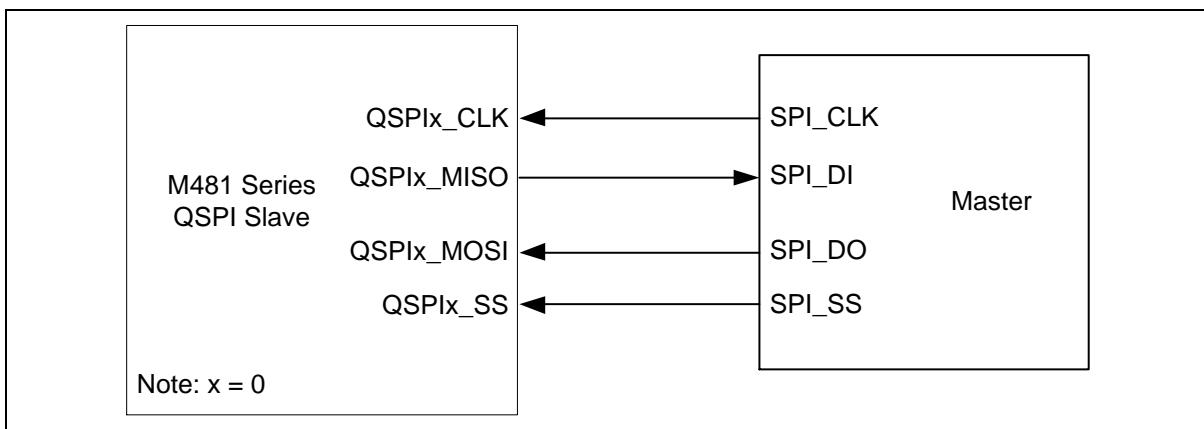

Figure 6.20-4 QSPI Full-Duplex Slave Mode Application Block Diagram

Slave Selection

In Master mode, the QSPI controller can drive off-chip slave device through the slave select output pin QSPIx_SS. In Slave mode, the off-chip master device drives the slave selection signal from the QSPIx_SS input port to this QSPI controller. The duration between the slave select active edge and the first QSPI clock input shall over 3 QSPI peripheral clock cycles of slave.

In Master/Slave mode, the active state of slave selection signal can be programmed to low or high active in SSACTPOL (QSPIx_SSCTL[2]). The selection of slave select conditions depends on what type of device is connected. In Slave mode, to recognize the inactive state of the slave selection signal, the inactive period of the slave selection signal must be larger than or equal to 3 peripheral clock cycles between two successive transactions.

Timing Condition

The CLKPOL (QSPIx_CTL[3]) defines the QSPI clock idle state. If CLKPOL = 1, the output QSPI clock is idle at high state; if CLKPOL = 0, it is idle at low state.

TXNEG (QSPIx_CTL[2]) defines the data transmitted out either on negative edge or on positive edge of QSPI clock. RXNEG (QSPIx_CTL[1]) defines the data received either on negative edge or on positive edge of QSPI clock.

Note: The settings of TXNEG and RXNEG are mutual exclusive. In other words, do not transmit and receive data at the same clock edge.

Transmit/Receive Bit Length

The bit length of a transaction word is defined in DWIDTH (QSPIx_CTL[12:8]) and can be configured up to 32-bit length in a transaction word for transmitting and receiving.

When QSPI controller finishes a transaction, i.e. receives or transmits a specific count of bits defined in DWIDTH (QSPIx_CTL[12:8]), the unit transfer interrupt flag will be set to 1.

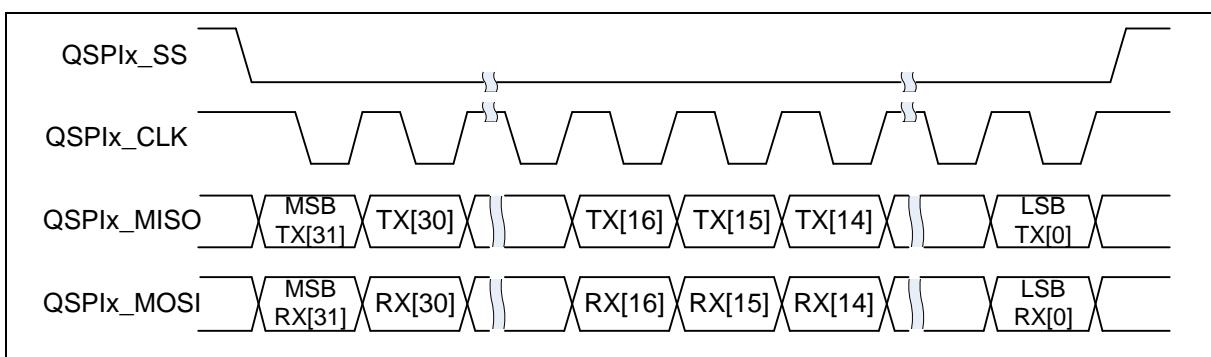

Figure 6.20-5 32-bit in One Transaction

LSB/MSB First

LSB (QSPIx_CTL[13]) defines the bit transfer sequence in a transaction. If the LSB (QSPIx_CTL[13]) is set to 1, the transfer sequence is LSB first. The bit 0 will be transferred firstly. If the LSB (QSPIx_CTL[13]) is cleared to 0, the transfer sequence is MSB first.

Suspend Interval

SUSPITV (QSPIx_CTL[7:4]) provides a configurable suspend interval, 0.5 ~ 15.5 QSPI clock periods, between two successive transaction words in Master mode. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value of SUSPITV is 0x3 (3.5 QSPI clock cycles).

6.20.5.2 Automatic Slave Selection

In Master mode, if AUTOSS (QSPIx_SSCTL[3]) is set, the slave selection signal will be generated automatically and output to the QSPIx_SS pin according to whether SS (QSPIx_SSCTL[0]) is enabled or not. The slave selection signal will be set to active state by the SPI controller when the QSPI data transfer is started by writing to FIFO. It will be set to inactive state when QSPI bus is idle. If QSPI bus is not idle, i.e. TX FIFO, TX shift register or TX skew buffer is not empty, the slave selection signal will be set to inactive state between transactions if the value of SUSPITV (QSPIx_CTL[7:4]) is greater than or equal to 3.

In Master mode, if the value of SUSPITV is less than 3 and the AUTOSS is set as 1, the slave selection signal will be kept at active state between two successive transactions.

If the AUTOSS bit is cleared, the slave selection output signal will be determined by the SS setting. The active state of the slave selection output signal is specified in SSACTPOL (QSPIx_SSCTL[2]).

The duration between the slave selection signal active edge and the first QSPI bus clock edge is 1 QSPI bus clock cycle and the duration between the last QSPI bus clock and the slave selection signal inactive edge is 1.5 QSPI bus clock cycle.

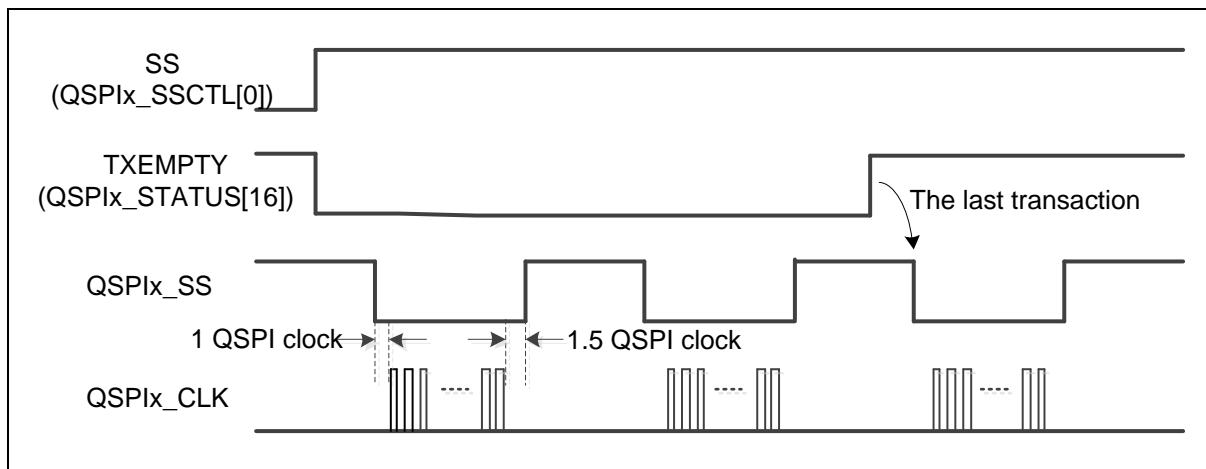

Figure 6.20-6 Automatic Slave Selection (SSACTPOL = 0, SUSPITV > 0x2)

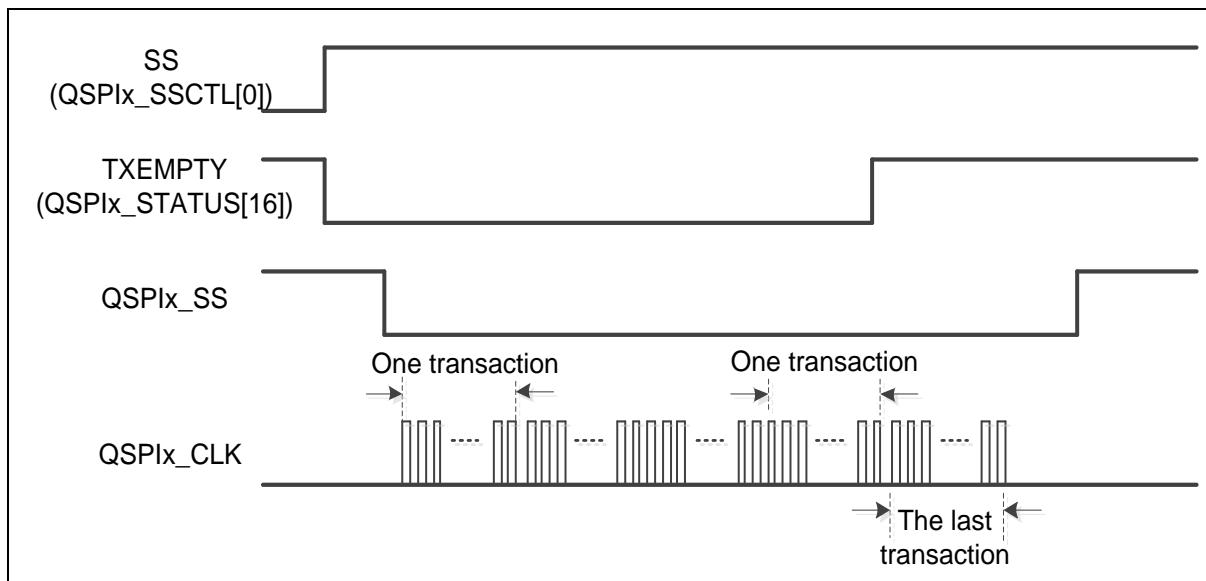

Figure 6.20-7 Automatic Slave Selection (SSACTPOL = 0, SUSPITV < 0x3)

6.20.5.3 Byte Reorder and Suspend Function

When the transfer is set as MSB first (LSB = 0) and the REORDER (QSPIx_CTL[19]) is set to 1, the data stored in the TX buffer and RX buffer will be rearranged in the order as [Byte0, Byte1, Byte2, Byte3] in 32-bit transfer (DWIDTH = 0). The sequence of transmitted/received data will be Byte0, Byte1, Byte2, and then Byte3. If the DWIDTH is set as 24-bit transfer mode, the data in TX buffer and RX buffer will be rearranged as [unknown byte, Byte0, Byte1, Byte2]. The QSPI controller will transmit/receive data with the sequence of Byte0, Byte1 and then Byte2. Each byte will be transmitted/received with MSB first. The rule of 16-bit mode is the same as above. Byte Reorder function is only available when DWIDTH is configured as 16, 24, and 32 bits.

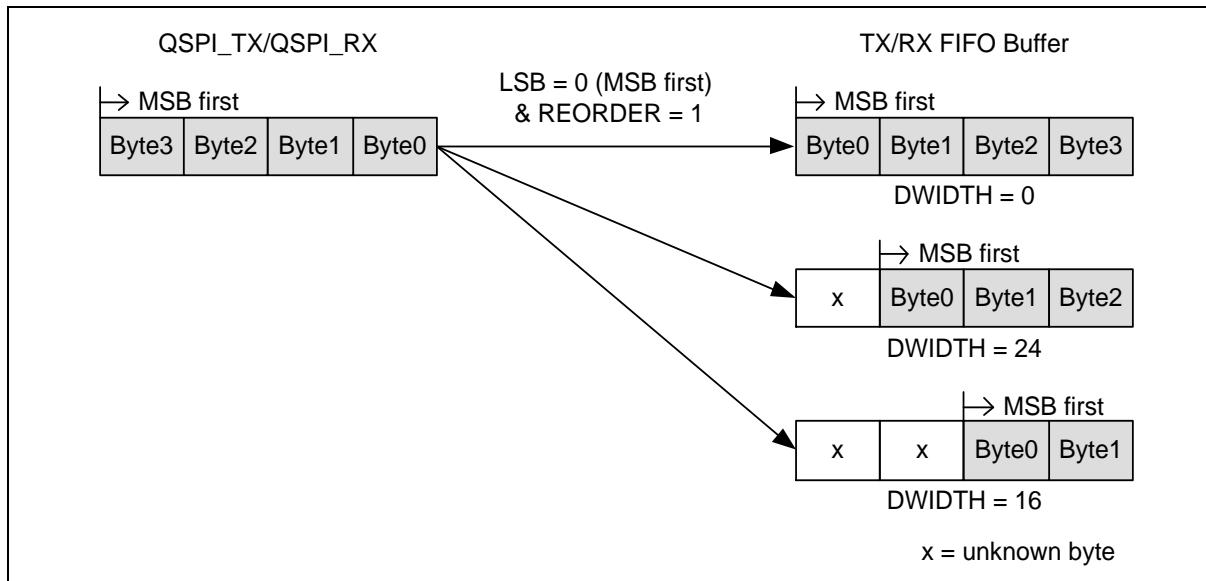

Figure 6.20-8 Byte Reorder Function

In Master mode, if REORDER (QSPIx_CTL[19]) is set to 1, a suspend interval of 0.5 ~ 15.5 QSPI clock periods will be inserted by hardware between two successive bytes in a transaction word. The suspend interval is configured in SUSPITV (QSPIx_CTL[7:4]).

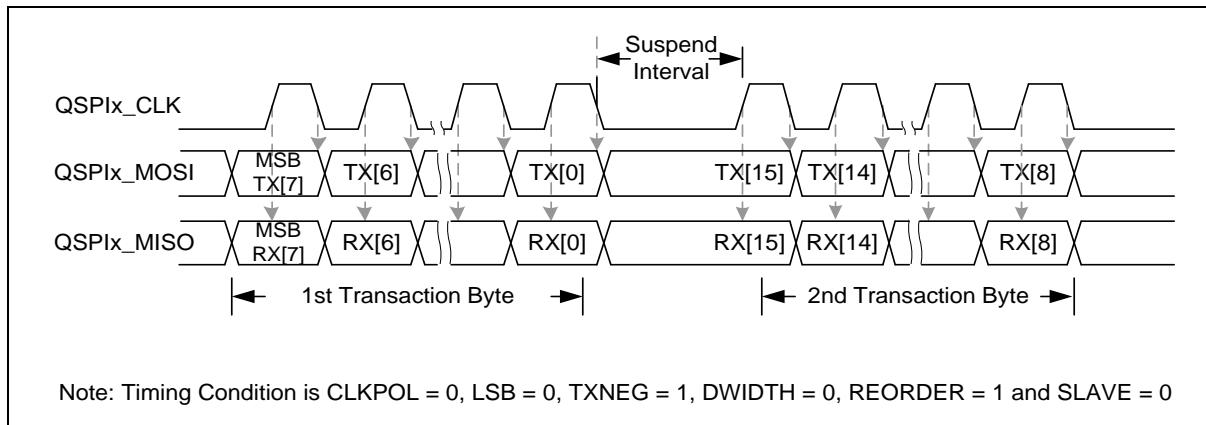

Figure 6.20-9 Timing Waveform for Byte Suspend

6.20.5.4 Half-Duplex Communication

The QSPI controller can communicate in half-duplex mode by setting HALFDPX (QSPIx_CTL[14]) bit. In half-duplex mode, there is only one data line for receiving or transmitting data direction which is defined by DATDIR (QSPIx_CTL[20]). In half-duplex configuration, the QSPIx_MISO pin is free for other applications and it can be configured as GPIO. Enabling or disabling the control bit HALFDPX (QSPIx_CTL[14]) will produce TXFBCLR (QSPIx_FIFOCTL[9]) and RXFBCLR (QSPIx_FIFOCTL[8]) at the same time automatically.

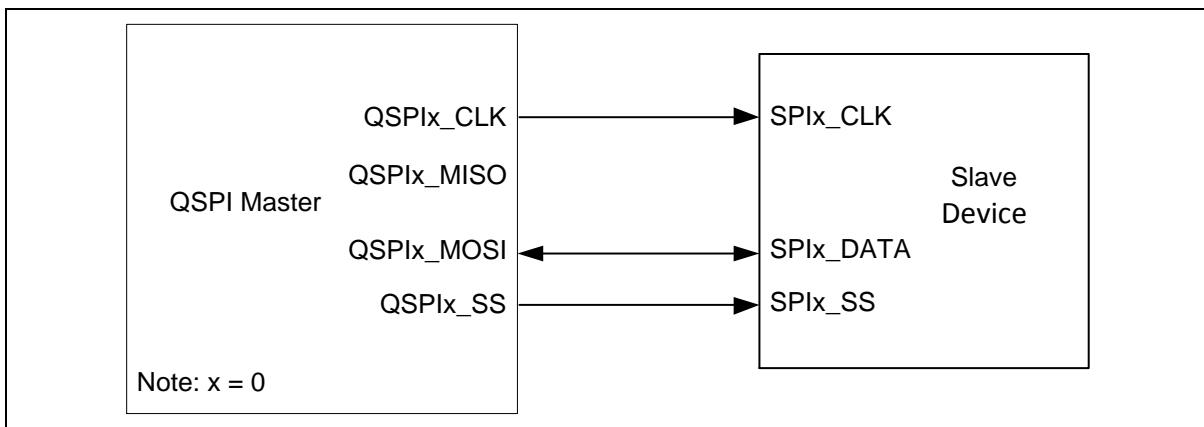

Figure 6.20-10 QSPI Half-Duplex Master Mode Application Block Diagram

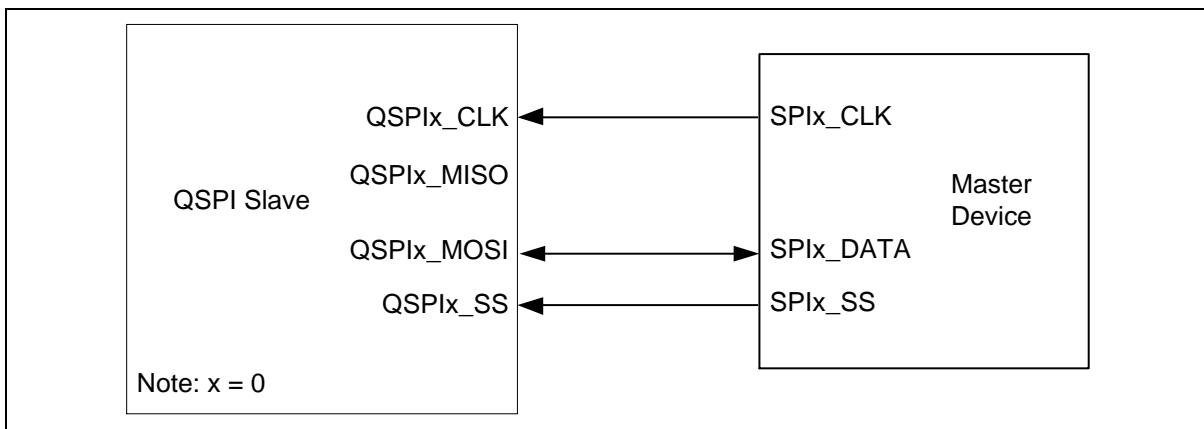

Figure 6.20-11 QSPI Half-Duplex Slave Mode Application Block Diagram

6.20.5.5 Receive-Only Mode

In QSPI Master device, it can communicate in receive-only mode by setting RXONLY (QSPIx_CTL[15]). In this configuration, the QSPI Master device will generate QSPI bus clock continuously as long as the receive-only mode is enabled for receiving data bit from SPI slave device. If AUTOSS (QSPIx_SSCTL[3]) is enabled in receive-only mode, QSPI Master will keep activating the slave select signal.

The remaining QSPIx_MOSI pin of QSPI Master device is not used for communication and can be configured as GPIO. The status BUSY (QSPIx_STATUS[0]) will be asserted in receive-only mode due to the generation of QSPI bus clock. Entering this mode will produce the TXFBCLR (QSPIx_FIFOCTL[9]) and RXFBCLR (QSPIx_FIFOCTL[8]) at the same time automatically. After enabling this mode, the output QSPI bus clock will be sent out in 6 peripheral clock cycles. In this mode, the data which has been written into transmit FIFO will be loaded into transmit shift register and sent out.

6.20.5.6 Slave 3-Wire Mode

When SLV3WIRE (QSPIx_SSCTL[4]) is set by software to enable the Slave 3-Wire mode, the QSPI controller can work with no slave selection signal in Slave mode. The SLV3WIRE (QSPIx_SSCTL[4]) only takes effect in Slave mode. Only three pins, QSPIx_CLK, QSPIx_MISO, and QSPIx_MOSI, are required to communicate with a SPI master. The QSPIx_SS pin can be configured as a GPIO. When the SLV3WIRE (QSPIx_SSCTL[4]) is set to 1, the QSPI slave will be ready to transmit/receive data after the SPIEN (QSPIx_CTL[0]) is set to 1.

6.20.5.7 PDMA Transfer Function

QSPI controller supports PDMA transfer function.

When TXPDMAEN (QSPIx_PDMACTL[0]) is set to 1, the controller will issue request to PDMA controller to start the PDMA transmission process automatically.

When RXPDMAEN (QSPIx_PDMACTL[1]) is set to 1, the controller will start the PDMA reception process. QSPI controller will issue request to PDMA controller automatically when there is data in the RX FIFO buffer.

Note: QSPI supports single request PDMA (Read/Write) only, burst request PDMA is not supported.

6.20.5.8 Two-bit Transfer Mode

The QSPI controller also supports 2-bit Transfer mode when setting TWOBIT (QSPIx_CTL[16]) to 1. In 2-bit Transfer mode, the QSPI controller performs full duplex data transfer. In other words, the two serial data bits can be transmitted and received simultaneously.

For example, in Master mode, the even data (TX Data (n)) stored in the QSPIx_TX register will be transmitted through the QSPIx_MOSI0 pin and the odd data (TX Data (n+1)) stored in the QSPIx_TX register will be transmitted through the QSPIx_MOSI1 pin respectively. In the meanwhile, the even data received from QSPIx_MISO0 pin will be written to RX FIFO prior to the odd data received from QSPIx_MISO1 pin.

In Slave mode, the even and odd data stored in the QSPIx_RX register will be transmitted through the QSPIx_MISO0 pin and QSPIx_MISO1 pin respectively. In the meanwhile, the QSPIx_RX register will store the even data received from the QSPIx_MOSI0 pin and the odd data from QSPIx_MOSI1 pin respectively. The data sequence of FIFO buffers is the same as the Master mode.

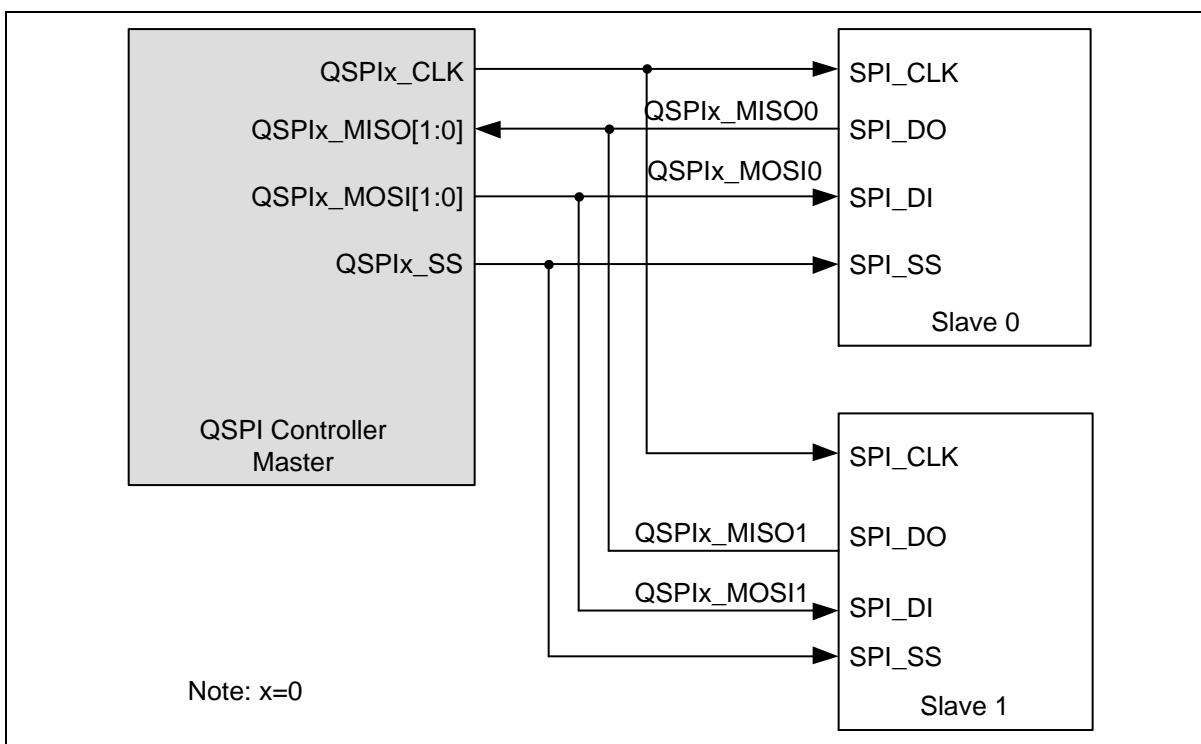

Figure 6.20-12 Two-bit Transfer Mode System Architecture

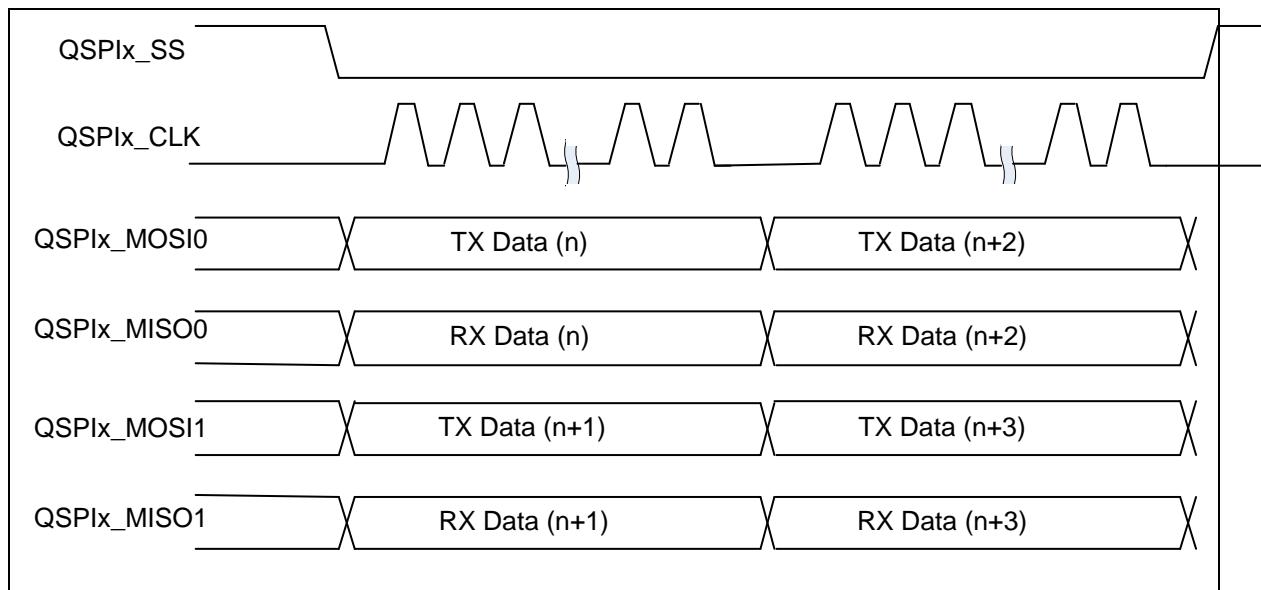

Figure 6.20-13 Two-bit Transfer Mode Timing (Master Mode)

6.20.5.9 Dual I/O Mode

The QSPI controller also supports Dual I/O transfer when setting the DUALIOEN ((QSPIx_CTL[21]) to 1. Many general SPI flashes support Dual I/O transfer. The DATDIR (QSPIx_CTL[20]) is used to define the direction of the transfer data. When the DATDIR bit is set to 1, the controller will send the data to external device. When the DATDIR bit is set to 0, the controller will read the data from the external device. This function supports 8, 16, 24, and 32 bits of length.

The Dual I/O mode is not supported when the Slave 3-Wire mode or the Byte Reorder function is enabled.

For Dual I/O mode, if both the DUALIOEN (QSPIx_CTL[21]) and DATDIR (QSPIx_CTL[20]) are set as 1, the QSPIx_MOSI0 is the even bit data output and the QSPIx_MISO0 will be set as the odd bit data output. If the DUALIOEN (QSPIx_CTL[21]) is set as 1 and DATDIR (QSPIx_CTL[20]) is set as 0, both the QSPIx_MISO0 and QSPIx_MOSI0 will be set as data input ports.

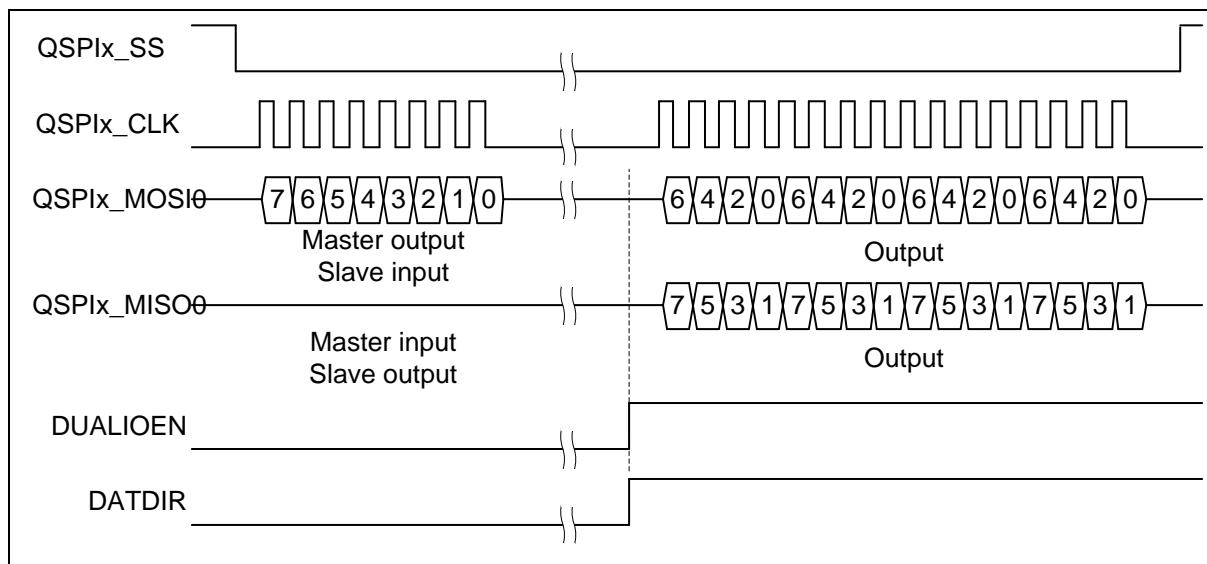

Figure 6.20-14 Bit Sequence of Dual Output Mode

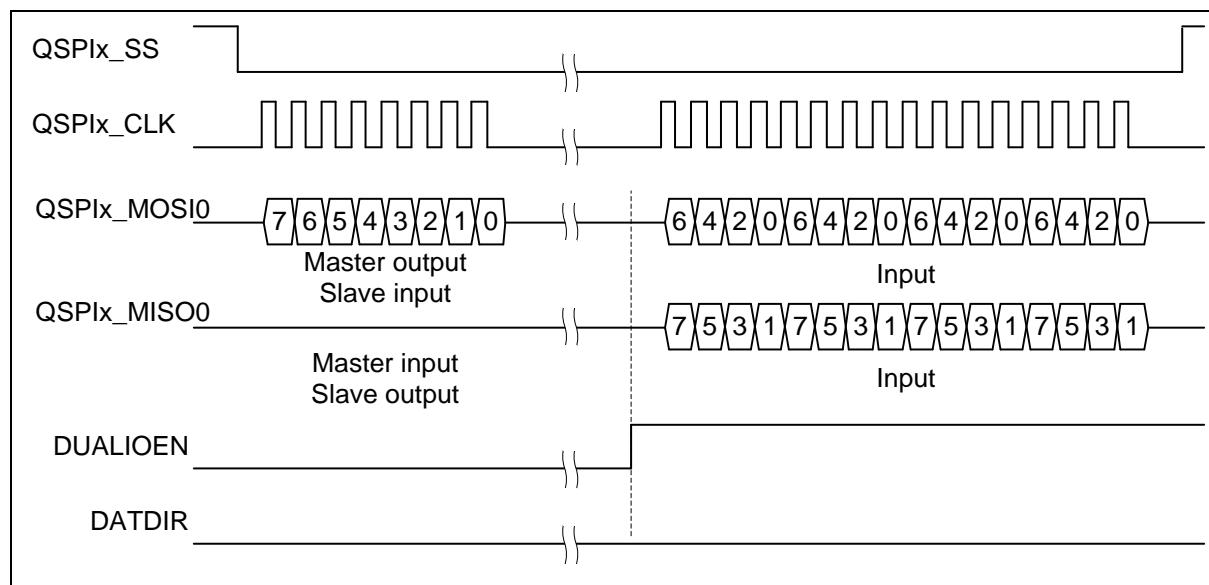

Figure 6.20-15 Bit Sequence of Dual Input Mode

6.20.5.10 Quad I/O Mode

The QSPI controller also supports Quad I/O transfer when setting the QUADIOEN (QSPIx_CTL[22]) to 1. Many general SPI flashes support Quad I/O transfer. The DATDIR bit (QSPIx_CTL[20]) is used to define the direction of the transfer data. When the DATDIR (QSPIx_CTL[20]) is set to 1, the controller will send the data to external device. When the DATDIR (QSPIx_CTL[20]) is set to 0, the controller will read the data from the external device. This function supports 8, 16, 24, and 32 bits of length.

The Quad I/O mode is not supported when the Slave 3-Wire mode or the Byte Reorder function is enabled. The DUALIOEN (QSPIx_CTL[21]) and QUADIOEN (QSPIx_CTL[22]) shall not be set to 1 simultaneously.

For Quad I/O mode, if both the QUADIOEN (QSPIx_CTL[22]) and DATDIR (QSPIx_CTL[20]) are set as 1, the QSPIx_MOSI0 and QSPIx_MOSI1 are the even bit data output and the QSPIx_MISO0 and QSPIx_MISO1 will be set as the odd bit data output. If the QUADIOEN (QSPIx_CTL[22]) is set as 1 and DATDIR (QSPIx_CTL[20]) is set as 0, all the QSPIx_MISO0, QSPIx_MISO1, QSPIx_MOSI0 and QSPIx_MOSI1 pins will be set as data input ports.

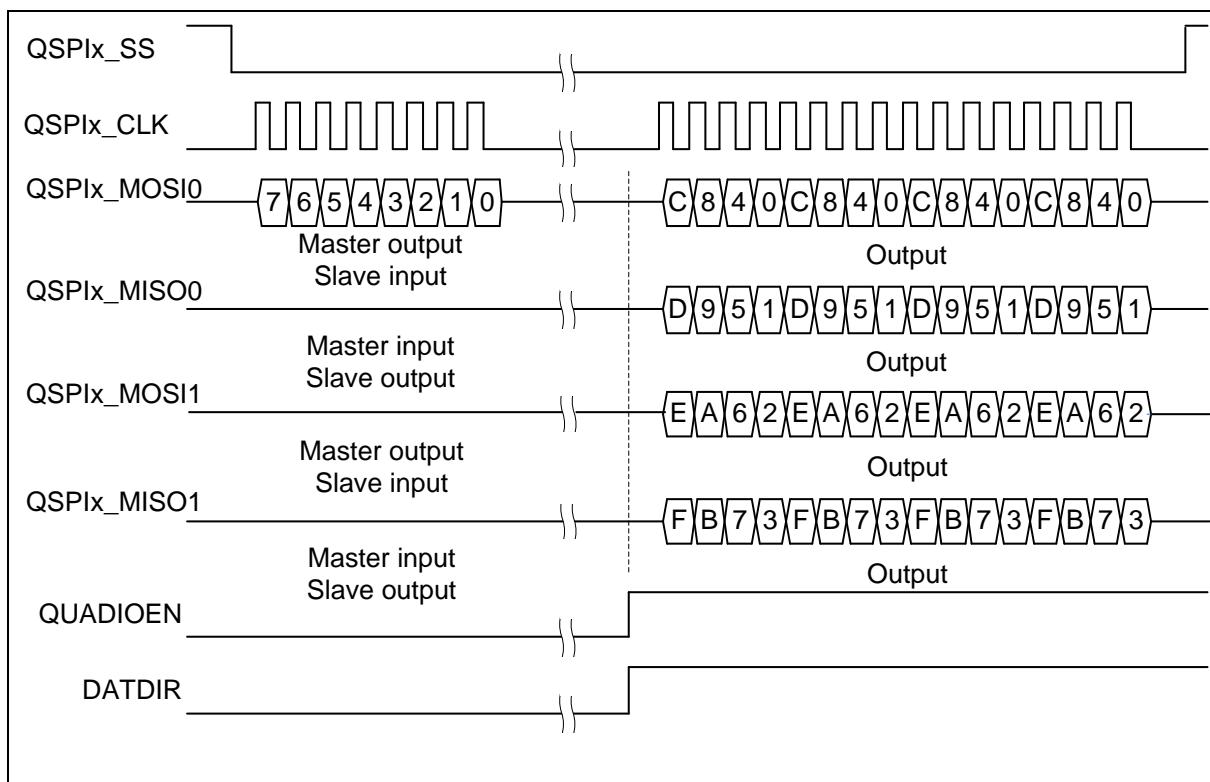

Figure 6.20-16 Bit Sequence of Quad Output Mode

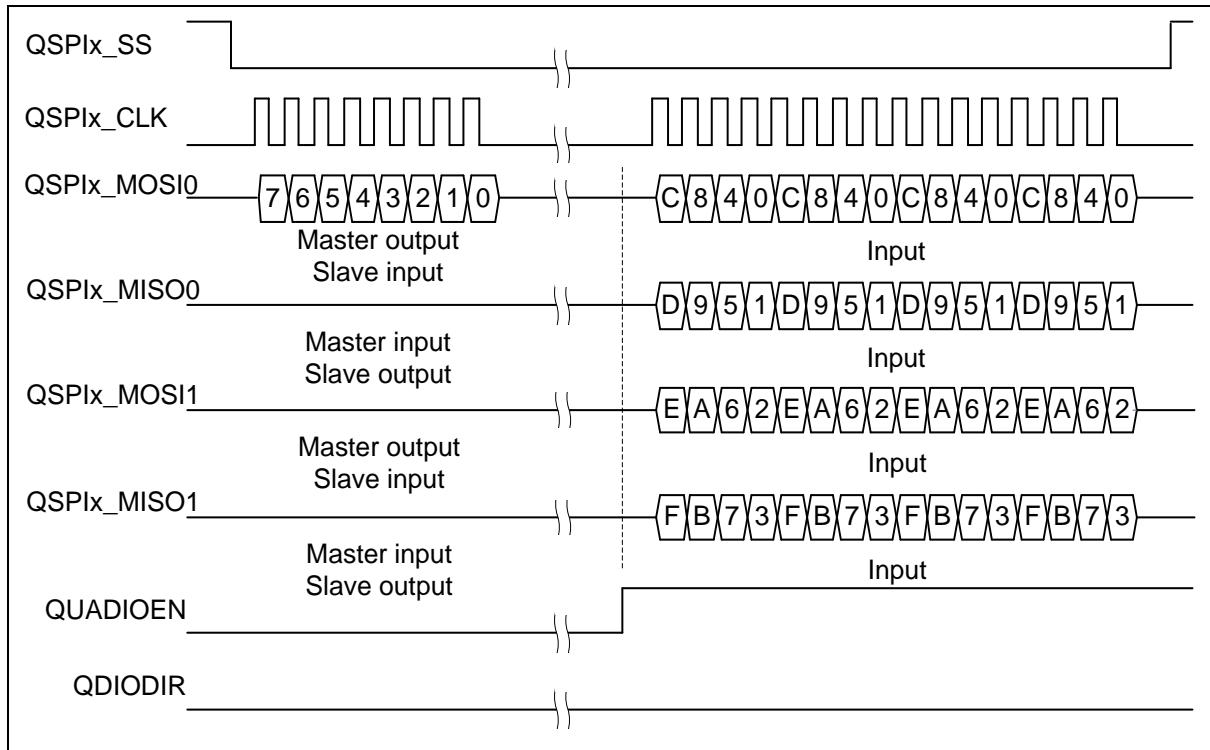

Figure 6.20-17 Bit Sequence of Quad Input Mode

6.20.5.11 FIFO Buffer Operation

The QSPI controllers equip with four 32-bit wide transmit and receive FIFO buffers. The data stored in the transmit FIFO buffer will be read and sent out by the transmission control logic. If the transmit FIFO buffer is full, the TXFULL (QSPIx_STATUS[17]) will be set to 1. When the QSPI transmission logic unit draws out the last datum of the transmit FIFO buffer, so that the transmit FIFO buffer is empty, the TXEMPTY (QSPIx_STATUS[16]) will be set to 1. Note that the TXEMPTY (QSPIx_STATUS[16]) flag is set to 1 while the last transaction is still in progress. In Master mode, the BUSY (QSPIx_STATUS[0]) is set to 1 when the FIFO buffer is written any data or there is any transaction on the SPI bus. (e.g. the slave selection signal is active and the QSPI controller is receiving data in Slave mode). It will set to 0 when the transmit FIFO is empty and the current transaction has done. Thus, the status of BUSY (QSPIx_STATUS[0]) should be checked by software to make sure whether the QSPI is in idle or not.

The receive control logic will store the QSPI input data into the receive FIFO buffer. There are FIFO related status bits, like RXEMPTY (QSPIx_STATUS[8]) and RXFULL (QSPIx_STATUS[9]), to indicate the current status of RX FIFO buffer.

The transmitting and receiving threshold can be configured by setting TXTH (QSPIx_FIFOCTL[30:28]) and RXTH (QSPIx_FIFOCTL[26:24]). When the count of valid data stored in transmit FIFO buffer is less than or equal to TXTH (QSPIx_FIFOCTL[30:28]) setting, TXTHIF (QSPIx_STATUS[18]) will be set to 1. When the count of valid data stored in receive FIFO buffer is larger than RXTH (QSPIx_FIFOCTL[26:24]) setting, RXTHIF (QSPIx_STATUS[10]) will be set to 1.

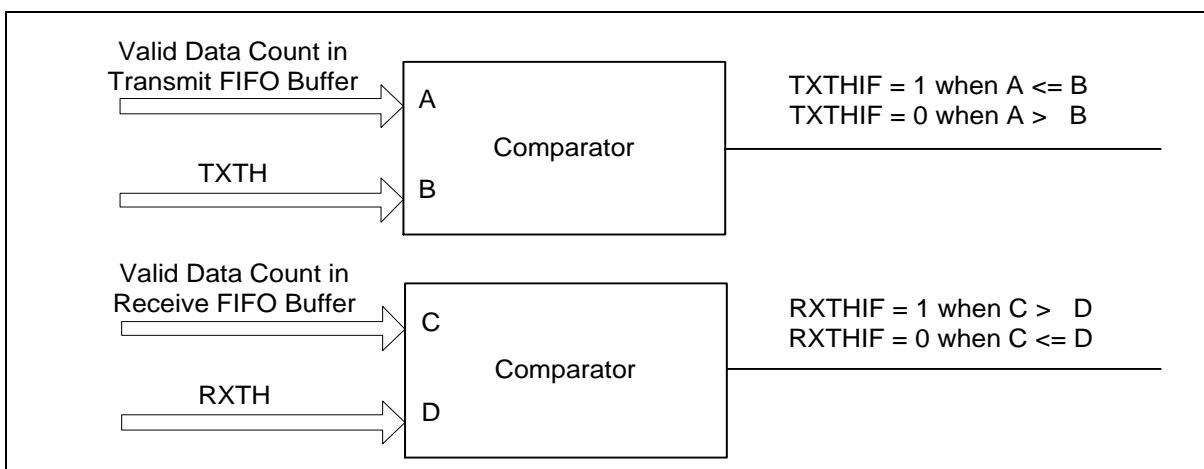

Figure 6.20-18 FIFO Threshold Comparator

In Master mode, when the first datum is written to the QSPIx_TX register, the TXEMPTY flag (QSPIx_STATUS[16]) will be cleared to 0. The transmission will start after 1 APB clock cycles and 6 peripheral clock cycles. User can write the next data into QSPIx_TX register immediately. The QSPI controller will insert a suspend interval between two successive transactions. The period of suspend interval is decided by the setting of SUSPITV (QSPIx_CTL[7:4]). If the SUSPITV (QSPIx_CTL[7:4]) equals 0, QSPI controller can perform continuous transfer. User can write data into QSPIx_TX register as long as the TXFULL (QSPIx_STATUS[17]) is 0.

In the example 1 of Figure 6.20-19, it indicates the updated condition of TXEMPTY (QSPIx_STATUS[16]) and the relationship among the FIFO buffer, shift register and the skew buffer. The TXEMPTY (QSPIx_STATUS[16]) is set to 0 when the Data0 is written into the FIFO buffer. The Data0 will be loaded into the shift register by the core logic and the TXEMPTY (QSPIx_STATUS[16]) will be to 1. The Data0 in shift register will be shift into skew buffer by bit for transmission until the transfer is done.

In the Example 2, it indicates the updated condition of TXFULL (QSPIx_STATUS[17]) when there are 8 data in the FIFO buffer and the next data of Data9 does not be written into the FIFO buffer when the TXFULL = 1.

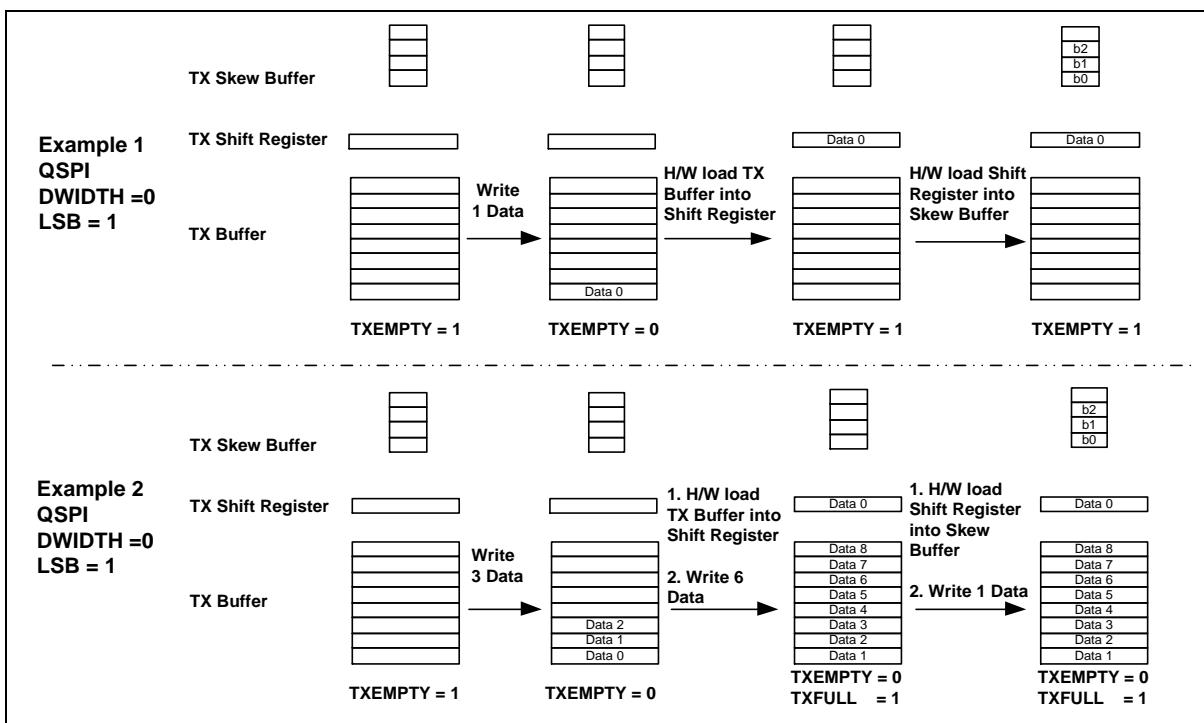

Figure 6.20-19 Transmit FIFO Buffer Example

The subsequent transactions will be triggered automatically if the transmitted data are updated in time. If the QSPIx_TX register does not be updated after all data transfer are done, the transfer will stop.

In Master mode, during receiving operation, the serial data are received from QSPIx_MISO pin and stored to receive FIFO buffer.

The received data (Data0's b0, b1, ...b31) is stored into skew buffer first according the serial clock (QSPIx_CLK) and then it is shift into the shift register bit by bit. The core logic will load the data in shift register into FIFO buffer when the received data bit count reach the value of DWIDTH (QSPIx_CTL[12:8]). The RXEMPTY (QSPIx_STATUS[8]) will be cleared to 0 while the receive FIFO buffer contains unread data (see the Example 1 of Receive FIFO Buffer Example). The received data can be read by software from QSPIx_RX register as long as the RXEMPTY (QSPIx_STATUS[8]) is 0. If the receive FIFO buffer contains 8 unread data, the RXFULL (QSPIx_STATUS[9]) will be set to 1 (see the Example 2 of Receive FIFO Buffer Example).

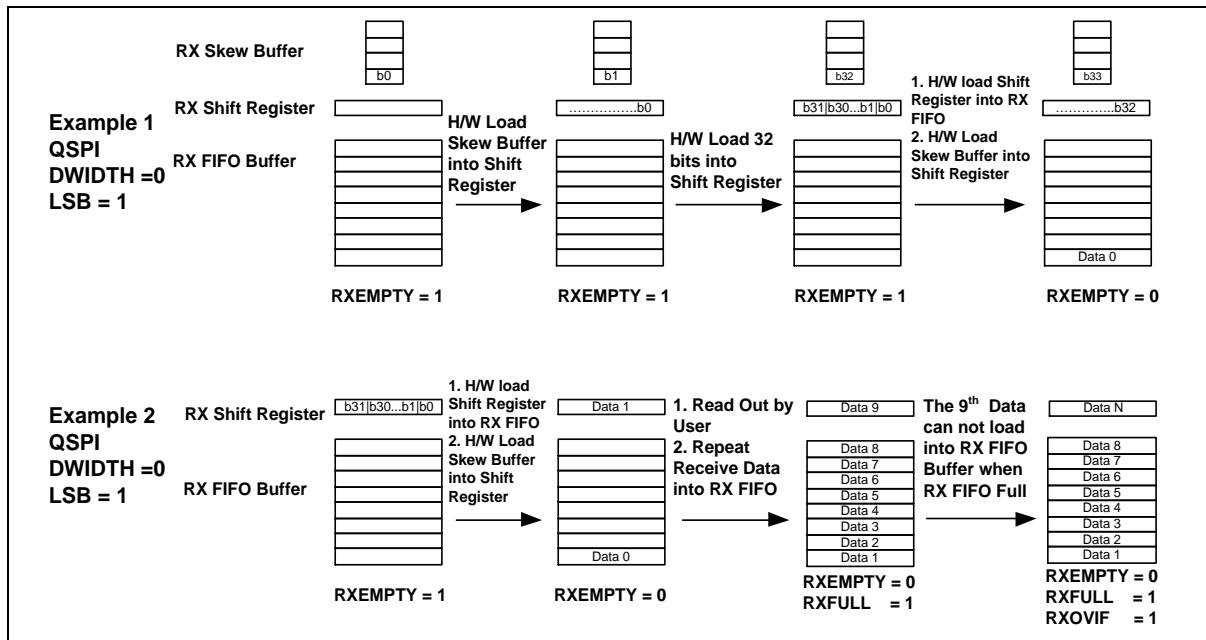

Figure 6.20-20 Receive FIFO Buffer Example

In Slave mode, during transmission operation, when data is written to the QSPIx_TX register by software, the data will be loaded into transmit FIFO buffer and the TXEMPTY (QSPIx_STATUS[16]) will be set to 0. The transmission will start when the slave device receives clock signal from master. Data can be written to QSPIx_TX register as long as the TXFULL (QSPIx_STATUS[17]) is 0. After all data have been drawn out by the QSPI transmission logic unit and the QSPIx_TX register is not updated by software, the TXEMPTY (QSPIx_STATUS[16]) will be set to 1.

If there is no any data written to the QSPIx_TX register, the transmit underflow interrupt flag, TXUFIF (QSPIx_STATUS[19]) will be set to 1 when the slave selection signal is active. The output data will be held by TXUFPOL (QSPIx_FIFOCTL[6]) setting during this transfer until the slave selection signal goes to inactive state. When the transmit underflow event occurs, the slave under run interrupt flag, SLVURIF (QSPIx_STATUS[7]), will be set to 1 as QSPIx_SS goes to inactive state.

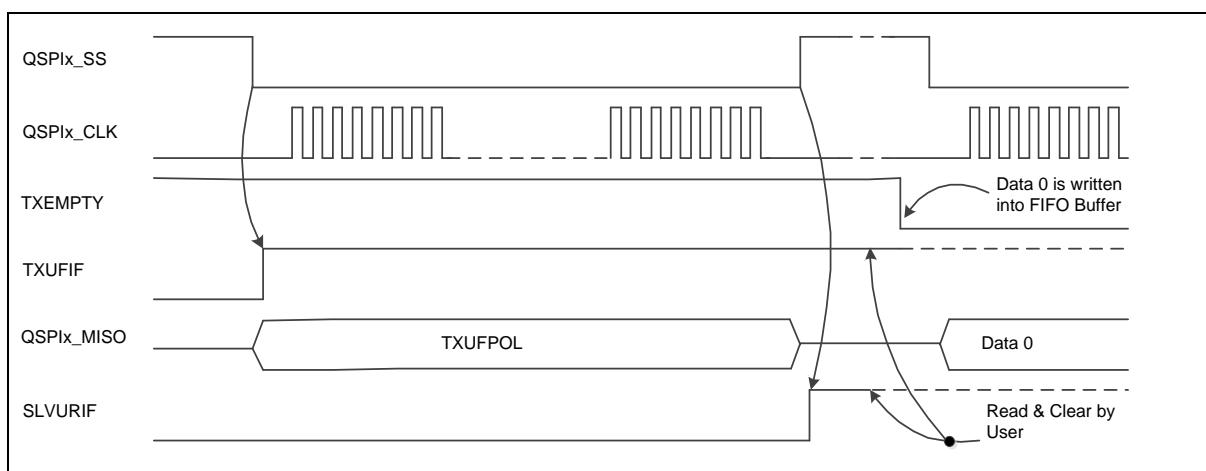

Figure 6.20-21 TX Underflow Event and Slave Under Run Event

In 2-bit Transfer mode, the transmit data is loaded into shift register after 2 datum have been written into the TX FIFO buffer. It uses two shift registers and two 4-level skew buffers concurrently. The detail timing of 2-bit Transfer mode, please refer to the section of Two-bit Transfer mode.

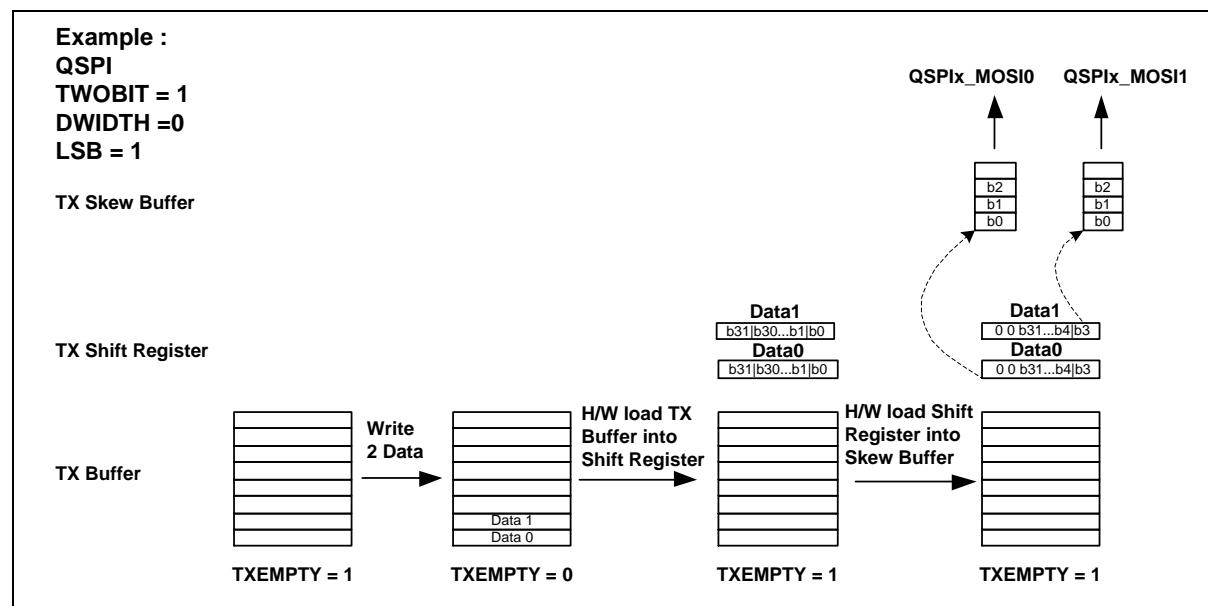

Figure 6.20-22 Two-bit Transfer Mode FIFO Buffer Example

In QSPI Slave 3-Wire mode, the first 2-bit data is un-predicted (keep on the level of last bit in previously transfer) if the data is written into TX FIFO among 3 peripheral clock cycles before the QSPI bus clock is presented. The other bits are held by TXUFPOL (QSPIx_FIFOCTL[6]) because there is TX underflow event. The written data will be transmitted in the next transfer.

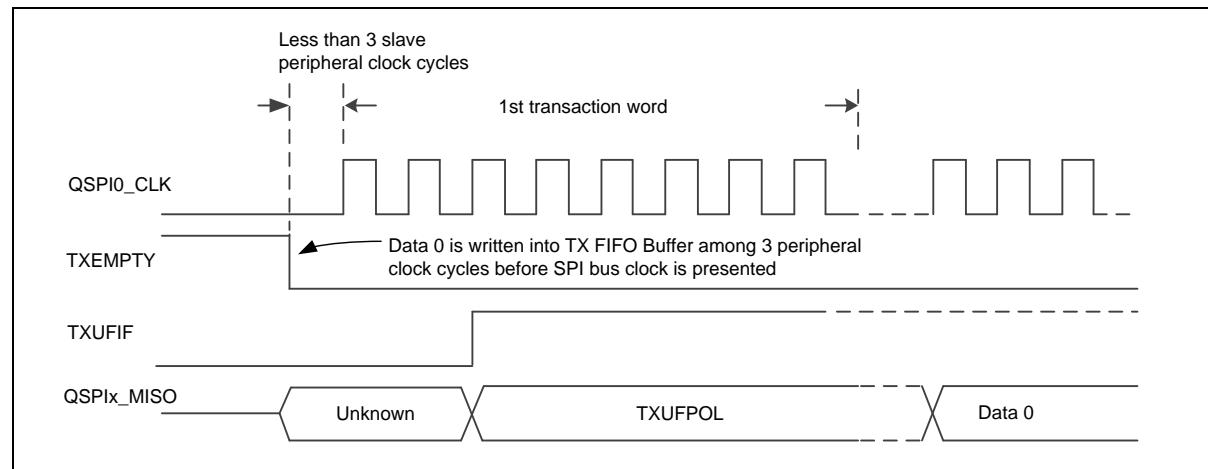

Figure 6.20-23 TX Underflow Event (QSPI0 Slave 3-Wire Mode Enabled)

In Slave mode, during receiving operation, the serial data is received from QSPIx_MOSI pin and stored to QSPIx_RX register. The reception mechanism is similar to Master mode reception operation. If the receive FIFO buffer contains 8 unread data, the RXFULL (QSPIx_STATUS[9]) will be set to 1 and the RXOVIF (QSPIx_STATUS[11]) will be set to 1 if there is more serial data received from QSPIx_MOSI and follow-up data will be dropped (refer to the Receive FIFO Buffer Example figure). If the receive bit count mismatch with the DWIDTH (QSPIx_CTL[12:8]) when the slave selection line goes to inactive state, the SLVBEIF (QSPIx_STATUS[6]) will be set to 1.

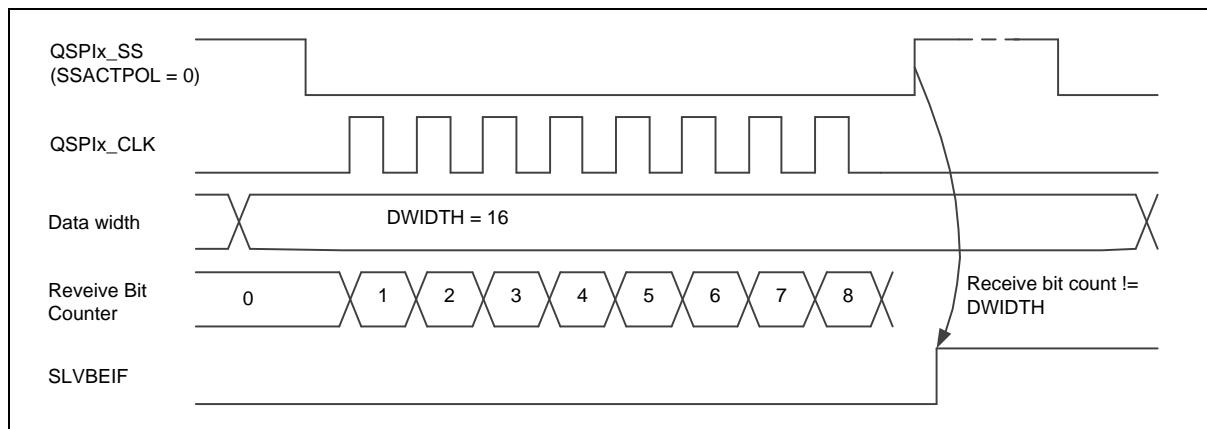

Figure 6.20-24 Slave Mode Bit Count Error

When the Slave select signal is active and the value of SLVTOCNT (QSPIx_SSCTL[31:16]) is not 0, the Slave time-out counter in the QSPI controller logic will start after the serial clock input. This counter will be cleared after one transaction done or the SLVTOCNT is set to 0. If the value of the time-out counter is equal to the value of SLVTOCNT before one transaction done, the slave time-out event occurs and the SLVTOIF (QSPIx_STATUS[5]) will be set to 1.

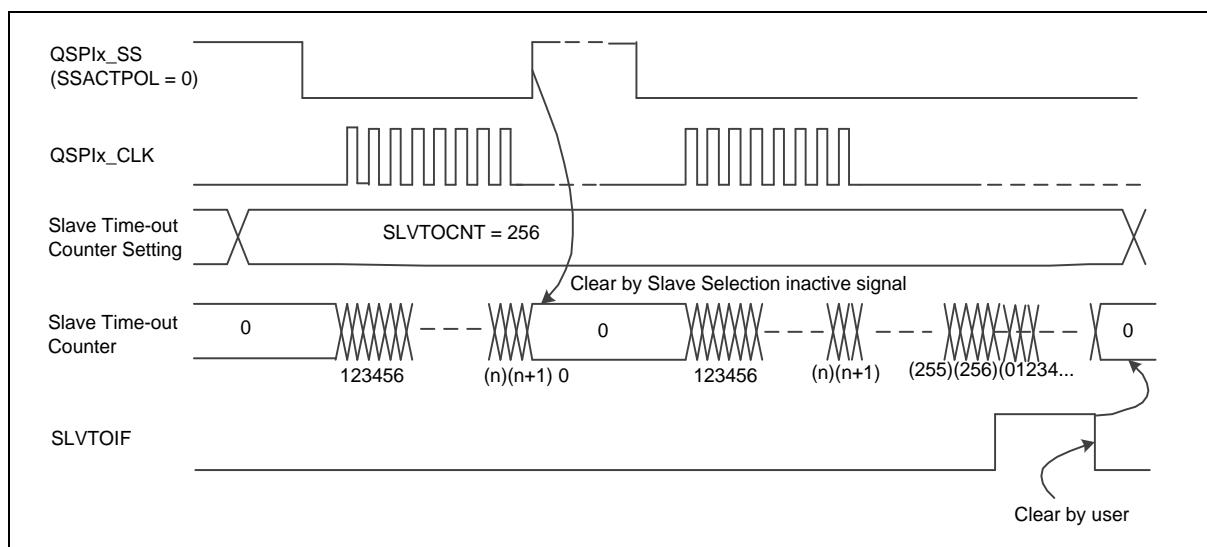

Figure 6.20-25 Slave Time-out Event

A receive time-out function is built-in in this controller. When the receive FIFO is not empty and no read operation in receive FIFO over 64 QSPI peripheral clock periods in Master mode or over 576 QSPI peripheral clock periods in Slave mode, the receive time-out occurs and the RXTOIF (QSPIx_STATUS[12]) will be set to 1. When the receive FIFO is read by user, the time-out status will be cleared automatically.

6.20.5.12 Interrupt

- QSPI unit transfer interrupt

As the QSPI controller finishes a unit transfer, the unit transfer interrupt flag UNITIF (QSPIx_STATUS[1]) will be set to 1. The unit transfer interrupt event will generate an interrupt to CPU if the unit transfer interrupt enable bit UNITIEN (QSPIx_CTL[17]) is set. The unit transfer interrupt flag can be cleared only by writing 1 to it.

- QSPI slave selection active/inactive interrupt

In Slave mode, the slave selection active/inactive interrupt flag, SSACTIF (QSPIx_STATUS[2]) and SSINAIF (QSPIx_STATUS[3]), will be set to 1 when the SPIEN (QSPIx_CTL[0]) and SLAVE (QSPIx_CTL[18]) are set to 1 and the slave selection signal goes to active/inactive state. The QSPI controller will issue an interrupt if the SSINAIEN (QSPIx_SSCTL[13]) or SSACTIEN (QSPIx_SSCTL[12]), are set to 1.

- Slave time-out interrupt

In Slave mode, there is slave time-out function for user to know that there is serial clock input but one transaction is not finished over the period of SLVTOCNT (QSPIx_SSCTL[31:16]) basing on Slave peripheral clock.

When the slave selection signal is active and the value of SLVTOCNT (QSPIx_SSCTL[31:16]) is not 0, the slave time-out counter in the QSPI controller logic will start after the serial clock input. This counter will be cleared after one transaction done or the SLVTOCNT (QSPIx_SSCTL[31:16]) is set to 0. If the value of the time-out counter is greater than or equal to the value of SLVTOCNT (QSPIx_SSCTL[31:16]) before one transaction done, the slave time-out event occurs and the SLVTOIF (QSPIx_STATUS[5]) will be set to 1. The QSPI controller will issue an interrupt if the SLVTOIEN (QSPIx_SSCTL[5]) is set to 1.

- Slave bit count error interrupt

In Slave mode, if the transmit/receive bit count mismatch with the DWIDTH (QSPIx_CTL[12:8]) when the slave selection line goes to inactive state, the SLVBEIF (QSPIx_STATUS[6]) will be set to 1. The uncompleted transaction will be dropped from TX and RX shift registers. The QSPI controller will issue an interrupt if the SLVBEIEN (QSPIx_SSCTL[8]) is set to 1.

Note: If the slave selection signal is active but there is no any serial clock input, the SLVBEIF (QSPIx_STATUS[6]) will be set to 1 when the slave selection signal goes to inactive state.

- TX underflow interrupt

In QSPI Slave mode, if there is no any data is written to the QSPIx_TX register, the TXUFIIF (QSPIx_STATUS[19]) will be set to 1 when the slave selection signal is active. The QSPI controller will issue a TX underflow interrupt if the TXUFIEN (QSPIx_FIFOCTL[7]) is set to 1.

Note: If underflow event occurs in QSPI Slave mode, there are two conditions which make QSPI Slave mode return to idle state and then goes for next transfer: (1) set TXRST to 1 (2) slave select signal is changed to inactive state while SLV3WIRE=0.

- Slave TX under run interrupt

If the TX underflow event occurs, the SLVURIF (QSPIx_STATUS[7]) will be set to 1 when QSPIx_SS goes to inactive state. The QSPI controller will issue a TX under run interrupt if the SLVURIEN (QSPIx_SSCTL[9]) is set to 1.

Note: In Slave 3-Wire mode, the slave selection signal is considered active all the time so that user shall poll the TXUFIIF (QSPIx_STATUS[19]) to know if there is TX underflow event or not.

- Receive Overrun interrupt

In Slave mode, if the receive FIFO buffer contains 8 unread data, the RXFULL (QSPIx_STATUS[9]) will be set to 1 and the RXOVIF (QSPIx_STATUS[11]) will be set to 1 if there is more serial data is received from QSPI bus and follow-up data will be dropped. The QSPI controller will issue an interrupt if the RXOVIEN (QSPIx_FIFOCTL[5]) is set to 1.

- Receive FIFO time-out interrupt

If there is a received data in the FIFO buffer and it is not read by software over 64 QSPI peripheral clock periods in Master mode or over 576 QSPI peripheral clock periods in Slave mode, it will send a RX time-out interrupt to the system if the RX time-out interrupt enable bit, RXTOIEN (QSPIx_FIFOCTL[4]), is set to 1.

- Transmit FIFO interrupt

In FIFO mode, if the valid data count of the transmit FIFO buffer is less than or equal to the setting value of TXTH (QSPIx_FIFOCTL[30:28]), the transmit FIFO interrupt flag TXTHIF (QSPIx_STATUS[18]) will be set to 1. The QSPI controller will generate a transmit FIFO interrupt to the system if the transmit FIFO interrupt enable bit, TXTHIEN (QSPIx_FIFOCTL[3]), is set to 1.

- Receive FIFO interrupt

In FIFO mode, if the valid data count of the receive FIFO buffer is larger than the setting value of RXTH (QSPIx_FIFOCTL[26:24]), the receive FIFO interrupt flag RXTHIF (QSPIx_STATUS[10]) will be set to 1. The QSPI controller will generate a receive FIFO interrupt to the system if the receive FIFO interrupt enable bit, RXTHIEN (QSPIx_FIFOCTL[2]), is set to 1.

6.20.6 Timing Diagram

The active state of slave selection signal can be defined by setting the SSACTPOL (QSPIx_SSCTL[2]). The QSPI clock which is in idle state can be configured as high or low state by setting the CLKPOL (QSPIx_CTL[3]). It also provides the bit length of a transaction word in DWIDTH (QSPIx_CTL[12:8]), and transmitting/receiving data from MSB or LSB first in LSB (QSPIx_CTL[13]). User can also select which edge of QSPI clock to transmit/receive data in TXNEG/RXNEG (QSPIx_CTL[2:1]). Four QSPI timing diagrams for master/slave operations and the related settings are shown below.

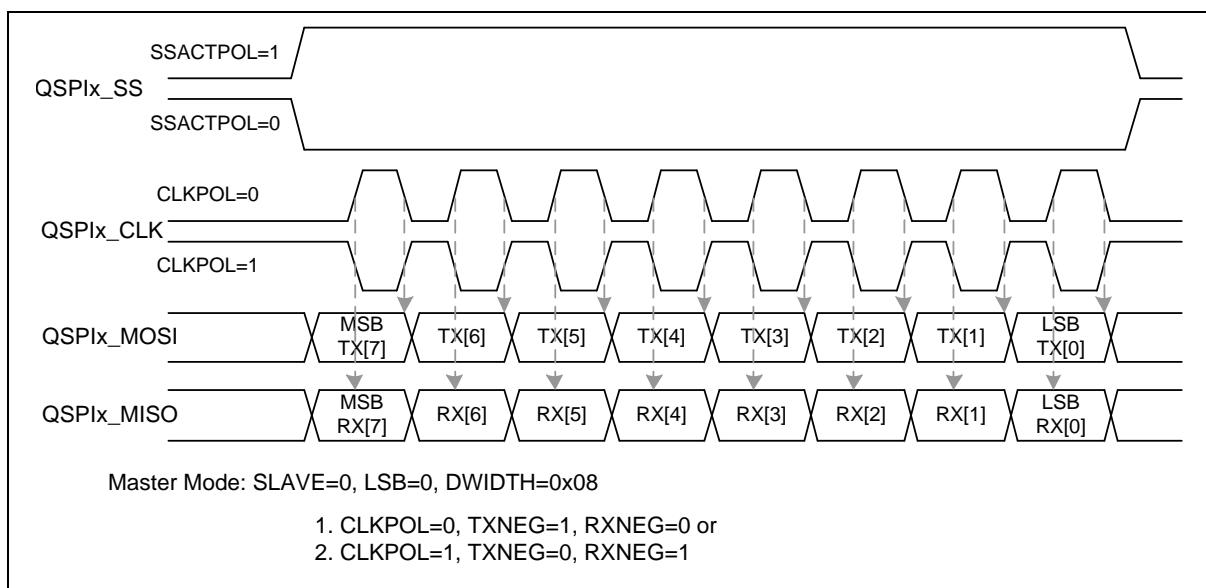

Figure 6.20-26 QSPI Timing in Master Mode

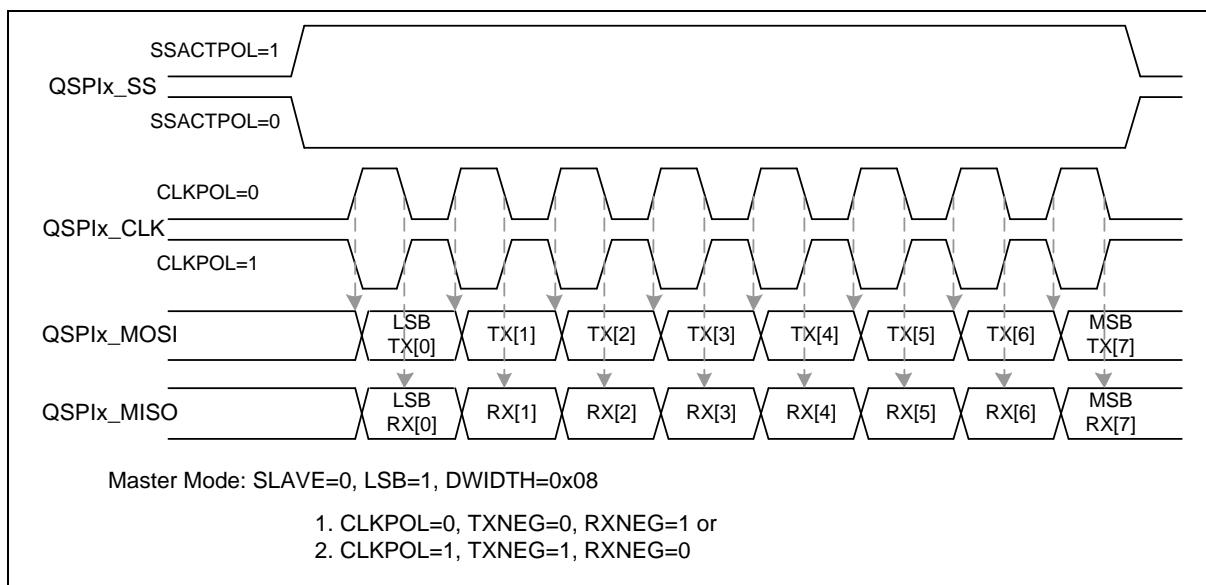

Figure 6.20-27 QSPI Timing in Master Mode (Alternate Phase of QSPIx_CLK)

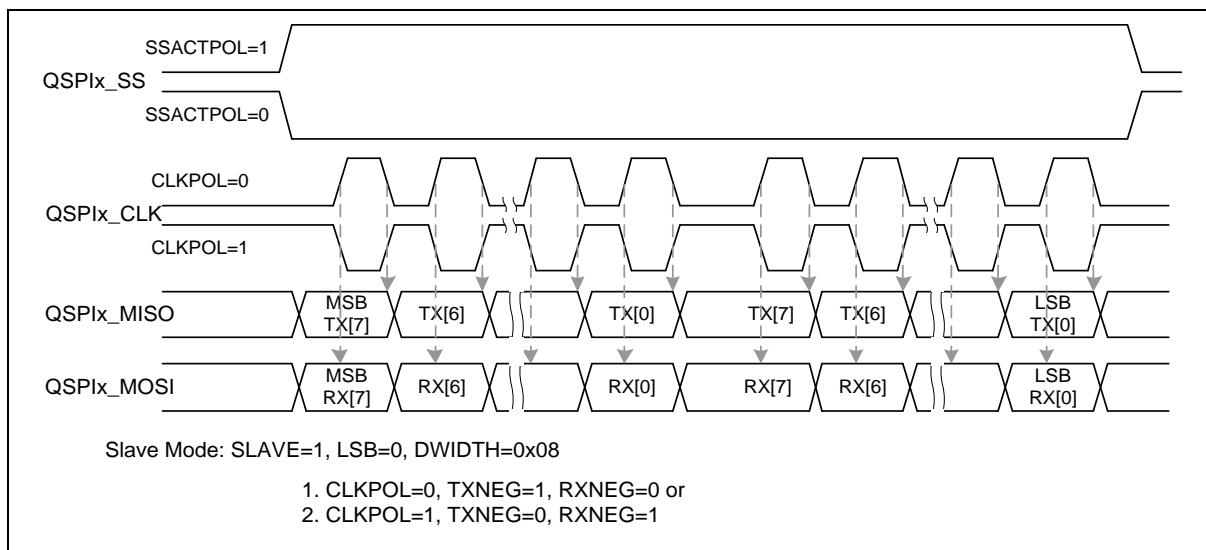

Figure 6.20-28 QSPI Timing in Slave Mode

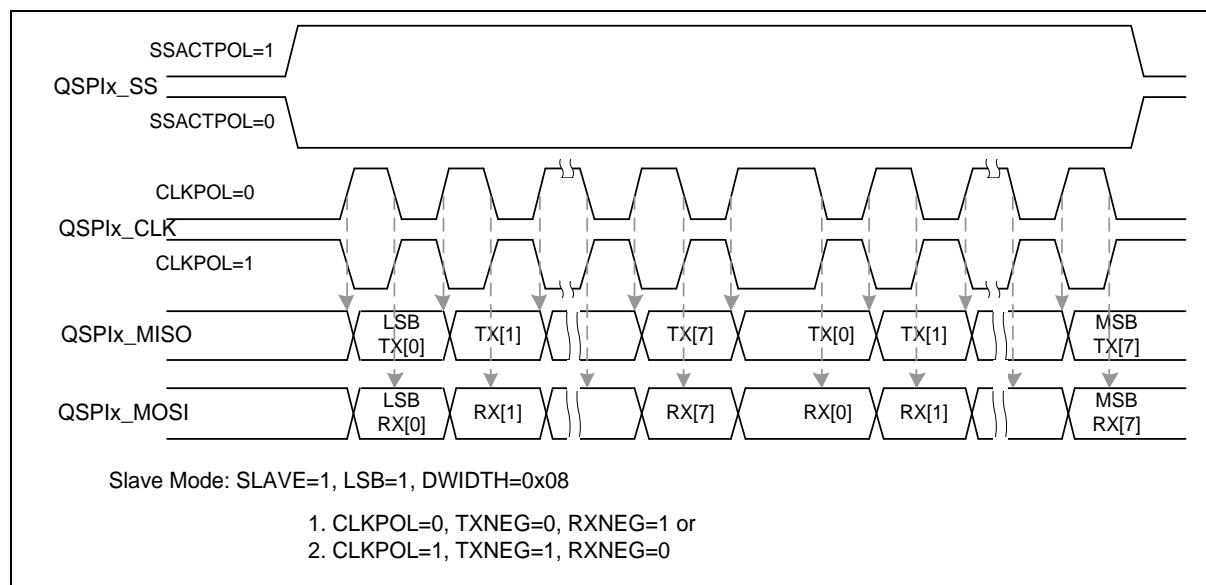

Figure 6.20-29 QSPI Timing in Slave Mode (Alternate Phase of QSPIx_CLK)

6.20.7 Programming Examples

Example 1:

The QSPI controller is set as a full-duplex master to access an off-chip slave device with the following specifications:

- Data bit is latched on positive edge of QSPI bus clock.
- Data bit is driven on negative edge of QSPI bus clock.
- Data is transferred from MSB first.
- QSPI bus clock is idle at low state.
- Only one byte of data to be transmitted/received in a transaction.
- Uses the first QSPI slave select pin to connect with an off-chip slave device. The slave selection signal is active low.

The operation flow is as follows:

1. Set DIVIDER (QSPIx_CLKDIV [8:0]) to determine the output frequency of QSPI clock.
2. Write the QSPIx_SSCTL register a proper value for the related settings of Master mode:
 - 1) Clear AUTOSS (QSPIx_SSCTL[3]) to 0 to disable the Automatic Slave Selection function.
 - 2) Configure slave selection signal as active low by clearing SSACTPOL (QSPIx_SSCTL[2]) to 0.
 - 3) Enable slave selection signal by setting SS (QSPIx_SSCTL[0]) to 1 to activate the off-chip slave device.
3. Write the related settings into the QSPIx_CTL register to control the QSPI master actions.
 - 1) Configure this QSPI controller as master device by setting SLAVE (QSPIx_CTL[18]) to 0.
 - 2) Force the QSPI clock idle state at low by clearing CLKPOL (QSPIx_CTL[3]) to 0.
 - 3) Select data transmitted on negative edge of QSPI bus clock by setting TXNEG (QSPIx_CTL[2]) to 1.
 - 4) Select data latched on positive edge of QSPI bus clock by clearing RXNEG

- (QSPIx_CTL[1]) to 0.
- 5) Set the bit length of a transaction as 8-bit in DWIDTH bit field (QSPIx_CTL[12:8] = 0x08).
 - 6) Set MSB transfer first by clearing LSB (QSPIx_CTL[13]) to 0.
 4. Set SPIEN (QSPIx_CTL[0]) to 1 to enable the data transfer with the QSPI interface.
 5. If this QSPI master attempts to transmit (write) one byte data to the off-chip slave device, write the byte data that will be transmitted into the QSPIx_TX register.
 6. Waiting for QSPI interrupt if the UNITIEN (QSPIx_CTL[17]) is set to 1, or just polling the unit transfer interrupt flag UNITIF (QSPIx_STATUS[1]).
 7. Read out the received one byte data from QSPIx_RX register.
 8. Go to 5) to continue another data transfer or set SS (QSPIx_SSCTL[0]) to 0 to deactivate the off-chip slave device.

Example 2:

The QSPI controller is set as a full-duplex slave device and connects with an off-chip master device. The off-chip master device communicates with the on-chip QSPI slave controller through the QSPI interface with the following specifications:

- Data bit is latched on positive edge of QSPI bus clock.
- Data bit is driven on negative edge of QSPI bus clock.
- Data is transferred from LSB first.
- QSPI bus clock is idle at high state.
- Only one byte of data to be transmitted/received in a transaction.
- Slave selection signal is active high.

The operation flow is as follows:

1. Write the QSPIx_SSCTL register a proper value for the related settings of Slave mode.
2. Select high level for the input of slave selection signal by setting SSACTPOL (QSPIx_SSCTL[2]) to 1.
3. Write the related settings into the QSPIx_CTL register to control this QSPI slave actions
 - 1) Set the QSPI controller as slave device by setting SLAVE (QSPIx_CTL[18]) to 1.
 - 2) Select the QSPI clock idle state at high by setting CLKPOL (QSPIx_CTL[3]) to 1.
 - 3) Select data transmitted on negative edge of QSPI bus clock by setting TXNEG (QSPIx_CTL[2]) to 1.
 - 4) Select data latched on positive edge of QSPI bus clock by clearing RXNEG (QSPIx_CTL[1]) to 0.
 - 5) Set the bit length of a transaction as 8-bit in DWIDTH bit field (QSPIx_CTL[12:8] = 0x08).
4. Set LSB transfer first by setting LSB (QSPIx_CTL[13]) to 1.
5. Set the SPIEN (QSPIx_CTL[0]) to 1. Wait for the slave select trigger input and QSPI clock input from the off-chip master device to start the data transfer.
6. If this QSPI slave attempts to transmit (be read) one byte data to the off-chip master device, write the byte data that will be transmitted into the QSPIx_TX register.
7. If this QSPI slave just only attempts to receive (be written) one byte data from the off-chip master device and does not care what data will be transmitted, the QSPIx_TX register does not need to be updated by software.
8. Waiting for QSPI interrupt if the UNITIEN (QSPIx_CTL[17]) is set to 1, or just polling the unit

transfer interrupt flag UNITIF (QSPIx_STATUS[1]).

9. Read out the received one byte data from QSPIx_RX register.
10. Go to 7 to continue another data transfer or stop data transfer.

6.20.8 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
QSPI Base Address:				
QSPIx_BA = 0x4006_0000 + (0x0000_1000 * x)				
	x=0			
QSPIx_CTL	QSPIx_BA+0x00	R/W	QSPI Control Register	0x0000_0034
QSPIx_CLKDIV	QSPIx_BA+0x04	R/W	QSPI Clock Divider Register	0x0000_0000
QSPIx_SSCTL	QSPIx_BA+0x08	R/W	QSPI Slave Select Control Register	0x0000_0000
QSPIx_PDMACTL	QSPIx_BA+0x0C	R/W	QSPI PDMA Control Register	0x0000_0000
QSPIx_FIFOCTL	QSPIx_BA+0x10	R/W	QSPI FIFO Control Register	0x4400_0000
QSPIx_STATUS	QSPIx_BA+0x14	R/W	QSPI Status Register	0x0005_0110
QSPIx_TX	QSPIx_BA+0x20	W	QSPI Data Transmit Register	0x0000_0000
QSPIx_RX	QSPIx_BA+0x30	R	QSPI Data Receive Register	0x0000_0000

6.20.9 Register Description

QSPI Control Register (QSPIx_CTL)

Register	Offset	R/W	Description				Reset Value
QSPIx_CTL	QSPIx_BA+0x00	R/W	QSPI Control Register				0x0000_0034

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved	QUADIOEN	DUALIOEN	DATDIR	REORDER	SLAVE	UNITIEN	TWOBIT
15	14	13	12	11	10	9	8
RXONLY	HALFDPX	LSB	DWIDTH				
7	6	5	4	3	2	1	0
SUSPITV				CLKPOL	TXNEG	RXNEG	SPIEN

Bits	Description	
[31:23]	Reserved	Reserved.
[22]	QUADIOEN	Quad I/O Mode Enable Bit 0 = Quad I/O mode Disabled. 1 = Quad I/O mode Enabled.
[21]	DUALIOEN	Dual I/O Mode Enable Bit 0 = Dual I/O mode Disabled. 1 = Dual I/O mode Enabled.
[20]	DATDIR	Data Port Direction Control This bit is used to select the data input/output direction in half-duplex transfer and Dual/Quad transfer 0 = QSPI data is input direction. 1 = QSPI data is output direction.
[19]	REORDER	Byte Reorder Function Enable Bit 0 = Byte Reorder function Disabled. 1 = Byte Reorder function Enabled. A byte suspend interval will be inserted among each byte. The period of the byte suspend interval depends on the setting of SUSPITV. Note: Byte Reorder function is only available if DWIDTH is defined as 16, 24, and 32 bits.
[18]	SLAVE	Slave Mode Control 0 = Master mode. 1 = Slave mode.
[17]	UNITIEN	Unit Transfer Interrupt Enable Bit 0 = QSPI unit transfer interrupt Disabled. 1 = QSPI unit transfer interrupt Enabled.
[16]	TWOBIT	2-bit Transfer Mode Enable Bit 0 = 2-bit Transfer mode Disabled.

		1 = 2-bit Transfer mode Enabled. Note: When 2-bit Transfer mode is enabled, the first serial transmitted bit data is from the first FIFO buffer data, and the 2 nd serial transmitted bit data is from the second FIFO buffer data. As the same as transmitted function, the first received bit data is stored into the first FIFO buffer and the 2 nd received bit data is stored into the second FIFO buffer at the same time.
[15]	RXONLY	Receive-only Mode Enable Bit (Master Only) This bit field is only available in Master mode. In receive-only mode, QSPI Master will generate QSPI bus clock continuously for receiving data bit from SPI slave device and assert the BUSY status. 0 = Receive-only mode Disabled. 1 = Receive-only mode Enabled.
[14]	HALFDPX	QSPI Half-duplex Transfer Enable Bit This bit is used to select full-duplex or half-duplex for QSPI transfer. The bit field DATDIR (QSPIx_CTL[20]) can be used to set the data direction in half-duplex transfer. 0 = QSPI operates in full-duplex transfer. 1 = QSPI operates in half-duplex transfer.
[13]	LSB	Send LSB First 0 = The MSB, which bit of transmit/receive register depends on the setting of DWIDTH, is transmitted/received first. 1 = The LSB, bit 0 of the QSPIx TX register, is sent first to the QSPI data output pin, and the first bit received from the QSPI data input pin will be put in the LSB position of the RX register (bit 0 of QSPIx_RX).
[12:8]	DWIDTH	Data Width This field specifies how many bits can be transmitted / received in one transaction. The minimum bit length is 8 bits and can up to 32 bits. DWIDHT = 0x08 8 bits. DWIDHT = 0x09 9 bits. DWIDHT = 0x1F 31 bits. DWIDHT = 0x00 32 bits.
[7:4]	SUSPITV	Suspend Interval (Master Only) The four bits provide configurable suspend interval between two successive transmit/receive transaction in a transfer. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value is 0x3. The period of the suspend interval is obtained according to the following equation. $(\text{SUSPITV}[3:0] + 0.5) * \text{period of QSPICLK clock cycle}$ Example: SUSPITV = 0x0 0.5 QSPICLK clock cycle. SUSPITV = 0x1 1.5 QSPICLK clock cycle. SUSPITV = 0xE 14.5 QSPICLK clock cycle. SUSPITV = 0xF 15.5 QSPICLK clock cycle.
[3]	CLKPOL	Clock Polarity 0 = QSPI bus clock is idle low. 1 = QSPI bus clock is idle high.
[2]	TXNEG	Transmit on Negative Edge 0 = Transmitted data output signal is changed on the rising edge of QSPI bus clock. 1 = Transmitted data output signal is changed on the falling edge of QSPI bus clock.

[1]	RXNEG	Receive on Negative Edge 0 = Received data input signal is latched on the rising edge of QSPI bus clock. 1 = Received data input signal is latched on the falling edge of QSPI bus clock.
[0]	SPIEN	QSPI Transfer Control Enable Bit In Master mode, the transfer will start when there is data in the FIFO buffer after this bit is set to 1. In Slave mode, this device is ready to receive data when this bit is set to 1. 0 = Transfer control Disabled. 1 = Transfer control Enabled. Note: Before changing the configurations of QSPIx_CTL, QSPIx_CLKDIV, QSPIx_SSCTL and QSPIx_FIFOCTL registers, user shall clear the SPIEN (QSPIx_CTL[0]) and confirm the SPIENSTS (QSPIx_STATUS[15]) is 0.

QSPI Clock Divider Register (QSPIx_CLKDIV)

Register	Offset	R/W	Description					Reset Value
QSPIx_CLKDIV	QSPIx_BA+0x04	R/W	QSPI Clock Divider Register					0x0000_0000

DIVIDER							

Bits	Description	
[31:9]	Reserved	Reserved.
[8:0]	DIVIDER	<p>Clock Divider</p> <p>The value in this field is the frequency divider for generating the peripheral clock, f_{spi_eclk}, and the QSPI bus clock of QSPI Master. The frequency is obtained according to the following equation.</p> $f_{spi_eclk} = \frac{f_{spi_clock_src}}{(DIVIDER + 1)}$ <p>where</p> <p>$f_{spi_clock_src}$ is the peripheral clock source, which is defined in the clock control register, CLK_CLKSEL2.</p>

Note: DIVIDER should be set carefully because the peripheral clock frequency must be slower than or equal to system frequency.

QSPI Slave Select Control Register (QSPIx_SSCTL)

Register	Offset	R/W	Description				Reset Value
QSPIx_SSCTL	QSPIx_BA+0x08	R/W	QSPI Slave Select Control Register				0x0000_0000

7	6	5	4	3	2	1	0
Reserved	SLVTORST	SLVTOIEN	SLV3WIRE	AUTOSS	SSACTPOL	Reserved	SS

Bits	Description	
[31:16]	SLVTOCNT	Slave Mode Time-out Period In Slave mode, these bits indicate the time-out period when there is bus clock input during slave select active. The clock source of the time-out counter is Slave peripheral clock. If the value is 0, it indicates the slave mode time-out function is disabled.
[15:14]	Reserved	Reserved.
[13]	SSINAIEN	Slave Select Inactive Interrupt Enable Bit 0 = Slave select inactive interrupt Disabled. 1 = Slave select inactive interrupt Enabled.
[12]	SSACTIEN	Slave Select Active Interrupt Enable Bit 0 = Slave select active interrupt Disabled. 1 = Slave select active interrupt Enabled.
[11:10]	Reserved	Reserved.
[9]	SLVURIEN	Slave Mode TX Under Run Interrupt Enable Bit 0 = Slave mode TX under run interrupt Disabled. 1 = Slave mode TX under run interrupt Enabled.
[8]	SLVBEIEN	Slave Mode Bit Count Error Interrupt Enable Bit 0 = Slave mode bit count error interrupt Disabled. 1 = Slave mode bit count error interrupt Enabled.
[7]	Reserved	Reserved.
[6]	SLVTORST	Slave Mode Time-out Reset Control 0 = When Slave mode time-out event occurs, the TX and RX control circuit will not be reset. 1 = When Slave mode time-out event occurs, the TX and RX control circuit will be reset by hardware.
[5]	SLVTOIEN	Slave Mode Time-out Interrupt Enable Bit 0 = Slave mode time-out interrupt Disabled. 1 = Slave mode time-out interrupt Enabled.

[4]	SLV3WIRE	Slave 3-wire Mode Enable Bit In Slave 3-wire mode, the QSPI controller can work with 3-wire interface including QSPIx_CLK, QSPIx_MISO and SPIx_MOSI pins. 0 = 4-wire bi-direction interface. 1 = 3-wire bi-direction interface.
[3]	AUTOSS	Automatic Slave Selection Function Enable Bit (Master Only) 0 = Automatic slave selection function Disabled. Slave selection signal will be asserted/de-asserted according to SS (QSPIx_SSCTL[0]). 1 = Automatic slave selection function Enabled.
[2]	SSACTPOL	Slave Selection Active Polarity This bit defines the active polarity of slave selection signal (QSPIx_SS). 0 = The slave selection signal QSPIx_SS is active low. 1 = The slave selection signal QSPIx_SS is active high.
[1]	Reserved	Reserved.
[0]	SS	Slave Selection Control (Master Only) If AUTOSS bit is cleared to 0, 0 = set the QSPIx_SS line to inactive state. 1 = set the QSPIx_SS line to active state. If the AUTOSS bit is set to 1, 0 = Keep the QSPIx_SS line at inactive state. 1 = QSPIx_SS line will be automatically driven to active state for the duration of data transfer, and will be driven to inactive state for the rest of the time. The active state of QSPIx_SS is specified in SSACTPOL (QSPIx_SSCTL[2]).

QSPI PDMA Control Register (QSPIx_PDMACTL)

Register	Offset	R/W	Description				Reset Value
QSPIx_PDMACTL	QSPIx_BA+0x0C	R/W	QSPI PDMA Control Register				0x0000_0000

31	30	29	28	27	26	25	24

Reserved					PDMARST	RXPDMAEN	TXPDMAEN

Bits	Description	
[31:3]	Reserved	Reserved.
[2]	PDMARST	PDMA Reset 0 = No effect. 1 = Reset the PDMA control logic of the QSPI controller. This bit will be automatically cleared to 0.
[1]	RXPDMAEN	Receive PDMA Enable Bit 0 = Receive PDMA function Disabled. 1 = Receive PDMA function Enabled.
[0]	TXPDMAEN	Transmit PDMA Enable Bit 0 = Transmit PDMA function Disabled. 1 = Transmit PDMA function Enabled. Note: In QSPI Master mode with full duplex transfer, if both TX and RX PDMA functions are enabled, RX PDMA function cannot be enabled prior to TX PDMA function. User can enable TX PDMA function firstly or enable both functions simultaneously.

QSPI FIFO Control Register (QSPIx_FIFOCTL)

Register	Offset	R/W	Description				Reset Value
QSPIx_FIFOCTL	QSPIx_BA+0x10	R/W	QSPI FIFO Control Register				0x4400_0000

31	30	29	28	27	26	25	24
Reserved	TXTH			Reserved	RXTH		
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved						TXFBCLR	RXFBCCLR
7	6	5	4	3	2	1	0
TXUFIEN	TXUFPOL	RXOVIEN	RXTOIEN	TXTHIEN	RXTHIEN	TXRST	RXRST

Bits	Description	
[31]	Reserved	Reserved.
[30:28]	TXTH	Transmit FIFO Threshold If the valid data count of the transmit FIFO buffer is less than or equal to the TXTH setting, the TXTHIF bit will be set to 1, else the TXTHIF bit will be cleared to 0.
[27]	Reserved	Reserved.
[26:24]	RXTH	Receive FIFO Threshold If the valid data count of the receive FIFO buffer is larger than the RXTH setting, the RXTHIF bit will be set to 1, else the RXTHIF bit will be cleared to 0.
[23:10]	Reserved	Reserved.
[9]	TXFBCLR	Transmit FIFO Buffer Clear 0 = No effect. 1 = Clear transmit FIFO pointer. The TXFULL bit will be cleared to 0 and the TXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 1 system clock after it is set to 1. Note: The TX shift register will not be cleared.
[8]	RXFBCCLR	Receive FIFO Buffer Clear 0 = No effect. 1 = Clear receive FIFO pointer. The RXFULL bit will be cleared to 0 and the RXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 1 system clock after it is set to 1. Note: The RX shift register will not be cleared.
[7]	TXUFIEN	TX Underflow Interrupt Enable Bit When TX underflow event occurs in Slave mode, TXUFIF (QSPIx_STATUS[19]) will be set to 1. This bit is used to enable the TX underflow interrupt. 0 = Slave TX underflow interrupt Disabled. 1 = Slave TX underflow interrupt Enabled.
[6]	TXUFPPOL	TX Underflow Data Polarity

		0 = The QSPI data out is keep 0 if there is TX underflow event in Slave mode. 1 = The QSPI data out is keep 1 if there is TX underflow event in Slave mode. Note: 1. The TX underflow event occurs if there is no any data in TX FIFO when the slave selection signal is active. 2. When TX underflow event occurs, QSPIx_MISO pin state will be determined by this setting even though TX FIFO is not empty afterward. Data stored in TX FIFO will be sent through QSPIx_MISO pin in the next transfer frame.
[5]	RXOVIEN	Receive FIFO Overrun Interrupt Enable Bit 0 = Receive FIFO overrun interrupt Disabled. 1 = Receive FIFO overrun interrupt Enabled.
[4]	RXTOIEN	Slave Receive Time-out Interrupt Enable Bit 0 = Receive time-out interrupt Disabled. 1 = Receive time-out interrupt Enabled.
[3]	TXTHIEN	Transmit FIFO Threshold Interrupt Enable Bit 0 = TX FIFO threshold interrupt Disabled. 1 = TX FIFO threshold interrupt Enabled.
[2]	RXTHIEN	Receive FIFO Threshold Interrupt Enable Bit 0 = RX FIFO threshold interrupt Disabled. 1 = RX FIFO threshold interrupt Enabled.
[1]	TXRST	Transmit Reset 0 = No effect. 1 = Reset transmit FIFO pointer and transmit circuit. The TXFULL bit will be cleared to 0 and the TXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 3 system clock cycles + 2 peripheral clock cycles after it is set to 1. User can read TXRXRST (QSPIx_STATUS[23]) to check if reset is accomplished or not. Note: If TX underflow event occurs in QSPI Slave mode, this bit can be used to make SPI return to idle state.
[0]	RXRST	Receive Reset 0 = No effect. 1 = Reset receive FIFO pointer and receive circuit. The RXFULL bit will be cleared to 0 and the RXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 3 system clock cycles + 2 peripheral clock cycles after it is set to 1. User can read TXRXRST (QSPIx_STATUS[23]) to check if reset is accomplished or not.

QSPI Status Register (QSPIx_STATUS)

Register	Offset	R/W	Description				Reset Value
QSPIx_STATUS	QSPIx_BA+0x14	R/W	QSPI Status Register				0x0005_0110

31	30	29	28	27	26	25	24
TXCNT				RXCNT			
23	22	21	20	19	18	17	16
TXRXRST	Reserved			TXUFIF	TXTHIF	TXFULL	TXEMPTY
15	14	13	12	11	10	9	8
SPIENSTS	Reserved		RXTOIF	RXOVIF	RXTHIF	RXFULL	RXEMPTY
7	6	5	4	3	2	1	0
SLVURIF	SLVBEIF	SLVTOIF	SSLINE	SSINAIF	SSACTIF	UNITIF	BUSY

Bits	Description	
[31:28]	TXCNT	Transmit FIFO Data Count (Read Only) This bit field indicates the valid data count of transmit FIFO buffer.
[27:24]	RXCNT	Receive FIFO Data Count (Read Only) This bit field indicates the valid data count of receive FIFO buffer.
[23]	TXRXRST	TX or RX Reset Status (Read Only) 0 = The reset function of TXRST or RXRST is done. 1 = Doing the reset function of TXRST or RXRST. Note: Both the reset operations of TXRST and RXRST need 3 system clock cycles + 2 peripheral clock cycles. User can check the status of this bit to monitor the reset function is doing or done.
[22:20]	Reserved	Reserved.
[19]	TXUFIF	TX Underflow Interrupt Flag When the TX underflow event occurs, this bit will be set to 1, the state of data output pin depends on the setting of TXUFPOL. 0 = No effect. 1 = No data in Transmit FIFO and TX shift register when the slave selection signal is active. Note 1: This bit will be cleared by writing 1 to it. Note 2: If reset slave's transmission circuit when slave selection signal is active, this flag will be set to 1 after 2 peripheral clock cycles + 3 system clock cycles since the reset operation is done.
[18]	TXTHIF	Transmit FIFO Threshold Interrupt Flag (Read Only) 0 = The valid data count within the transmit FIFO buffer is larger than the setting value of TXTH. 1 = The valid data count within the transmit FIFO buffer is less than or equal to the setting value of TXTH.
[17]	TXFULL	Transmit FIFO Buffer Full Indicator (Read Only) 0 = Transmit FIFO buffer is not full.

		1 = Transmit FIFO buffer is full.
[16]	TXEMPTY	Transmit FIFO Buffer Empty Indicator (Read Only) 0 = Transmit FIFO buffer is not empty. 1 = Transmit FIFO buffer is empty.
[15]	SPIENSTS	QSPI Enable Status (Read Only) 0 = QSPI controller Disabled. 1 = QSPI controller Enabled. Note: The QSPI peripheral clock is asynchronous with the system clock. In order to make sure the QSPI control logic is disabled, this bit indicates the real status of QSPI controller.
[14:13]	Reserved	Reserved.
[12]	RXTOIF	Receive Time-out Interrupt Flag 0 = No receive FIFO time-out event. 1 = Receive FIFO buffer is not empty and no read operation on receive FIFO buffer over 64 QSPI peripheral clock periods in Master mode or over 576 QSPI peripheral clock periods in Slave mode. When the received FIFO buffer is read by software, the time-out status will be cleared automatically. Note: This bit will be cleared by writing 1 to it.
[11]	RXOVIF	Receive FIFO Overrun Interrupt Flag When the receive FIFO buffer is full, the follow-up data will be dropped and this bit will be set to 1. 0 = No FIFO is overrun. 1 = Receive FIFO is overrun. Note: This bit will be cleared by writing 1 to it.
[10]	RXTHIF	Receive FIFO Threshold Interrupt Flag (Read Only) 0 = The valid data count within the receive FIFO buffer is smaller than or equal to the setting value of RXTH. 1 = The valid data count within the receive FIFO buffer is larger than the setting value of RXTH.
[9]	RXFULL	Receive FIFO Buffer Full Indicator (Read Only) 0 = Receive FIFO buffer is not full. 1 = Receive FIFO buffer is full.
[8]	RXEMPTY	Receive FIFO Buffer Empty Indicator (Read Only) 0 = Receive FIFO buffer is not empty. 1 = Receive FIFO buffer is empty.
[7]	SLVURIF	Slave Mode TX Under Run Interrupt Flag In Slave mode, if TX underflow event occurs and the slave select line goes to inactive state, this interrupt flag will be set to 1. 0 = No Slave TX under run event. 1 = Slave TX under run event occurred. Note: This bit will be cleared by writing 1 to it.
[6]	SLVBEIF	Slave Mode Bit Count Error Interrupt Flag In Slave mode, when the slave select line goes to inactive state, if bit counter is mismatch with DWIDTH, this interrupt flag will be set to 1. 0 = No Slave mode bit count error event. 1 = Slave mode bit count error event occurred. Note: If the slave select active but there is no any bus clock input, the SLVBEIF also active when the slave select goes to inactive state. This bit will be cleared by writing 1 to it.
[5]	SLVTOIF	Slave Time-out Interrupt Flag

		<p>When the slave select is active and the value of SLVTOCNT is not 0, as the bus clock is detected, the slave time-out counter in QSPI controller logic will be started. When the value of time-out counter is greater than or equal to the value of SLVTOCNT (QSPIx_SSCTL[31:16]) before one transaction is done, the slave time-out interrupt event will be asserted.</p> <p>0 = Slave time-out is not active. 1 = Slave time-out is active.</p> <p>Note: This bit will be cleared by writing 1 to it.</p>
[4]	SSLINE	<p>Slave Select Line Bus Status (Read Only)</p> <p>0 = The slave select line status is 0. 1 = The slave select line status is 1.</p> <p>Note: This bit is only available in Slave mode. If SSACTPOL (QSPIx_SSCTL[2]) is set 0, and the SSLINE is 1, the QSPI slave select is in inactive status.</p>
[3]	SSINAIF	<p>Slave Select Inactive Interrupt Flag</p> <p>0 = Slave select inactive interrupt was cleared or not occurred. 1 = Slave select inactive interrupt event occurred.</p> <p>Note: Only available in Slave mode. This bit will be cleared by writing 1 to it.</p>
[2]	SSACTIF	<p>Slave Select Active Interrupt Flag</p> <p>0 = Slave select active interrupt was cleared or not occurred. 1 = Slave select active interrupt event occurred.</p> <p>Note: Only available in Slave mode. This bit will be cleared by writing 1 to it.</p>
[1]	UNITIF	<p>Unit Transfer Interrupt Flag</p> <p>0 = No transaction has been finished since this bit was cleared to 0. 1 = QSPI controller has finished one unit transfer.</p> <p>Note: This bit will be cleared by writing 1 to it.</p>
[0]	BUSY	<p>Busy Status (Read Only)</p> <p>0 = QSPI controller is in idle state. 1 = QSPI controller is in busy state.</p> <p>The following lists the bus busy conditions:</p> <ul style="list-style-type: none"> f. QSPIx_CTL[0] = 1 and TXEMPTY = 0. g. For QSPI Master mode, QSPIx_CTL[0] = 1 and TXEMPTY = 1 but the current transaction is not finished yet. h. For QSPI Master mode, QSPIx_CTL[0] = 1 and RXONLY = 1. i. For QSPI Slave mode, the QSPIx_CTL[0] = 1 and there is serial clock input into the QSPI core logic when slave select is active. j. For QSPI Slave mode, the QSPIx_CTL[0] = 1 and the transmit buffer or transmit shift register is not empty even if the slave select is inactive.

QSPI Data Transmit Register (QSPIx_TX)

Bits	Description	
[31:0]	RX	<p>Data Receive Register (Read Only)</p> <p>There are 8-level FIFO buffers in this controller. The data receive register holds the data received from QSPI data input pin. If the RXEMPTY (QSPIx_STATUS[8]) is not set to 1, the receive FIFO buffers can be accessed through software by reading this register.</p>

6.21 SPI Synchronous Serial Interface Controller (SPI Master mode)

6.21.1 Overview

The SPI Synchronous serial Interface Controller for SPI master mode performs a serial-to-parallel conversion on data received from the peripheral, and a parallel-to-serial conversion on data received from MCU. This SPI controller can drive one external peripheral (External SPI Flash) and it is seen as the SPI master mode. It can generate an interrupt signal when data transfer is finished and can be cleared by writing 1 to the interrupt flag. The active level of device/slave select signal can be chosen to low active or high active, which depends on the peripheral. Writing a divisor into the SPIM_CTL1 register can program the frequency of serial clock output to the peripheral.

In SPI Flash controller, normal I/O mode contains four 32-bit transmit/receive buffers, and can provide 1 to 4 burst mode operation. The number of bits in each transaction can be 8, 16, 24, or 32; data can be transmitted/received up to four successive transactions in one transfer.

By DMA write mode, user can move data from SRAM to external SPI Flash component. In DMA read mode, user can move data from external SPI Flash component to SRAM. In direct memory mapping mode (DMM mode), this SPI Flash controller will translate the AHB bus commands into SPI Flash operations without MCU setting related SPI Flash command. Therefore users can access external SPI Flash as a ROM module.

In direct memory mapping mode with cache off mode, it will pre-fetch 4-word Flash data after a direct memory mapping access. when using direct memory mapping mode with cache on mode, it will use 32 Kbytes cache memory to reduce the number of accessing external SPI Flash component and the performance of SPI Flash access can be improved. To improve the read operation of SPI Flash without increasing the serial clock frequency, this SPI Flash controller supports DTR/DDR (Double Transfer Rate/Double Data Rate) read command codes that support Standard/Dual/Quad SPI modes. The one byte command code is still latched into the device on the rising edge of the serial clock similar to all other SPI commands. Once a DTR/DDR instruction code is accepted by the device, the address input and data output will be latched on both rising and falling edges of the serial clock.

In core coupled memory mode (CCM mode), the cache function is disabled by hardware automatically, and MCU can access this 32 Kbytes cache memory as general SRAM. For data protection, this SPI Flash controller supports cipher encryption and decryption circuits to protect data which user places into external SPI Flash when DMA read/write mode and direct memory mapping mode are used.

6.21.2 Features

- Supports maximum 32M bytes SPI Flash size
- Supports SPI master mode
- Supports Direct Memory Mapping Mode and Normal I/O Mode
- Supports 8/16/24/32 bits transaction for Normal I/O mode
- Provides burst mode operation in Normal I/O mode, which can transmit/receive data up to four successive transactions in one transfer
- Supports DMA mode read/write
- Supports standard (1-bit), dual (2-bit), and quad (4-bit) I/O transfer mode
- Supports Double Transfer Rate (DTR) / Double Data Rate (DDR) transfer mode
- Supports 32 Kbytes cache memory
- Supports 32 Kbytes Core Coupled Memory (CCM) when cache function disable
- Supports Cipher encryption/decryption

- One slave/device select line for external SPI Flash component

6.21.5 Functional Description

6.21.5.1 SPIM Timing Diagram

The timing diagram of SPI transaction is shown as follows:

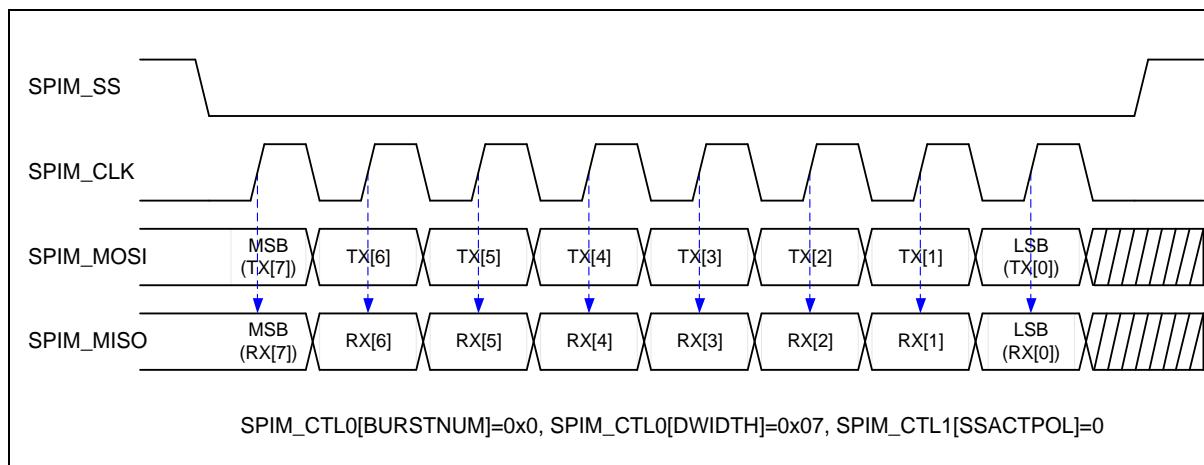

Figure 6.21-2 SPIM Timing Diagram

6.21.5.2 SPIM Programming Example without DMA (Normal I/O Mode)

To access a device with the following requirements, where the timing diagram is shown in Figure 6.21-2:

- Data is transferred with the MSB first.
- Only one byte is transmitted/received in a transfer.
- Chip select signal is active low.
- User should do the following actions basically (refer to the specification of the device for the detailed steps):

1. Write a divisor into DIVIDER (SPIM_CTL1[31:16]) to determine the frequency of serial clock.

2. Set SACTPOL (SPIM_CTL1[5]) to 0 to activate the device you want to access.
3. When transmitting (writing) data to device:
 - QDIODIR (SPIM_CTL0[15]) = 1
 - BURSTNUM (SPIM_CTL0[14:13]) = 0x0
 - DWIDTH (SPIM_CTL0[12:8]) = 0x07
 - Write the data you want to transmit into SPIM_TX0[7:0]
4. When receiving (reading) data from device:
 - QDIODIR (SPIM_CTL0[15]) = 0
 - BURSTNUM (SPIM_CTL0[14:13]) = 0x0
 - DWIDTH (SPIM_CTL0[12:8]) = 0x07
5. Set SPIMEN (SPIM_CTL1[0]) to 1 to start the transfer.
6. Wait for interrupt or poll the SPIMEN (SPIM_CTL1[0]) until it turns to 0.
7. When receiving (reading) data from device:
 - Read out the received data from the SPIM_RX0[7:0] register.

6.21.5.3 SPIM Programming Example with DMA

If user wants to access a device with DMA function, three additional registers need to be configured, including SPIM_DMACNT, SPIM_SRAMADDR and SPIM_FADDR. The DMA function can be used to support loading code (reading data from the peripheral into system memory) or reading data from system memory and storing the data in the peripheral. Users must define the source, length and destination, and then hardware will automatically move the desired length of code to the specific target address. It is recommended to send disable commands of continuous read mode and burst wrap mode to external SPI Flash component before using DMA read/write operations to transfer data between SRAM and SPI Flash.

6.21.5.4 Move Data from SPI Flash to System Memory (DMA Read Mode)

Step 1: Check device ID by using normal I/O mode to confirm the device has connected.

Step 2:

1. Set the target memory address into the SPIM_SRAMADDR register.
2. Set the code length into the SPIM_DMACNT register.
3. Set the SPI Flash start address in the SPIM_FADDR register.
4. Set OPMODE (SPIM_CTL0[23:22]) with the DMA Read mode.
5. Set CMDCODE (SPIM_CTL0[31:24]) with the 0x03 command code.
6. Set SPIMEN (SPIM_CTL1[0]) to start. Then SPIM will move the code block from SPIM_FADDR to SPIM_SRAMADDR with the transfer length set in SPIM_DMACNT.
7. Wait for interrupt or poll the SPIMEN (SPIM_CTL1[0]) bit until it turns to 0.

If the used SPI Flash supports other associated read commands, users can also use the following read command codes.

- Fast Read (0Bh), set CMDCODE (SPIM_CTL0[31:24]) with 0x0B.
- Fast Read Dual Output (3Bh), set CMDCODE (SPIM_CTL0[31:24]) with 0x3B.
- Fast Read Dual I/O (BBh), set CMDCODE (SPIM_CTL0[31:24]) with 0xBB.
- Fast Read Quad I/O (EBh), set CMDCODE (SPIM_CTL0[31:24]) with 0xEB.

- Word Read Quad I/O (E7h), set CMDCODE (SPIM_CTL0[31:24]) with 0xE7.
- DTR/DDR Fast Read (0Dh), set CMDCODE (SPIM_CTL0[31:24]) with 0x0D.
- DTR/DDR Fast Read Dual I/O (BDh), set CMDCODE (SPIM_CTL0[31:24]) with 0xBD.
- DTR/DDR Fast Read Quad I/O (EDh), set CMDCODE (SPIM_CTL0[31:24]) with 0xED.

6.21.5.5 Move Data from System Memory to SPI Flash (DMA Write Mode)

Step 1: Erase the SPI Flash (using normal I/O mode) before programming it.

Step 2:

- Send Write Enable command to SPI Flash (using normal I/O mode).
- Set the source memory address in the SPIM_SRAMADDR register.
- Set the transfer count into the SPIM_DMACNT register.
- Set the SPI Flash start address in the SPIM_FADDR register.
- Set OPMODE (SPIM_CTL0[23:22]) with the DMA Write mode.
- Set CMDCODE (SPIM_CTL0[31:24]) with the 0x02 command code.
- Set SPIMEN (SPIM_CTL1[0]) to start.
- Wait for interrupt or poll the SPIMEN (SPIM_CTL1[0]) until it turns to 0.

If the used SPI Flash supports other associated write commands, users can also use the following command code. (User needs to refer to specification of external SPI Flash component to select suitable quad write mode command.)

- Quad write, set CMDCODE (SPIM_CTL0[31:24]) to 0x32 for TYPE_1 program command (refer to Figure 6.21-3).
- Quad write, set CMDCODE (SPIM_CTL0[31:24]) to 0x38 for TYPE_2 program command (refer to Figure 6.21-4).
- Quad write, set CMDCODE (SPIM_CTL0[31:24]) to 0x40 for TYPE_3 program command (refer to Figure 6.21-5).

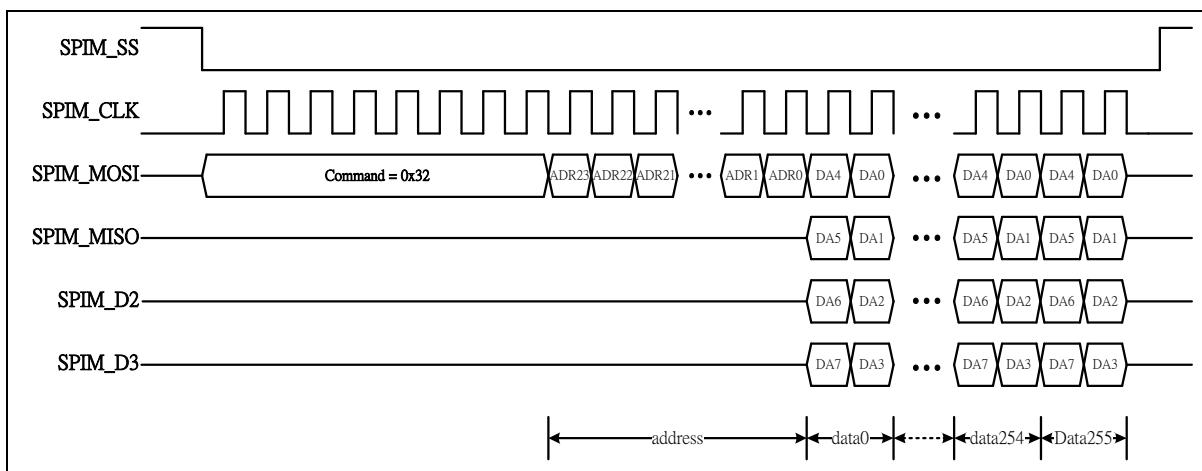

Figure 6.21-3 TYPE_1 Program Command Flow with Quad Mode Write

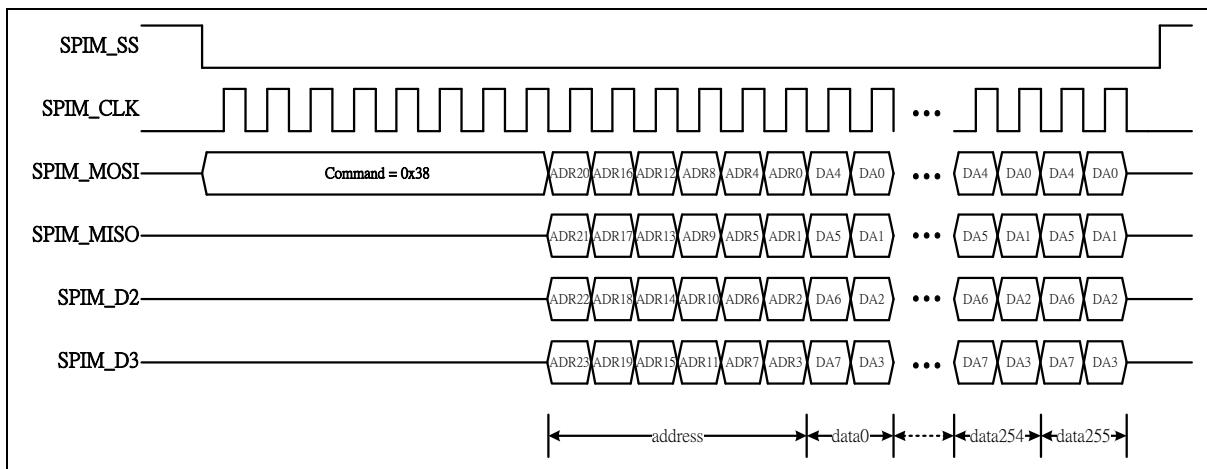

Figure 6.21-4 TYPE_2 Program Command Flow with Quad Mode Write

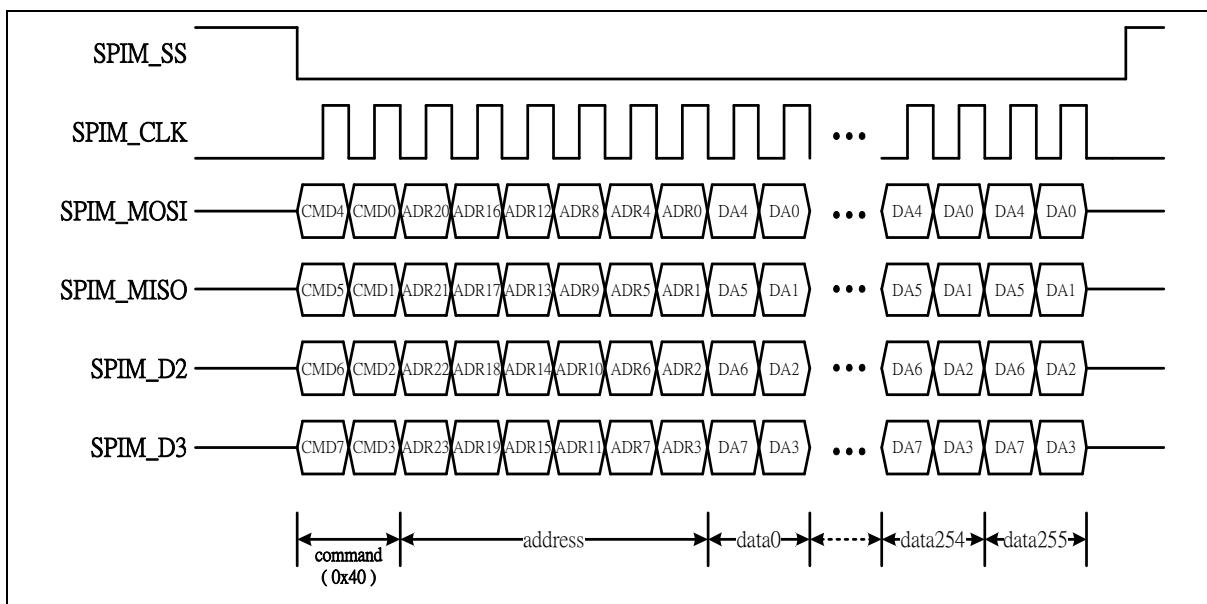

Figure 6.21-5 TYPE_3 Program Command Flow with Quad Mode Write

6.21.5.6 Direct Memory Mapping Mode

SPI Flash can be regarded as a ROM module in direct memory mapping mode. The controller will convert the AHB cycle into SPI Flash without MCU setting related SPI Flash command. The only setting MCU needs to do is to set CMDCODE(SPI_M_CTL0[31:24]) with command codes 0x03, 0x0B, 0x3B, 0xBB, 0xEB, 0xE7, 0x0D, 0xBD, or 0xED. Then users can access SPI Flash as a ROM module.

In direct memory mapping mode with cache off mode, it will pre-fetch 4-word Flash data after a direct memory mapping access. In direct memory mapping mode with cache function on and core coupled memory mode (CCM mode) off, it will use cache memory to reduce the number of accessing external SPI Flash component. Therefore the performance of SPI Flash access can be improved. If users want to modify SPIM hardware registers after the direct memory mapping access, wait for at least 250 peripheral cycles (SPIM bus cycles).

In direct memory mapping mode (DMM mode), quad/dual read commands codes “0xEB, 0xE7, 0xBB” and DTR/DDR read command codes “0x0D, 0xBD, 0xED” support continuous read mode (or performance enhance mode) to reduce the command sequence by eight clocks, and allows the read address data to be entered after chip select of SPI Flash component is asserted low (please check the used SPI Flash specification to know support information). Figure 6.21-6 shows the SPI data transfer of quad I/O mode when the continuous read mode is disabled and address mode is 3 bytes.

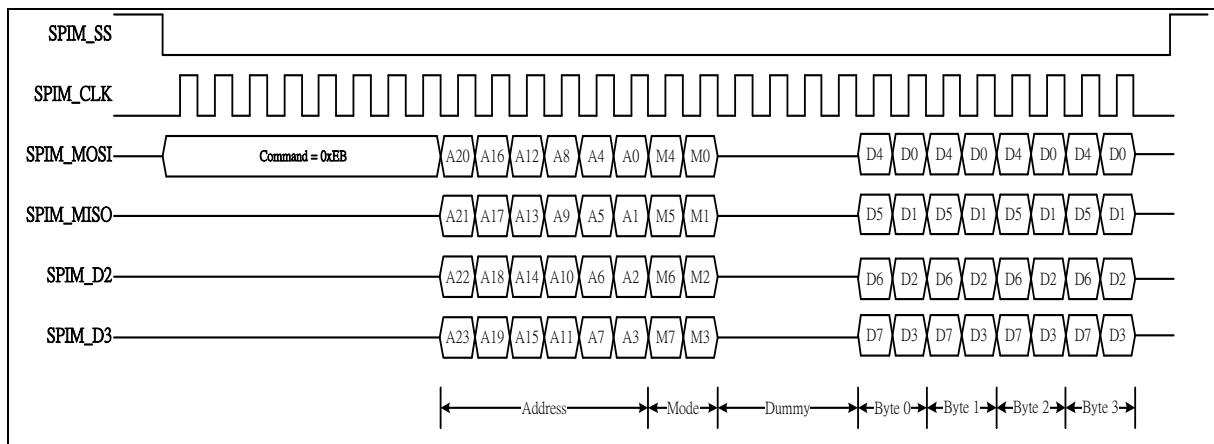

Figure 6.21-6 Fast Read Quad I/O Command 0xEB with Continuous Read Mode Disable

Figure 6.21-7 shows the next SPI data transfer of quad I/O mode when the continuous read mode is enabled and address mode is 3 bytes.

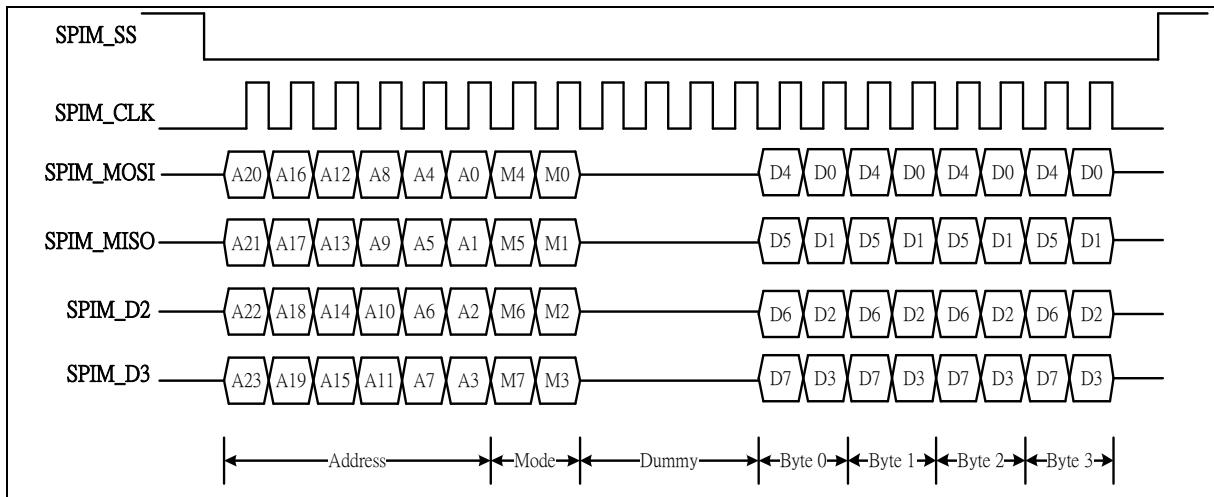

Figure 6.21-7 Fast Read Quad I/O Command 0xEB with Continuous Read Mode Enable

List for supported SPI Flash vendors of continuous read mode for read command 0xBB, 0xEB, 0xE7, 0x0D, 0xBD, and 0xED in direct memory mapping mode:

- Supported SPI Flash vendors for read command 0xBB: Winbond only
- Supported SPI Flash vendors for read command 0xEB: Winbond, Gigadevice, Spansion, EON, and MXIC
- Supported SPI Flash vendors for read command 0xE7: Winbond only
- Supported SPI Flash vendors for DTR/DDR read command 0x0D: Check used SPI Flash specification
- Supported SPI Flash vendors for DTR/DDR Dual I/O read command 0xBD: Check used SPI Flash specification
- Supported SPI Flash vendors for DTR/DDR Quad I/O read command 0xED: Check used SPI Flash specification

After using command codes 0xEB, 0xE7, 0x0D, 0xBD, and 0xED to read the last needed SPI Flash data in DMM mode with the continuous read mode on, please use normal I/O mode to send 0xFF (8 SPI clocks for 3 bytes address mode) or 0x3FF (10 SPI clocks for 4 bytes address mode) to the

external SPI Flash on SPI serial interface pin sdo_0 to disable continuous read mode of the external SPI Flash. Check the used SPI Flash specification to know the information of continuous read mode (or performance enhance mode).

When using command codes “0xBB” to read the last needed SPI Flash data in DMM mode with the continuous read mode on, please use normal I/O mode to send 0xFFFF (16 SPI clocks for 3 bytes address mode) or 0xFFFFFFF (20 SPI clocks for 4 bytes address mode) to the external SPI Flash on SPI serial interface pin sdo_0. Please check the used SPI Flash specification to know the information of continuous read mode (or performance enhance mode).

Use the following settings of normal I/O mode to send continuous read mode reset to the external SPI Flash. Please check the used SPI Flash specification to know the information of continuous read mode (or performance enhance mode).

Steps for continuous read mode reset (disable) for command codes 0xEB, 0xE7, 0x0D, 0xBD, 0xED in direct memory mapping mode:

1. Set OPMODE(SPIM_CTL0[23:22]) to 0x0 (normal I/O mode)
2. Set BITMODE(SPIM_CTL0[21:20]) to 0x2 (quad mode, use 4 serial SPI signals to send data to SPI Flash)
3. Set QDIODIR(SPIM_CTL0[15]) to 0x1 (write mode)
4. Set BURSTNUM(SPIM_CTL0[14:13]) to 0x0 (only one transmit/receive transaction will be executed in one transfer)
5. Set DWIDTH(SPIM_CTL0[12:8]) to 0x1F (send 32 bits data to SPI Flash)
6. Set SPIM_TX0 register to 0xFFFFFFFF
7. Set SPIMEN(SPIM_CTL1[0]) to start normal I/O operations
8. Polling SPIMEN(SPIM_CTL1[0]) to check operation status when normal I/O mode is going. (1 = busy, 0 = finish)
9. Set SS(SPIM_CTL1[4]) to let SPIM_SS in inactive level

Steps for continuous read mode reset for command code 0xBB in direct memory mapping mode:

1. Set OPMODE(SPIM_CTL0[23:22]) to 0x0 (normal I/O mode)
2. Set BITMODE(SPIM_CTL0[21:20]) to 0x1 (dual mode, use 2 serial SPI signals to send data to SPI Flash)
3. Set QDIODIR(SPIM_CTL0[15]) to 0x1 (write mode)
4. Set BURSTNUM(SPIM_CTL0[14:13]) to 0x0 (only one transmit/receive transaction will be executed in one transfer)
5. Set DWIDTH(SPIM_CTL0[12:8]) to 0x1F (send 32 bits data to SPI Flash)
6. Set SPIM_TX0 register to 0xFFFFFFFF
7. Set SPIMEN(SPIM_CTL1[0]) to start normal I/O operations
8. Polling SPIMEN(SPIM_CTL1[0]) to check operation status when normal I/O mode is going. (1 = busy, 0 = finish)
9. Set SS(SPIM_CTL1[4]) to let SPIM_SS in inactive level

In direct memory mapping mode, both of quad read commands “0xEB” and “0xE7” support burst wrap mode for cache application and performance enhance. For cache application, the burst wrap mode can be used to fill the cache line quickly (In this SPI Flash controller, use cache data line with 16 bytes size). For performance enhance with direct memory mapping mode and cache enable, when cache data is miss, the burst wrap mode can let MCU get the required SPI Flash data quickly. When both of the burst wrap mode and continuous read mode are switched from enable to disable, the continuous

read mode of the external SPI Flash is disabled firstly and then the burst wrap mode of the external SPI Flash is disabled secondly.

Before DMM mode with read command codes “0xEB or 0xE7” and burst wrap mode is used to access external SPI Flash, please use normal I/O mode of SPI Flash controller to send “0x1101_1101 and 0x2000_0000” (burst wrap enable command of external SPI Flash, it needs 16 SPI clocks. Please check used SPI Flash specification to know information and setting values for burst wrap mode.) to the external SPI Flash on SPI serial interface pin sdo_0 ~ sdo_3. After using command codes “0xEB and 0xE7” to read the last needed SPI Flash data in DMM mode with the burst wrap mode on, please use normal I/O mode of SPI Flash controller to send “0x1101_1101 and 0x0000_0000” (burst wrap disable command of external SPI Flash, it needs 16 SPI clocks. Please check used SPI Flash specification to know information and setting values for burst wrap mode.) to the external SPI Flash on SPI serial interface pin sdo_0 ~ sdo_3.

Use the following settings of normal I/O mode of SPI Flash controller to send SPI command codes to enable or disable the burst wrap mode for the external SPI Flash.

Steps for burst wrap mode enable in direct memory mapping mode:

1. Set OPMODE(SPIM_CTL0[23:22]) to 0x0 (normal I/O mode)
2. Set BITMODE(SPIM_CTL0[21:20]) to 0x2 (quad mode, use 4 serial SPI signals to send data to SPI Flash)
3. Set QDIODIR(SPIM_CTL0[15]) to 0x1 (write mode)
4. Set BURSTNUM(SPIM_CTL0[14:13]) to 0x1 (two successive/receive transaction will be executed in one transfer)
5. Set DWIDTH(SPIM_CTL0[12:8]) to 0x1F (send 32 bits data to SPI Flash)
6. Set SPIM_TX0 register to 0x20000000, SPIM_TX1 register to 0x11011101
7. Set SPIMEN(SPIM_CTL1[0]) to start normal I/O operations
8. Polling SPIMEN(SPIM_CTL1[0]) to check operation status when normal I/O mode is going. (1 = busy, 0 = finish)
9. Set SS(SPIM_CTL1[4]) to let SPIM_SS in inactive level

Steps for burst wrap mode disable in direct memory mapping mode:

1. Set OPMODE(SPIM_CTL0[23:22]) to 0x0 (normal I/O mode)
2. Set BITMODE(SPIM_CTL0[21:20]) to 0x2 (quad mode, use 4 serial SPI signals to send data to SPI Flash)
3. Set QDIODIR(SPIM_CTL0[15]) to 0x1 (write mode)
4. Set BURSTNUM(SPIM_CTL0[14:13]) to 0x1 (two successive/receive transaction will be executed in one transfer)
5. Set DWIDTH(SPIM_CTL0[12:8]) to 0x1F (send 32 bits data to SPI Flash)
6. Set SPIM_TX0 register to 0x00000000, SPIM_TX1 register to 0x11011101
7. Set SPIMEN(SPIM_CTL1[0]) to start normal I/O operations
8. Polling SPIMEN(SPIM_CTL1[0]) to check operation status when normal I/O mode is going. (1 = busy, 0 = finish)
9. Set SS(SPIM_CTL1[4]) to let SPIM_SS in inactive level

To improve the read operation throughput without increasing the serial clock frequency, this SPI Flash controller supports DTR/DDR (Double Transfer Rate/Double Data Rate) Read command codes (i.e. 0x0D, 0xBD, 0xED) that support Standard/Dual/Quad SPI modes for direct memory mapping mode and DMA read mode. The one byte command code is still latched into the device on the 8 rising edges of the serial clock. Once a DTR/DDR instruction code is accepted by the device, the SPI Flash read

address, mode bits, dummy cycles, and output data, which sends from SPI Flash component will be latched on both rising and falling edges of the serial clock. The timing diagrams for DTR/DDR read command 0x0D, 0xBD, and 0Xed are shown below.

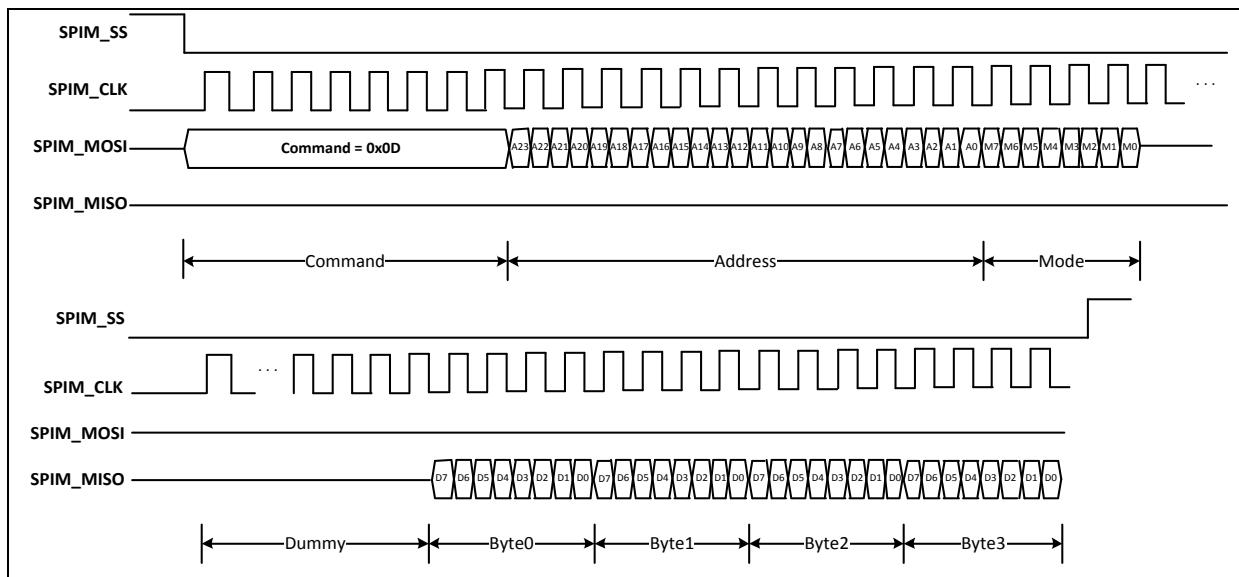

Figure 6.21-8 DTR/DDR Fast read command 0x0D

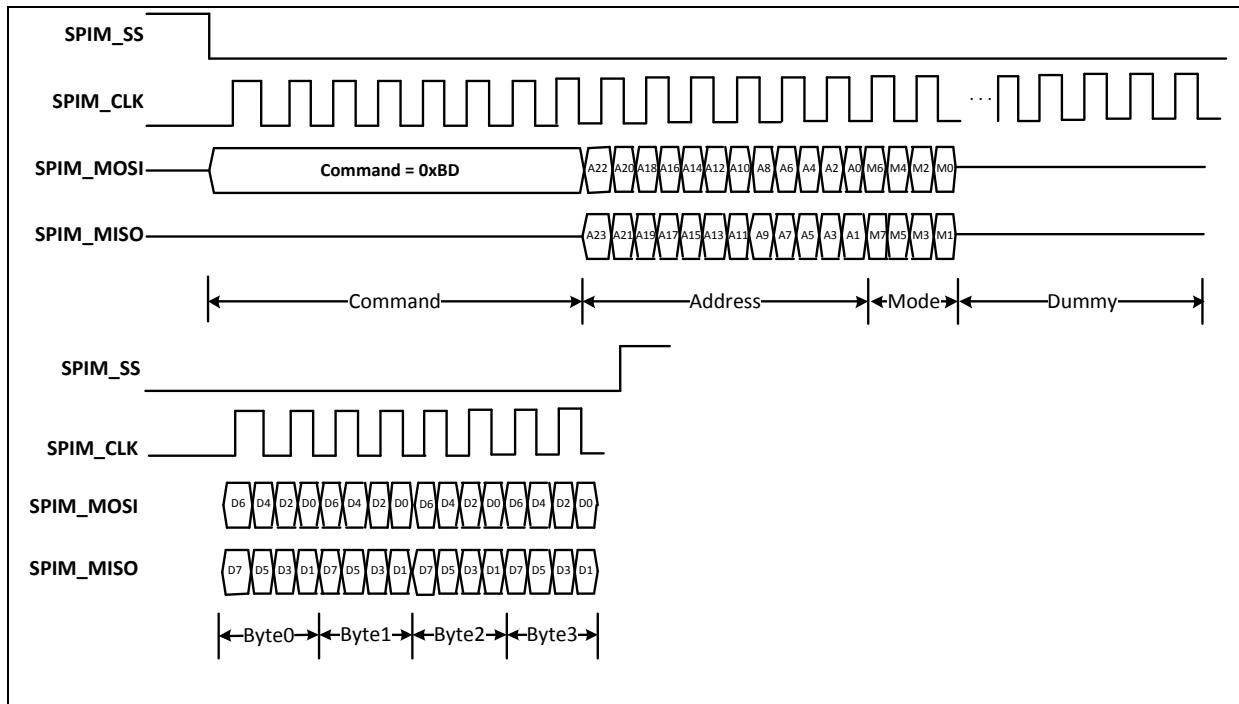

Figure 6.21-9 DTR/DDR Fast Read Dual I/O Command 0xBD

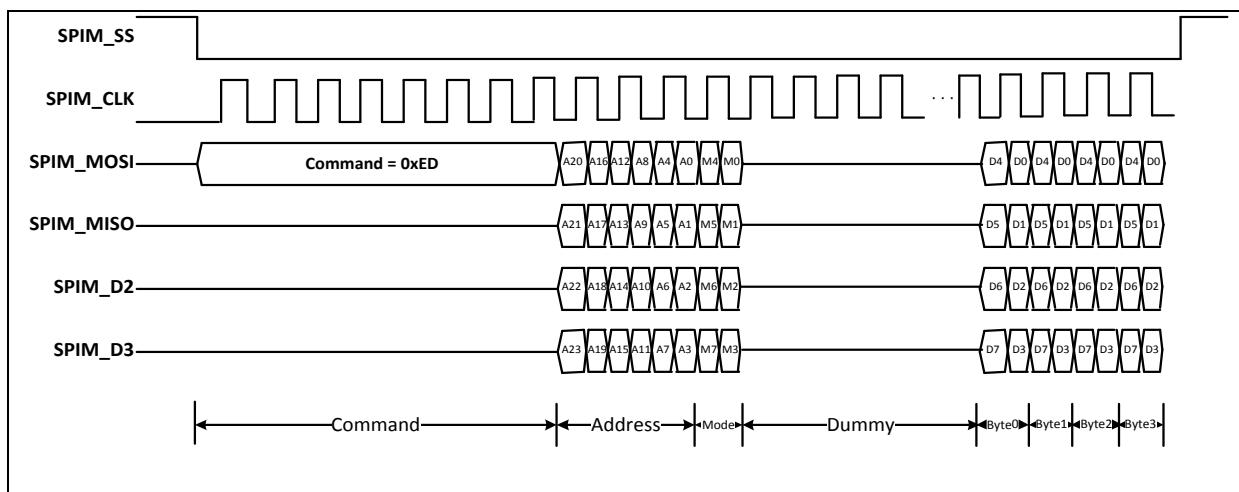

Figure 6.21-10 DTR/DDR Fast Read Quad I/O Command 0xED

The dummy cycle number depends on SPI Flash vendors, operation frequencies, and command types, and please check used SPI Flash specification to know dummy cycle number correctly.

6.21.5.7 Core Coupled Memory Mode (CCM Mode)

When user sets CCMEN(SPI_M_CTL1[2]) to 1, the operation mode of cache memory will be core coupled memory mode (CCM mode). In CCM mode, the cache function of SPI Flash controller is disabled by hardware automatically, and MCU can access this core coupled memory as general SRAM. When user sets CCMEN(SPI_M_CTL1[2]) to 0 and MCU accesses CCM address range, SPI Flash controller will generate AHB error response to MCU.

6.21.5.8 Cipher Encryption and Decryption

In the SPI Flash controller, cipher encryption and decryption functions are supported to protect data which user places into external SPI Flash. When DMA write mode is used and cipher function is enabled, cipher circuit will encrypt the data which move from SRAM to external SPI Flash. When DMA read mode is used and cipher function is enabled, cipher circuit will decrypt the data which move from external SPI Flash to SRAM. When direct memory mapping mode is used and cipher function is enabled, cipher circuit will decrypt the data which MCU reads from external SPI Flash. In normal I/O mode, the data which send to external SPI Flash or receive from external SPI Flash are not encrypted and decrypted by cipher circuit.

6.21.6 Mapping Address for SPI Flash Controller in AMBA System

Address Space	Token	Controllers
Mapping address for SPIM control register, SPI Flash memory space, core coupled memory space		
0x4000_7000 – 0x4000_7FFF	SPIM_BA	SPIM Control Registers
(1) When chip SRAM size is 96KB: 0x1001_0000 – 0x1001_7FFF 0x2001_0000 – 0x2001_7FFF (2) When chip SRAM size is 128KB: 0x1001_8000 – 0x1001_FFFF 0x2001_8000 – 0x2001_FFFF (3) When chip SRAM size is 160KB: 0x1002_0000 – 0x1002_7FFF 0x2002_0000 – 0x2002_7FFF	SRAM2_BA	<p>SRAM Memory Space (32KB) for MCU only and share with SPIM cache (when CCM mode is enabled)</p> <p>Note: the chip can be configured as three kinds of SRAM size (160KB/128KB/96KB). Please check the SRAM configuration to confirm the address range which MCU can access in CCM mode.</p>
0x0800_0000 – 0x09FF_FFFF	SPIM_FLASH_BA	Access address range of SPIM Memory Space (32MB) for Direct Memory Mapping mode (DMM mode).

Table 6.21-1 Mapping Address for SPI Flash Controller in AMBA System

6.21.7 Register Map

R: read only, W: write only, R/W: both read and write, C: Only value 0 can be written

Register	Offset	R/W	Description	Reset Value
SPIM Base Address:				
SPIM_BA = 0x4000_7000

Bits	Description
[31:24]	<p>Page Program Command Code (Note4) 0x02 = Page program (Used for DMA Write mode). 0x32 = Quad page program with TYPE_1 program flow (Used for DMA Write mode). (Note3) 0x38 = Quad page program with TYPE_2 program flow (Used for DMA Write mode). (Note3) 0x40 = Quad page program with TYPE_3 program flow (Used for DMA Write mode). (Note3) The Others = Reserved.</p> <p>Read Command Code: 0x03 = Standard Read (Used for DMA Read/DMM mode). 0x0B = Fast Read (Used for DMA Read/DMM mode). The fast read command code “0xB” is similar to command code of standard read “0x03” except it can operate at highest possible frequency. (Note2)</p> <p>0x3B = Fast Read Dual Output (Used for DMA Read/DMM mode). 0xBB = Fast Read Dual I/O (Used for DMA Read/DMM mode). The fast read dual I/O command code “0xBB” is similar to command code of fast read dual output “0x3B” but with capability to input the address bits two bits per clock. (Note2)</p> <p>0xEB = Fast quad read (Used for DMA Read/DMM mode). 0xE7 = Word quad read (Used for DMA Read/DMM mode). The command code of word quad read “0xE7” is similar to command code of fast quad read “0xEB” except that the lowest address bit must equal to 0 and the number of dummy cycles is less than fast quad read. (Note2)</p> <p>0x0D = DTR/DDR Fast read (Used for DMA Read/DMM mode). 0xBD = DTR/DDR dual read (Used for DMA Read/DMM mode). 0xED = DTR/DDR quad read (Used for DMA Read/DMM mode). The Others command codes are Reserved. The DTR/DDR read commands “0x0D,0xBD,0xED” improves throughput by transferring address and data on both the falling and rising edge of SPI Flash clock (SPIM_CLK). It is</p>

		<p>similar to those commands “0x0B, 0xBB, 0xEB” but allows transfer of address and data on rising edge and falling edge of SPI Flash output clock. (Note2)</p> <p>Note1: Quad mode of SPI Flash must be enabled first by normal I/O mode before using quad page program/quad read commands.</p> <p>Note2: See SPI Flash specifications for support items.</p> <p>Note3: For TYPE_1, TYPE_2, and TYPE_3 of page program command code, refer to Figure 6.21-3, Figure 6.21-4, and Figure 6.21-5.</p> <p>Note4: Please disable “continuous read mode” and “burst wrap mode” before DMA write mode of SPI Flash controller is used to program data of external SPI Flash. After using DMA write mode of SPI Flash controller to program the content of external SPI Flash, please set CDINVAL(SPIM_CTL1[3]) to 0x1 (Set all cache data to be invalid).</p>
[23:22]	OPMODE	<p>SPI Function Operation Mode</p> <p>0x0 = Normal I/O mode. (Note1) (Note3)</p> <p>0x1 = DMA write mode. (Note2) (Note3)</p> <p>0x2 = DMA read mode. (Note3)</p> <p>0x3 = Direct Memory Mapping mode (DMM mode) (Default). (Note4)</p> <p>Note1: After using Normal I/O mode of SPI Flash controller to program the content of external SPI Flash, please set CDINVAL(SPIM_CTL1[3]) to 0x1 (Set all cache data to be invalid).</p> <p>Note2: In DMA write mode, hardware will send just one page program command per operation. Users must take care of cross-page cases. After using DMA write mode of SPI Flash controller to program the content of external SPI Flash, please set CDINVAL(SPIM_CTL1[3]) to 0x1 (Set all cache data to be invalid).</p> <p>Note3: For external SPI Flash with 32 MB, access address range of external SPI Flash address is from 0x00000000 to 0x01FFFFFF when using Normal I/O mode, DMA write mode, and DMA read mode to write/read external SPI Flash data. Please user check size of used SPI Flash component to know access address range of external SPI Flash.</p> <p>Note4: For external SPI Flash with 32 MB, access address range of external SPI Flash address is from 0x08000000 to 0x09FFFFFF when using Direct Memory mapping mode (DMM mode) to read external SPI Flash data. Please user check size of used SPI Flash component to know access address range of external SPI Flash.</p>
[21:20]	BITMODE	<p>SPI Interface Bit Mode</p> <p>0x0 = Standard mode.</p> <p>0x1 = Dual mode.</p> <p>0x2 = Quad mode.</p> <p>0x3 = Reserved.</p> <p>Note: Only used for normal I/O mode.</p>
[19:16]	SUSPITV	<p>Suspend Interval</p> <p>These four bits provide the configuration of suspend interval between two successive transmit/receive transactions in a transfer. The default value is 0x00. When BURSTNUM = 00, setting this field has no effect on transfer. The desired interval is obtained according to the following equation (from the last falling edge of current SPI clock to the first rising edge of next SPI clock):</p> <p>(SUSPITV+2)*period of AHB clock</p> <p>0x0 = 2 AHB clock cycles.</p> <p>0x1 = 3 AHB clock cycles.</p> <p>.....</p> <p>0xE = 16 AHB clock cycles.</p> <p>0xF = 17 AHB clock cycles.</p> <p>Note: Only used for normal I/O mode</p>
[15]	QDIODIR	<p>SPI Interface Direction Select for Quad/Dual Mode</p> <p>0 = Interface signals are input.</p> <p>1 = Interface signals are output.</p> <p>Note: Only used for normal I/O mode</p>

[14:13]	BURSTNUM	<p>Transmit/Receive Burst Number</p> <p>This field specifies how many transmit/receive transactions should be executed continuously in one transfer.</p> <p>0x0 = Only one transmit/receive transaction will be executed in one transfer.</p> <p>0x1 = Two successive transmit/receive transactions will be executed in one transfer.</p> <p>0x2 = Three successive transmit/receive transactions will be executed in one transfer.</p> <p>0x3 = Four successive transmit/receive transactions will be executed in one transfer.</p> <p>Note: Only used for normal I/O Mode.</p>
[12:8]	DWIDTH	<p>Transmit/Receive Bit Length</p> <p>This specifies how many bits are transmitted/received in one transmit/receive transaction.</p> <p>0x7 = 8 bits.</p> <p>0xF = 16 bits.</p> <p>0x17 = 24 bits.</p> <p>0x1F = 32 bits.</p> <p>Others = Incorrect transfer result.</p> <p>Note1: Only used for normal I/O mode.</p> <p>Note2: Only 8, 16, 24, and 32 bits are allowed. Other bit length will result in incorrect transfer.</p>
[7]	IF	<p>Interrupt Flag</p> <p>Write Operation:</p> <p>0 = No effect.</p> <p>1 = Write 1 to clear.</p> <p>Read Operation:</p> <p>0 = The transfer has not finished yet.</p> <p>1 = The transfer has done.</p>
[6]	IEN	<p>Interrupt Enable Bit</p> <p>0 = SPIM Interrupt Disabled.</p> <p>1 = SPIM Interrupt Enabled.</p>
[5]	B4ADDREN	<p>4-byte Address Mode Enable Bit</p> <p>0 = 4-byte address mode Disabled, and 3-byte address mode Enabled.</p> <p>1 = 4-byte address mode Enabled.</p> <p>Note: Used for DMA write mode, DMA read mode, and DMM mode.</p>
[4:3]	Reserved	Reserved.
[2]	BALEN	<p>Balance the AHB Control Time Between Cipher Enable and Disable Control</p> <p>When cipher is enabled, the AHB control signal will delay some time caused by the encoding or decoding calculation. Therefore, if set BALEN to 1, it will make the AHB signal processing time with cipher disabled be equal to that with cipher enabled.</p> <p>Note: Only useful when cipher is disabled.</p>
[1]	Reserved	Reserved.
[0]	CIPHOFF	<p>Cipher Disable Bit</p> <p>0 = Cipher function Enabled.</p> <p>1 = Cipher function Disabled.</p> <p>Note1: If there is not any KEY1(SPIM_KEY1[31:0]) or KEY2(SPIM_KEY2[31:0]) (KEY1 is 0x0000_0000 or KEY2 is 0x0000_0000), the cipher function will be disabled automatically.</p> <p>Note2: When CIPHOFF(SPIM_CTL0[0]) is 0, both of KEY1(SPIM_KEY1[31:0]) and KEY2(SPIM_KEY2[31:0]) do not equal to 0x0000_0000 (i.e. KEY1≠ 0x0000_0000 and KEY2≠ 0x0000_0000), cipher encryption/decryption is enabled.</p> <p>Note3: When cipher encryption/decryption is enabled, please set DESELTIM</p>

	(SPIM_DMMCTL[20:16]) >= 0x10. When cipher encryption/decryption is disabled, please set DESELTIM(SPIM_DMMCTL[20:16]) >= 0x8.

7	6	5	4	3	2	1	0
Reserved		SSACTPOL	SS	CDINVAL	CCMEN	CACHEOFF	SPIMEN

Bits	Description
[31:16]	Clock Divider Register The value in this field is the frequency divider of the AHB clock (HCLK) to generate the serial SPI output clock "SCLK" on the output SPIM_CLK pin. The desired frequency is obtained according to the following equation: $f_{SPIM_CLK} = \frac{f_{HCLK}}{(DIVIDER)*2}$ Note1: When set DIVIDER to zero, the frequency of SPIM_CLK will be equal to the frequency of HCLK. Note2: SCLK is serial SPI output clock. Note3: Please check the specification of the used SPI Flash component to decide the frequency of SPI Flash clock. Note4: For DTR/DDR read commands "0x0D, 0xBD, 0xED", the setting values of DIVIDER are only 1,2,4,8,16,32,..., 2^n , where n = 0,1,2,3,4,
[15:12]	Reserved
[11:8]	Idle Time Interval In DMM mode, IDLETIME is set to control the minimum idle time between two SPI Flash accesses. Minimum idle time = (IDLETIME + 1) * AHB clock cycle time. Note1: Only used for DMM mode. Note2: AHB clock cycle time = 1/AHB clock frequency.
[7:6]	Reserved.
[5]	Slave Select Active Level It defines the active level of device/slave select signal (SPIM_SS), as shown in Table 6.21-2. 0 = The SPIM_SS slave select signal is active low. 1 = The SPIM_SS slave select signal is active high.
[4]	Slave Select Active Enable Bit 0 = SPIM_SS is in active level.

		1 = SPIM_SS is in inactive level (Default). Note: This interface can only drive one device/slave at a given time. Therefore, the slave selects of the selected device must be set to its active level before starting any read or write transfer. Functional description of SSACTPOL(SPIM_CTL1[5]) and SS is shown in Table 6.21-2.
[3]	CDINVAL	Cache Data Invalid Enable Bit Write Operation: 0 = No effect. 1 = Set all cache data to be invalid. This bit is cleared by hardware automatically. Read Operation: No effect Note: When SPI Flash memory is page erasing or whole Flash erasing, please set CDINVAL to 0x1. After using normal I/O mode or DMA write mode of SPI Flash controller to program or erase the content of external SPI Flash, please set CDINVAL to 0x1.
[2]	CCMEN	CCM (Core Coupled Memory) Mode Enable Bit 0 = CCM mode Disabled. (Default) 1 = CCM mode Enabled. Note1: When CCM mode is enabled, the cache function will be disable by hardware automatically. When CCM mode is disabled, the cache function can be enabled or disabled by user. Note2: When CCM mode is disabled, user accesses the core coupled memory by bus master. In this case, the SPI Flash controller will send error response via HRESP bus signal to bus master. Note3: When CCM mode needs to be enabled, user sets CCMEN to 1 and needs to read this register to show the current hardware status. When reading data of CCMEN is 1, MCU can start to read data from CCM memory space or write data to CCM memory space.
[1]	CACHEOFF	Cache Memory Function Disable Bit 0 = Cache memory function Enabled. (Default) 1 = Cache memory function Disabled. Note: When CCM mode is enabled, the cache function will be disable by hardware automatically. When CCM mode is disabled, the cache function can be enable or disable by user.
[0]	SPIMEN	Go and Busy Status Write Operation: 0 = No effect. 1 = Start the transfer. This bit remains set during the transfer and is automatically cleared after transfer finished. Read Operation: 0 = The transfer has done. 1 = The transfer has not finished yet. Note: All registers should be set before writing 1 to the SPIMEN bit. When a transfer is in progress, user should not write to any register of this peripheral.

SSACTPOL	SS	Functional Descriptions
0	0	SPIM_SS is active low, and set SPIM_SS to 0
0	1	SPIM_SS is active low, and set SPIM_SS to 1
1	0	SPIM_SS is active high, and set SPIM_SS to 1
1	1	SPIM_SS is active high, and set SPIM_SS to 0

PHDELSEL							
7	6	5	4	3	2	1	0
DWDELSEL							

Bits	Description	
[31:21]	Reserved	Reserved.
[20]	RDEdge	Sampling Clock Edge Selection for Received Data (for Normal I/O Mode, DMA Read Mode, DMA Write Mode, and Direct Memory Mapping Mode) 0 = Use SPI input clock rising edge to sample received data. (Default) 1 = Use SPI input clock falling edge to sample received data.
[19]	Reserved	Reserved.
[18:16]	RDDLYSEL	Sampling Clock Delay Selection for Received Data (for Normal I/O Mode, DMA Read Mode, DMA Write Mode, and Direct Memory Mapping Mode) Determine the number of inserted delay cycles. Used to adjust the sampling clock of received data to latch the correct data. 0x0: No delay. (Default) 0x1: Delay 1 SPI Flash clock. 0x2: Delay 2 SPI Flash clocks. 0x3: Delay 3 SPI Flash clocks. ... 0x7: Delay 7 SPI Flash clocks Note: The manufacturer or device ID of external SPI Flash component can be used to determine the correct setting value of RDDLYSEL. An example is given as follows. For example, the manufacturer ID and device ID of external SPI Flash for some vendor are 0xEF and 0x1234 separately. First, set RDDLYSEL to 0x0, and use read manufacturer id/device id command to read the manufacturer id of external SPI Flash by using normal I/O mode (the manufacturer id is 0xEF (1110_1111) in this example). If the manufacturer ID which reads from external SPI Flash is 0xF7 (1111_0111), it denotes that manufacturer id is shifted the right by 1 bit and most significant bit (MSB) of manufacturer id is assigned to 1. According to manufacturer id reads from external SPI Flash, RDDLYSEL needs to be set to 0x1 to receive SPI Flash data correctly.
[15:8]	PHDELSEL	SPI Flash Phase Delay Time (for DMA Write Mode, DMA Read Mode) The bits set phase delay time between command data phase, address data phase, and dummy cycle phase, where SPI Flash controller will send those phase data to external SPI Flash. Phase delay time of DMA write mode and DMA read mode = (PHDELSEL + 1) * AHB clock cycle time (Note).

		<p>Note: AHB clock cycle time = 1/AHB clock frequency.</p>
[7:0]	DWDELSEL	<p>SPI Flash Deselect Time Interval of DMA Write Mode (for DMA Write Mode Only) The bits set the deselect time interval of SPI Flash (i.e. time interval of inactive level of SPIM_SS) when SPI Flash controller operates on DMA write mode. (Note1) Deselect time interval of DMA write mode = (DWDELSEL + 1) * AHB clock cycle time (Note2). Note1: Please check the used external SPI Flash component to set this register value. In general case, the deselect time interval of SPI Flash is greater than 50 ns when SPI Flash performs the program operation. Note2: AHB clock cycle time = 1/AHB clock frequency.</p>

Data Receive Register 0~3 (SPIM_RX0~3)

7	6	5	4	3	2	1	0
Reserved							

Bits	Description
[31:28]	ACTSCLKT SPI Flash Active SCLK Time (Only for Direct Memory Mapping Mode, DMA Write Mode, and DMA Read Mode) The bits set time interval between SPIM SS active edge and the position edge of the first serial SPI output clock, as shown in Figure 6.21-11. (1) ACTSCLKT = 0 (function disable): Time interval = 1 AHB clock cycle time. (2) ACTSCLKT ≠ 0 (function enable): Time interval = (ACTSCLKT + 3) * AHB clock cycle time. Note1: AHB clock cycle time = 1/AHB clock frequency. Note2: SCLK is SPI output clock Note3: Please check the used SPI Flash specification to know the setting value of this register, and different SPI Flash vendor may use different setting values.
[27]	Reserved Reserved.
[26]	UACTSCLK User Sets SPI Flash Active SCLK Time (Only for Direct Memory Mapping Mode, DMA Write Mode, and DMA Read Mode) 0 = According to DIVIDER(SPIM_CTL1[31:16]), ACTSCLKT(SPIM_DMMCTL[31:28]) is set by hardware automatically. (Default) 1 = Set ACTSCLKT(SPIM_DMMCTL[31:28]) by user manually. Note: When user wants to set ACTSCLKT(SPIM_DMMCTL[31:28]) manually, please set UACTSCLK to 1.
[25]	CREN Continuous Read Mode Enable Bit (Only for Direct Memory Mapping Mode, Read Command Codes 0xBB, 0xEB, 0xE7, 0x0D, 0xBD, 0xED) 0 = Continuous Read Mode Disabled. (Default) 1 = Continuous Read Mode Enabled. For read operations of SPI Flash, commands of fast read quad I/O (0xEB), word read quad I/O (0xE7), fast read dual I/O (0xBB), DTR/DDR fast read (0x0D), DTR/DDR fast read dual I/O (0xBD), and DTR/DDR fast read quad I/O (0xED) can further reduce command overhead through setting the “continuous read mode” bits (8 bits) after the input address data. Note: When using function of continuous read mode and setting USETEN (SPIM_CTL2[16]) to 1, CRMDAT(SPIM_DMMCTL[15:8]) must be set by used SPI Flash specifications. When using function of continuous read mode and setting USETEN(SPIM_CTL2[16]) to 0, CRMDAT(SPIM_DMMCTL[15:8]) is set to value 0x20.

		16 Bytes Burst Wrap Mode Enable Bit (Only for Direct Memory Mapping Mode, Cache Enable, and Read Command Code “0xEB, and 0xE7”) 0 = Burst Wrap Mode Disabled. (Default) 1 = Burst Wrap Mode Enabled. In direct memory mapping mode, both of quad read commands “0xEB” and “0xE7” support burst wrap mode for cache application and performance enhance. For cache application, the burst wrap mode can be used to fill the cache line quickly (In this SPI Flash controller, use cache data line with 16 bytes size). For performance enhance with direct memory mapping mode and cache enable, when cache data is miss, the burst wrap mode can let MCU get the required SPI Flash data quickly.
[24]	BWEN	Reserved.
[23:21]	Reserved	SPI Flash Deselect Time (Only for Direct Memory Mapping Mode) Set the minimum time width of SPI Flash deselect time (i.e. Minimum SPIM_SS deselect time), as shown in Figure 6.21-11. (1) Cache function disable: Minimum time width of SPIM_SS deselect time = (DESELTIM + 1) * AHB clock cycle time. (2) Cache function enable: Minimum time width of SPIM_SS deselect time = (DESELTIM + 4) * AHB clock cycle time. Note1: AHB clock cycle time = 1/AHB clock frequency. Note2: When cipher encryption/decryption is enabled, please set this register value >= 0x10. When cipher encryption/decryption is disabled, please set this register value >= 0x8. Note3: Please check the used SPI Flash specification to know the setting value of this register, and different SPI Flash vendor may use different setting values.
[20:16]	DESELTIM	Mode Bits Data for Continuous Read Mode (or Performance Enhance Mode) (Only for Direct Memory Mapping Mode) Set the mode bits data for continuous read mode (or performance enhance mode). When setting this mode bits currently (Note1) and set CREN(SPIM_DMMCTL[25]), this reduces the command phase by eight clocks and allows the read address to be immediately entered after SPIM_SS asserted to active. (Note1) Note1: Please check the used SPI Flash specification to know the setting value of this mode bits data, and different SPI Flash vendor may use different setting values. Note2: CRMDAT needs to be used with CREN(SPIM_DMMCTL[25]).
[15:8]	CRMDAT	Reserved.
[7:0]	Reserved	Reserved.

6.22 I²C Serial Interface Controller (I²C)

6.22.1 Overview

I²C is a two-wire, bi-directional serial bus that provides a simple and efficient method of data exchange between devices. The I²C standard is a true multi-master bus including collision detection and arbitration that prevents data corruption if two or more masters attempt to control the bus simultaneously.

There are two sets of I²C controllers which support Power-down wake-up function.

6.22.2 Features

The I²C bus uses two wires (SDA and SCL) to transfer information between devices connected to the bus. The main features of the I²C bus include:

- Supports up to three I²C ports
- Master/Slave mode
- Bidirectional data transfer between masters and slaves
- Multi-master bus (no central master)
- Supports Standard mode (100 kbps), Fast mode (400 kbps) and Fast mode plus (1 Mbps)
- Arbitration between simultaneously transmitting masters without corruption of serial data on the bus
- Serial clock synchronization allow devices with different bit rates to communicate via one serial bus
- Serial clock synchronization used as a handshake mechanism to suspend and resume serial transfer
- Built-in 14-bit time-out counter requesting the I²C interrupt if the I²C bus hangs up and timer-out counter overflows
- Programmable clocks allow for versatile rate control
- Supports 7-bit addressing and 10-bit addressing mode
- Supports multiple address recognition (four slave address with mask option)
- Supports Power-down wake-up function
- Supports PDMA with one buffer capability
- Supports setup/hold time programmable
- Supports Bus Management (SM/PM compatible) function

6.22.5 Functional Description

On I²C bus, data is transferred between a Master and a Slave. Data bits transfer on the SCL and SDA lines are synchronously on a byte-by-byte basis. Each data byte is 8-bit long. There is one SCL clock pulse for each data bit with the MSB being transmitted first, and an acknowledge bit follows each transferred byte. Each bit is sampled during the high period of SCL; therefore, the SDA line may be changed only during the low period of SCL and must be held stable during the high period of SCL. A transition on the SDA line while SCL is high is interpreted as a command (START or STOP). Please refer to Figure 6.22-2 for more detailed I²C BUS Timing.

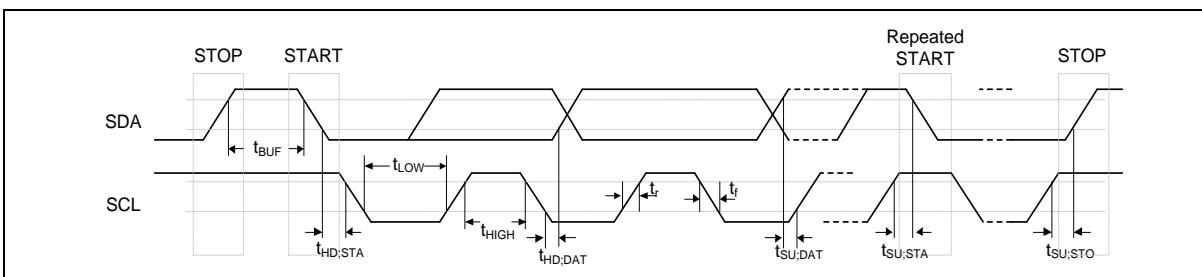

Figure 6.22-2 I²C Bus Timing

The device's on-chip I²C provides the serial interface that meets the I²C bus standard mode specification. The I²C port handles byte transfers autonomously. To enable this port, the bit I2CEN in I2C_CTL0 should be set to '1'. The I²C hardware interfaces to the I²C bus via two pins: SDA and SCL. When I/O pins are used as I²C ports, user must set the pins function to I²C in advance.

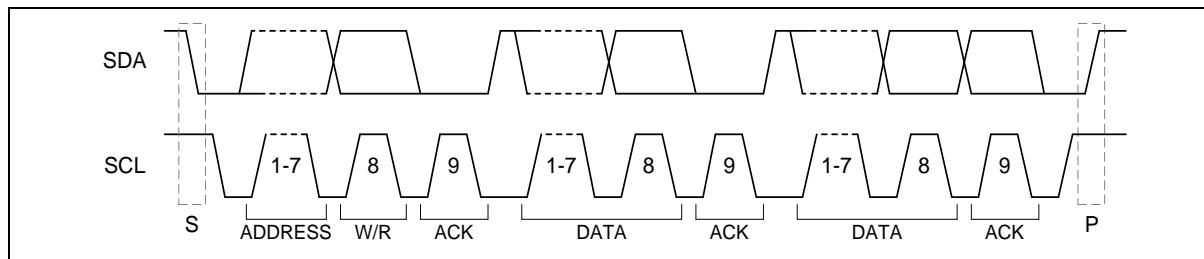

Note: Pull-up resistor is needed for I²C operation as the SDA and SCL are open-drain pins.

6.22.5.1 I²C Protocol

Figure 6.22-3 shows the typical I²C protocol. Normally, a standard communication consists of four parts:

- START or Repeated START signal generation
 - Slave address and R/W bit transfer
 - Data transfer

- STOP signal generation

Figure 6.22-3 I²C Protocol

- START or Repeated START signal

When the bus is free/idle, which means no master device is engaging the bus (both SCL and SDA lines are high), a master can initiate a transfer by sending a START signal. A START signal, usually referred to as the "S" bit, is defined as a HIGH to LOW transition on the SDA line while SCL is HIGH. The START signal denotes the beginning of a new data transmission.

After having sent the address byte (address and read/write bit), the master may send any number of bytes followed by a stop condition. Instead of sending the stop condition it is also allowed to send another start condition again followed by an address (and of course including a read/write bit) and more data. The start condition is called as Repeat START (Sr). This is defined recursively allowing any number of start conditions to be sent. The purpose of this is to allow combined write/read operations to one or more devices without releasing the bus and thus with the guarantee that the operation is not interrupted. The controller uses this method to communicate with another slave or the same slave in a different transfer direction (e.g. from writing to a device to reading from a device) without releasing the bus.

- STOP signal

The master can terminate the communication by generating a STOP signal. A STOP signal, usually referred to as the "P" bit, is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH.

Figure 6.22-4 shows the waveform of START, Repeat START and STOP.

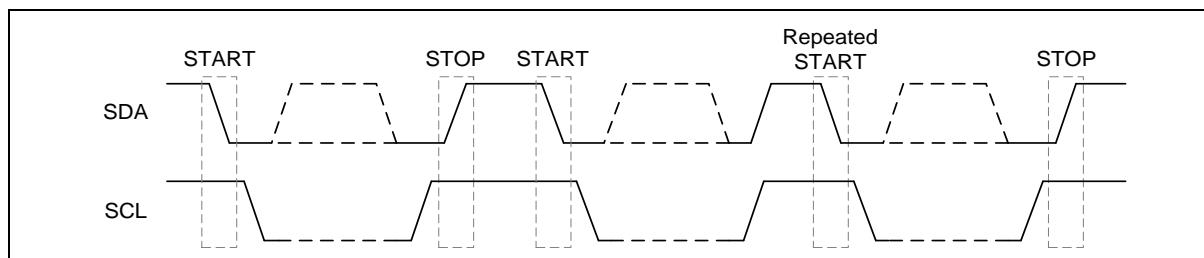

Figure 6.22-4 START and STOP Conditions

- Slave Address Transfer

After a (Repeated) START condition, the master sends a slave address to identify the target device of the communication. The start address can comprise one or two address bytes (for 7-bit or for 10-bit addressing schemes). After an address byte, a slave sensitive to the transmitted address has to acknowledge the reception.

Therefore, the slave's address can be programmed in the device, where it is compared to the received address. In case of a match, the slave answers with an acknowledge (SDA = 0). Slaves that are not targeted answer with a non-acknowledge (SDA = 1). In addition to

the match of the programmed address, another address byte value has to be answered with an acknowledge if the slave is capable to handle the corresponding requests.

- Data Transfer

When a slave receives a correct address with an R/W bit, the data will follow R/W bit specified to transfer. Each transferred byte is followed by an acknowledge bit on the 9th SCL clock cycle. If the slave signals a Not Acknowledge (NACK), the master can generate a STOP signal to abort the data transfer or generate a Repeated START signal and start a new transfer cycle.

If the master, as a receiving device, does Not Acknowledge (NACK) the slave, the slave releases the SDA line for the master to generate a STOP or Repeated START signal. The Figure 6.22-5 and Figure 6.22-6 shows the waveform of bit transfer and acknowledge.

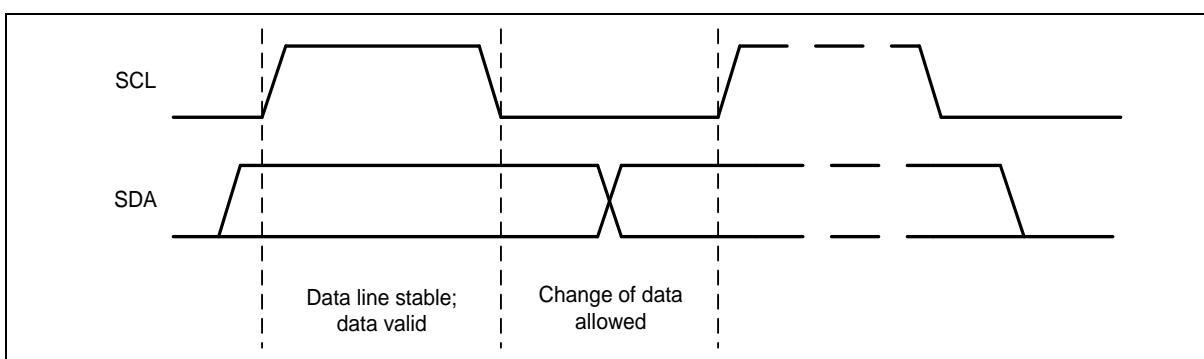

Figure 6.22-5 Bit Transfer on the I²C Bus

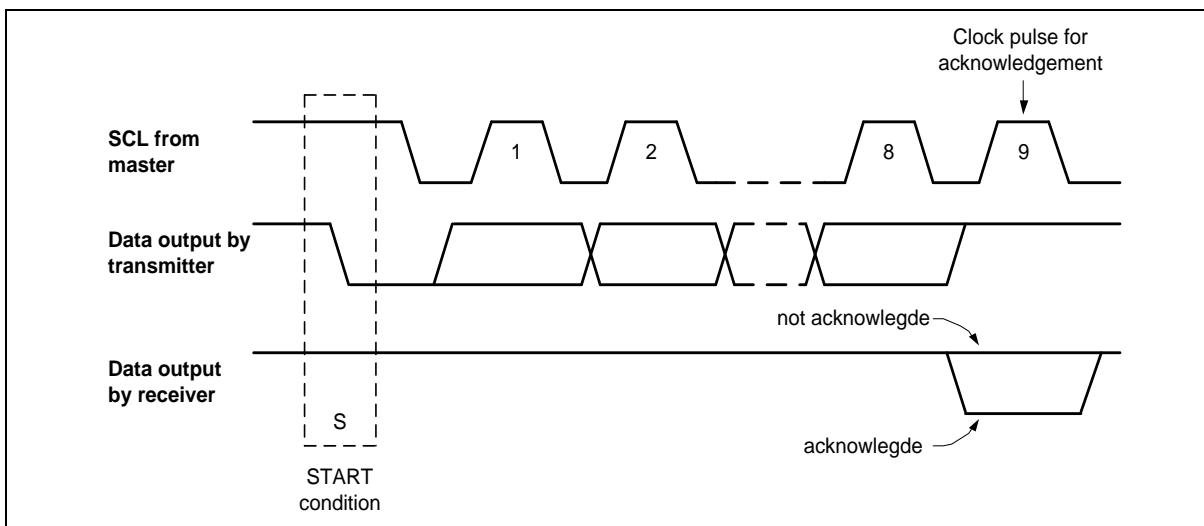

Figure 6.22-6 Acknowledge on the I²C Bus

- Data transfer on I²C bus

Figure 6.22-7 shows a master transmits data to slave by 7-bit. A master addresses a slave with a 7-bit address and 1-bit write index to denote that the master wants to transmit data to the slave. The master keeps transmitting data after the slave returns acknowledge to the master.

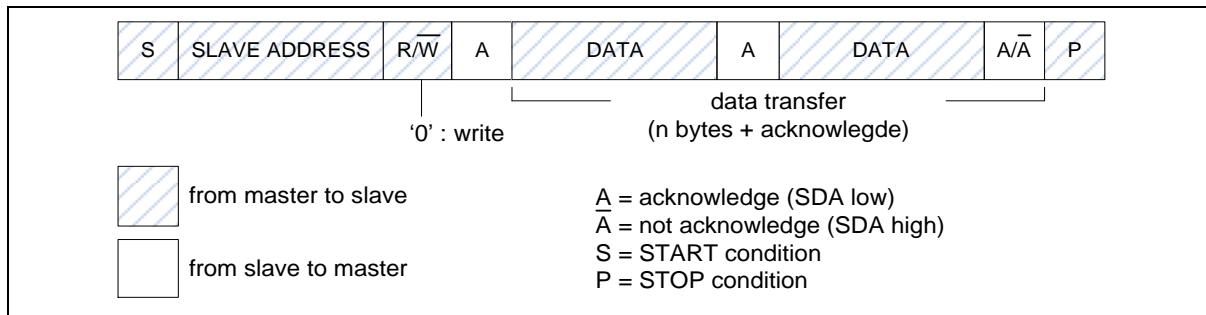

Figure 6.22-7 Master Transmits Data to Slave by 7-bit

Figure 6.22-8 shows a master read data from slave by 7-bit. A master addresses a slave with a 7-bit address and 1-bit read index to denote that the master wants to read data from the slave. The slave will start transmitting data after the slave returns acknowledge to the master.

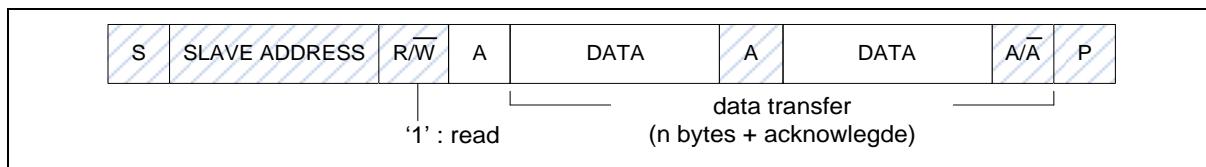

Figure 6.22-8 Master Reads Data from Slave by 7-bit

Figure 6.22-9 shows a master transmits data to slave by 10-bit. A master addresses a slave with a 10-bit address. First byte contains 10-bit address indicator (5'b11110) and 2-bit address with write index, second byte contains 8-bit address. The master keeps transmitting data after the second byte end. Note that 7-bit and 10-bit address device can work on the same bus.

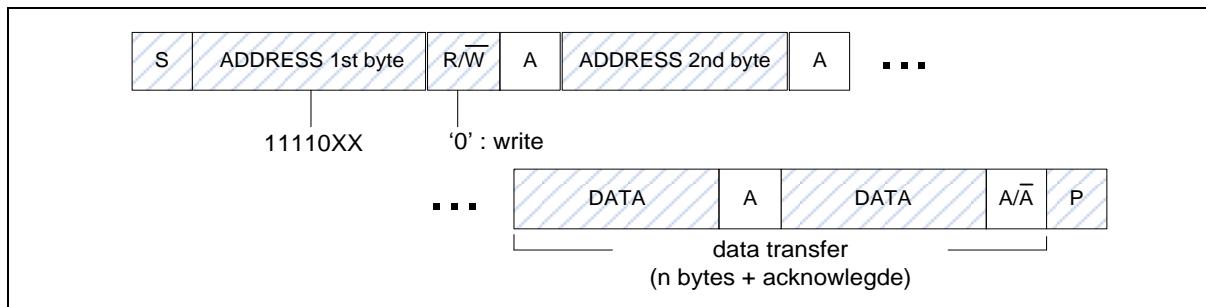

Figure 6.22-9 Master Transmits Data to Slave by 10-bit

Figure 6.22-10 shows a master read data from slave by 10-bit. A master addresses a slave with a 10-bit address. First master transmits 10-bit address to slave, after that master transmits first byte with read index. The slave will start transmitting data after the first byte with read index.

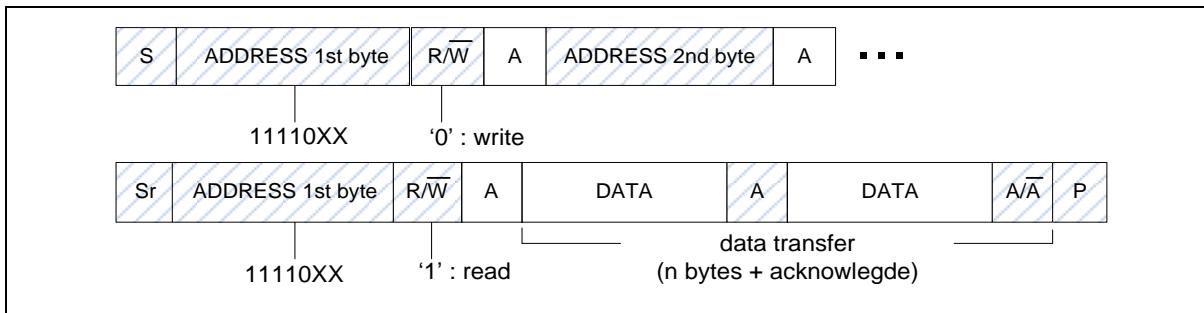

Figure 6.22-10 Master Reads Data from Slave by 10-bit

6.22.5.2 Operation Modes

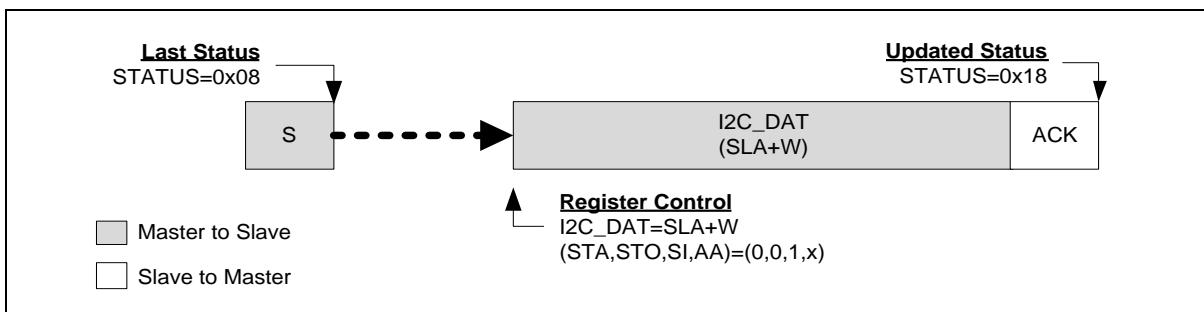

The on-chip I²C ports support three operation modes, Master, Slave, and General Call Mode.

In a given application, I²C port may operate as a master or as a slave. In Slave mode, the I²C port hardware looks for its own slave address and the general call address. If one of these addresses is detected, and if the slave is willing to receive or transmit data from/to master(by setting the AA bit), acknowledge pulse will be transmitted out on the 9th clock, hence an interrupt is requested on both master and slave devices if interrupt is enabled. When the microcontroller wishes to become the bus master, hardware waits until the bus is free before entering Master mode so that a possible slave action is not be interrupted. If bus arbitration is lost in Master mode, I²C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer.

To control the I²C bus transfer in each mode, user needs to set I2C_CTL0, I2C_DAT registers according to current status code of I2C_STATUS0 register. In other words, for each I²C bus action, user needs to check current status by I2C_STATUS0 register, and then set I2C_CTL0, I2C_DAT registers to take bus action. Finally, check the response status by I2C_STATUS0.

The bits, STA, STO and AA in I2C_CTL0 register are used to control the next state of the I²C hardware after SI flag of I2C_CTL0 [3] register is cleared. Upon completion of the new action, a new status code will be updated in I2C_STATUS0 register and the SI flag of I2C_CTL0 register will be set. But the SI flag will not be set when I²C STOP. If the I²C interrupt control bit INTEN (I2C_CTL0 [7]) is set, appropriate action or software branch of the new status code can be performed in the Interrupt service routine.

Figure 6.22-11 shows the current I²C status code is 0x08, and then set I2C_DATA=SLA+W and (STA,STO,SI,AA) = (0,0,1,x) to send the address to I²C bus. If a slave on the bus matches the address and response ACK, the I2C_STATUS0 will be updated by status code 0x18.

Figure 6.22-11 Control I²C Bus according to the Current I²C Status

Master Mode

In Figure 6.22-12 and Figure 6.22-13, all possible protocols for I²C master are shown. User needs to follow proper path of the flow to implement required I²C protocol.

In other words, user can send a START signal to bus and I²C will be in Master Transmitter (MT) mode

(Figure 6.22-12) or Master receiver (MR) mode (Figure 6.22-13) after START signal has been sent successfully and new status code would be 0x08. Followed by START signal, user can send slave address, read/write bit, data and Repeat START, STOP to perform I²C protocol.

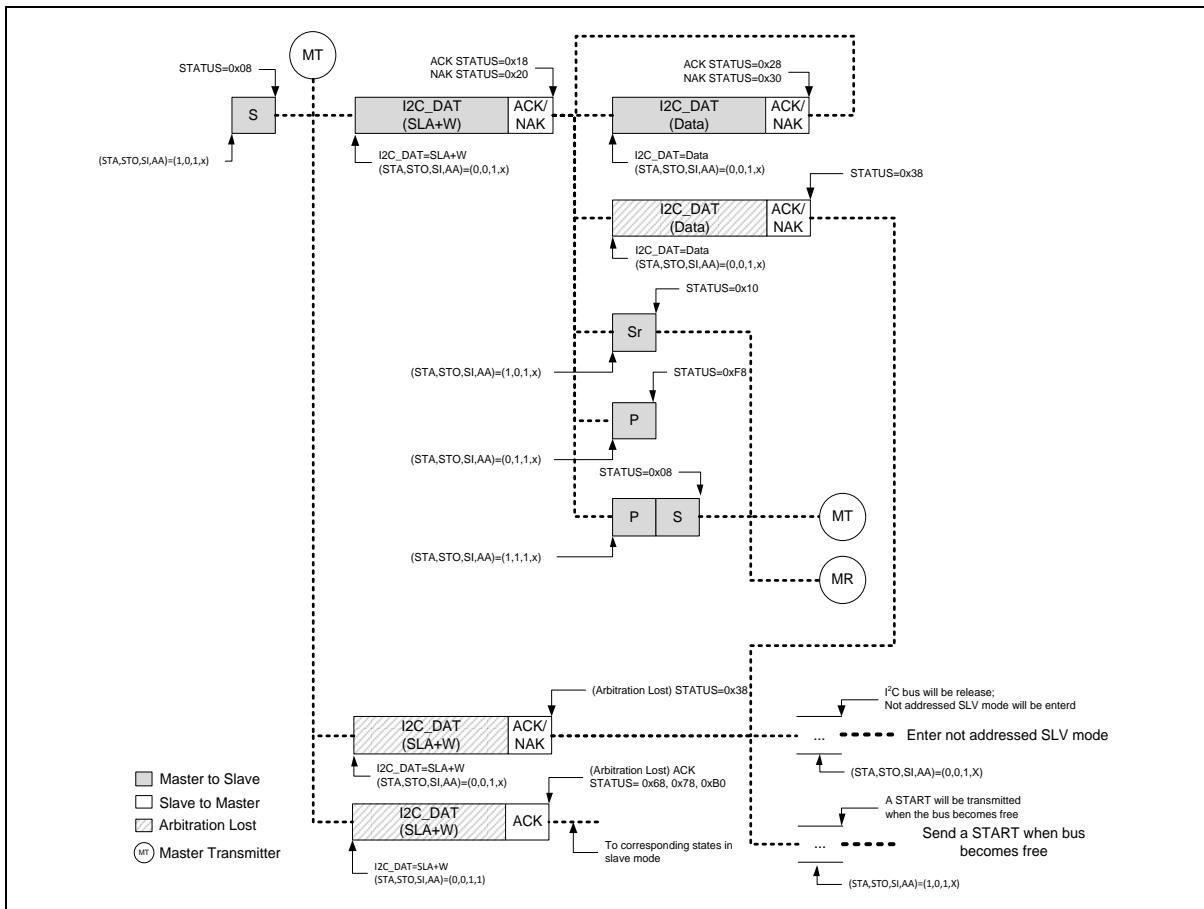

Figure 6.22-12 Master Transmitter Mode Control Flow

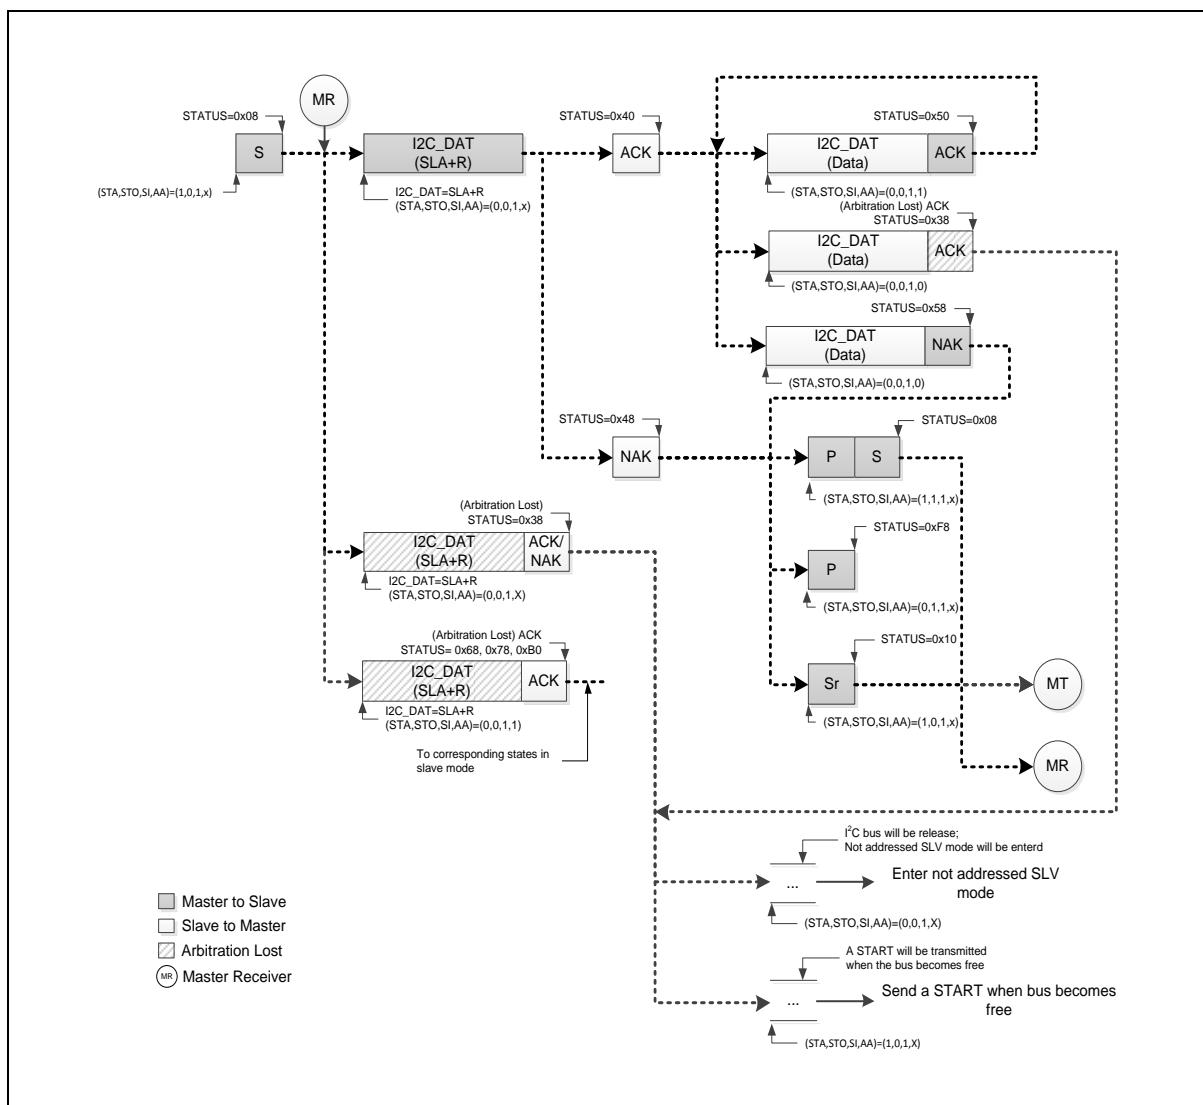

Figure 6.22-13 Master Receiver Mode Control Flow

If the I²C is in Master mode and gets arbitration lost, the status code will be 0x38. In status 0x38, user may set (STA, STO, SI, AA) = (1, 0, 1, X) to send START to re-start Master operation when bus become free. Otherwise, user may set (STA, STO, SI, AA) = (0, 0, 1, X) to release I²C bus and enter not addressed Slave mode.

Slave Mode

When reset default, I²C is not addressed and will not recognize the address on I²C bus. User can set slave address by I2C_ADDRn (n=0~3) and set (STA, STO, SI, AA) = (0, 0, 1, 1) to let I²C recognize the address sent by master. Figure 6.22-14 shows all the possible flow for I²C in Slave mode. Users need to follow a proper flow (as shown in Figure 6.22-14 to implement their own I²C protocol.

If bus arbitration is lost in Master mode, I²C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer. If the detected address is SLA+W (Master want to write data to Slave) after arbitration lost, the status code is 0x68. If the detected address is SLA+R (Master want to read data from Slave) after arbitration lost, the status code is 0xB0.

Note: During I²C communication, the SCL clock will be released when writing '1' to clear SI flag in Slave mode.

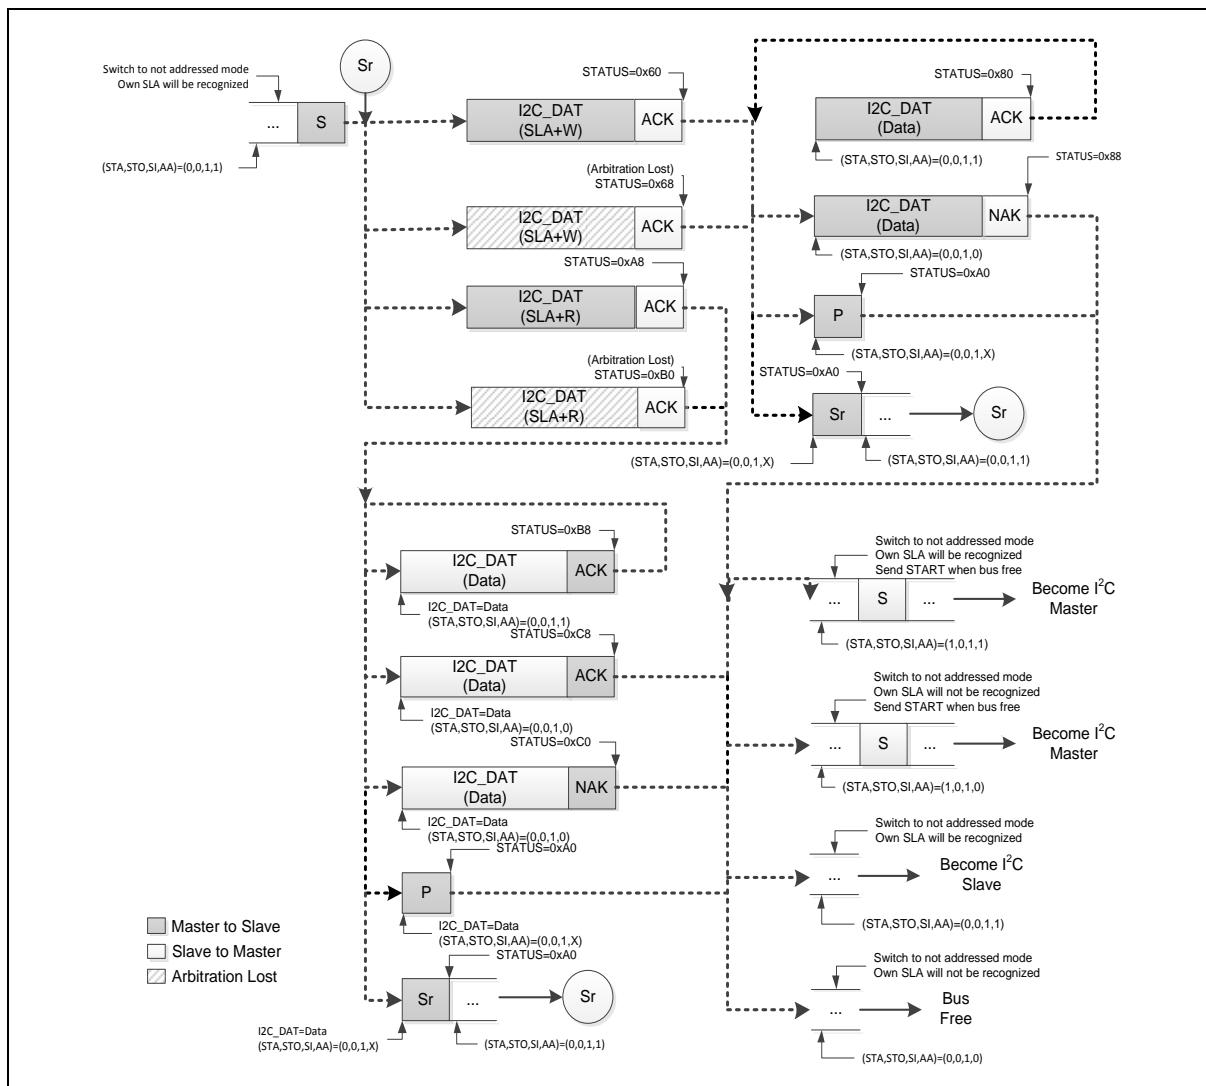

Figure 6.22-14 Slave Mode Control Flow

If I²C is still receiving data in addressed Slave mode but got a STOP or Repeat START, the status code will be 0xA0. User could follow the action for status code 0x88 as shown in the above figure when getting 0xA0 status.

If I²C is still transmitting data in addressed Slave mode but got a STOP or Repeat START, the status code will be 0xA0. User could follow the action for status code 0xC8 as shown in the above figure when getting 0xA0 status.

Note: After slave gets status of 0x88, 0xC8, 0xC0 and 0xA0, slave can switch to not address mode and own SLA will not be recognized. If entering this status, slave will not receive any I²C signal or address from master. At this status, I²C should enter idle mode.

General Call (GC) Mode

If the GC bit (I²C_ADDRn [0]) is set, the I²C port hardware will respond to General Call address (00H). User can clear GC bit to disable general call function. When the GC bit is set and the I²C in Slave mode, it can receive the general call address by 0x00 after master send general call address to I²C bus, then it will follow status of GC mode.

The GC mode can wake up when address matched. Note that the default address is 0x00, but user must set an address except for 0x00.

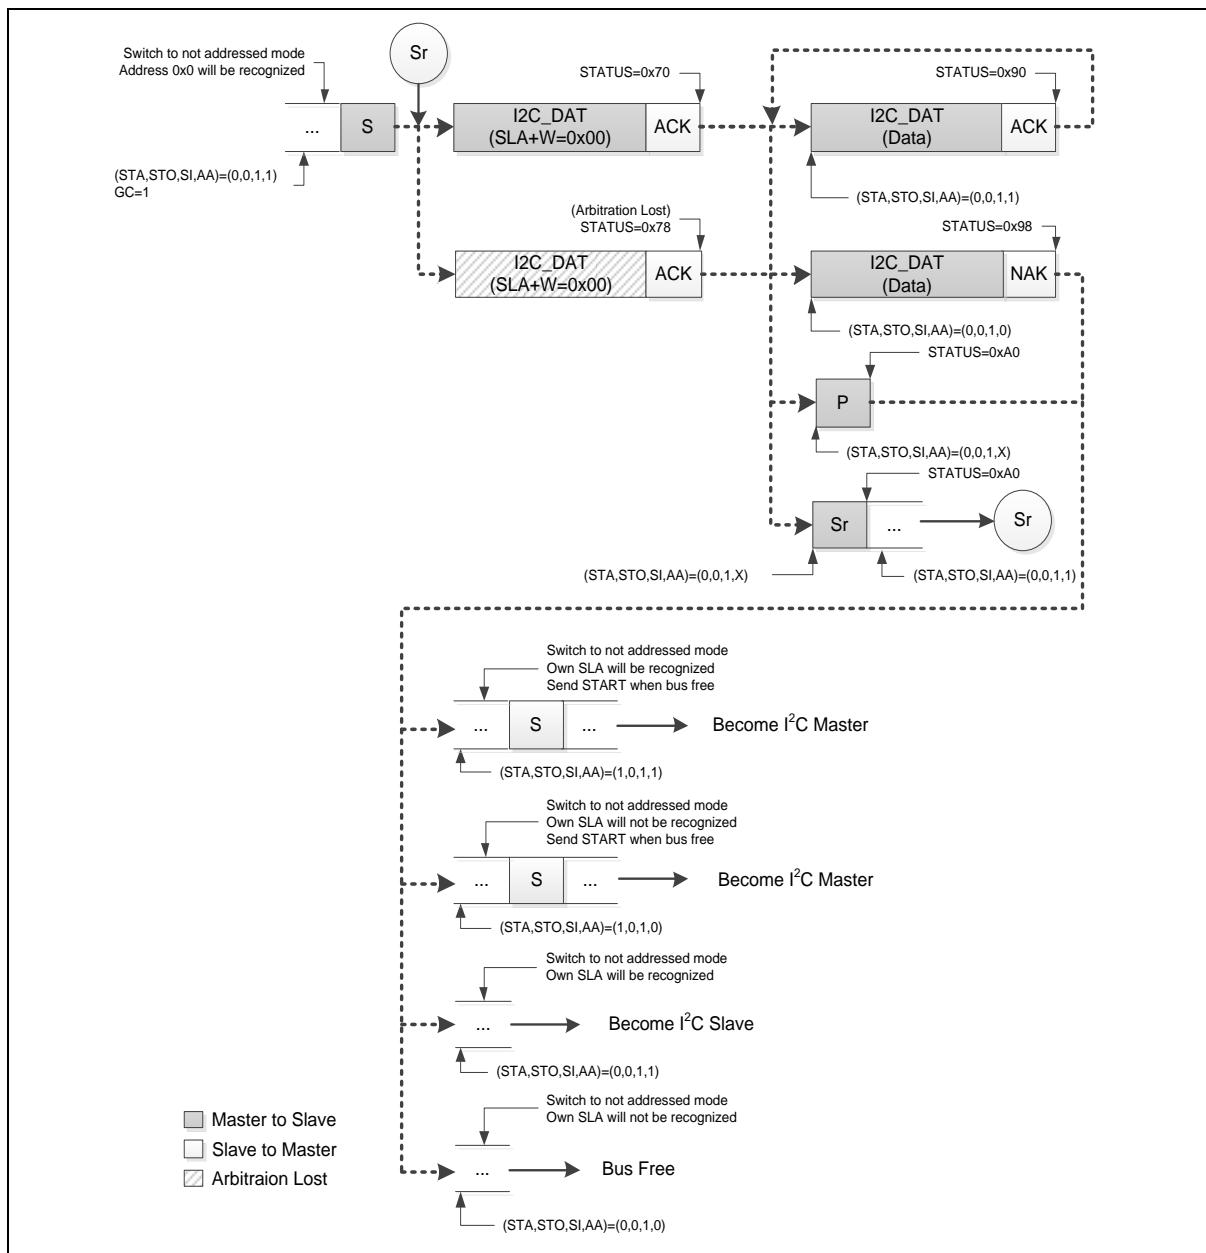

Figure 6.22-15 GC Mode

If I²C is still receiving data in GC mode but got a STOP or Repeat START, the status code will be 0xA0. User could follow the action for status code 0x98 in above figure when getting 0xA0 status.

Note: After slave gets status of 0x98 and 0xA0, slave can switch to not address mode and own SLA will not be recognized. If entering this status, slave will not receive any I²C signal or address from master. At this time, the I²C controller should enter idle mode.

Multi-Master

In some applications, there are two or more masters on the same I²C bus to access slaves, and the masters may transmit data simultaneously. The I²C supports multi-master by including collision detection and arbitration to prevent data corruption.

If for some reason two masters initiate command at the same time, the arbitration procedure determines which master wins and can continue with the command. Arbitration is performed on the

SDA signal while the SCL signal is high. Each master checks if the SDA signal on the bus corresponds to the generated SDA signal. If the SDA signal on the bus is low but it should be high, then this master has lost arbitration. The device that has lost arbitration can generate SCL pulses until the byte ends and must then release the bus and go into slave mode. The arbitration procedure can continue until all the data is transferred. This means that in multi-master system each master must monitor the bus for collisions and act accordingly.

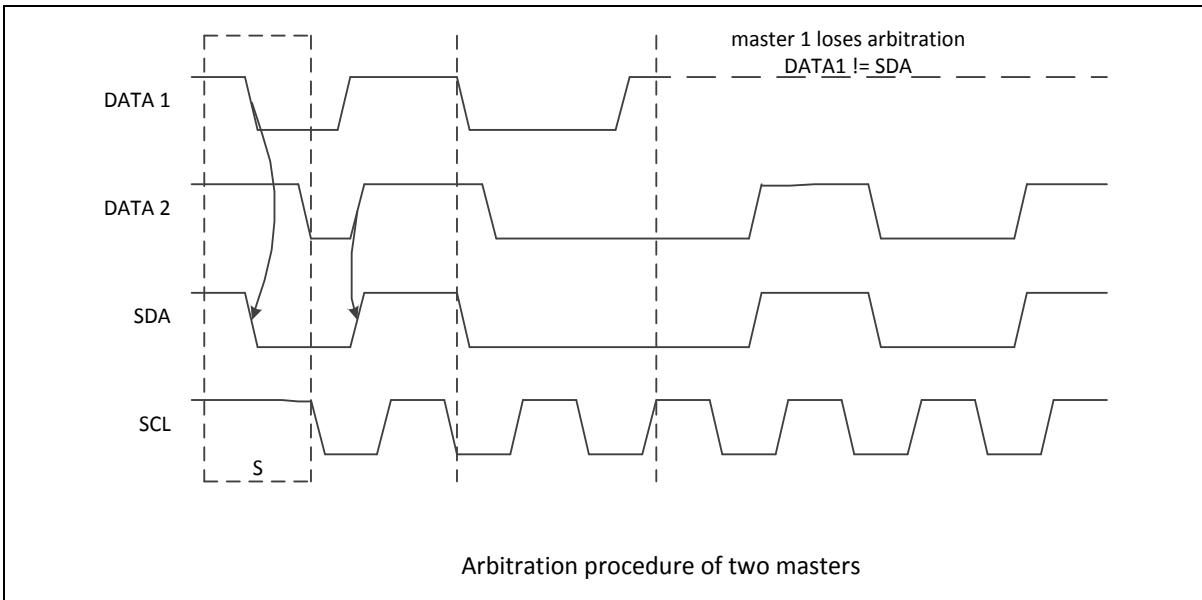

Figure 6.22-16 Arbitration Lost

- When I2C_STATUS0 = 0x38, an “Arbitration Lost” is received. Arbitration lost event maybe occur during the send START bit, data bits or STOP bit. User could set (STA, STO, SI, AA) = (1, 0, 1, X) to send START again when bus free, or set (STA, STO, SI, AA) = (0, 0, 1, X) to not addressed Slave mode. User can detect bus free by ONBUSY (I2C_STATUS1 [8]).
- When I2C_STATUS0 = 0x00, a “Bus Error” is received. To recover I²C bus from a bus error, STO should be set and SI should be cleared, and then STO is cleared to release bus.
 - Set (STA, STO, SI, AA) = (0, 1, 1, X) to stop current transfer
 - Set (STA, STO, SI, AA) = (0, 0, 1, X) to release bus

Bus Management (SMBus/PMBus Compatiable)

This section is relevant only when Bus Management feature is supported.

Introduction

The Bus Management is an I²C interface through which various devices can communicate with each other and with the rest of the system. It is based on I²C principles of operation. The Bus Management provides a control bus for system and power management related tasks.

This peripheral is compatible with the SMBUS specification rev 2.0 (<http://smbus.org/specs/>) and PMBUS specification rev 1.2 (<http://pmbus.org/>).

The System Management Bus Specification refers to three types of devices.

- A slave is a device that receives or responds to a command.
- A master is a device that issues commands, generates the clocks and terminates the transfer.

- A host is a specialized master that provides the main interface to the system's CPU. A host must be a master-slave and must support the SMBus host notify protocol. Only one host is allowed in a system.

This Bus Management peripheral is based on I²C specification Rev 2.1.

Device Identification – Slave Address

Any device that exists on the Bus Management as a slave has a unique address called the Slave Address. For reference, the following addresses are reserved and must not be used by or assign to any Bus Management device. (Refer to SMBus specification for detail information)

Slave Address Bits 7-1	R/W Bit Bit 0	Comment
0000 000	0	General Call Address
0000 000	1	START byte
0000 001	X	CBUS address
0000 010	X	Address reserved for different bus format
0000 011	X	Reserved for future use
0000 1XX	X	Reserved for future use
0101 000	X	Reserved for ACCESS.bus host
0110 111	X	Reserved for ACCESS.bus default address
1111 0XX	X	10-bit slave addressing
1111 1XX	X	Reserved for future use
0001 000	X	SMBus Host
0001 100	X	SMBus Alert Response Address
1100 001	X	SMBus Device Default Address

Table 6.22-1 Reserved SMBus Address

Bus Protocols

There are eleven possible command protocols for any given device. A device may use any or all of the eleven protocols to communicate. The protocols are Quick Command, Send Byte, Receive Byte, Write Byte, Write Word, Read Byte, Read Word, Process Call, Block Read, Block Write and Block Write-Block Read Process Call. These protocols should be implemented by the user software. (For more details of these protocols, refer to SMBus specification ver. 2.0)

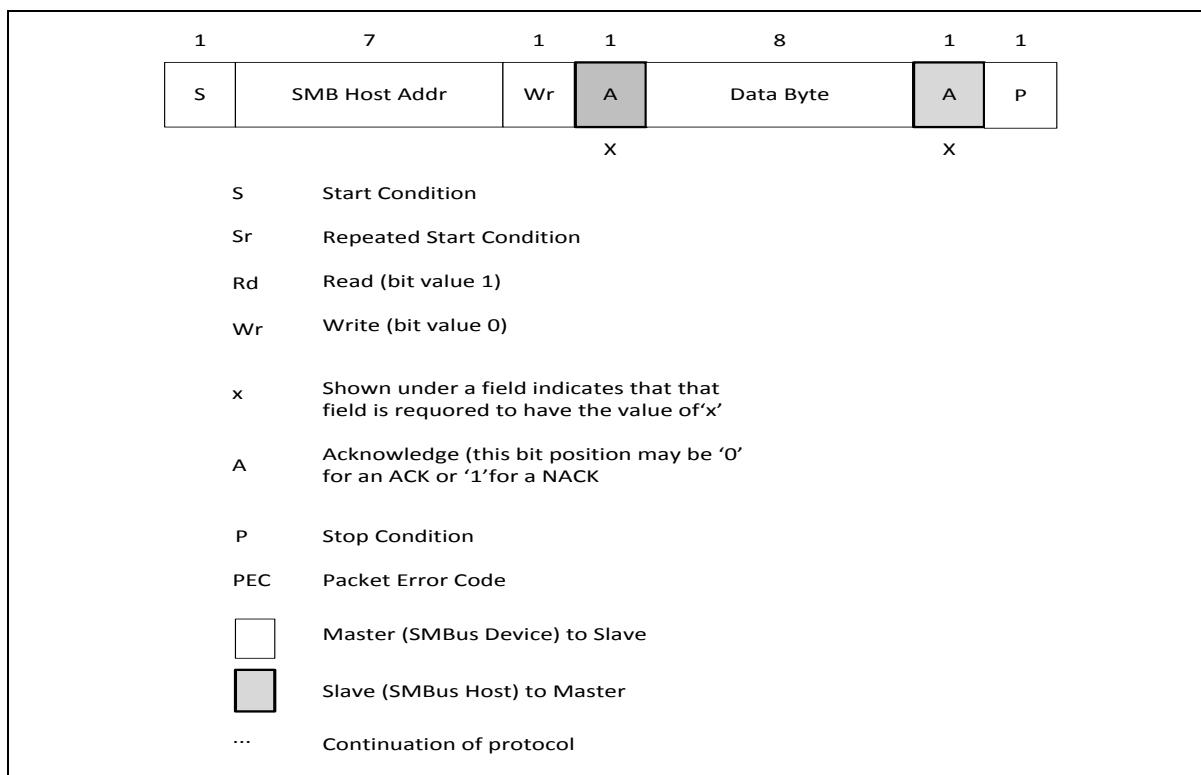

Figure 6.22-17 Bus Management Packet Protocol Diagram Element Key

Address Resolution Protocol (ARP)

Bus Management slave address conflicts can be resolved by dynamically assigning a new unique address to each slave device. In order to provide a mechanism to isolate each device for the purpose of address assignment each device must implement a unique device identifier (UDID). This 128-bit number is implemented by software.

This peripheral supports the Address Resolution Protocol (ARP). The Bus Management Device Default Address (0b1100 001) is enabled by setting BUSEN (I2C_BUSCTL[7]), BMDEN (I2C_BUSCTL[2]) and ALERTEN (I2C_BUSCTL[4]) bits. The ARP commands should be implemented by the user software. Arbitration is also performed in slave mode for ARP support.

Received Command and Data acknowledge control

A Bus Management receiver must be able to NACK each received command or data. In order to allow the ACK control in slave mode, the Slave Byte Control mode must be enabled by setting ACKMEN bit (I2C_BUSCTL[0]).

Host Notify Protocol

To prevent message coming to the Bus Management host controller from unknown devices in unknown formats only one method of communication is allowed, a modified form of the Write Word protocol. The standard Write Word protocol is modified by replacing the command code with the alerting device's address.

This peripheral supports the Host Notify protocol by setting the BUSEN (I2C_BUSCTL[7]), BMHEN (I2C_BUSCTL[3]) and ALERTEN (I2C_BUSCTL[4]). In this case the host will acknowledge the Bus Management Host address (0b0001000). This protocol is used when the device acts as a master and the host as a slave.

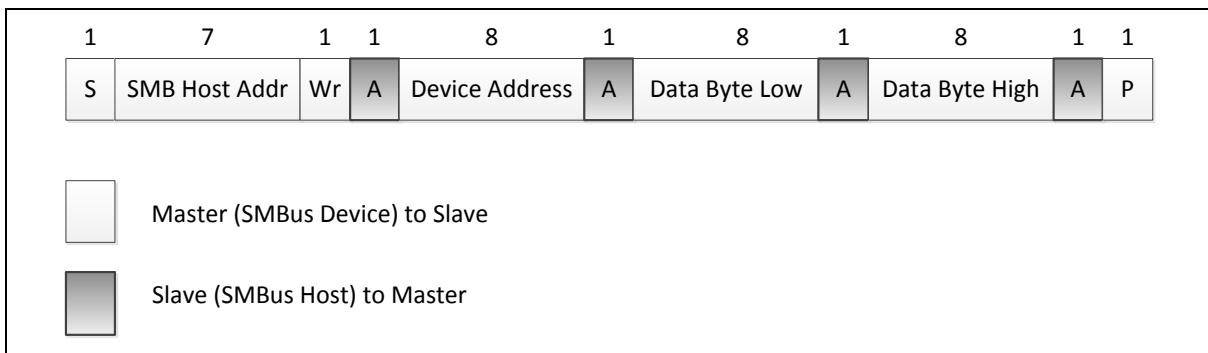

Figure 6.22-187-bit Addressable Device to Host Communication

Bus Management Alert

The Bus Management ALERT optional signal is supported. A slave-only device can signal the host through the Bus Management ALERT pin (GPA[14]/GPE[10]) that it wants to talk. The host processes the interrupt and simultaneously accesses all Bus Management ALERT pin's devices through the Alert Response Address (0b0001 100). Only the device(s) which pulled Bus Management ALERT pin low will acknowledge the Alert Response Address.

When configured as a slave device(BMHEN=0), the Bus Management ALERT pin is pulled low by setting the ALERTEN bit (I2C_BUSCTL[4]). The Alert Response Address (ARA) is enabled at the same time.

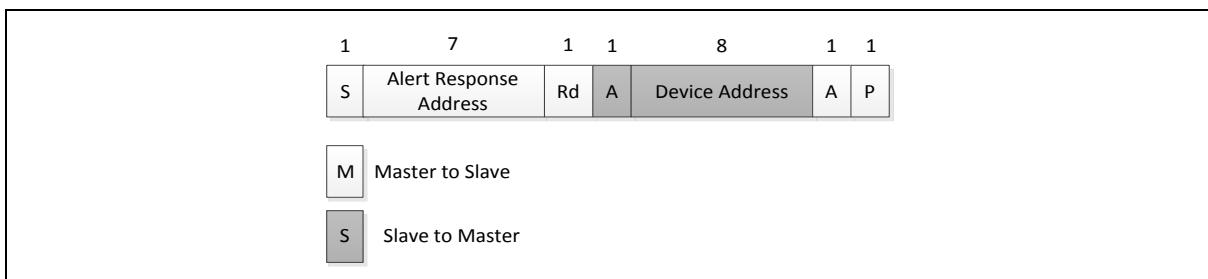

Figure 6.22-197-bit Addressable Device Responds to an ARA

When configured as a host (BMHEN=1), the ALERT flag (I2C_BUSSTS[3]) is set when a falling edge is detected on the Bus Management ALERT pin and ALERTEN=1. When ALERTEN=0, the ALERT line is considered high even if the external Bus Management ALERT pin is low. If the Bus Management ALERT pin is not needed, the Bus Management ALERT pin can be used as a standard GPIO if ALERTEN = 0;

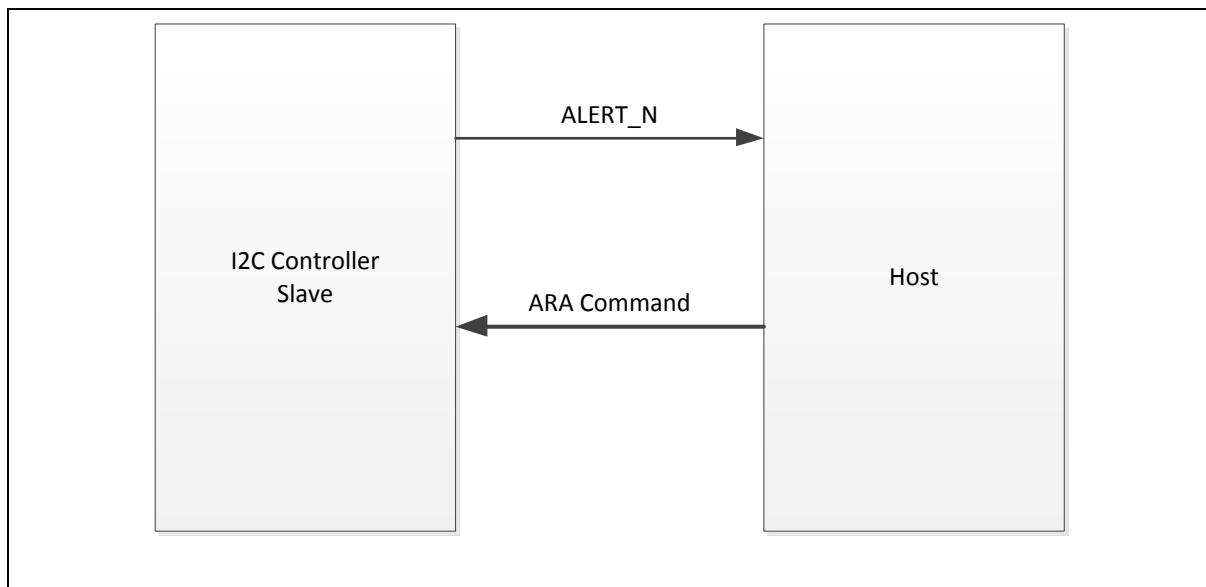

Figure 6.22-20 Bus Management ALERT function

Packet Error Checking

A packet error checking mechanism has been introduced in the SMBus specification to improve reliability and communication robustness. Packet Error Checking is implemented by appending a Packet Error Code (PEC) at the end of each message transfer. The PEC is calculated by using the $C(x) = x^8 + x^2 + x + 1$ CRC-8 polynomial on all the message bytes (including addresses and read/write bits).

The peripheral embeds a hardware PEC calculator when the PECEN bit (I2C_BUSCTL[1]) is set and allows to send a Not Acknowledge automatically when the received byte does not match with the hardware calculated PEC. The calculated value of PEC also can be read back on I2C_PKTCRC.

Time-out

This peripheral embeds hardware timers in order to be compliant with the 3 time-outs defined in SMBus specification ver. 2.0.

Bus Management Time-out:

The SCLK low time-out condition when bus no IDLE

$$T_{\text{Time-out}} = (\text{BUSTO}(\text{I2C_BUSTOUT}[7:0]) + 1) \times 16 \times 1024 \text{ (14-bit)} \times T_{\text{PCLK}} \text{ (if TOCDIV4 = 0).}$$

$$= (\text{BUSTO}(\text{I2C_BUSTOUT}[7:0]) + 1) \times 16 \times 1024 \text{ (14-bit)} \times 4 \times T_{\text{PCLK}} \text{ (if TOCDIV4 = 1)}$$

The bus idle condition (both SCLK and SDA high) when bus IDLE

$$T_{\text{Time-out}} = (\text{BUSTO}(\text{I2C_BUSTOUT}[7:0]) + 1) \times 4 \times T_{\text{PCLK}}.$$

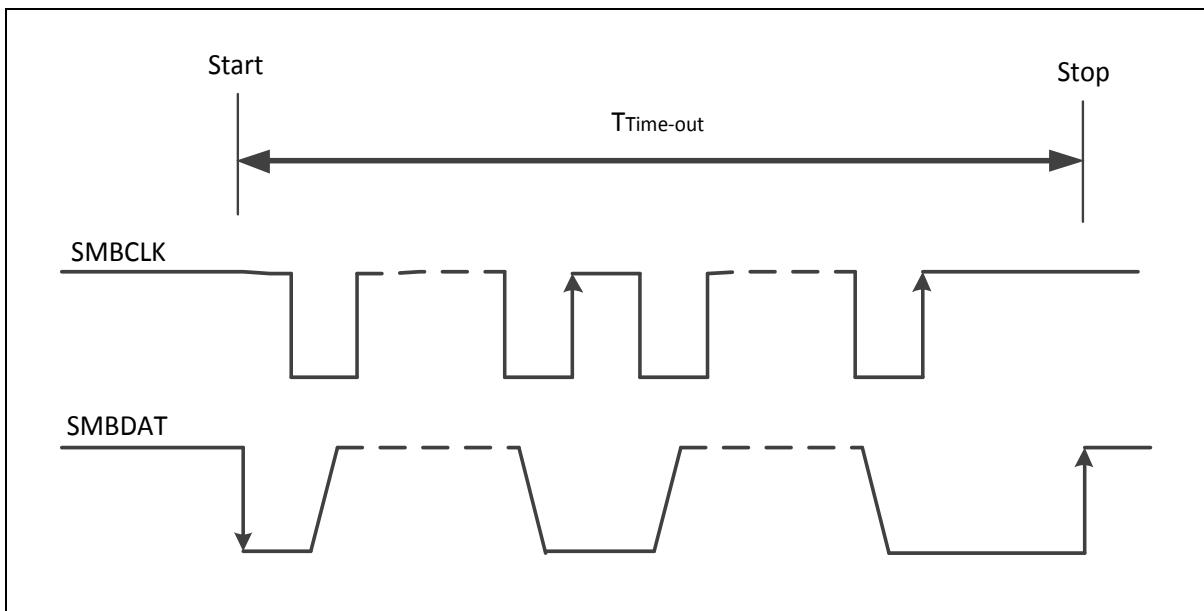

Figure 6.22-21 Bus Management Time Out Timing

Bus Clock Low Time-out:

In Master mode, the Master cumulative clock low extend time ($T_{\text{LOW:MEXT}}$) is detected

In Slave mode, the slave cumulative clock low extend time ($T_{\text{LOW:SEXT}}$) is detected

$$T_{\text{LOW:EXT}} = (\text{CLKTO } (\text{I2C_CLKTOUT}[7:0])+1) \times 16 \times 1024 \text{ (14-bit)} \times T_{\text{PCLK}} \text{ (if TOCDIV4= 0).}$$

$$= (\text{CLKTO } (\text{I2C_CLKTOUT}[7:0])+1) \times 16 \times 1024 \text{ (14-bit)} \times 4 \times T_{\text{PCLK}} \text{ (if TOCDIV4= 1)}$$

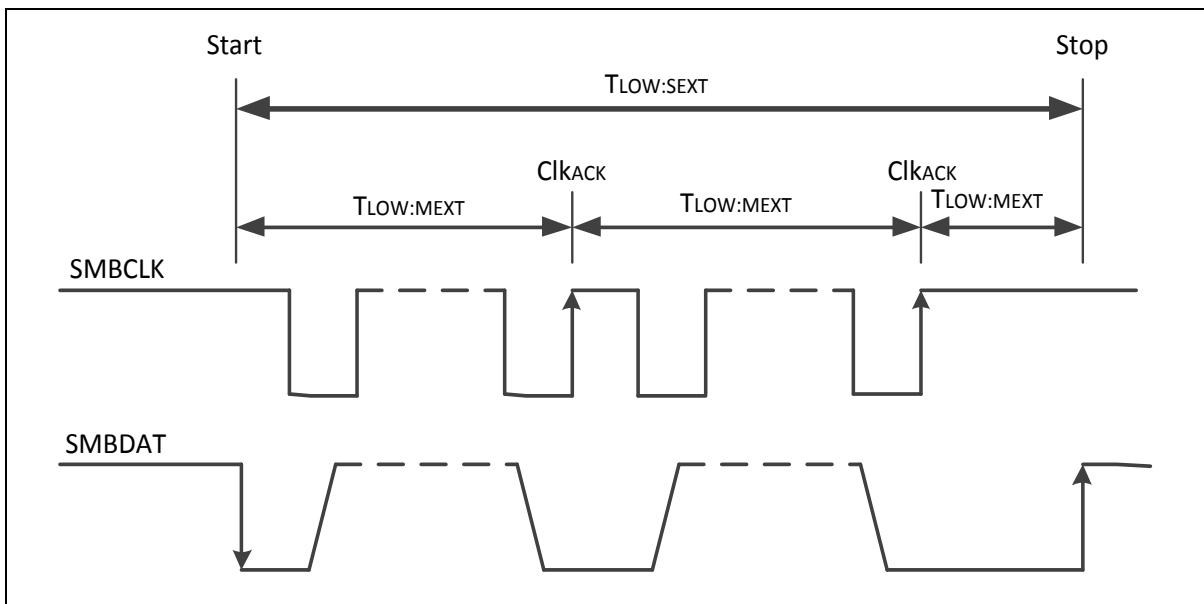

Figure 6.22-22 Bus Clock Low Time Out Timing

Bus Idle Detection

A master can assume that the bus is free if it detects that the clock and data signals have been high for T_{IDLE} greater than $T_{\text{HIGH,MAX}}$.

This timing parameter covers the condition where a master has been dynamically added to the bus

and may not have detected a state transition on the SMBCLK or SMBDAT lines. In this case, the master must wait long enough to ensure that a transfer is not currently in progress. The peripheral supports a hardware bus idle detection.

6.22.5.3 PDMA Transfer Function

The I²C controller supports PDMA transfer function. When TXPDMAEN (I2C_CTL1 [0]) is set to 1, the I²C controller will issue request to PDMA controller to start the DMA transmission process automatically.

When RXPDMAEN (I2C_CTL1 [1]) is set to 1, the I²C controller will start the receive PDMA process. The I²C controller will issue the request to PDMA controller automatically when there is data written into the received BUFFER.

When I²C enters PDMA mode, the mostly status interrupt will be masked. Let the interrupt not occur besides the bus error or NACK or STOP interrupt (0x20, 0x30, 0x38, 0x48, 0x58, 0x00, 0xA0, 0xC0, 0x88 and 0x98).

Set the PDMASTR (I2C_CTL1 [8]) only the I²C controller in master TX mode. If PDMASTR is cleared to 0, I²C will send STOP automatically after PDMA transfer done and buffer empty. If PDMASTR is set to 1, SI will be set to 1 and I²C bus will be stretched by hardware after PDMA transfer done and buffer empty.

6.22.5.4 Programmable setup and hold times

To guarantee a correct data setup and hold time, the timing must be configured. By programming HTCTL (I2C_TMCTL[24:16]) to configure hold time and STCTL (I2C_TMCTL[8:0]) to configure setup time.

The delay timing refer peripheral clock (PCLK). When device stretch master clock, the setup and hold time configuration value will not affected by stretched.

User should focus the limitation of setup and hold time configuration, the timing setting must follow I²C protocol. Once setup time configuration greater than design limitation, that means if setup time setting make SCL output less than three PCLKs, the I²C controller can't work normally due to SCL must sample three times. And once hold time configuration greater than I²C clock limitation, I²C will occur bus error. It is suggested that user calculate suitable timing with baud rate and protocol before setting timing. Table 6.22-2 shows the relationship between I²C baud rate and PCLK, the number of table represent one clock duty contain how many PCLKs. Setup and hold time configuration even can program some extreme values in the design, but user should follow I²C protocol standard.

I ² C Baud Rate PCLK	100k	200k	400k	800k	1200k
12 MHz	120	60	30	15	10
24 MHz	240	120	60	30	20
48 MHz	480	240	120	60	40
72 MHz	720	360	180	90	60

Table 6.22-2 Relationship between I²C Baud Rate and PCLK

For setup time wrong adjustment example, assuming one SCL cycle contains 5 PCLKs and set STCTL (I2C_TMCTL[8:0]) to 3 that stretch three PCLKs for setup time setting. The setup time maximum setting value: $ST_{limit} = (I2C_CLKDIV[7:0]+1) \times 2 - 6$.

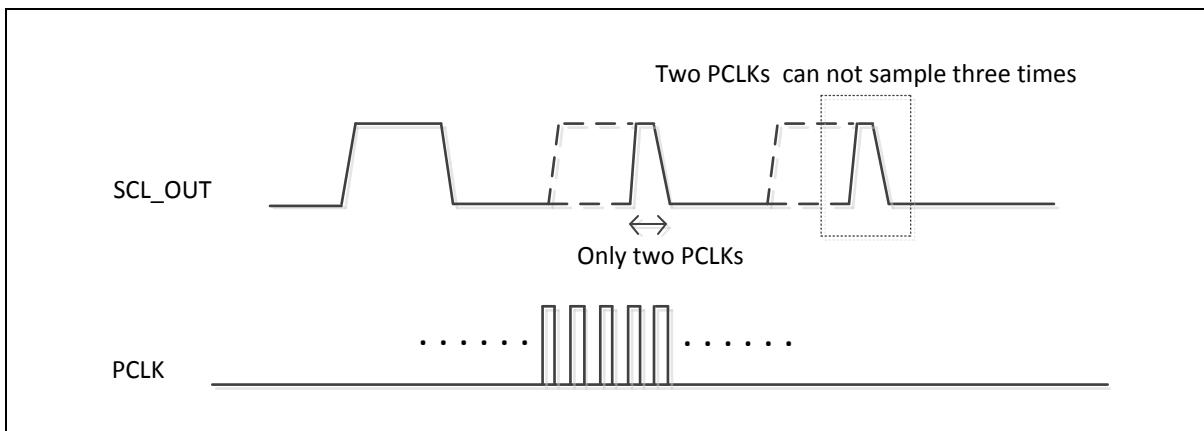

Figure 6.22-23 Setup Time Wrong Adjustment

For hold time wrong adjustment example, use I²C Baud Rate = 1200k and PCLK = 72MHz, the SCL high/low duty = 60 PCLK. When HTCTL (I2C_TMCTL[24:16]) is set to 61 and STCTL (I2C_TMCTL[8:0]) is set to 0, then SDA output delay will over SCL high duty and cause bus error. The hold time maximum setting value: $HT_{limit} = (I2C_CLKDIV[7:0]+1) \times 2 - 9$.

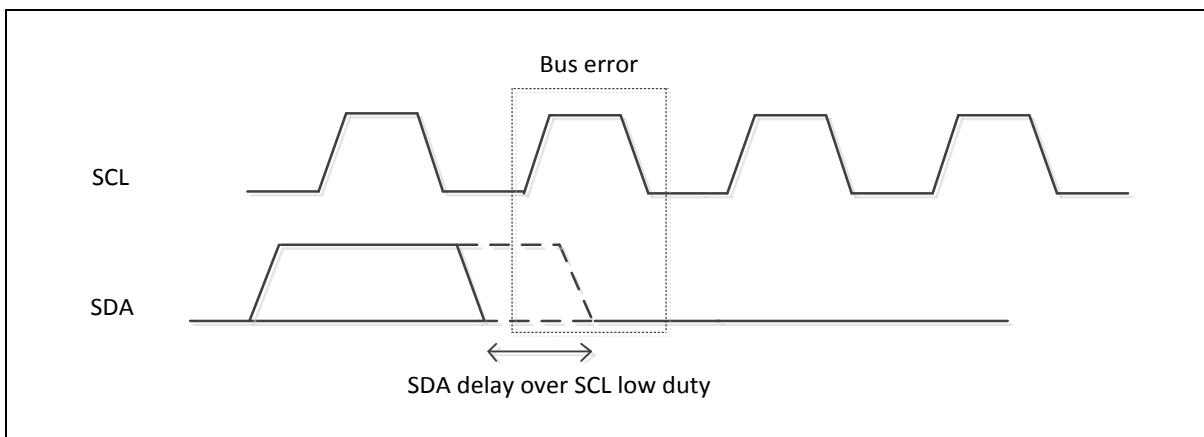

Figure 6.22-24 Hold Time Wrong Adjustment

6.22.5.5 I²C Protocol Registers

To control I²C port through the following fifteen special function registers: I2C_CTL0 (control register), I2C_STATUS0 (status register), I2C_DAT (data register), I2C_ADDRn (address registers, n=0~3), I2C_ADDRMSKn (address mask registers, n=0~3), I2C_CLKDIV (clock rate register), I2C_TOCTL (Time-out control register), I2C_WKCTL(wake up control register) and I2C_WKSTS(wake up status register).

Address Registers (I2C_ADDR)

The I²C port is equipped with four slave address registers, I2C_ADDRn (n=0~3). The contents of the register are irrelevant when I²C is in Master mode. In Slave mode, the bit field ADDR(I2C_ADDRn[7:1]) must be loaded with the chip's own slave address. The I²C hardware will react if the contents of I2C_ADDRn are matched with the received slave address.

The I²C ports support the “General Call” function. If the GC bit (I2C_ADDRn [0]) is set the I²C port hardware will respond to General Call address (00H). Clear GC bit to disable general call function.

When the GC bit is set and the I²C is in Slave mode, it can receive the general call address by 00H after Master send general call address to I²C bus, then it will follow status of GC mode.

Slave Address Mask Registers (I2C_ADDRMSK)

The I²C bus controller supports multiple address recognition with four address mask registers I2C_ADDRMSKn (n=0~3). When the bit in the address mask register is set to 1, it means the received corresponding address bit is "Don't care". If the bit is set to 0, it means the received corresponding register bit should be exactly the same as address register.

Data Register (I2C_DAT)

This register contains a byte of serial data to be transmitted or a byte which just has been received. The CPU can be read from or written to the 8-bit (I2C_DAT [7:0]) directly while it is not in the process of shifting a byte. When I²C is in a defined state and the serial interrupt flag (SI) is set, data in I2C_DAT [7:0] remains stable. While data is being shifted out, data on the bus is simultaneously being shifted in; I2C_DAT [7:0] always contains the last data byte presented on the bus.

The acknowledge bit is controlled by the I²C hardware and cannot be accessed by the CPU. Serial data is shifted into I2C_DAT [7:0] on the rising edges of serial clock pulses on the SCL line. When a byte has been shifted into I2C_DAT [7:0], the serial data is available in I2C_DAT [7:0], and the acknowledge bit (ACK or NACK) is returned by the control logic during the ninth clock pulse. In order to monitor bus status while sending data, the bus data will be shifted to I2C_DAT[7:0] when sending I2C_DAT[7:0] to bus. In the case of sending data, serial data bits are shifted out from I2C_DAT [7:0] on the falling edge of SCL clocks, and is shifted to I2C_DAT [7:0] on the rising edge of SCL clocks. Figure 6.22-25 shows I²C Data Shifting Direction.

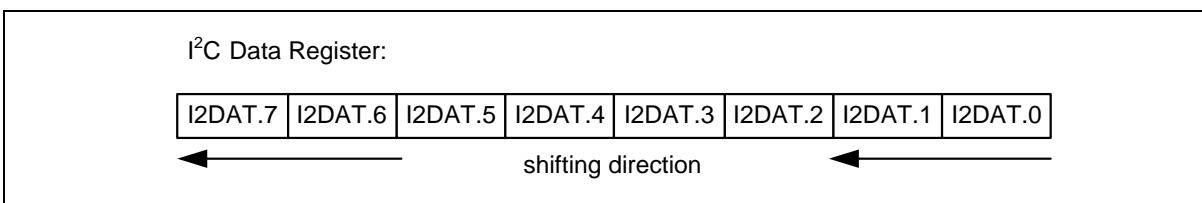

Figure 6.22-25 I²C Data Shifting Direction

Control Register (I2C_CTL0)

The CPU can be read from and written to I2C_CTL0 [7:0] directly. When the I²C port is enabled by setting I2CEN (I2C_CTL0 [6]) to high, the internal states will be controlled by I2C_CTL0 and I²C logic hardware.

There are two bits affected by hardware: the SI bit is set when the I²C hardware requests a serial interrupt, and the STO bit is cleared when a STOP condition is present on the bus. The STO bit is also cleared when I2CEN = 0.

Once a new status code is generated and stored in I2C_STATUS0, the I²C Interrupt Flag bit SI (I2C_CTL0 [3]) will be set automatically. If the Enable Interrupt bit INTEN (I2C_CTL0 [7]) is set at this time, the I²C interrupt will be generated. The bit field I2C_STATUS0[7:0] stores the internal state code, the content keeps stable until SI is cleared by software.

Status Register (I2C_STATUS0)

I2C_STATUS0 [7:0] is an 8-bit read-only register. The bit field I2C_STATUS0 [7:0] contains the status code and there are 26 possible status codes. All states are listed in Table 6.22-3. When I2C_STATUS0 [7:0] is F8H, no serial interrupt is requested. All other I2C_STATUS0 [7:0] values correspond to the defined I²C states. When each of these states is entered, a status interrupt is requested (SI = 1). A valid status code is present in I2C_STATUS0[7:0] one cycle PCLK after SI set by hardware and is still present one cycle PCLK after SI reset by software.

In addition, the state 00H stands for a Bus Error, which occurs when a START or STOP condition is present at an incorrect position in the I²C format frame. A Bus Error may occur during the serial transfer of an address byte, a data byte or an acknowledge bit. To recover I²C from bus error, STO should be set and SI should be cleared to enter Not Addressed Slave mode. Then STO is cleared to release bus and to wait for a new communication. The I²C bus cannot recognize stop condition during this action when a bus error occurs.

Master Mode		Slave Mode	
Status	Description	Status	Description
0x08 ^[1]	Start	0xA0	Slave Transmit Repeat Start or Stop
0x10 ^[1]	Master Repeat Start	0xA8 ^[1]	Slave Transmit Address ACK
0x18 ^[1]	Master Transmit Address ACK	0xB8 ^[1]	Slave Transmit Data ACK
0x20	Master Transmit Address NACK	0xC0	Slave Transmit Data NACK
0x28 ^[1]	Master Transmit Data ACK	0xC8 ^[1]	Slave Transmit Last Data ACK
0x30	Master Transmit Data NACK	0x60 ^[1]	Slave Receive Address ACK
0x38	Master Arbitration Lost	0x68 ^[1]	Slave Receive Arbitration Lost
0x40 ^[1]	Master Receive Address ACK	0x80 ^[1]	Slave Receive Data ACK
0x48	Master Receive Address NACK	0x88	Slave Receive Data NACK
0x50 ^[1]	Master Receive Data ACK	0x70 ^[1]	GC mode Address ACK
0x58	Master Receive Data NACK	0x78 ^[1]	GC mode Arbitration Lost
0x00	Bus error	0x90 ^[1]	GC mode Data ACK
		0x98	GC mode Data NACK
		0xB0 ^[1]	Address Transmit Arbitration Lost
0xF0	If the BMDEN =1 and the ACKMEN bit is enabled, the information of I2C_STATUS0 will be fixed as 0xF0 in slave receive condition.		
0xF8	Bus Released Note: Status "0xF8" exists in both master/slave modes, and it won't raise interrupt. Note [1]: No interrupt in PDMA mode		

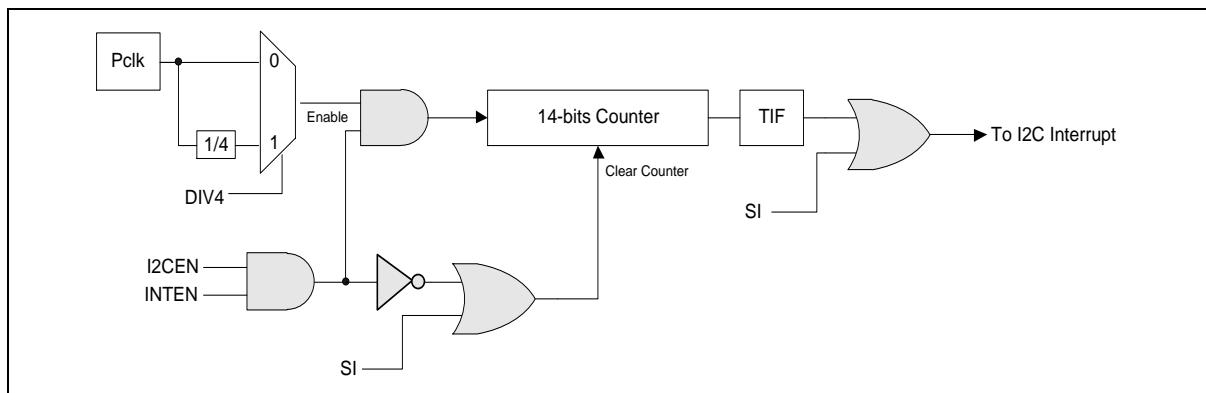

Table 6.22-3 I²C Status Code Description**Clock Baud Rate Bits (I2C_CLKDIV)**

The data baud rate of I²C is determined by DIVIDER(I2C_CLKDIV [7:0]) register when I²C is in Master mode, and it is not necessary in a Slave mode. In the Slave mode, I²C will automatically synchronize it with any clock frequency from master I²C device. In the slave mode, system clock frequency should be greater than I²C bus maximum clock 20 times.

The data baud rate of I²C setting is Data Baud Rate of I²C = (system clock) / (4x (I2C_CLKDIV [7:0] +1)). If system clock = 16 MHz, the I2C_CLKDIV [7:0] = 40 (28H), the data baud rate of I²C = 16 MHz / (4x (40 +1)) = 97.5 Kbits/sec.

Time-out Control Register (I2C_TOCTL)

There is a 14-bit time-out counter which can be used to deal with the I²C bus hang-up. If the time-out counter is enabled, the counter starts up counting until it overflows (TOIF=1) and generates I²C interrupt to CPU or stops counting by clearing TOCEN to 0. When time-out counter is enabled, writing 1 to the SI flag will reset counter and re-start up counting after SI is cleared. If I²C bus hangs up, it causes the I2C_STATUS0 and flag SI are not updated for a period, the 14-bit time-out counter may overflow and acknowledge CPU the I²C interrupt. Refer to Figure 6.22-26 for the 14-bit time-out counter. User may write 1 to clear TOIF to 0.

Figure 6.22-26 I²C Time-out Count Block Diagram**Wake-up Control Register (I²C_WKCTL)**

When chip enters Power-down mode and set WKEN (I²C_WKCTL [0]) to 1, other I²C master can wake up the chip by addressing the I²C device, user must configure the related setting before entering sleep mode. The ACK bit cycle of address match frame is done in power-down. The controller will stretch the SCL to low when the address is matched the device's address and the ACK cycle done, then the I²C controller will go ahead. If NHDBUSEN (I²C_WKCTL [7]) is set, the controller will don't stretch the SCL to low. Note that when the controller don't stretch the SCL to low, transmit or receive data will perform immediately. If data transmitted or received when SI event is not clear, user must reset the I²C controller and execute the original operation again.

Wake-up Status Register (I²C_WKSTS)

When system is woken up by other I²C master device, WKIF is set to indicate this event. User needs write "1" to clear this bit.

When the chip is woken-up by address match with one of the device address register (I²C_ADDRn), the user shall check the WKAKDONE (I²C_WKSTS [1]) bit is set to 1 to confirm the address byte has done. The WKAKDONE bit indicates that the ACK bit cycle of address byte is done in power-down. The controller will stretch the SCL to low when the address is matched the device's slave address and the ACK cycle done. The SCL is stretched until WKAKDONE is clear by user. If the frequency of SCL is low speed and the system has wakeup from address match frame, the user shall check WKAKDONE to confirm this frame has transaction done and then to do the wakeup procedure. Note that user can't release WKIF through clearing the WKAKDONE bit to 0.

The WRSTSWK (I²C_WKSTS [2]) bit records the Read/Write command before the I²C controller sends address. The user can read this bit's status to prepare the next transmitted data (WRSTSWK = 0) or to wait the incoming data (WRSTSWK = 1) can be stored in time after the system is wake-up by the address match frame. Note that the WRSTSWK (I²C_WKSTS [2]) bit is cleared when writing one to the WKAKDONE (I²C_WKSTS [1]) bit.

When system is woken up by other I²C master device, WKIF is set to indicate this event. User needs to write "1" to clear this bit.

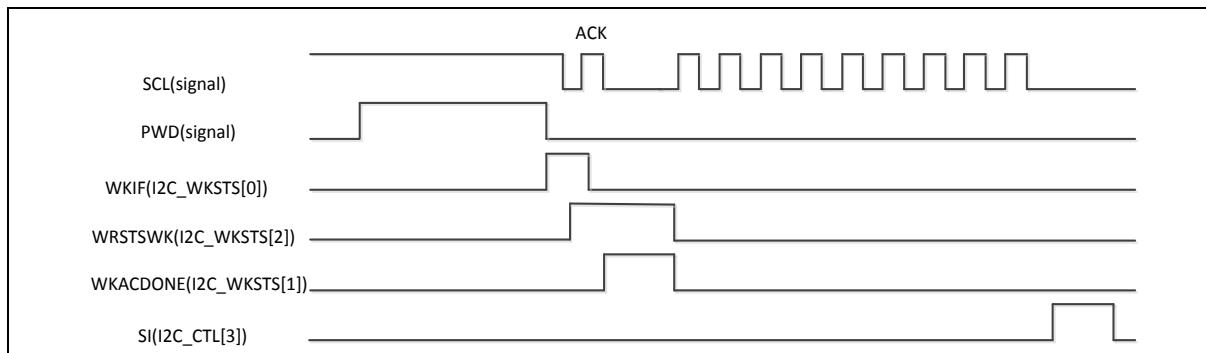

Figure 6.22-27 I²C Wake-Up Related Signals Waveform**I²C Control Register 1 (I2C_CTL1)**

If enable 10-bit addressing mode ADDR10EN (I2C_CTL1 [9]) is set, the I²C will run in 10-bit mode.

For PDMA function, set TXPDMAEN (I2C_CTL1 [0]) and RXPDMAEN (I2C_CTL1 [1]) can be set to operate. And set PDMARST (I2C_CTL1 [2]) to reset the PDMA control logic.

I²C Status Register 1 (I2C_STATUS1)

The I²C controller supports four slave address flag registers, ADMAT0, ADMAT1, ADMAT2 and ADMAT3 (I2C_STATUS1[3:0]). Every control register represent which address is used and set 1 to inform software.

I²C Timing Configure Control Register (I2C_TMCTL)

In order to configure setup/hold time, the HTCTL (I2C_TMCTL[24:16]) and STCTL (I2C_TMCTL[8:0]) are set based on actual demand.

Bus Management Control Register (I2C_BUSCTL)

The SM bus management control events are defined in this register. It includes the Acknowledge Control by Manual (ACKMEN (I2C_BUSCTL[0])), Packet Error Checking Enable (PECEN (I2C_BUSCTL[1])), device (BMDEN(I2C_BUSCTL[2])) or host (BMHEN (I2C_BUSCTL[3])) enable in this peripheral device. Both the alert and the suspend function can be set in ALERTEN (I2C_BUSCTL[4]), SCTLOSTS (I2C_BUSCTL[5]) and SCTLOEN (I2C_BUSCTL[6]).

The system bus management enable control by BUSEN(I2CBUSCTL[7]) bit. The BUSTOUT(I2CBUSCTL[9]) is used to calculate the time-out of clock low in bus active and the idle period in bus Idle.

The calculated PEC (when the PECEN is set) value is transmitted or received can be controlled by PECTXEN bit (I2C_BUSCTL[8]).

There is a special bit of ACKM9SI (I2C_BUSCTL[11]). When the ACKMEN is set, there is SI interrupt in the 8th clock input and the user can read the data and status register. If the 8th clock bus is released when the SI interrupt is cleared, there is another SI interrupt event in the 9th clock cycle when this bit is set to 1 to know the bus status in this transaction frame done.

Set the PECDIEN (I2C_BUSCTL[13]), BCDIEN (I2C_BUSCTL[12]) or PECCLR (I2C_BUSCTL[10]) for PEC control flow.

I²C Bus Management Timer Control Register (I2C_BUSTCTL)

Set TORSTEN (I2C_BUSTCTL[4]), CLKTOIEN (I2C_BUSTCTL[3]), BUSTOIEN (I2C_BUSTCTL[2]), CLKTOEN (I2C_BUSTCTL[1]) and BUSTOEN (I2C_BUSTCTL[0]) for bus time-out or clock low time-out control flow.

I²C Bus Management Status Register (I2C_BUSSTS)

Monitor the PECDONE (I2C_BUSSTS[7]), BCDONE (I2C_BUSSTS[1]) or PECERR (I2C_BUSSTS[2]) for PEC control flow.

Monitor the SCTLDIN (I2C_BUSSTS[4]) for SUSCON input status.

I²C Byte Number Register (I2C_PKTSIZE)

When the PECEN bit (I2C_BUSCTL[1]) is set. The I²C controller will calculate the PEC value of the data on the bus. The PLDSIZE (I2C_PKTSIZE[8:0]) is used to define the data number in the bus. When the counter reach the value of PLDSIZE, the final PEC value will be transmitted or received automatically when the PECTXEN bit (I2C_BUSCTL[8]) is set.

I²C PEC VALUR Register (I2C_PKTCRC)

The register indicates the calculated PECCRC (I2C_PKTCRC[7:0]) value of data on the I²C bus. The

detail of information is defined the Bus Management (SMBus/PMBus Compatiable).

I²C Bus Management Timer and I²C Clock Low Timer Register (I2C_BUSTOUT/ I2C_CLKTOUT)

Both of the definitions of these registers are described in the Bus Management (SMBus/PMBus Compatiable)

6.22.5.6 Example for Random Read on EEPROM

The following steps are used to configure the I²C0 related registers when using I²C to read data from EEPROM.

1. Set I2C0 the multi-function pin as SCL and SDA pins The muti-function configuration reference Basic Configuration.
2. Enable I2C0 APB clock. The clock configuration reference Basic Configuration.
3. Set I2C0RST=1 to reset I2C0 controller then set I2C0 controller to normal operation The reset controller configuration reference Basic Configuration.
4. Set I2CEN=1 to enable I2C0 controller in the “I2C_CTL0” register.
5. Give I2C0 clock a divided register value for I2C clock rate in the “I2C_CLKDIV”.
6. Enable system I2C0 IRQ in system “NVIC” control register.
7. Set INTEN=1 to enable I2C0 Interrupt in the “I2C_CTL0” register.
8. Set I2C0 address registers “I2C_ADDR0 ~ I2C_ADDR3”.

Random read operation is one of the methods of access EEPROM. The method allows the master to access any address of EEPROM space. Figure 6.22-28 shows the EEPROM random read operation.

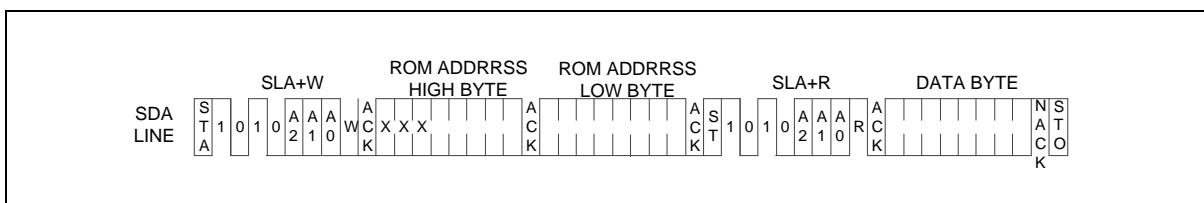

Figure 6.22-28 EEPROM Random Read

Figure 6.22-29 shows how to use the I²C controller to implement the protocol of EEPROM random read.

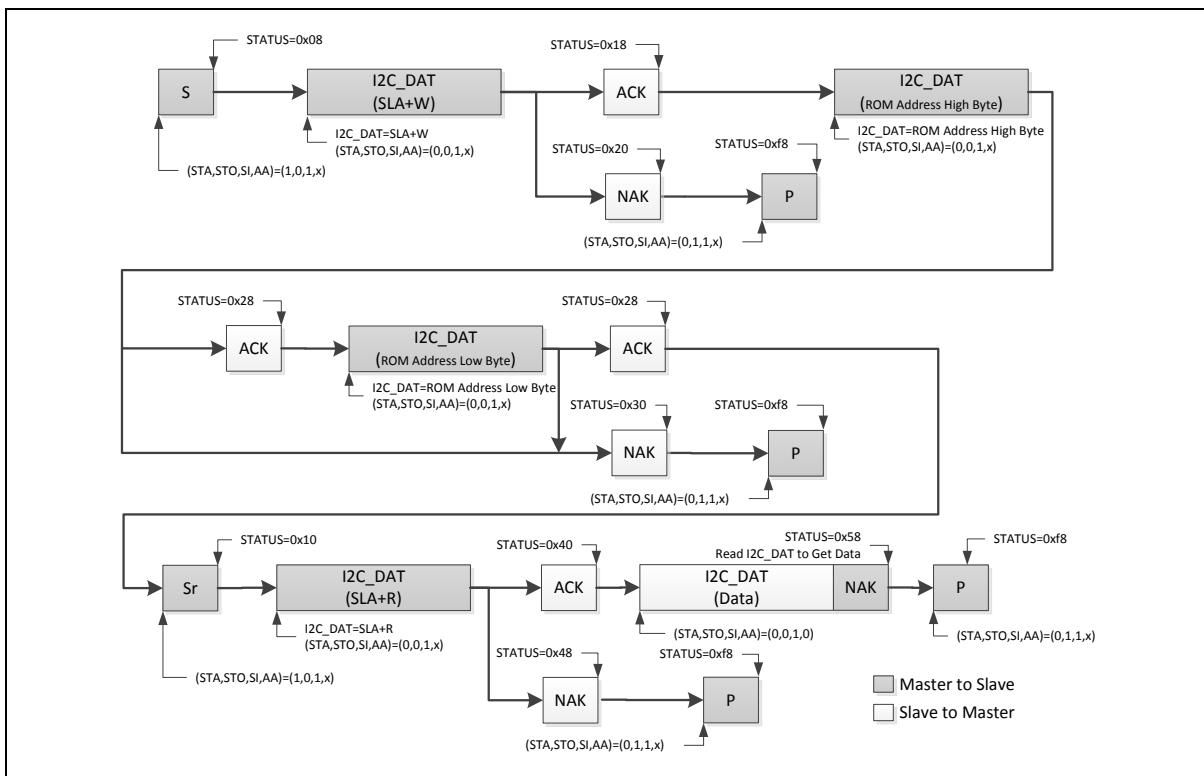

Figure 6.22-29 Protocol of EEPROM Random Read

The I²C controller, which is a master, sends START to bus. Then, it sends a SLA+W (Slave address + Write bit) to EEPROM followed by two bytes data address to set the EEPROM address to read. Finally, a Repeat START followed by SLA+R is sent to read the data from EEPROM.

6.22.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	INTEN	Enable Interrupt 0 = I ² C interrupt Disabled. 1 = I ² C interrupt Enabled.
[6]	I2CEN	I²C Controller Enable Bit Set to enable I ² C serial function controller. When I2CEN=1 the I ² C serial function enable. The multi-function pin function must set to SDA, and SCL of I ² C function first. 0 = I ² C controller Disabled. 1 = I ² C controller Enabled.
[5]	STA	I²C START Control Setting STA to logic 1 to enter Master mode, the I ² C hardware sends a START or repeat START condition to bus when the bus is free.
[4]	STO	I²C STOP Control In Master mode, setting STO to transmit a STOP condition to bus then I ² C controller will check the bus condition if a STOP condition is detected. This bit will be cleared by hardware automatically.
[3]	SI	I²C Interrupt Flag When a new I ² C state is present in the I2C_STATUS0 register, the SI flag is set by hardware. If bit INTEN (I2C_CTL0 [7]) is set, the I ² C interrupt is requested. SI must be cleared by software. Clear SI by writing 1 to this bit. For ACKMEN is set in slave read mode, the SI flag is set in 8th clock period for user to confirm the acknowledge bit and 9th clock period for user to read the data in the data buffer.
[2]	AA	Assert Acknowledge Control When AA =1 prior to address or data is received, an acknowledged (low level to SDA) will be returned during the acknowledge clock pulse on the SCL line when 1.) A slave is acknowledging the address sent from master, 2.) The receiver devices are acknowledging the data sent by transmitter. When AA=0 prior to address or data received, a Not acknowledged (high level to SDA) will be returned during the acknowledge clock pulse on

		the SCL line.

Bits	Description	
[31:8]	Reserved	Reserved.
[7:0]	STATUS	<p>I²C Status</p> <p>The three least significant bits are always 0. The five most significant bits contain the status code. There are 28 possible status codes. When the content of I2C_STATUS0 is F8H, no serial interrupt is requested. Others I2C_STATUS0 values correspond to defined I²C states. When each of these states is entered, a status interrupt is requested (SI = 1). A valid status code is present in I2C_STATUS0 one cycle after SI is set by hardware and is still present one cycle after SI has been reset by software. In addition, states 00H stands for a Bus Error. A Bus Error occurs when a START or STOP condition is present at an illegal position in the formation frame. Example of illegal position are during the serial transfer of an address byte, a data byte or an acknowledge bit.</p>

I²C Clock Divided Register (I2C_CLKDIV)

Register	Offset	R/W	Description	Reset Value
I2C_CLKDIV	I2Cn_BA+0x10	R/W	I ² C Clock Divided Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved						DIVIDER	
7	6	5	4	3	2	1	0
DIVIDER							

Bits	Description	
[31:10]	Reserved	Reserved.
[9:0]	DIVIDER	I²C Clock Divided Indicates the I ² C clock rate: Data Baud Rate of I ² C = (system clock) / (4x (I2C_CLKDIV+1)). Note: The minimum value of I2C_CLKDIV is 4.

I²C Time-out Control Register (I2C_TOCTL)

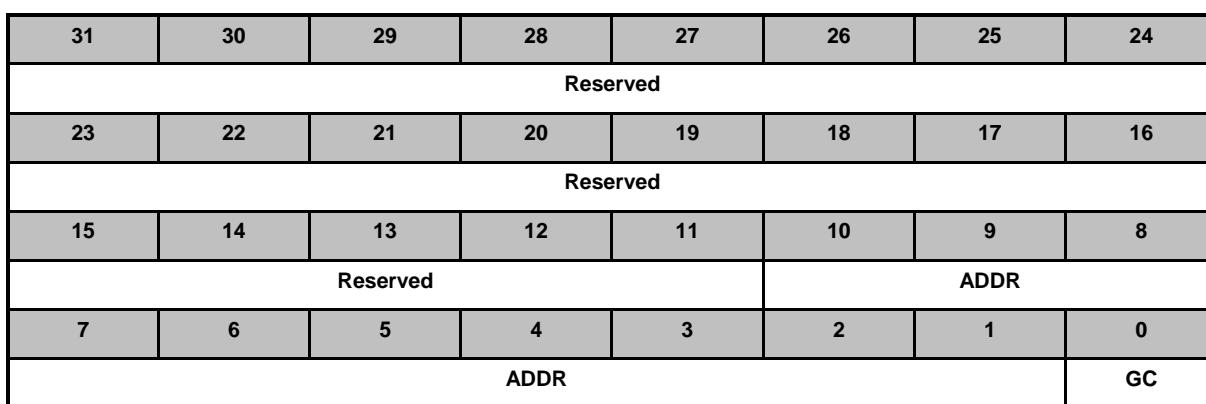

Register	Offset	R/W	Description	Reset Value
I2C_TOCTL	I2Cn_BA+0x14	R/W	I ² C Time-out Control Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved					TOCEN	TOCDIV4	TOIF

Bits	Description	
[31:3]	Reserved	Reserved.
[2]	TOCEN	Time-out Counter Enable Bit When enabled, the 14-bit time-out counter will start counting when SI is cleared. Setting flag SI to '1' will reset counter and re-start up counting after SI is cleared. 0 = Time-out counter Disabled. 1 = Time-out counter Enabled.
[1]	TOCDIV4	Time-out Counter Input Clock Divided by 4 When enabled, the time-out period is extended 4 times. 0 = Time-out period is extend 4 times Disabled. 1 = Time-out period is extend 4 times Enabled.
[0]	TOIF	Time-out Flag This bit is set by hardware when I ² C time-out happened and it can interrupt CPU if I ² C interrupt enable bit (INTEN) is set to 1. Note: Software can write 1 to clear this bit.

I²C Slave Address Register (ADDRx)

Register	Offset	R/W	Description	Reset Value
I ² C_ADDR0	I2Cn_BA+0x04	R/W	I ² C Slave Address Register0	0x0000_0000
I ² C_ADDR1	I2Cn_BA+0x18	R/W	I ² C Slave Address Register1	0x0000_0000
I ² C_ADDR2	I2Cn_BA+0x1C	R/W	I ² C Slave Address Register2	0x0000_0000
I ² C_ADDR3	I2Cn_BA+0x20	R/W	I ² C Slave Address Register3	0x0000_0000

Bits	Description	
[31:11]	Reserved	Reserved.
[10:1]	ADDR	<p>I²C Address The content of this register is irrelevant when I²C is in Master mode. In the slave mode, the seven most significant bits must be loaded with the chip's own address. The I²C hardware will react if either of the address is matched.</p> <p>Note: When software set 10'h000, the address can not be used.</p>
[0]	GC	<p>General Call Function 0 = General Call Function Disabled. 1 = General Call Function Enabled.</p>

I²C Slave Address Mask Register (ADDRMSKx)

7	6	5	4	3	2	1	0
BUSEN	SCTLOEN	SCTLOSTS	ALERTEN	BMHEN	BMDEN	PECEN	ACKMEN

Bits	Description	
[31:14]	Reserved	Reserved.
[13]	PECDIEN	Packet Error Checking Byte Transfer Done Interrupt Enable Bit 0 = PEC transfer done interrupt Disabled. 1 = PEC transfer done interrupt Enabled. Note: This bit is used in PECEN =1.
[12]	BCDIEN	Packet Error Checking Byte Count Done Interrupt Enable Bit 0 = Byte count done interrupt Disabled. 1 = Byte count done interrupt Enabled. Note: This bit is used in PECEN =1.
[11]	ACKM9SI	Acknowledge Manual Enable Extra SI Interrupt 0 = There is no SI interrupt in the 9th clock cycle when the BUSEN =1 and ACKMEN =1. 1 = There is SI interrupt in the 9th clock cycle when the BUSEN =1 and ACKMEN =1.
[10]	PECCLR	PEC Clear at Repeat Start The calculation of PEC starts when PECEN is set to 1 and it is cleared when the STA or STO bit is detected. This PECCR bit is used to enable the condition of REPEAT START can clear the PEC calculation. 0 = PEC calculation is cleared by "Repeat Start" function Disabled. 1 = PEC calculation is cleared by "Repeat Start" function Enabled.
[9]	TIDLE	Timer Check in Idle State The BUSTOUT is used to calculate the time-out of clock low in bus active and the idle period in bus Idle. This bit is used to define which condition is enabled. 0 = BUSTOUT is used to calculate the clock low period in bus active. 1 = BUSTOUT is used to calculate the IDLE period in bus Idle. Note: The BUSY (I2C_BUSSTS[0]) indicate the current bus state.
[8]	PECTXEN	Packet Error Checking Byte Transmission/Reception 0 = No PEC transfer. 1 = PEC transmission is requested.

		Note: 1.This bit has no effect in slave mode when ACKMEN =0.
[7]	BUSEN	<p>BUS Enable Bit 0 = The system management function Disabled. 1 = The system management function Enabled.</p> <p>Note: When the bit is enabled, the internal 14-bit counter is used to calculate the time out event of clock low condition.</p>
[6]	SCTLOEN	<p>Suspend or Control Pin Output Enable Bit 0 = The SUSCON pin in input. 1 = The output enable is active on the SUSCON pin.</p>
[5]	SCTLOSTS	<p>Suspend/Control Data Output Status 0 = The output of SUSCON pin is low. 1 = The output of SUSCON pin is high.</p>
[4]	ALERTEN	<p>Bus Management Alert Enable Bit Device Mode (BMHEN =0). 0 = Release the BM_ALERT pin high and Alert Response Header disabled: 0001100x followed by NACK if both of BMDEN and ACKMEN are enabled. 1 = Drive BM_ALERT pin low and Alert Response Address Header enables: 0001100x followed by ACK if both of BMDEN and ACKMEN are enabled. Host Mode (BMHEN =1). 0 = BM_ALERT pin not supported. 1 = BM_ALERT pin supported.</p>
[3]	BMHEN	<p>Bus Management Host Enable Bit 0 = Host function Disabled. 1 = Host function Enabled.</p>
[2]	BMDEN	<p>Bus Management Device Default Address Enable Bit 0 = Device default address Disable. When the address 0'b1100001x coming and the both of BMDEN and ACKMEN are enabled, the device responses NACKed 1 = Device default address Enabled. When the address 0'b1100001x coming and the both of BMDEN and ACKMEN are enabled, the device responses ACKed.</p>
[1]	PECEN	<p>Packet Error Checking Calculation Enable Bit 0 = Packet Error Checking Calculation Disabled. 1 = Packet Error Checking Calculation Enabled.</p> <p>Note: When I²C enter powerdown mode, the bit should be enabled after wake-up if needed PEC calculation.</p>
[0]	ACKMEN	<p>Acknowledge Control by Manual In order to allow ACK control in slave reception including the command and data, slave byte control mode must be enabled by setting the ACKMEN bit. 0 = Slave byte control Disabled. 1 = Slave byte control Enabled. The 9th bit can response the ACK or NACK according the received data by user. When the byte is received, stretching the SCLK signal low between the 8th and 9th SCLK pulse.</p> <p>Note: If the BMDEN =1 and this bit is enabled, the information of I2C_STATUS0 will be fixed as 0xF0 in slave receive condition.</p>

I²C Bus Management Timer Control Register (I2C_BUSTCTL)

6.23 USCI - Universal Serial Control Interface Controller (USCI)

6.23.1 Overview

The Universal Serial Control Interface (USCI) is a flexible interface module covering several serial communication protocols. The user can configure this controller as UART, SPI, or I²C functional protocol.

6.23.2 Features

The controller can be individually configured to match the application needs. The following protocols are supported:

- UART
- SPI
- I²C

6.23.3 Block Diagram

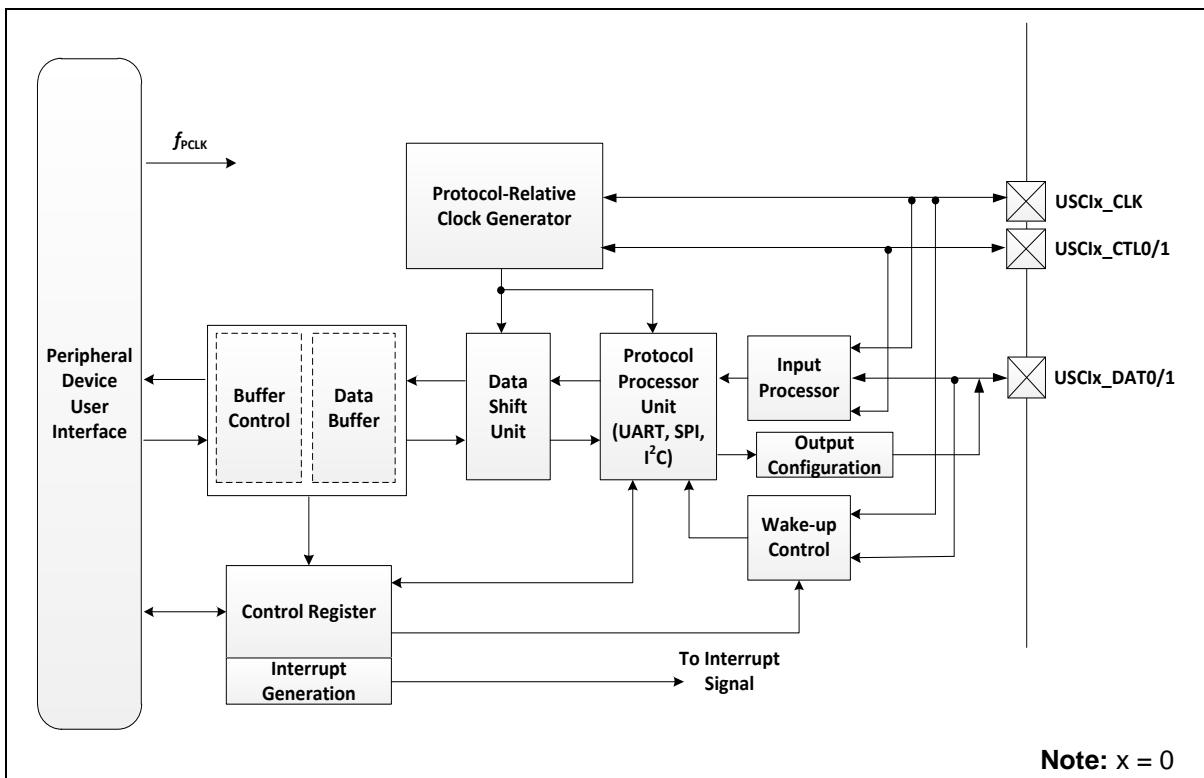

Figure 6.23-1 USCI Block Diagram

6.23.4 Functional Description

The structure of the Universal Serial Control Interface (USCI) controller is shown in Figure 6.23-1 USCI Block Diagram. The input signal is implemented in input processor. The data buffers and the data shift unit support the data transfers. Each protocol-specific function is handled by the protocol processor unit. The timing and time event control signals of the specific protocol are handled by the protocol-relative clock generator. All the protocol-specific events are processed in the interrupt generation unit. The wake-up function of the specific protocol is implemented in the wake-up control unit.

The USCI is equipped with three protocols including UART, SPI, and I²C. They can be selected by FUNMODE (USCI_CTL [2:0]). Note that the FUNMODE must be set to 0 before changing protocol.

6.23.4.1 I/O Processor

Input Signal

All input stages offer the similar feature set. They are used for all protocols.

Table 6.23-1 lists the relative input signals for each selected protocol. Each input signal is handled by an input processor for signal conditioning, such as signal inverse selection control, or a digital input filter.

Selected Protocol		UART	SPI	I ² C
Serial Bus Clock Input	USCIx_CLK	-	SPI_CLK	SCL
Control Input	USCIx_CTL0	nCTS	SPI_SS	-
	USCIx_CTL1	-	-	-
Data Input	USCIx_DAT0	RX	SPI_MOSI_0	SDA
	USCIx_DAT1	-	SPI_MISO_0	-

Table 6.23-1 Input Signals for Different Protocols

The description of protocol-specific items are given in the related protocol chapters.

General Input Structure

The input structures of data and control signals include inverter, digital filter and edge detection (data signal only).

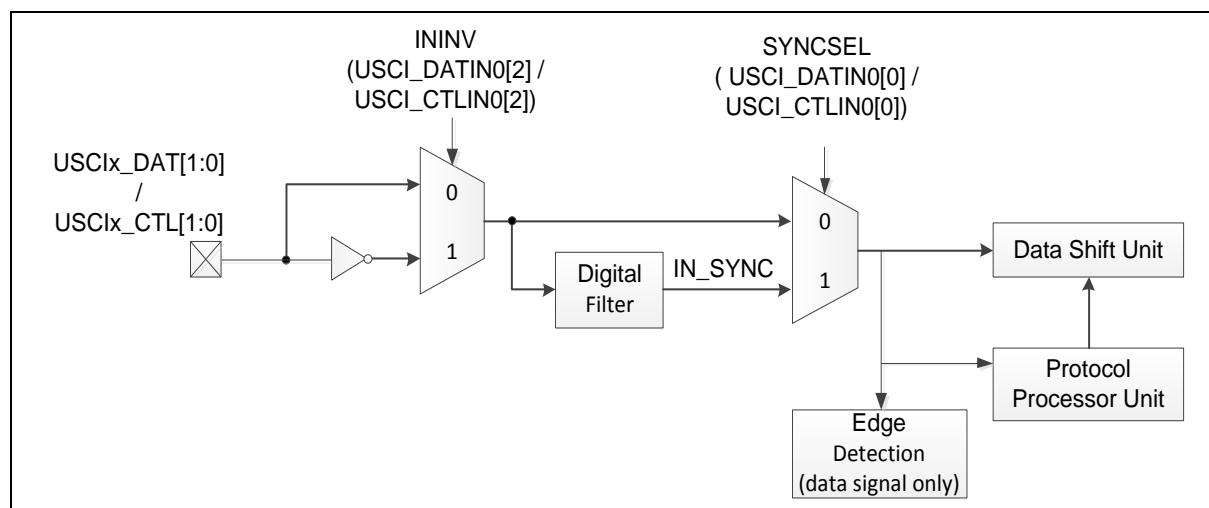

Figure 6.23-2 Input Conditioning for USCIx_DAT[1:0] and USCIx_CTL[1:0]

The input structure of USCIx_CLK is similar to USCIx_CTL[1:0] input structure, except it does not support inverse function.

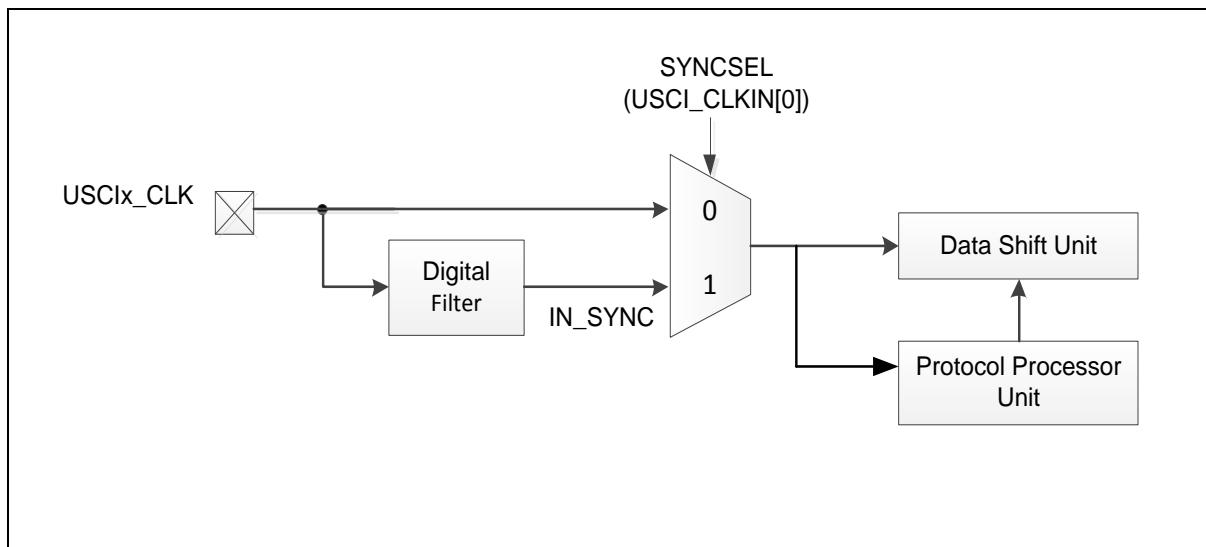

Figure 6.23-3 Input Conditioning for USCIx_CLK

All configurations of control, clock and data input structures are in USCI_CTLIN0, USCI_CLKIN and USCI_DATIN0 registers respectively. EDGEDET (USCI_DATIN0[4:3]) is used to select the edge detection condition. Note that the EDGEDET for USCI_DATIN0 must be set 2'b10 in UART mode. The programmable edge detection indicates that the desired event has occurred by activating the trigger signal.

ININV (USCI_DATIN0[2] / USCI_CTLIN0[2]) allows a polarity inversion of the selected input signal to adapt the input signal polarity to the internal polarity of the data shift unit and the protocol state machine.

If the SYNCSEL (USCI_DATIN0[0] / USCI_CTLIN0[0] / USCI_CLKIN[0]) is set to 0, the paths of input signals do not contain any delay due to synchronization or filtering. If there is noise on the input signals, there is the possibility to synchronize the input signal (signal IN_SYNC is synchronized to f_{PCLK}). The synchronized input signal is taken into account by SYNCSEL = 1. The synchronization leads to a delay in the signal path of 2-3 times the period of f_{PCLK} .

Output Signals

Table 6.23-2 shows the relative output signals for each protocol. The number of actually used outputs depends on the selected protocol and they can be classified according to their meaning for the protocols.

Selected Protocol		UART	SPI	I ² C
Serial Bus Clock Output	USCIx_CLK	-	SPI_CLK	SCL
Control Output	USCIx_CTL0	-	SPI_SS	-
	USCIx_CTL1	nRTS	-	-
Data Output	USCIx_DAT0	-	SPI_MOSI_0	SDA
	USCIx_DAT1	TX	SPI_MISO_0	-

Table 6.23-2 Output Signals for Different Protocols

The description of protocol-specific items are given in the related protocol chapters.

6.23.4.2 Data Buffering

The data handling of the USCI controller is based on a Data Shift Unit (DSU) and a buffer structure. Both of the data shift and buffer registers are 16-bit wide. The inputs of Data Shift Unit include the shift data, the serial bus clock, and the shift control. The output pin of transmission can be USCI_x_DAT0 pin or USCI_x_DAT1 pin depends on what protocol is selected.

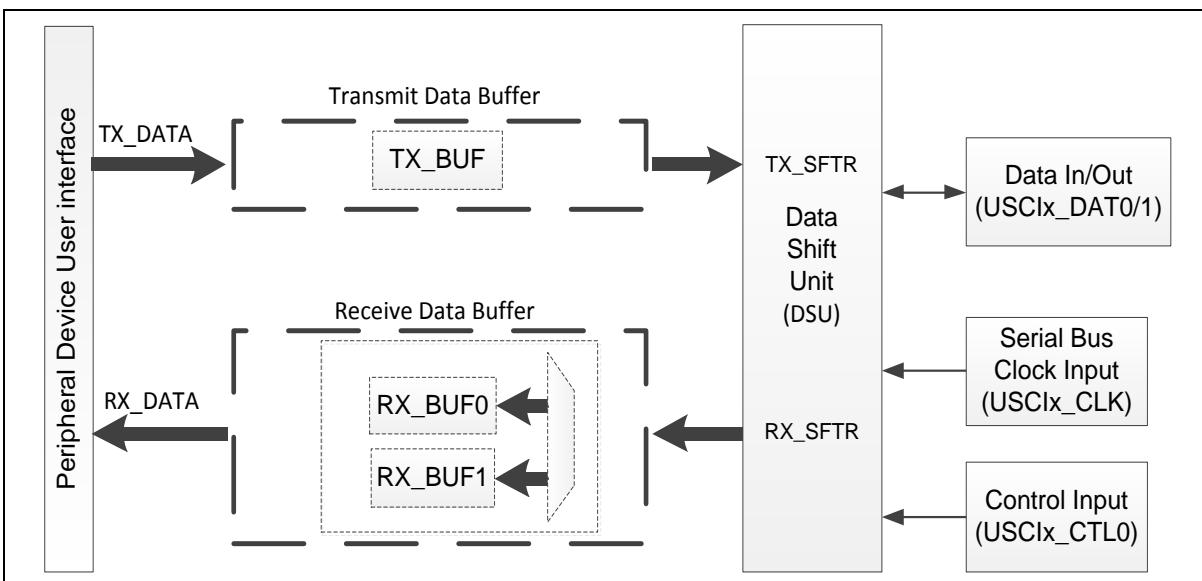

Figure 6.23-4 Block Diagram of Data Buffering

The operation of data handling includes:

- The peripheral device user interface (APB) is used to handle data, interrupts, status and control information.
- A transmitter includes transmit shift register (TX_SFTR) and a transmit data buffer (TX_BUF). The TXFULL / TXEMPTY (USCI_BUFSTS[9:8]) and TXENDIF (USCI_PROTSTS[2]) can indicate the status of transmitter.
- A receiver includes receive shift register (RX_SFTR) and a double receive buffer structure (RX_BUFO, RX_BUF1). In double buffer structure, user need not care about the reception sequence and two received data can be hold if user does not read the data of USCI_RXDAT register in time.

Data Access Structure

The Data Access Structure includes read access to received data and write access of data to be transmitted. The received data is stored in the receiver buffers including RX_BUFO and RX_BUF1. User need not care about the reception sequence. The receive buffer can be accessed by reading USCI_RXDAT register. The first received data is read out first and the next received data becomes visible in USCI_RXDAT and can be read out next.

Transmit data can be loaded to TX_BUF by writing to the transmit register USCI_TXDAT.

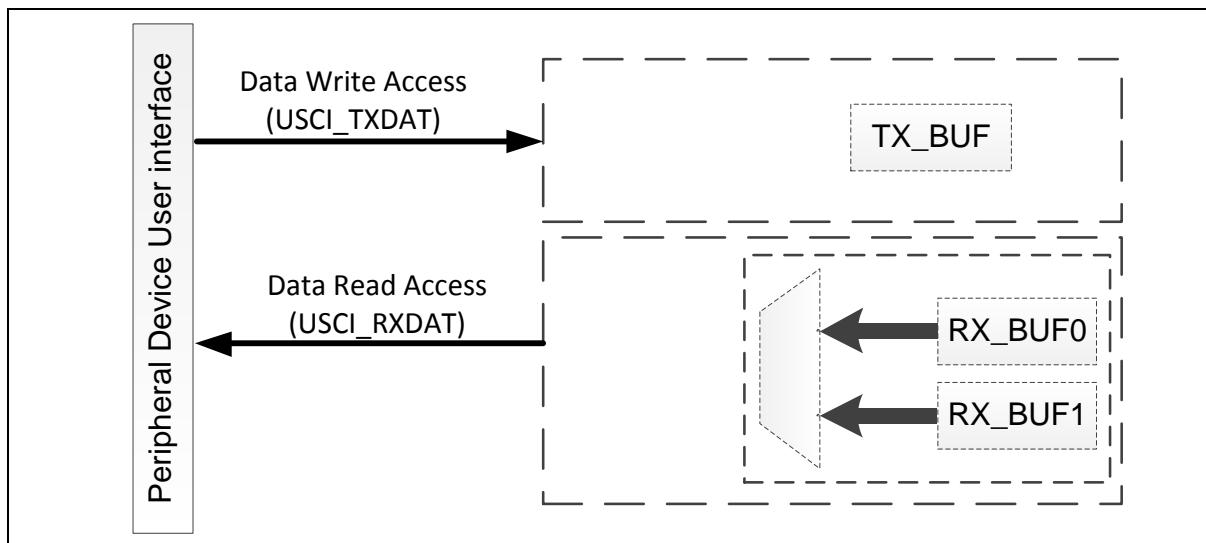

Figure 6.23-5 Data Access Structure

Transmit Data Path

The transmit data path is based on 16-bit wide transmit shift register (TX_SFTR) and transmit buffer TX_BUF. The data transfer parameters like data word length is controlled commonly for transmission and reception by the line control register USCI_LINECTL.

Transmit Buffering

The transmit shift register cannot be directly accessed by user. It is updated automatically with the value stored in the transmit buffer (TX_BUF) if a currently transmitted data is finished and new data is valid for transmission.

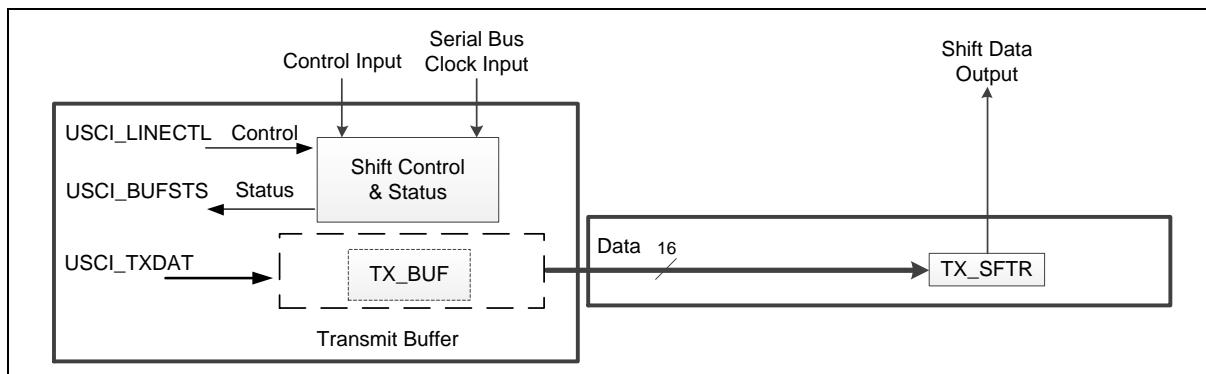

Figure 6.23-6 Transmit Data Path

Transmit Data Validation

The status of TXEMPTY (USCI_BUFSTS[8]) indicates the transmission data is valid or not in the transmit buffer (TX_BUF) and the TXSTIF (USCI_PROTSTS[1]) labels the start conditions for each data.

- If the USCI controller is a Master, the data transfer can only be started with valid data in the transmit buffer (TX_BUF). In this case, the transmit shift register is loaded with the content of transmit buffer.
- Note:** Master defines the start of data transfer.
- If the USCI controller is a Slave, a data transfer requested by Master and it has to be started independently of the status in transmit buffer (TX_BUF). If a data transfer is

requested and started by the Master, the transmit shift register is loaded from specific protocol control signal if it is valid for transmission.

Note: Slave can not define the start itself, but has to react.

- The timing of loading data from transmit buffer to data shift unit depends on protocol configurations.
- **UART:** A transmission of the data word in transmit buffer can be started if TXEMPTY = 0 in normal operation. In auto flow control, A transmission of the data word in transmit buffer can be started while TXEMPTY = 0 and USCIx_CTL0 in active stage.
- **SPI:** In Master mode, data transmission will be started when TXEMPTY (USCI_BUFSTS[8]) is 0. In Slave mode, the data transmission can be started only when slave selection signal is at active state and clock is presented on USCIx_CLK pin.
- **I²C:** A transmission of the data byte in transmit buffer can be started if TXEMPTY = 0.
- A transmission data which is located in transmit buffer can be started if the TXEMPTY (USCI_BUFSTS [8]) = 0. The content of the transmit buffer (in TX_BUF condition) should not be overwritten with new data while it is valid for transmission and a new transmission can start. If the content of TX_BUF has to be changed, user can set TXRST (USCI_BUFCTL [16]) to 1 to clear the content of TX_BUF before updating the data. Moreover, TXEMPTY (USCI_BUFSTS [8]) will be cleared automatically when transmit buffer (TX_BUF) is updated with new data. While a transmission is in progress, TX_BUF can be loaded with new data. User has to update the TX_BUF before a new transmission.

Receive Data Path

The receive data path is based on 16-bit wide receive shift register RX_SFTR and receive buffers RX_BUF0 and RX_BUF1. The data transfer parameters like data word length, or the shift direction are controlled commonly for transmission and reception by the line control register USCI_LINECTL. Register USCI_BUFSTS monitors the data validation of USCI_RXDAT.

Receive Buffering

The receive shift register cannot be directly accessed by user, but its content is automatically loaded into the receive buffer if a complete data word has been received or the frame is finished. The received data words in Receive Buffer can be read out automatically from register USCI_RXDAT.

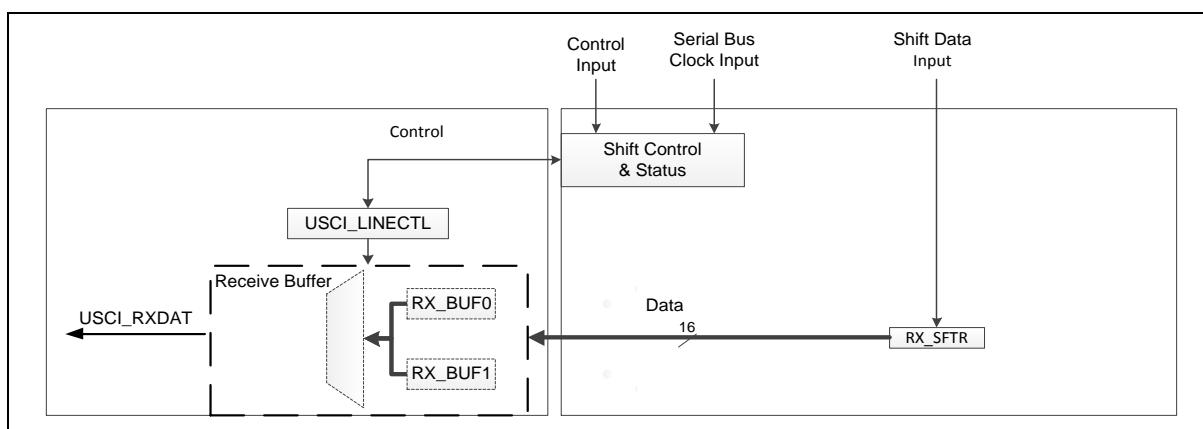

Figure 6.23-7 Receive Data Path

6.23.4.3 Port Direction Control

In SPI protocol with half-duplex configurations, the data port is bidirectional. Port direction control is intended to control the pin direction through a dedicated hardware interface.

The direction of selected pin is controlled by PORTDIR (USCI_TXDAT[16]). When user writes

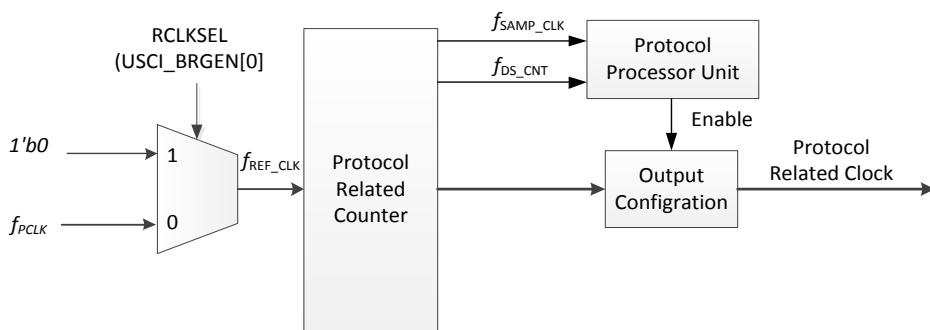

USCI_TXDAT register, the transmit data and its port direction are settled simultaneously.

6.23.4.4 Protocol Control and Status

The protocol-related control and status information are located in the protocol control register USCI_PROTCTL and in the protocol status register USCI_PROTSTS. These registers are shared between the available protocols. As a consequence, the meaning of the bit positions in these registers is different within the protocols. Refer to each protocol's relative register for detail information.

6.23.4.5 Protocol-Relative Clock Generator

The USCI controller contains a protocol-relative clock generator and it is controlled by register USCI_BRGEN. It is reset when the USCI_BRGEN register is written. The structured of protocol-relative clock generator is shown below.

Note: Refer the **Basic Clock Divider Counter** section to get the f_{SAMP_CLK}

Figure 6.23-8 Protocol-Relative Clock Generator

The protocol related counter contains basic clock divider counter and timing measurement counter. It is based on a divider stages, providing the frequencies needed for the different protocols. It contains:

- The basic clock divider counter provides the protocol relative clock signal and other protocol-related signals (f_{SAMP_CLK} and f_{DS_CLK}).
- The timing measurement counter for time interval measurement, e.g. baud rate detection on UART protocol.
- The output signals of protocol relative clock generator can be made available on pins (e.g. USCIx_CLK for SPI).

Basic Clock Divider Counter

The basic clock divider counter is used for an integer division delivering f_{REF_CLK2} , f_{REF_CLK} , f_{DIV_CLK} , f_{SCLK} , and f_{SAMP_CLK} . The frequencies of this divider are controlled by PTCLKSEL (USCI_BRGEN [1]), CLKDIV (USCI_BRGEN [25:16]), SPCLKSEL (USCI_BRGEN [3:2]).

The basic clock divider counter is used to generate the relative protocol timing signals.

$$f_{DIV_CLK} = f_{REF_CLK} \times \frac{1}{CLKDIV + 1} \text{ if PTCLKSEL} = 0$$

$$f_{DIV_CLK} = f_{REF_CLK} \times \frac{1}{(CLKDIV + 1) \times 2} \text{ if PTCLKSEL} = 1$$

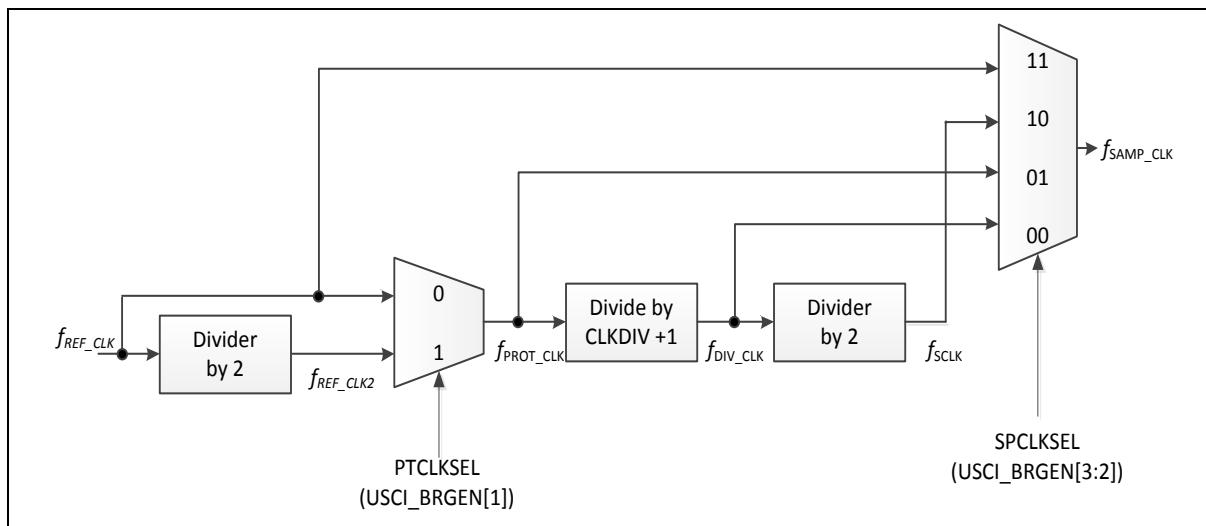

Figure 6.23-9 Basic Clock Divider Counter

Timing Measurement Counter

The timing measurement counter is used for time interval measurement and is enabled by TMCNTEN (USCI_BRGEN [4]) = 1. When TMCNTSRC (USCI_BRGEN [5]) is set to 1, the timer works on f_{DIV_CLK} , otherwise, the timer works independently from f_{PROT_CLK} . Therefore, any serial data reception or transmission can continue while the timer is performing timing measurements. The timer counts the length of protocol-related signals with f_{PROT_CLK} or f_{DIV_CLK} . It stops counting when it reaches the user-specified value.

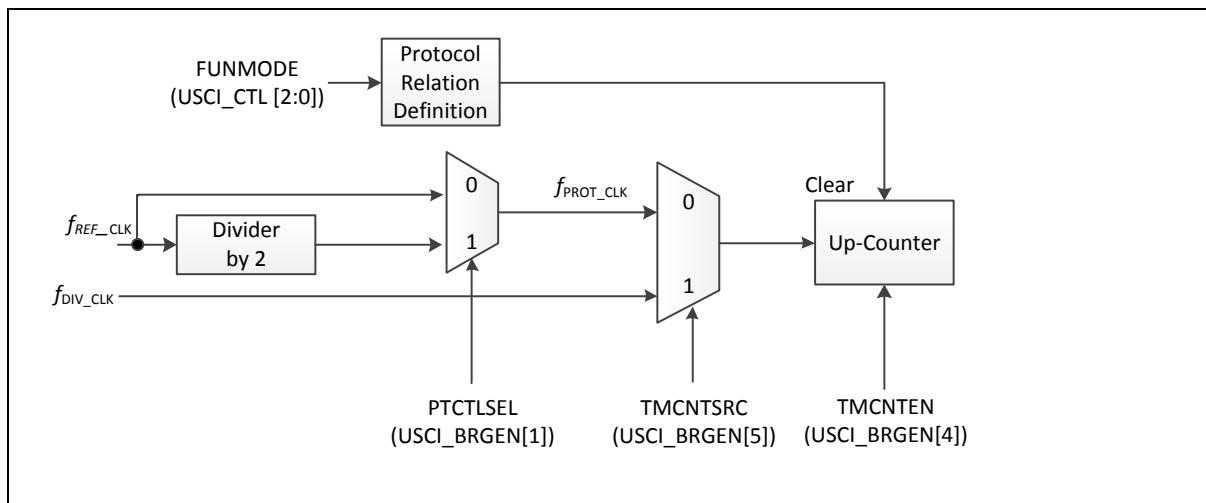

Figure 6.23-10 Block of Timing Measurement Counter

The timing measurement counter is used to perform time-out function or auto-baud rate mechanism. Its functionality depends on the selected protocol as shown below.

- UART: The timing measurement counter is used in auto baud rate detection.
- SPI: The timing measurement counter is used for counting the slave time-out period.
- I²C: The timing measurement counter indicates time-out clock cycle.

Sample Time Counter

A sample time counter associated to the protocol related counter defining protocol specific timings, such shift control signals or bit timings, based on the input frequency f_{SAMP_CLK} . The sample time

counter allows generating time intervals for protocol-specific purposes. The period of a sample frequency f_{PDS_CNT} is given by the selected input frequency f_{SAMP_CLK} and the programmed pre-divider value (PDSCNT (USCI_BRGEN [9:8])). The meaning of the sample time depends on the selected protocol. Please refer to the corresponding chapters for more protocol-specific information.

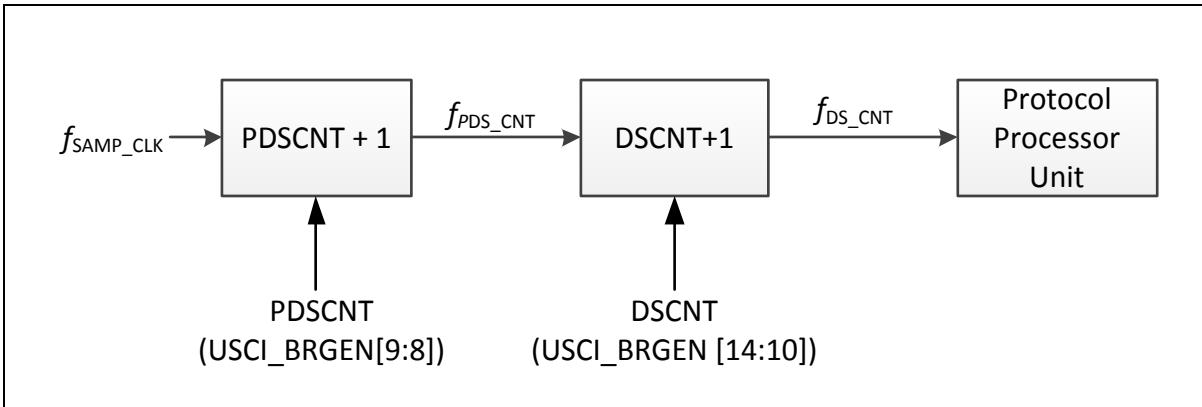

Figure 6.23-11 Sample Time Counter

6.23.4.6 Data Transfer Events and Interrupts

The data transfer events are based on the transmission or reception of a data word. The related indication flags are located in register USCI_PROTSTS. All events can be individually enabled for interrupt generation. If the FUNMODE (USCI_CTL [2:0]) is set to 0, the USCI is disabled. When FUNMODE (USCI_CTL [2:0]) is setting for a protocol port, the internal states will be controlled by logic hardware of the selected protocol.

- Transmit start interrupt event to indicate that a data word has been started:

A transmit start interrupt event occurs when the data is loaded into transmitted shift register. It is indicated by flag TXSTIF (USCI_PROTSTS [1]) and, if enabled, leads to transmit start interrupt.

- Transmit end interrupt event to indicate that a data word transmission has been done:

A transmit end interrupt event occurs when the current transmit data in shift register had been finished. It is indicated by flag TXENDIF (USCI_PROTSTS [2]) and, if enabled, leads to transmit end interrupt. This event also indicates when the shift control settings (word length, shift direction, etc.) are internally “frozen” for the current data word transmission. In UART and I²C mode, the transmit data valid is according to TXEMPTY (USCI_BUFSTS [8]) and protocol relative internal signal with the transmit end interrupt event.

- Receiver start event to indicate that a data word reception has started:

When the receive clock edge that shifts in the first bit of a new data word is detected and reception is enabled, a receiver start event occurs. It is indicated by flag RXSTIF (USCI_PROTSTS [3]) and, if enabled, leads to receiver start interrupt.

- Receive event to indicate that a data word has been received:

If a new received word becomes available in the receive buffer, a receive event occurs. It is indicated by flag RXENDIF (USCI_PROTSTS [4]) and, if enabled, leads to receive interrupt.

- Data lost event to indicate a loss of the newest received data word:

If the data word available in register USCI_RXDAT (oldest data word from RX_BUFO or RX_BUF1) has not been read out and the receive buffer is FULL, the new incoming data will lose and this event occurs. It is indicated by flag RXOVIF (USCI_BUFSTS[3]) and, if

enabled, leads to a protocol interrupt.

The general event and interrupt structure is shown in Figure 6.23-12.

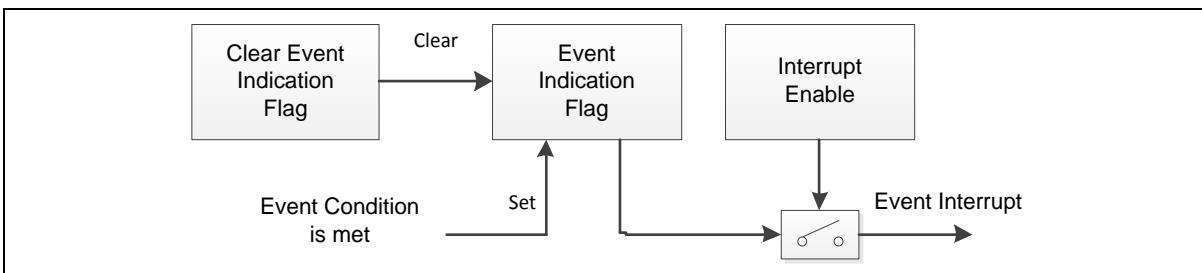

Figure 6.23-12 Event and Interrupt Structure

Each general interrupt enable can set by RXENDIEN, RXSTIEN, TXENDIEN, and TXSTIEN of USCI_INTEN [4:1]. The events are including receive end interrupt event, receive start interrupt event, transmit end interrupt event, and transmit start interrupt event. For protocol-specific interrupt, it is specified in each protocol interrupt enable register.

If a defined condition is met, an event is detected and an event indication flag becomes automatically set. The flag stays set until it is cleared by software. If enabled, an interrupt can be generated if an event is detected.

The registers, bits and bit fields indicate the data transfer events and control the general interrupts of a USCI are shown in Table 6.23-3.

Event	Indication Flag	Indication Cleared By	Interrupt Enabled By
Transmit start interrupt event	TXSTIF (USCI_PROTSTS [1])	It is cleared by software writes 1 to corresponding interrupt bit of USCI_PROTSTS.	TXSTIEN (USCI_INTEN [1])
Transmit end interrupt event	TXENDIF (USCI_PROTSTS [2])		TXENDIEN (USCI_INTEN [2])
Receive start interrupt event	RXSTIF (USCI_PROTSTS [3])		RXSTIEN (USCI_INTEN [3])
Receive end interrupt event	RXENDIF (USCI_PROTSTS [4])		RXENDIEN (USCI_INTEN [4])

Table 6.23-3 Data Transfer Events and Interrupt Handling

6.23.4.7 Protocol-specific Events and Interrupts

These events are related to protocol-specific actions that are described in the corresponding protocol chapters. The related indication flags are located in register USCI_PROTSTS. All events can be individually enabled for the generation of the common protocol interrupt.

Event	Indication Flag	Indication Cleared By	Interrupt Enabled By
Protocol-specific events in UART mode	USCI_PROTSTS [17:16] and USCI_PROTSTS [11:5]	It is cleared by software writes 1 to corresponding interrupt bit of USCI_PROTSTS.	USCI_PROTIEN[2:1]
Protocol-specific events in SPI mode	USCI_PROTSTS [9:8], USCI_PROTSTS [6:5]		USCI_PROTIEN [3:0]
Protocol-specific events in I ² C mode	USCI_PROTSTS [13:8], USCI_PROTSTS [5]		USCI_PROTIEN [6:0]

Table 6.23-4 Protocol-specific Events and Interrupt Handling

6.23.4.8 Wake-up

The protocol-related wake-up functional information is located in the Wake-up Control Register (USCI_WKCTL) and in the Wake-up Status Register (USCI_WKSTS). These registers are shared between the available protocols. As a consequence, the meaning of the bit positions in these registers is different within the protocols.

6.23.4.9 PDMA

The USCI supports PDMA transfer function. When PDMAEN (USCI_PDMACTL [3]) is set to 1, the PDMA function is enabled.

When TXPDMAEN (USCI_PDMACTL [1]) is set to 1, the controller will issue request to PDMA controller to start the PDMA transmission process automatically.

When RXPDMAEN (USCI_PDMACTL [2]) is set to 1, the controller will start the PDMA reception process. USCI will issue request to PDMA controller automatically when there is data in the receive FIFO buffer.

In UART function, the requirement of RXPDMAEN will be cleared and hold if there is any error condition events including frame error, parity error or break detection. The user shall read out the current data and then the requirement of RXPDMAEN will send to the PDMA module in the next data.

6.24 USCI – UART Mode

6.24.1 Overview

The asynchronous serial channel UART covers the reception and the transmission of asynchronous data frames. It performs a serial-to-parallel conversion on data received from the peripheral, and a parallel-to-serial conversion on data transmitted from the controller. The receiver and transmitter being independent, frames can start at different points in time for transmission and reception.

The UART controller also provides auto flow control. There are two conditions to wake-up the system.

6.24.2 Features

- Supports one transmit buffer and two receive buffer for data payload
- Supports hardware auto flow control function
- Supports programmable baud-rate generator
- Support 9-bit Data Transfer (Support 9-bit RS-485)
- Baud rate detection possible by built-in capture event of baud rate generator
- Supports PDMA capability
- Supports Wake-up function (Data and nCTS Wakeup Only)

6.24.3 Block Diagram

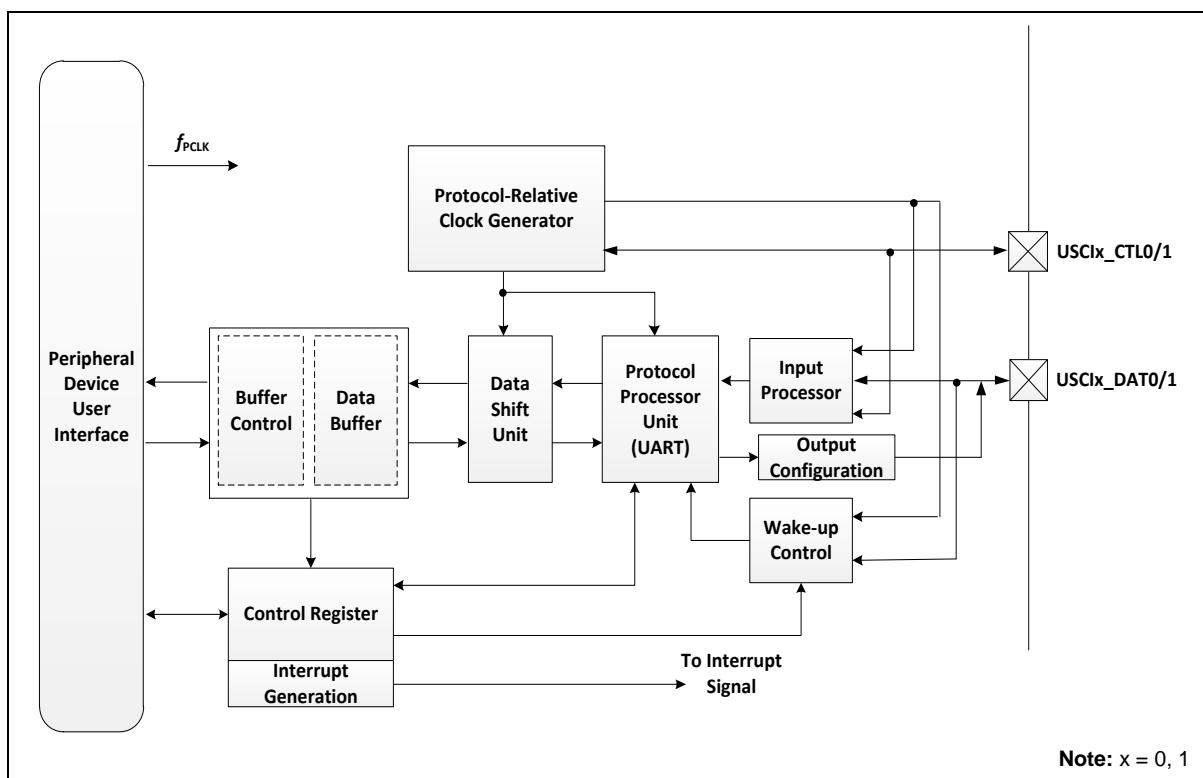

Figure 6.24-1 USCI-UART Mode Block Diagram

6.24.4 Basic Configuration

The basic configurations of USCI0_UART are as follows:

- Clock Source Configuration
- Enable USCI0 clock (USCI0CKEN) on CLK_APBCLK1[8] register.
- Reset USCI0 (USCI0RST) on SYS_IPRST2[8] register.
- Enable USCI0_UART function USCI0_CTL[2:0] register, USCI1_CTL[2:0]=3'b010.
- Pin Configuration

Group	Pin Name	GPIO	MFP
USCI0	USCI0_CLK	PD.0	MFP3
		PB.12	MFP5
		PA.11	MFP6
		PE.2	MFP7

6.24.5 Functional Description

6.24.5.1 USCI Common Function Description

Please refer to section 6.23.4 for detailed information.

6.24.5.2 Signal Description

An UART connection is characterized by the use of a single connection line between a transmitter and a receiver. The receiver input signal (RXD) is handled by the input stage USCIx_DAT0 and the transmit output (TXD) signal is handled by the output stage of USCIx_DAT1.

For full-duplex communication, an independent communication line is needed for each transfer direction. Figure 6.24-2 shows an example with a point-to-point full-duplex connection between two communication partners UART module A and UART module B.

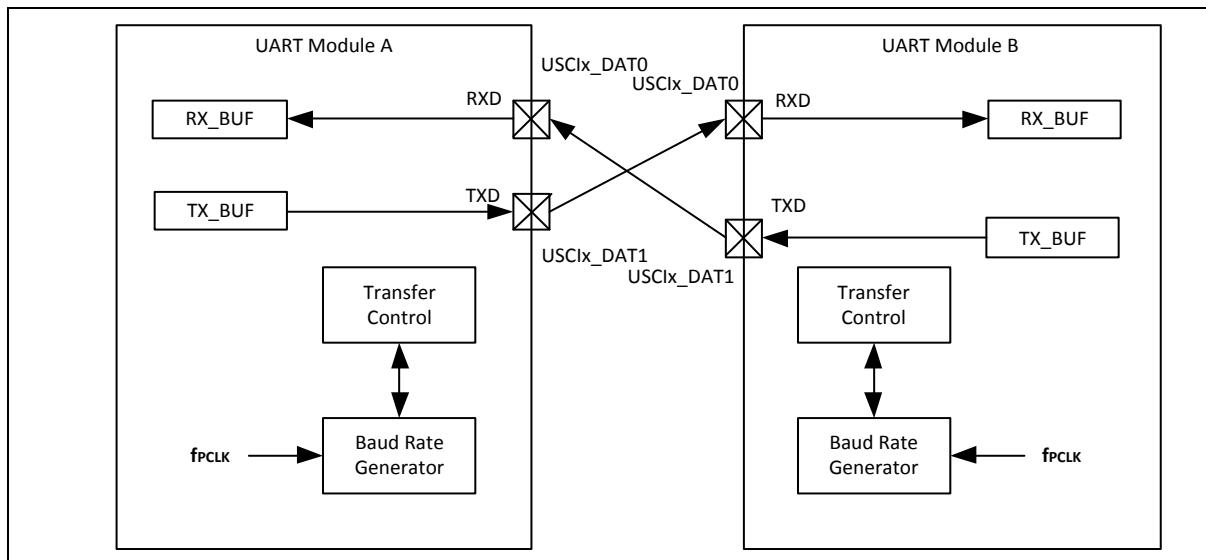

Figure 6.24-2 UART Signal Connection for Full-Duplex Communication

Input Signal

For UART protocol, the number of input signals is shown in Table 6.24-1. Each input signal is handled by an input processor for signal conditioning, such as signal inverse selection control, or a digital input filter. They can be classified according to their meaning for the protocols (see Table 6.24-1).

Selected Protocol		UART
Control Input	USCIx_CTL0	nCTS
	USCIx_CTL1	X
Data Input	USCIx_DAT0	RX
	USCIx_DAT1	X

Table 6.24-1 Input Signals for UART Protocol

Output Signals

For UART protocol, up to each protocol-related output signals are available. The number of actually used outputs depends on the selected protocol. They can be classified according to their meaning for the protocols.

Selected Protocol		UART
Control Output	USCIx_CTL0	X
	USCIx_CTL1	nRTS
Data Output	USCIx_DAT0	X
	USCIx_DAT1	TX

Table 6.24-2 Output Signals for Different Protocol

6.24.5.3 Frame Format

A standard UART frame is shown in Figure 6.24-3. It consists of:

- An idle time with the signal level 1.
- One start of frame bit (SOF) with the signal level 0.
- 6~13 bit data
- A parity bit (P), programmable for either even or odd parity. It is optionally possible to handle frames without parity bit.
- One or two stop bits with the signal level 1.

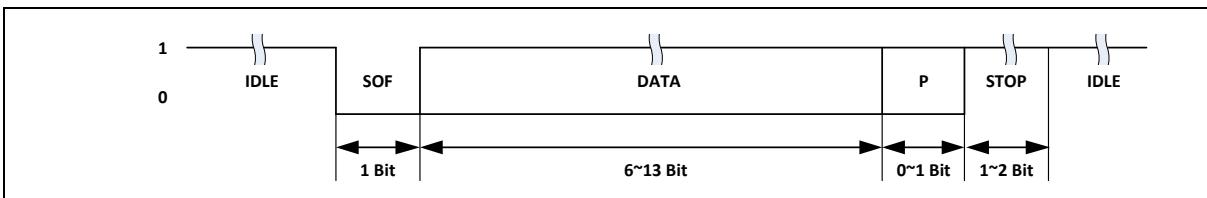

Figure 6.24-3 UART Standard Frame Format

The protocol specific bits (SOF, P, STOP) are automatically handled by the UART protocol state machine and do not appear in the data flow via the receive and transmit buffers.

Start Bit

The receiver input signal USCIx_DAT0 is checked for a falling edge. An SOF bit is detected when a

falling edge occurs while the receiver is idle or after the sampling point of the last stop bit. To increase noise immunity, the SOF bit timing starts with the first falling edge that is detected. If the sampled bit value of the SOF is 1, the previous falling edge is considered to be due to noise and the receiver is considered to be idle again.

Data Field

The length of the data field (number of data bits) can be programmed by the bit field DWIDTH (USCI_LINECTL[11:8]). It can vary between 6 to 13 data bits.

Note: In UART protocol, the data transmission order is LSB first by setting LSB (USCI_LINECTL[0]) to 1.

Parity Bit

The UART allows parity generation for transmission and parity check for reception on frame base. The type of parity can be selected by bit field PARITYEN (USCI_PROTCTL[1]) and EVENPARITY (USCI_PROTCTL[2]), common for transmission and reception (no parity, even or odd parity). If the parity handling is disabled, the UART frame does not contain any parity bit. For consistency reasons, all communication partners have to be programmed to the same parity mode.

After the last data bit of the data field, the transmitter automatically sends out its calculated parity bit if parity generation has been enabled. The receiver interprets this bit as received parity and compares it to its internally calculated one. The result of the parity check and frame check (STOP bit) are monitored in the protocol status registers (USCI_PROTSTS). The register contains bits to monitor a protocol-related status and protocol-related error indication (FRMERR, PARITYERR).

Stop Bit

Each UART frame is completed by 1 or 2 of stop bits with the signal level 1 (same level as the idle level). The number of stop bits is programmable by bit STOPB (USCI_PROTCTL[0]). A new start bit can be transferred directly after the last stop bit.

Transfer Status Indication

RXBUSY (USCI_PROTSTS[10]) indicates the receiver status.

The receiver status can be monitored by RXBUSY bit. In this case, bit RXBUSY is set during a complete frame reception from the beginning of the start of frame bit to the end of the last stop bit.

6.24.5.4 Operating Mode

To operate the UART protocol, the following issues have to be considered:

Select UART Mode

The UART protocol can be selected by setting FUNMODE (USCI_CTL[2:0]) to 010B and the UART protocol can be enabled by setting PROTEN (USCI_PROTCTL [31]) to 1. Note that the FUNMODE must be set 0 before protocol changing and it is recommended to configure all parameters of the UART before UART protocol is enabled.

Pin Connections

The USCIx_DAT0 pin is used for UART receive data input signal (RX) in UART protocol. The property of input data signal can be configured in USCI_DATIN0. It is suggested to set EDGEDET (USCI_DATIN0[4:3]) as 10B for start bit detection.

The USCIx_DAT1 pin is used for UART transmit data output signal (TX) in UART protocol. The property of output data signal can be configured in USCI_LINECTL.

The USCIx_CTL0 pin is used for UART clear to send signal (nCTS) in UART protocol. The property of input control signal can be configured in USCI_CTLIN0.

The USCIx_CTL1 pin is used for UART request to send signal (nRTS) in UART protocol. The property of output control signal can be configured in USCI_LINECTL.

Bit Timing Configuration

The desired baud rate setting has to be selected, comprising the baud rate generator and the bit

timing.

Frame Format Configuration

The word length, the stop bit number, and the parity mode has to be set up according to the application requirements by programming USCI_LINECTL and the USCI_PROTCTL register. If required by the application, the data input and output signals can be inverted. The data transmission order is LSB first by setting LSB (USCI_LINECTL[0]) to 1.

6.24.5.5 Bit Timing

In UART mode, each frame bit is divided into data sample time in order to provide granularity in the sub-bit range to adjust the sample point to the application requirements. The number of data sample time per bit is defined by bit fields DSCNT (USCI_BRGEN[14:10]) and the length of a data sample time is given by PDSCNT (USCI_BRGEN[9:8]).

In the example given in Figure 6.24-4, one bit time is composed of 16 data sample time DSCNT(USCI_BRGEN[14:10]) = 15. It is not recommended to program less and equal than 4 data sample time per bit time.

The position of the sampling point for the bit value is fixed in 1/2 samples time. It is possible to sample the bit value to take the average of samples.

The bit timing setup (number of data sample time) is common for the transmitter and the receiver because they use the same hardware circuit.

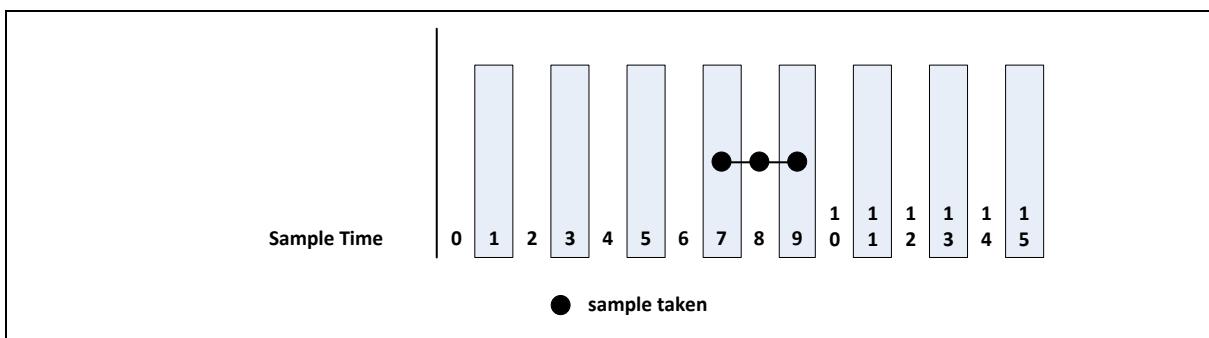

Figure 6.24-4 UART Bit Timing (data sample time)

6.24.5.6 Baud Rate Generation

The baud rate fUART in UART mode depends on the number of data sample time per bit time and their timing. The baud rate setting should only be changed while the transmitter and the receiver are idle. The bits RCLKSEL, SPCLKSEL, PDSCNT, and DSCNT define the baud rate setting:

RCLKSEL (USCI_BRGEN [0])

to define the input frequency fREF_CLK

SPCLKSEL (USCI_BRGEN[3:2])

to define the multiple source of the sample clock fSAM_CLK

PDSCNT (USCI_BRGEN [9:8])

to define the length of a data sample time (division of fREF_CLK by 1, 2, 3, or 4)

DSCNT (USCI_BRGEN [14:10])

to define the number of data sample time per bit time

The standard setting is given by RCLKSEL = 0 (fREF_CLK = f_{PCLK}), PTCLKSEL = 0 (f_{PROT_CLK} = f_{REF_CLK}) and SPCLKSEL = 2'b00 (f_{SAMP_CLK} = f_{DIV_CLK}). Under these conditions, the baud rate is given by:

$$f_{\text{UART}} = f_{\text{REF_CLK}} \times \frac{1}{\text{CLKDIV} + 1} \times \frac{1}{\text{PDSCNT} + 1} \times \frac{1}{\text{DSCNT} + 1}$$

In order to generate slower frequencies, additional divide-by-2 stages can be selected by PTCLKSEL = 1 ($f_{PROT_CLK} = f_{REF_CLK2}$), leading to:

$$f_{UART} = \frac{f_{REF_CLK}}{2} \times \frac{1}{CLKDIV + 1} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

If SPCLKSEL = 2'b10 ($f_{SAMP_CLK} = f_{SCLK}$), and RCLKSEL = 0 ($f_{REF_CLK} = f_{PCLK}$), PTCLKSEL = 0 ($f_{PROT_CLK} = f_{REF_CLK}$). The baud rate is given by:

$$f_{UART} = f_{REF_CLK} \times \frac{1}{CLKDIV + 1} \times \frac{1}{2} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

There is error tolerance for the UART baud rate after setting the baud rate parameter. Table 6.26-1 lists the relative error percentage examples for user to calculate his relative baud rate setting.

HCLK Source	PCLK Source	Expect Baud Rate	CLKDIV (USCI_BRGEN[25:16])	DSCNT (USCI_BRGEN[14:10])	PDSCNT	Active Baud Rate	Error Percentage
12MHz	HCLK	115200	0xC	0x7	0x0	115384	0.16%
12MHz	HCLK	9600	0x7C	0x9	0x0	9600	0%
12MHz	HCLK	2400	0x1F3	0x9	0x0	2400	0%

Table 6.24-1 Baud Rate Relationship

Note: {SPCLKSEL, PTCLKSEL, RCLKSEL = 2'b0,1'b0,1'b0}

6.24.5.7 Auto Baud Rate Detection

The UART controller supports auto baud rate detection function. It is used to identify the input baud rate from the receiver signal (USCIx_DAT0) and then revised the baud rate clock divider CLKDIV (USCI_BRGEN[25:16]) after the baud rate function done to meet the detected baud rate information. According the section of Timing Measurement Counter, the timing measurement counter is used for time interval measurement of the input signal (USCIx_DAT0) and the actual timer value is captured into bit field BRDETITV (USCI_PROTCTL [24:16]) in each falling edge of the detected signal.

When the ABREN (PROTOCOL[6]) bit is enabled, the 0x55 data patterns is necessary for auto baud rate detection. The falling edge of input signal starts the baud rate counter and it loads the timing measurement counter value into the BRDETITV (USCI_PROTCTL [24:16]) in the next falling edge. It is suggested to use the fDIV_CLK (TMCNTSRC (USCI_BRGEN[5]) =1) as the counter source.

The CLKDIV (USCI_BRGEN[25:16]) will be revised by BRDETITV (USCI_PROTCTL [25:16]) after the auto baud rate function done (the time of 4th falling edge of input signal). If the user want to receive the next successive frame correctly, it is better to set the value of CLKDIV (USCI_BRGEN[25:16]) and DSCNT (USCI_BRGEN[14:10]) as the same value (the value shall be among the rang of 0xF and 0x5 because the DSCNT is used to define the sample counter of each bit and the PDSCNT (USCI_BRGEN[9:8]) is 0x0).

During the auto baud rate detection, the ABRDETIF (USCI_PROTSTS[9]) and the BRDETITV (USCI_PROTCTL [24:16]) will be updated after each falling edge of input signal and the auto baud rate pattern, 0x55, won't be received into the receiver buffer after the frame done. The bit of ABREN will be cleared by hardware after the 4th falling edge of input signal is detected thus the user can read the status of ABREN to know the auto baud rate function is done or not.

If the CLKDIV and DSCNT are not set as the same value in calculation the auto baud rate function, the user shall calculate the proper average baud rate by the value of BRDETITV and CLKDIV after the auto baud rate function done.

If the baud rate of input signal is very slower and the bit time of timing measurement counter can't calculate the correct period of the input bit time, there is a ABERRSTS bit (USCI_PROTSTS[11]) to indicate the error information of the auto baud rate detection. At this time, the user shall revise the value of CLKDIV and require the Host device to send the 0x55 pattern again.

According the limitation of timing measurement counter, the maximum auto baud rate detection is 0x1FE for BRDETTIV. The UART Auto Baud Rate Control is shown in Figure 6.24-5.

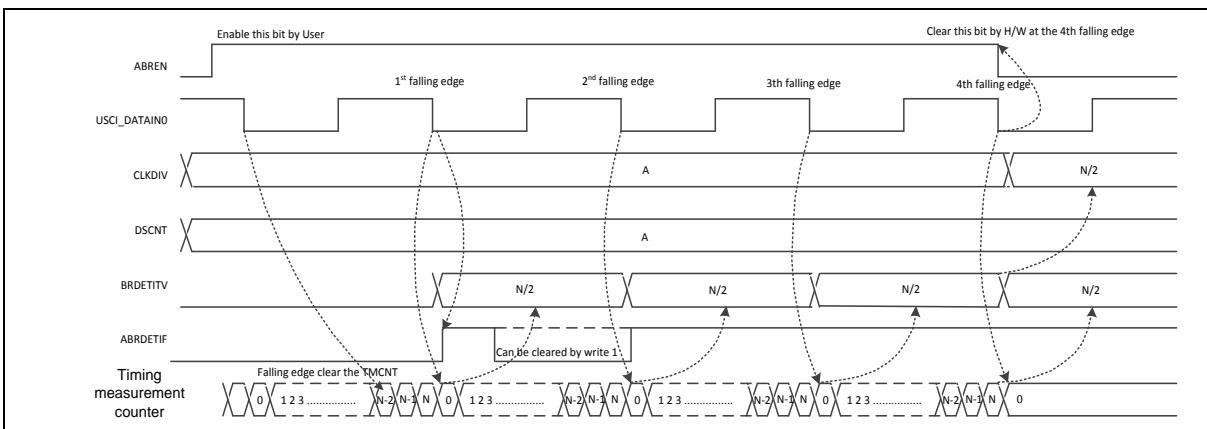

Figure 6.24-5 UART Auto Baud Rate Control

6.24.5.8 Auto Flow Control

The UART supports hardware auto-flow control that provides nRTS flow control by indicator RXFULL (UUART_BUFSTS[1]) on receiver buffer. When the buffer is full (RXFULL = 1), the nRTS is deasserted.

The UART also provides nCTS flow control on transmitter. The nCTS is used to control the transmitted data is sent out when the nCTS is asserted.

6.24.5.9 RS-485 Support

The UART controller can play the role of the RS-485 master transmitter will identify an address character by setting the parity (9-th bit) to 1. For data characters, the parity is set to 0. Software can use the bit15 of each data to control the parity bit (PARITYEN (USCI_PROTCTL[1]) be set) when the STICKEN (USCI_PROTCTL[26]) is set. For example, if the STICKEN is set to 1 and data sequence are 0x8015, 0x8033, 0x0055, 0x0033 and 0x80AA the transmitted parity of data 0x15, 0x33, 0x55 0x33 and 0xAA will be 1, 1, 0, 0 and 1.

The UART controller can also play as an RS-485 addressable slave, the protocol-related error of PARITYERR (USCI_PROTSTS[5]) can be acted as the address bit detection when the PARITYEN (USCI_PROTCTL[1]), EVENPARITY (USCI_PROTCTL[2]) and STICKEN (USCI_PROTCTL[26]) were set. If the PARITYERR was set, it means that the address bit in the received bus is detected otherwise, the data is received into Buffer.

6.24.5.10 Wake-up Function

The USCI Controller in UART mode supports wake-up system function. The wake-up source includes incoming data and nCTS pin. Each wake-up source description is as follows:

(a) Incoming data wake-up

When system is in power-down and both of the WKEN (USCI_WKCTL [0]) and DATWKEN (USCI_PROTCTL[9]) are set, the toggle of incoming data pin can wake-up the system. In order to receive the incoming data after the system wake-up, the WAKECNT (USCI_PROTCTL[14:11]) shall be set. These bits field of WAKECNT (USCI_PROTCTL[14:11]) indicate how many clock cycle selected by fPDS_CNT do the controller can get the 1st bit (start bit) when the device is wakeup from Power-down mode. The incoming data wake-wp is shown in Figure 6.24-6.

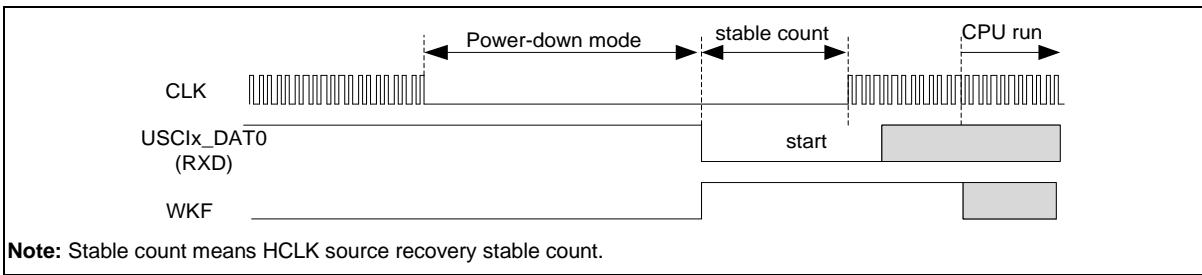

Figure 6.24-6 Incoming Data Wake-Up

(b) nCTS pin wake-up

When system is in power-down and both of the WKEN (USCI_WKCTL [0]) and CTSWKEN (USCI_PROTCTL[10]) are set, the toggle of nCTS pin can wake-up the system. The nCTS wake-wp is shown in Figure 6.24-7 and Figure 6.24-8.

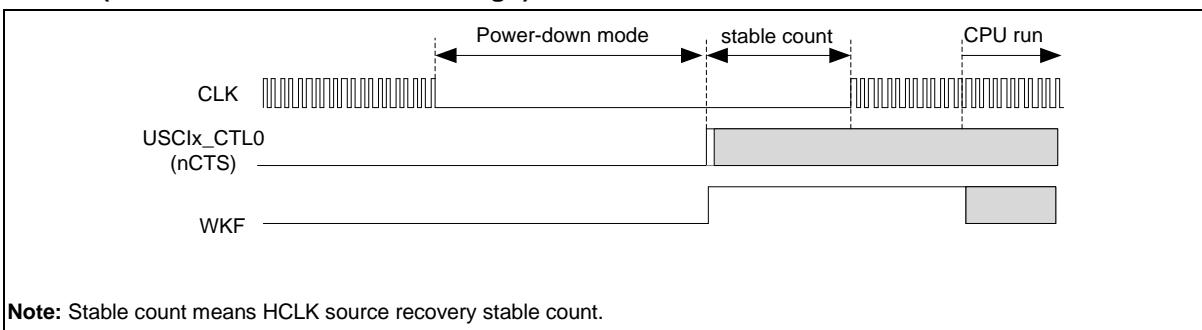

Case 1(nCTS transition from low to high):

Figure 6.24-7 nCTS Wake-Up Case 1

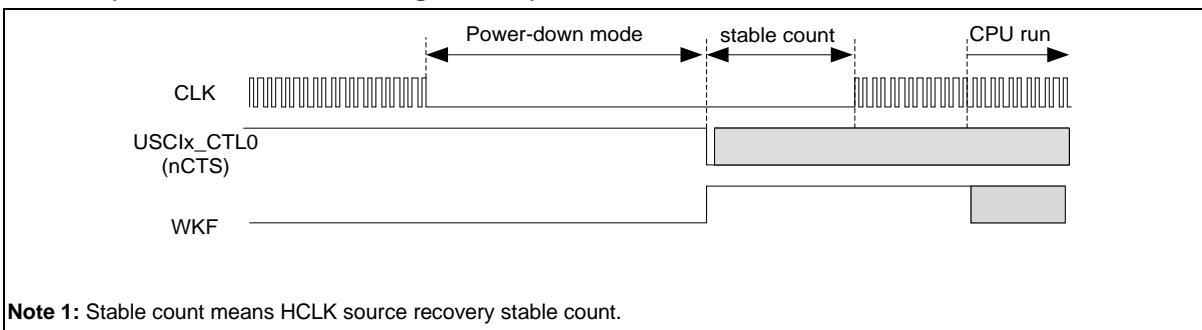

Case 2 (nCTS transition from high to low):

Figure 6.24-8 nCTS Wake-Up Case 2

6.24.5.11 Interrupt Events

The UART provided interrupt for protocol event and data transfer event. The description show below:

Protocol Interrupt Events

The following protocol-related events are generated in UART mode and can lead to a protocol interrupt.

Please note that the bits in register USCI_PROTSTS are not automatically cleared by hardware and have to be cleared by software in order to monitor new incoming events.

Receiver Line Status

The protocol-related error FRMERR (USCI_PROTSTS[6]) or PARITYERR (USCI_PROTSTS[5]) are

two flags that are assigned to each received data word in the corresponding receiver buffer status registers.

In UART mode, the result of the parity check by the protocol-related error indication (0 = received parity bit equal to calculated parity value), and the result of frame check by the protocol-related error indication (0 = received stop bit equal to the format value '1'). This information is elaborated for each data frame.

The break error flag BREAK (UUART_PROTSTS[7]) is assigned when the receive data is 0, the received parity and the stop bit are also 0.

The interrupt indicates that there are parity error, frame error or the break data detection in the BREAK, FRMERR, PARITYERR (USCI_PROTSTS[7:5]) bits.

Auto Baud Rate Detection

The auto baud rate interrupt, ABRDETIF (USCI_PROTSTS [9]), indicates that the timing measurement counter has getting 2-bit duration for auto baud rate capture function.

The auto baud rate detection function will be enabled in the first falling edge of receiver signal. The auto baud rate detection function is measurement after the next following falling is detected and it is finished when the frame transfer done. After the transfer done, the timing measurement counter value divided by twice is equal to the number of sample time per bit. The user can read the value of BRDETITV (USCI_PROTCTL[24:16]) and write into the baud rate generator register CLKDIV (USCI_BRGEN[25:16]).

Data Transfer Interrupt Handling

The data transfer interrupts indicate events related to UART frame handling.

Transmit Start Interrupt

Bit TXSTIF (USCI_PROTSTS [1]) is set after the start bit of a data word. In buffer mode, this is the earliest point in time when a new data word can be written to USCI_TXDAT.

Transmitter Finished

This interrupt indicates that the transmitter has completely finished all data in the buffer. Bit TXENDIF (USCI_PROTSTS [2]) becomes set at the end of the last stop bit.

Receiver Starts Interrupt

Bit RXSTIF (USCI_PROTSTS [3]) is set after the sample point of the start bit.

Receiver Frame Finished

This interrupt indicates that the receiver has completely finished a frame. Bit RXENDIF (USCI_PROTSTS [4]) becomes set at the end of the last receive bit.

6.24.5.12 Programming Example

The following steps are used to configure the UART protocol setting and the data transmission.

1. Set FUNMODE (UUART_CTL[2:0]) to 0x2 to select UART protocol.
2. Write baud rate generator register UUART_BRGEN to select desired baud rate.
 - Set SPCLKSEL (UUART_BRGEN[3:2]), PTCLKSEL (UUART_BRGEN[1]) and RCLKSEL (UUART_BRGEN[0]) to select the clock source.
 - Configure CLKDIV (UUART_BRGEN[25:16]), DSCNT (UUART_BRGEN[14:10]) and PDSCNT (UUART_BRGEN[9:8]) to determine the baud rate divider.
3. Write line control register UUART_LINECTL and protocol control register UUART_PROTCTL to configure the transmission data format and UART protocol setting.
 - Program data field length in DWIDTH (UUART_LINECTL[11:8]).
 - Enable parity bit and determine the parity bit type by setting EVENPARITY (UUART_PROTCTL[2]) and PARITYEN (UUART_PROTCTL[1]).

- Configure stop bit length by setting STOPB (UART_PROTCTL[0]).
 - Enable LSB (UART_LINECTL[0]) to select LSB first transmission for UART protocol.
 - Set EDGEDET (UART_DATIN0[4:3]) to “10” to select the detected edge as falling edge for receiver start bit detection.
4. Set PROTEN (UART_PROTCTL[31]) to 1 to enable UART protocol.
 5. Transmit and receive data.
 - Write transmit data register UART_TXDAT to transmit data.
 - Wait until TXSTIF(UART_PROTSTS[1]) is set and then user can write the next data in UART_TXDAT.
 - When TXENDIF(UART_PROTSTS[2]) is set, the transmit buffer is empty and the stop bit of the last data has been transmitted.
 - If RXENDIF(UART_PROTSTS[4]) is set, the receiver has finished a data frame completely. User can get the data by reading receive data register UART_RXDAT.

6.24.6 Register Map

R: read only, W: write only, R/W: both read and write

Note 2: Used for user to load next transmit data when there is no data in transmit buffer.</p>
[0]	Reserved	Reserved.

6.25 USCI - SPI Mode

6.25.1 Overview

The SPI protocol of USCI controller applies to synchronous serial data communication and allows full duplex transfer. It supports both master and Slave operation mode with the 4-wire bi-directional interface. SPI mode of USCI controller performs a serial-to-parallel conversion on data received from a peripheral device, and a parallel-to-serial conversion on data transmitted to a peripheral device. The SPI mode is selected by FUNMODE (USCI_CTL[2:0]) = 0x1

This SPI protocol can operate as master or Slave mode by setting the SLAVE (USCI_PROTCTL[0]) to communicate with the off-chip SPI Slave or master device. The application block diagrams in master and Slave mode are shown below.

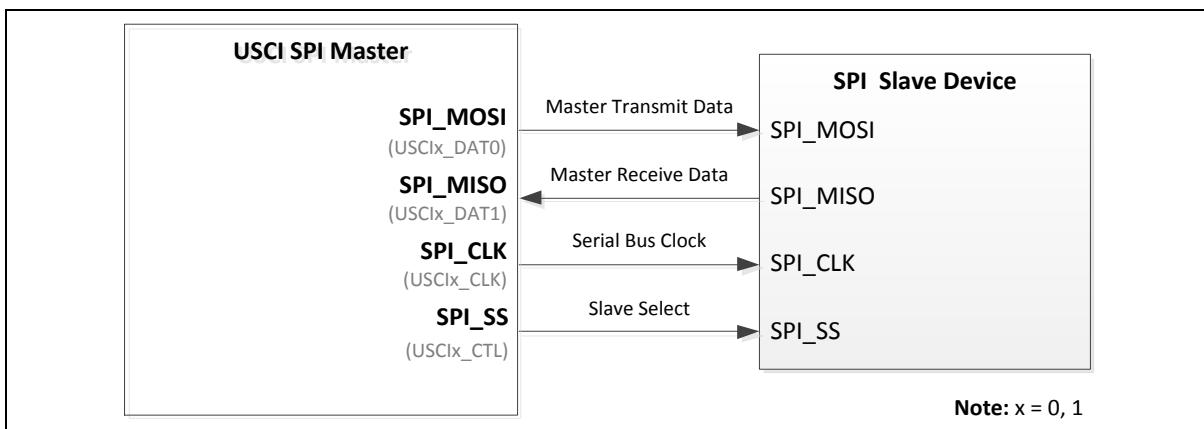

Figure 6.25-1 SPI Master Mode Application Block Diagram

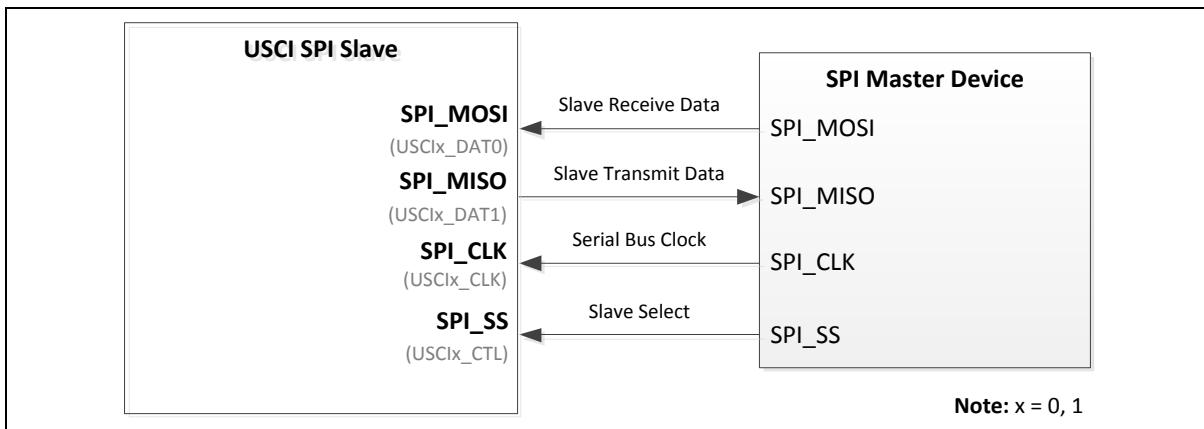

Figure 6.25-2 SPI Slave Mode Application Block Diagram

6.25.2 Features

- Supports Master or Slave mode operation (the maximum frequency -- Master = $f_{PCLK} / 2$, Slave < $f_{PCLK} / 5$)
- Configurable bit length of a transfer word from 4 to 16-bit
- Supports one transmit buffer and two receive buffers for data payload
- Supports MSB first or LSB first transfer sequence
- Supports Word Suspend function

- Supports PDMA transfer
- Supports 3-wire, no slave select signal, bi-direction interface
- Supports wake-up function by slave select signal in Slave mode
- Supports one data channel half-duplex transfer

6.25.5 Functional Description

6.25.5.1 USCI Common Function Description

Please refer to section 6.23.4 for detailed information.

6.25.5.2 Signal Description

A device operating in Master mode controls the start and end of a data transfer, as well as the generation of the SPI bus clock and slave select signal. The slave select signal indicates the start and end of a data transfer, and the master device can use it to enable the transmitting or receiving operations of Slave device. Slave device receives the SPI bus clock and optionally a slave select signal for data transaction. The signals for SPI communication are shown below.

SPI Mode	Receive Data	Transmit Data	Serial Bus Clock	Slave Select
Full-duplex SPI Master	SPI_MISO (USCIx_DAT1)	SPI_MOSI (USCIx_DAT0)	SPI_CLK (USCIx_CLK)	SPI_SS (USCIx_CTL0)
Full-duplex SPI Slave	SPI_MOSI (USCIx_DAT0)	SPI_MISO (USCIx_DAT1)	SPI_CLK (USCIx_CLK)	SPI_SS (USCIx_CTL0)
Half-duplex SPI Master/Slave	SPI_MOSI (USCIx_DAT0)	SPI_MOSI (USCIx_DAT0)	SPI_CLK (USCIx_CLK)	SPI_SS (USCIx_CTL0)

SPI Communication Signals

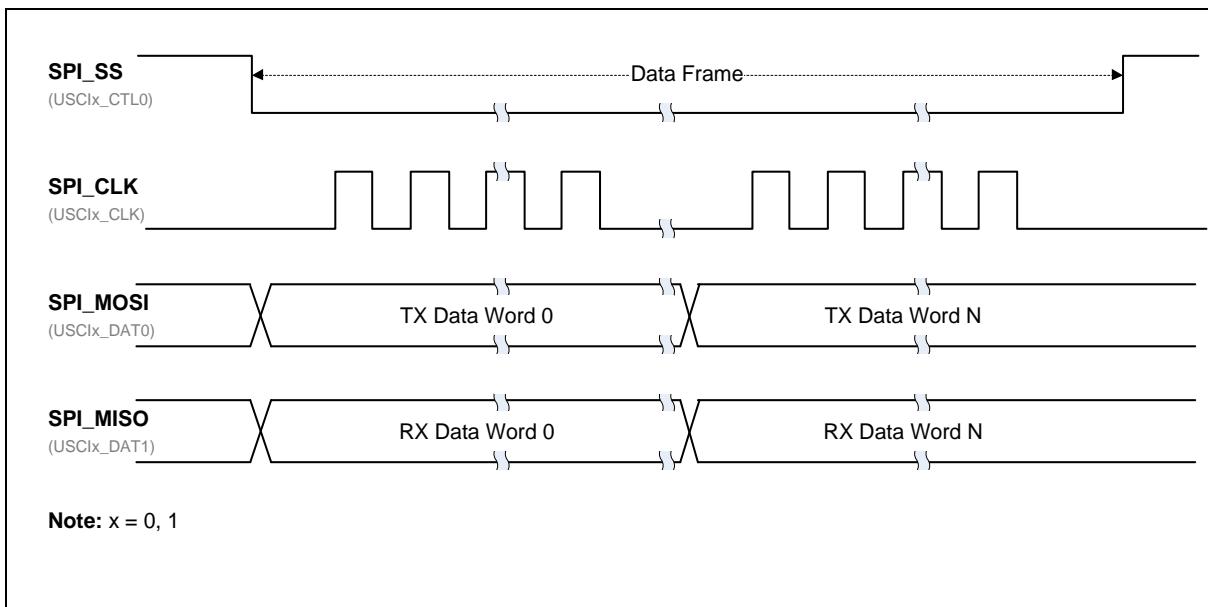

Figure 6.25-44-Wire Full-Duplex SPI Communication Signals (Master Mode)

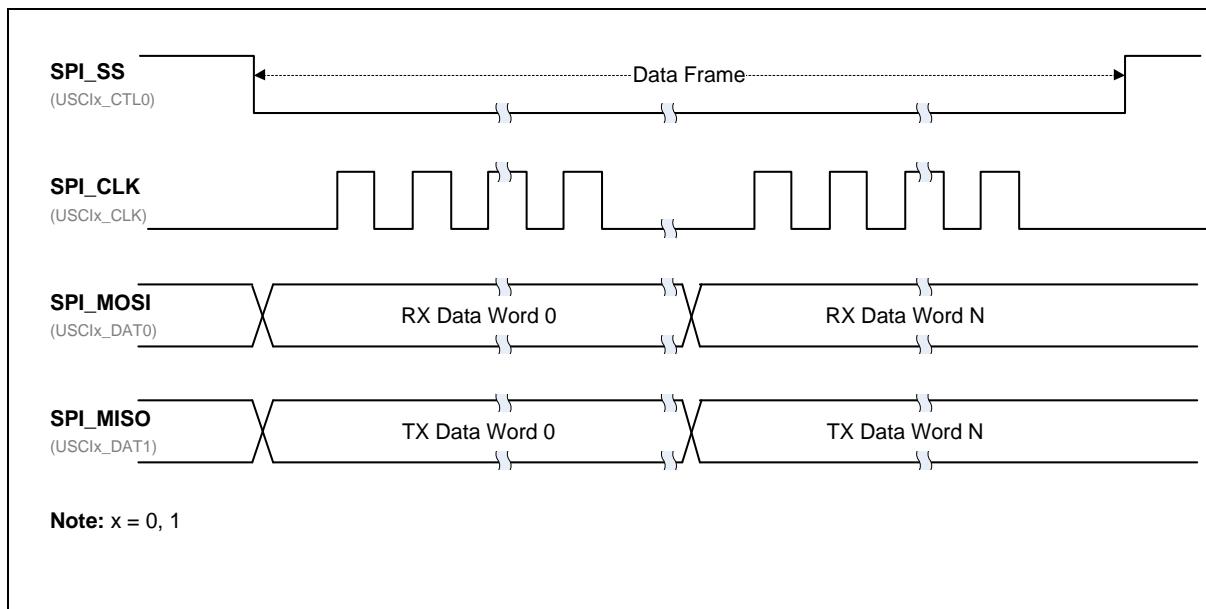

Figure 6.25-54-Wire Full-Duplex SPI Communication Signals (Slave Mode)

6.25.5.3 Serial Bus Clock Configuration

The USCI controller needs the peripheral clock to drive the USCI logic unit to perform the data transfer. The peripheral clock frequency is equal to PCLK frequency.

In Master mode, the frequency of the SPI bus clock is determined by protocol-relative clock generator. In general, the SPI bus clock is denoted as SPI clock. The frequency of SPI clock is half of f_{SAMP_CLK} , which can be selected by SPCLKSEL (USCI_BRGEN[3:2]). Refer to 6.23.4 for details of protocol-relative clock generator.

In Slave mode, the SPI bus clock is provided by an off-chip Master device. The peripheral clock frequency, f_{PCLK} , of SPI Slave device must be 5-times faster than the serial bus clock rate of the SPI Master device connected together (i.e. the clock rate of serial bus clock < 1/5 peripheral clock f_{PCLK} in Slave mode).

In SPI protocol, SCLKMODE (USCI_PROTCTL[7:6]) defines not only the idle state of serial bus clock but also the serial clock edge used for transmit and receive data. Both Master and Slave devices on the same communication bus should have the same SCLKMODE configuration. The four kinds of serial bus clock configuration are shown below.

SCLKMODE [1:0]	SPI Clock Idle State	Transmit Timing	Receive Timing
0x0	Low	Falling edge	Rising edge
0x1	Low	Rising edge	Falling edge
0x2	High	Rising edge	Falling edge
0x3	High	Falling edge	Rising edge

Table 6.25-1 Serial Bus Clock Configuration

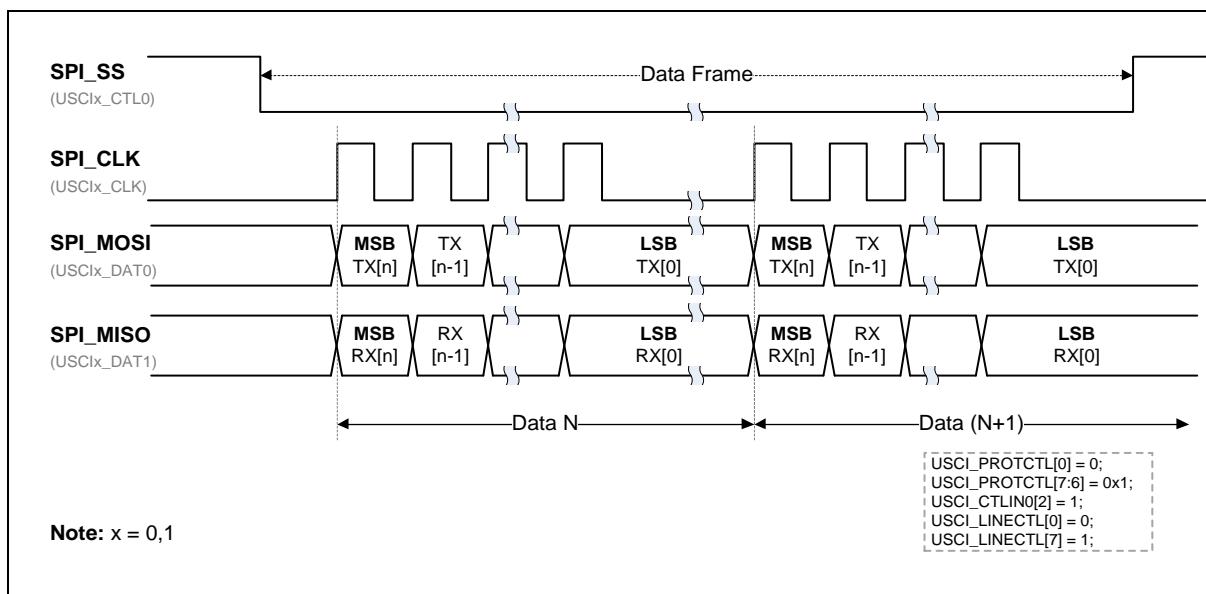

Figure 6.25-7 SPI Communication with Different SPI Clock Configuration (SCLKMODE=0x1)

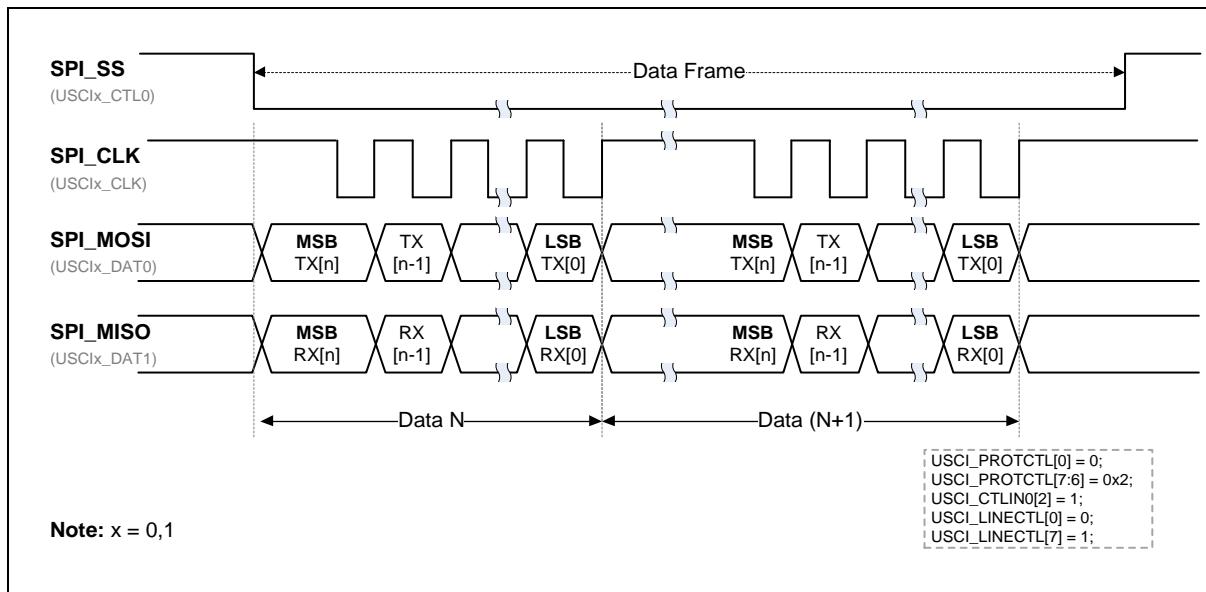

Figure 6.25-8 SPI Communication with Different SPI Clock Configuration (SCLKMODE=0x2)

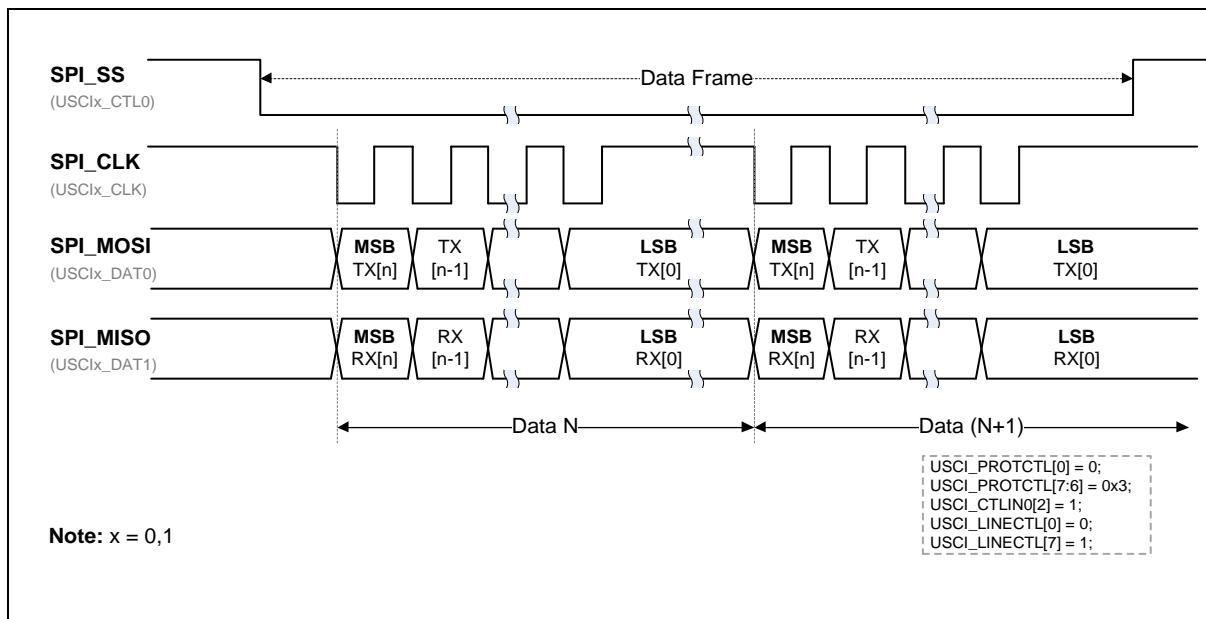

Figure 6.25-9 SPI Communication with Different SPI Clock Configuration (SCLKMODE=0x3)

6.25.5.4 Slave Select Signal

The slave selection signal of SPI protocol is active high by default. In SPI Master mode, the USCI controller can drive the control signal to off-chip SPI Slave device through slave select pin SPI_SS (USCIx_CTL0). In SPI Slave mode, the received slave select signal can be inverted by ININV (USCI_CTLIN0[2]).

If the slave select signal of external SPI Master device is low active, the ININV (USCI_CTLIN[2]) setting of slave device should be set to 1 for the inversion of input control signal. If USCI operates as SPI Master mode, the output slave select inversion CTLOINV (USCI_LINECTL[7]) is also needed to

set as 1 for the external SPI Slave device whose slave select signal is active low.

The duration between the slave select active edge and the first SPI clock input edge shall over 2 USCI peripheral clock cycles.

The input slave select signal of SPI Slave has to be keep inactive for at least 2 USCI peripheral clock cycles between two consecutive frames in order to correctly detect the end of a frame.

6.25.5.5 Transmit and Receive Data

The bit length of a transmit/receive data word in SPI protocol of USCI controller is defined in DWIDTH (USCI_LINECTL[11:8]), and it can be configured up to 16-bit length for transmitting and receiving data in SPI communication.

The LSB bit (USCI_LINECTL[0]) defines the order of transfer data bit. If the LSB bit is set to 1, the transmission data sequence is LSB first. If the LSB bit is cleared to 0, the transmission data sequence is MSB first.

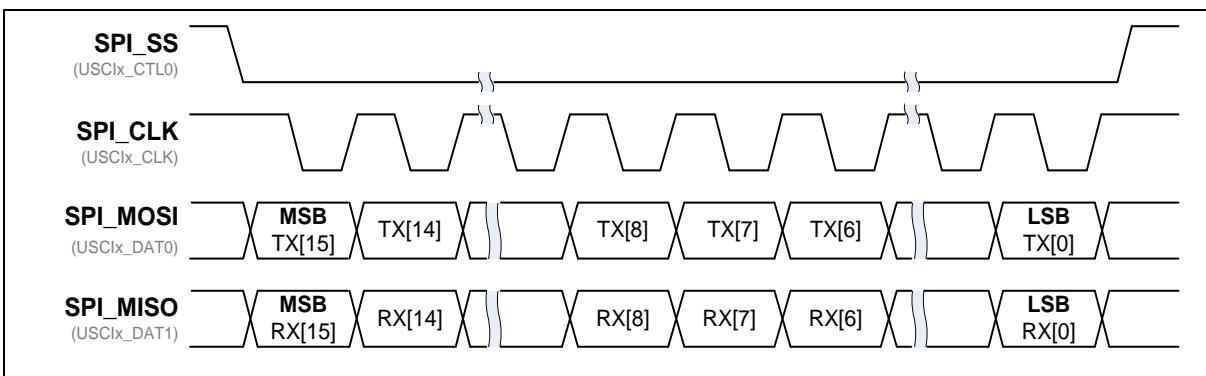

Figure 6.25-1016-bit Data Length in One Word Transaction with MSB First Format

6.25.5.6 Word Suspend

SUSPITV (USCI_PROTCTL[11:8]) provides a configurable suspend interval, 0.5 ~ 15.5 SPI clock periods, between two successive transaction words in Master mode. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value of SUSPITV (USCI_PROTCTL[11:8]) is 0x3 (3.5 SPI clock cycles).

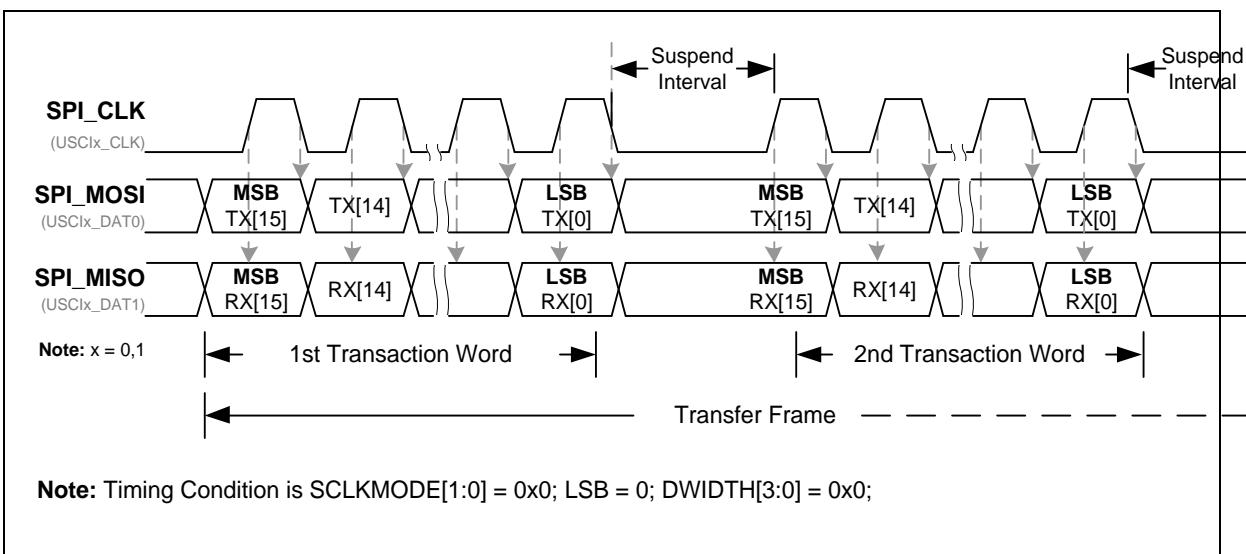

Figure 6.25-11 Word Suspend Interval between Two Transaction Words

6.25.5.7 Automatic Slave Select Function

AUTOSS (USCI_PROTCTL[3]) is used for SPI Master mode to enable the automatic slave select function. If the bit AUTOSS (USCI_PROTCTL[3]) is set, the slave select signal will be generated automatically and the setting value of SS (USCI_PROTCTL[2]) will not affect the output slave select (through USCIx_CTL0 line). This means that the slave select signal will be asserted by the USCI controller when the SPI data transfer is started by writing to the transmit buffer. And, it will be deasserted after either all transaction is finished or one word transaction done if the value of SUSPITV (USCI_PROTCTL[11:8]) is equal to or greater than 3.

If the AUTOSS bit (USCI_PROTCTL[3]) is cleared, the slave select on USCIx_CTL0 pin will be asserted/de-asserted by setting/clearing the SS (USCI_PROTCTL[2]). The internal slave select signal is active high and the CTLOINV (USCI_LINECTL[7]) can be used for the inversion of the slave select signal.

In SPI Master mode, if the value of SUSPITV (USCI_PROTCTL[11:8]) is less than 3 and the AUTOSS (USCI_PROTCTL[3]) is set as 1, the slave select signal will be kept at active state between two successive word transactions.

In SPI Slave mode, to recognize the inactive state of the slave select signal, the inactive period of the received slave select signal must be larger than 2 peripheral clock cycles between two successive transactions.

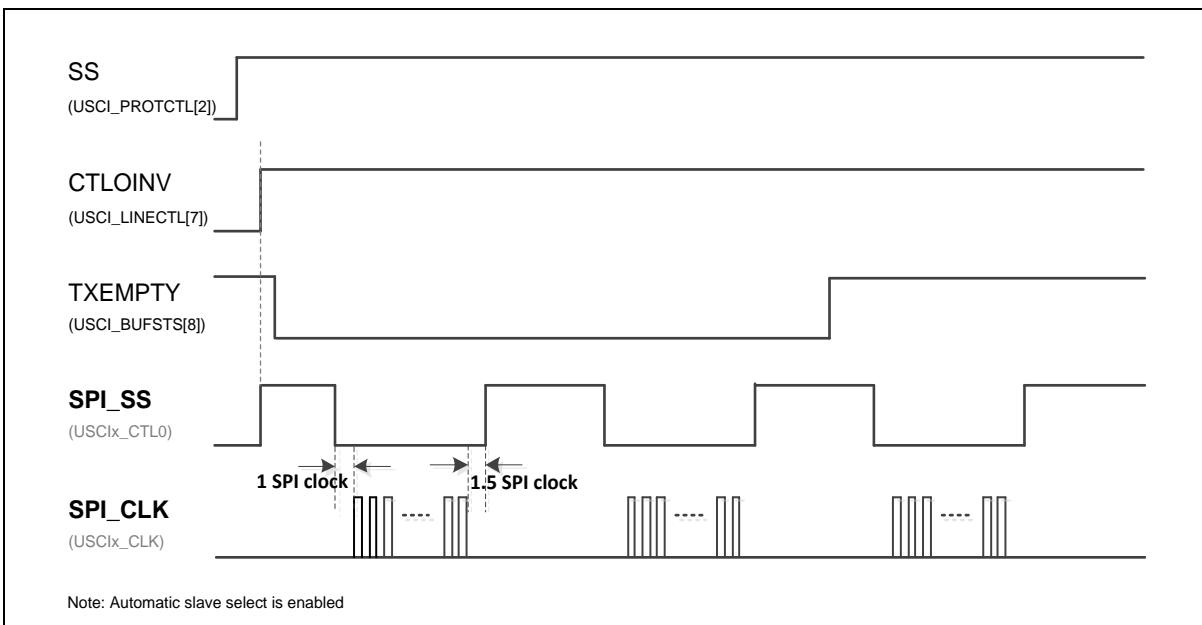

Figure 6.25-12 Auto Slave Select ($\text{SUSPITV} \geq 0x3$)

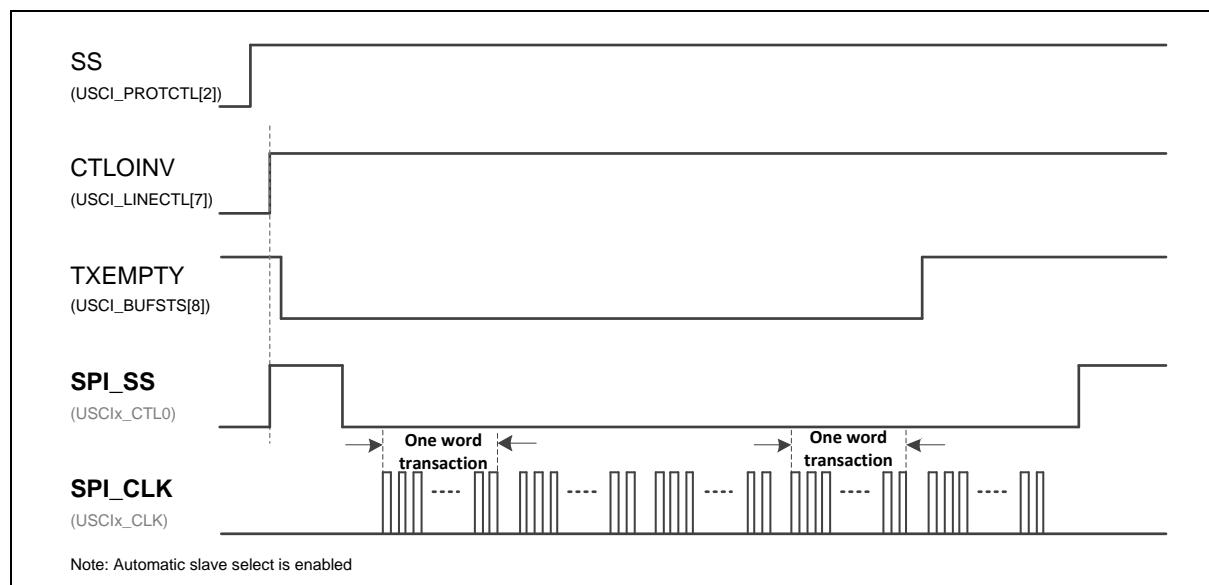

Figure 6.25-13 Auto Slave Select (SUSPITV < 0x3)

6.25.5.8 Slave 3-wire Mode

When the SLV3WIRE (USCI_PROTCTL[1]) is set by software to enable the Slave 3-wire mode, the USCI SPI communication can work with no slave select signal in Slave mode. The SLV3WIRE (USCI_PROTCTL[1]) only takes effect in SPI Slave mode. Only three pins, SPI_CLK (through USCIx_CLK line), SPI_MOSI (through USCIx_DAT0 line), and SPI_MISO (through USCIx_DAT1 line), are required to communicate with a SPI Master. When the SLV3WIRE (USCI_PROTCTL[1]) is set to 1, the SPI Slave will be ready to transmit/receive data after the SPI protocol is enabled by setting FUNMODE(USCI_CTL [2:0]) to 0x1.

6.25.5.9 Data Transfer Mode

The USCI controller supports full-duplex SPI transfer and one data channel half-duplex SPI transfer.

- Full-duplex SPI transfer

In full-duplex SPI transfer, there are two data pins. One is used for transmitting data and the other is used for receiving data. Thus, data transmission and data reception can be performed simultaneously.

SCLKMODE (USCI_PROTCTL[7:6]) defines the transition timing of the data shift output signal on USCIx_DAT0 pin. The transition may happen at the corresponding edge of SPI bus clock or active edge of slave select signal. The level of the last data bit of a data word is held on USCIx_DAT0 pin until the next data word begins with the next corresponding edge of the serial bus clock.

- One data channel half-duplex SPI transfer

In one data channel half-duplex SPI transfer, there is only one data pin for data transfer. Thus, the data transmission and data reception are at different time interval. The data shift direction is determined by PORTDIR (USCI_TXDAT[16]). Refer to the register description for more detail information.

The function of one data channel half-duplex SPI transfer is similar to the full-duplex SPI protocol. All the transfer data timing is the same as the full-duplex SPI transfer.

Figure 6.25-14 shows the one output data channel and one input data channel half-duplex transfer diagrams with the external device.

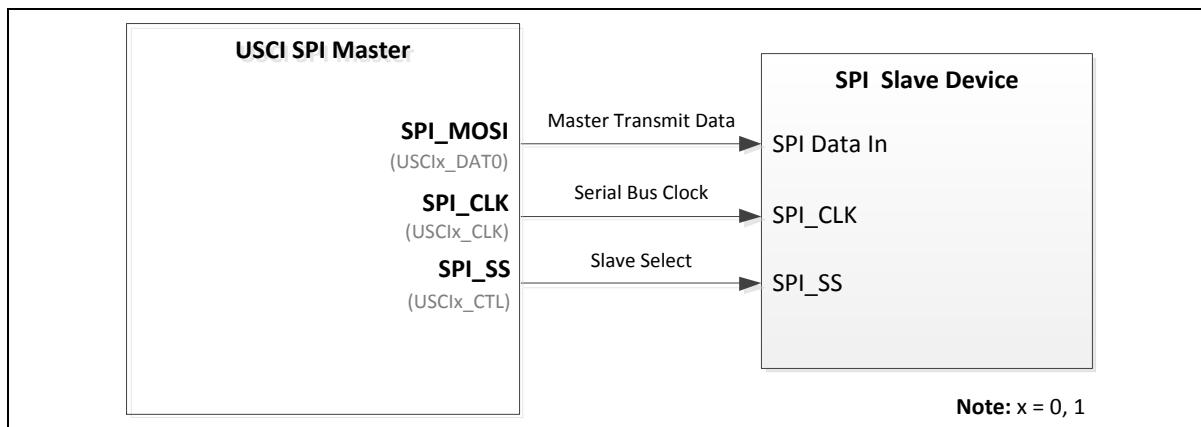

Figure 6.25-14 One Output Data Channel Half-duplex (SPI Master Mode)

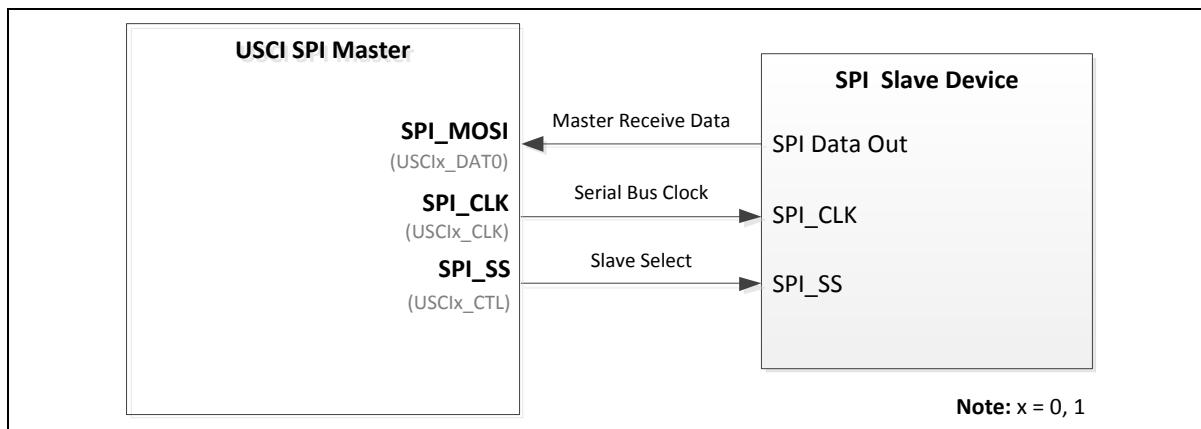

Figure 6.25-15 One Input Data Channel Half-duplex (SPI Master Mode)

The one data channel half-duplex transfer mode can be configured by TSMSEL[2:0] (USCI_PROTCTL[14:12]) and PORTDIR (USCI_TXDAT[16]) settings. When TSMSEL (USCI_PROTCTL[14:12]) is set to 0x4, one data channel half-duplex transfer mode is selected. The PORTDIR (USCI_TXDAT[16]) is used to define the direction of the corresponding transmit data. When the PORTDIR bit is set to 0, the USCI controller will send the corresponding data to external SPI device. When the PORTDIR bit is set to 1, the controller will read the corresponding data from the external SPI device.

For example, in one data channel half-duplex transfer mode with PORTDIR=0, USCI SPI transmits data through USCIx_DAT0 pin; if PORTDIR=1, USCI SPI receives data through USCIx_DAT0 pin.

6.25.5.10 Interrupt

Data Transfer Interrupts

- Transmit start interrupt

The interrupt event TXSTIF (USCI_PROTSTS[1]) is set after the start of the first data bit of a transmit data word. It can be cleared only by writing 1 to it.

- Transmit end interrupt

The interrupt event TXENDIF (USCI_PROTSTS[2]) is set after the start of the last data bit of the last transmit data which has been stored in transmit buffer. It can be cleared only by writing 1 to it.

- Receive start interrupt

The interrupt event RXSTIF (USCI_PROTSTS[3]) is set after the start of the first data bit of a receive data word. It can be cleared only by writing 1 to it.

- Receive end interrupt

The interrupt event RXENDIF (USCI_PROTSTS[4]) is set after the start of the last data bit of a receive data word. It can be cleared only by writing 1 to it.

Protocol-Related Interrupts

- SPI slave select interrupt

In SPI Slave mode, there are slave select active and in-active interrupt flags, SSACTIF (USCI_PROTSTS[9]) and SSINAIF (USCI_PROTSTS[8]), will be set to 1 when SLAVE (USCI_PROTCTL [0]) is set to 1 and Slave senses the slave select signal active or inactive. The SPI controller will issue an interrupt if SSINAIF (USCI_PROTIEN[0]) or SSACTIEN (USCI_PROTIEN[1]), are set to 1. Because the internal slave select signal in SPI function is active high, the ININV (USCI_CTLIN0[2]) can be used for inverting the slave select signal comes from an active low device.

- Slave time-out interrupt

In SPI Slave mode, there is Slave time-out function for user to know that there is no serial clock input during the period of one word transaction. The Slave time-out function uses the timing measurement counter for the calculation of Slave time-out period which is defined by SLVTOCNT (USCI_PROTCTL[25:16]). TMCNTSRC (USCI_BRGEN[5]) can be used for clock frequency selection of timing measurement counter to calculate the Slave time-out period.

When the timing measurement counter is enabled by TMCNTEN (USCI_BRGEN[4]) and the setting value of SLVTOCNT (USCI_PROTCTL[25:16]) is not 0 in SPI Slave mode, the timing measurement counter will start counting after the first input serial clock of each received word data. This counter will be reset while receiving the following input serial clock and then keep counting. Finally, the timing measurement counter will be cleared and stopped after the finish of the current word transaction. If the value of the time-out counter is equal to or greater than the value of SLVTOCNT (USCI_PROTCTL[25:16]) before one word transaction is done, the Slave time-out interrupt event occurs and the SLVTOIF (USCI_PROTSTS[5]) will be set to 1.

Buffer-Related Interrupts

The buffer-related interrupts are available if there is transmit/receive buffer in USCI controller.

- Receive buffer overrun interrupt

If there is receive buffer overrun event, RXOVIF (USCI_BUFSTS[3]) will be set as 1. It can be cleared by write 1 into it.

- Transmit buffer under-run interrupt

If there is transmit buffer under-run event, TXUDRIF (USCI_BUFSTS[11]) will be set as 1. It can be cleared by write 1 into it.

6.25.5.11 Timing Diagram

The slave select signal of USCI SPI protocol is active high by default, and it can be inverted by CTLOINV (USCI_LINECTL[7]) setting.

The idle state of serial bus clock and the serial bus clock edge used for transmit/receive data can be configured by setting SCLKMODE (USCI_PROTCTL[7:6]). The bit length of a transaction word data is determined by DWIDTH (USCI_LINECTL[11:8]), and data bit transfer sequence is determined by LSB (USCI_LINECTL[0]). Four SPI timing diagrams for Master/Slave operations and the related settings are shown below.

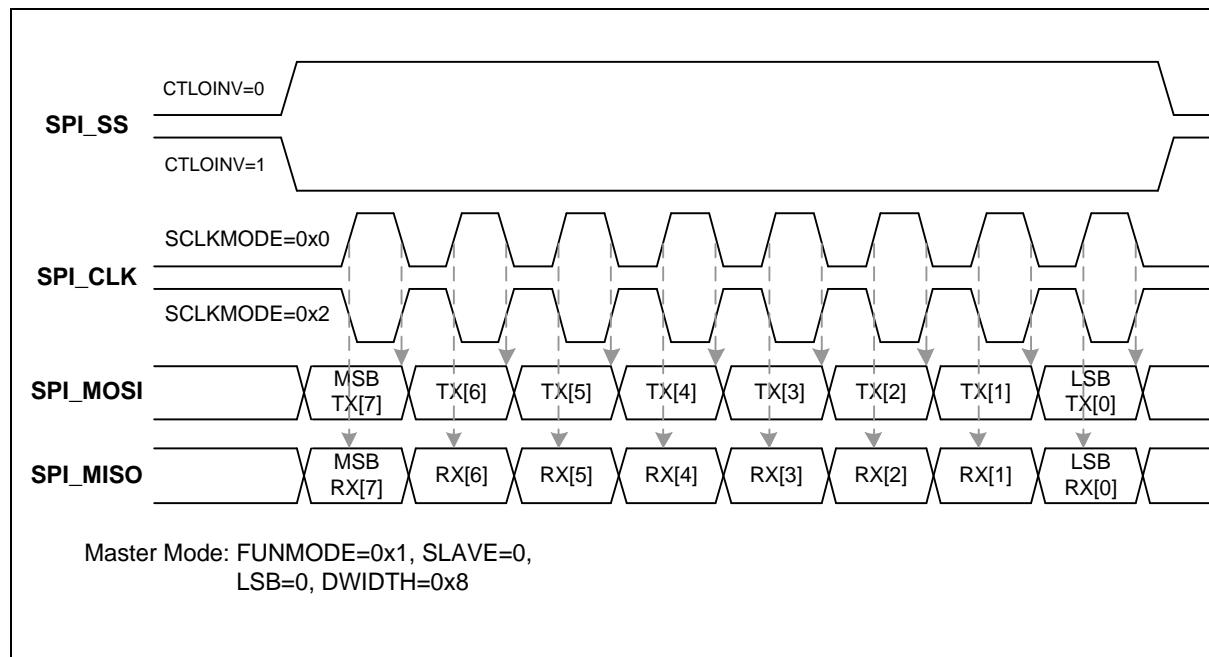

Figure 6.25-16 SPI Timing in Master Mode

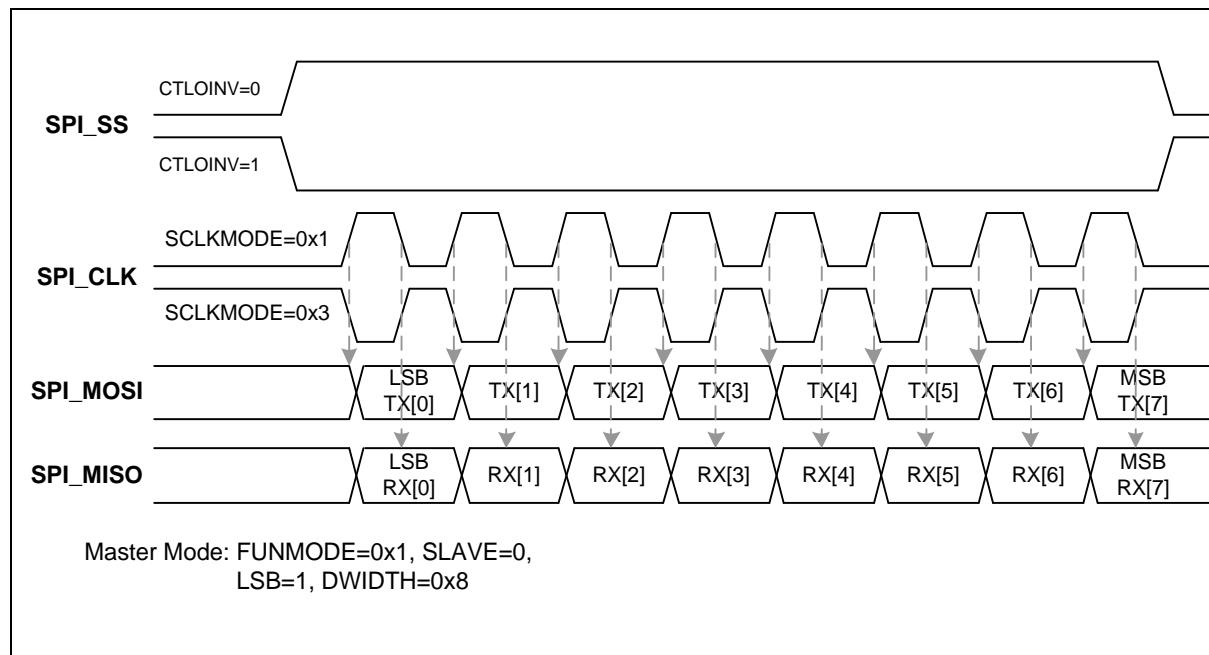

Figure 6.25-17 SPI Timing in Master Mode (Alternate Phase of Serial Bus Clock)

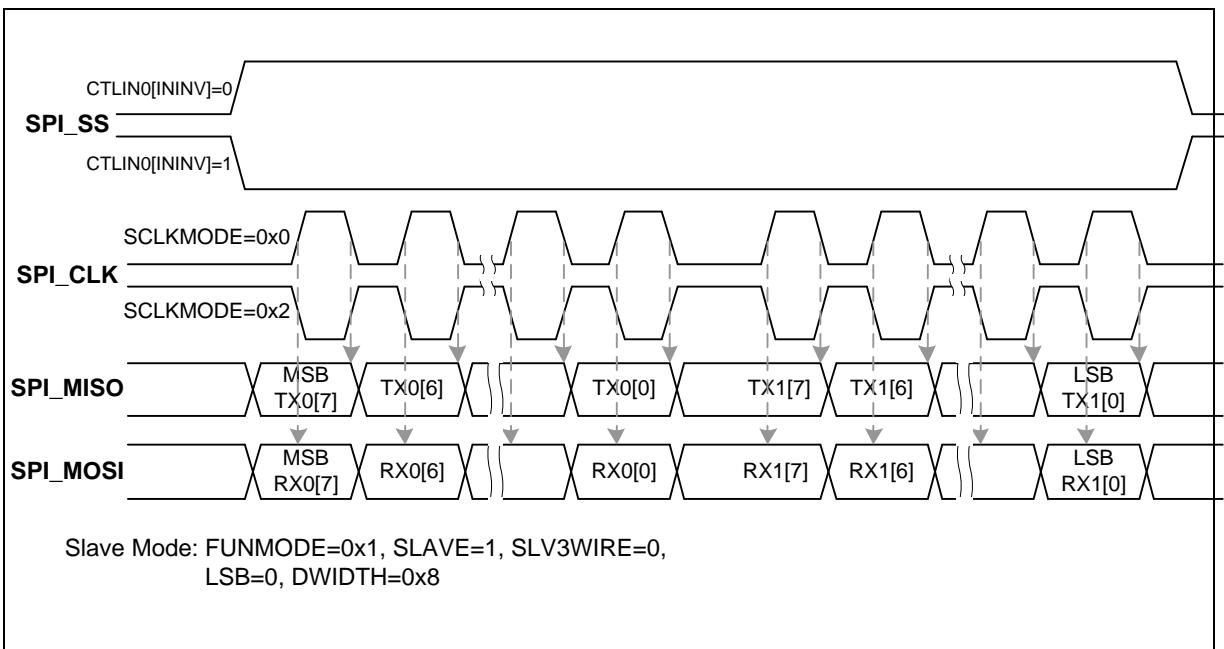

Figure 6.25-18 SPI Timing in Slave Mode

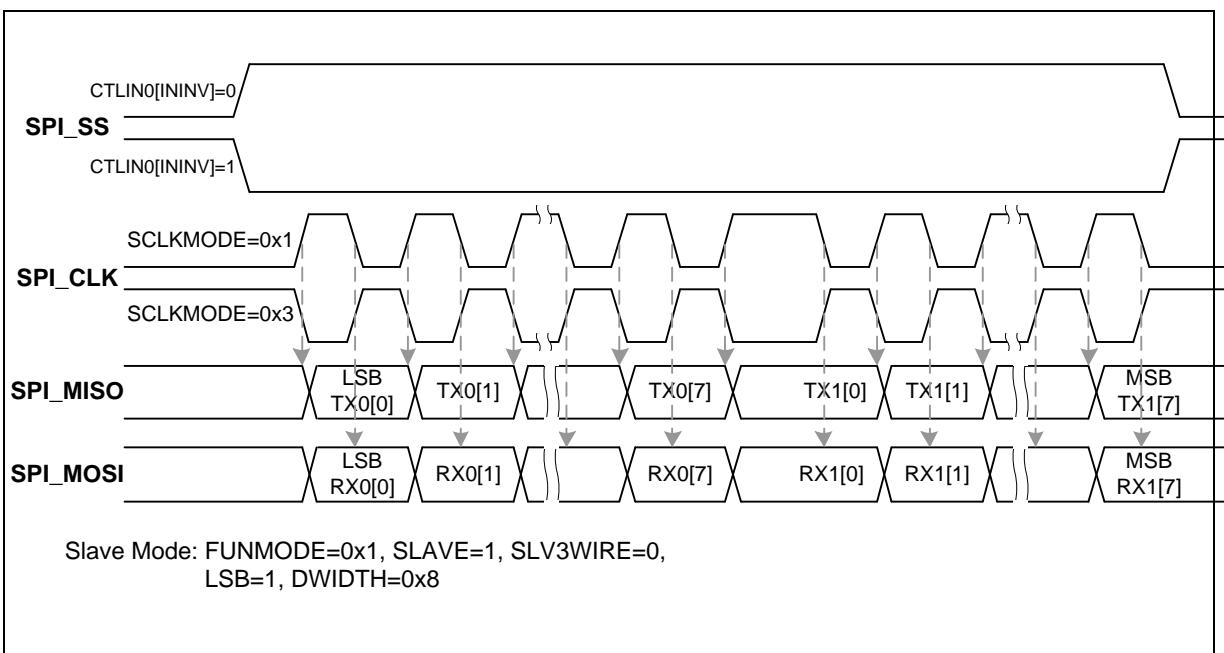

Figure 6.25-19 SPI Timing in Slave Mode (Alternate Phase of Serial Bus Clock)

6.25.5.12 Programming Flow

This section describes the programming flow for USCI SPI data transfer.

For Master mode:

1. Enable USCI peripheral clock by setting CLK_APBCLK1 register.
2. Configure user-specified pins as USCI function pins by setting corresponding multiple function control registers.
3. Set FUNMODE (USCI_CTL[2:0]) to 1 to select SPI mode.

4. Set USCI_BRGEN register to determine the SPI bus clock frequency.
5. According to the requirements of user's application, configure the settings as follows.
 - CTLOINV (USCI_LINECTL[7]): If the slave selection signal is active low, set this bit to 1; otherwise, set it to 0.
 - DWIDTH (USCI_LINECTL[11:8]): Data width setting.
 - LSB (USCI_LINECTL[0]): LSB first or MSB first.
 - TSMSEL (USCI_PROTCTL[14:12]): Full-duplex SPI transfer or one channel half-duplex SPI transfer.
 - SCLKMODE (USCI_PROTCTL[7:6]): Determine the clock timing.
 - AUTOSS (USCI_PROTCTL[3]): Enable automatic slave select function or not.
 - SLAVE (USCI_PROTCTL[0]): Set to 0 for Master mode.
 - Set PROTEN (USCI_PROTCTL[31]) to 1 to enable SPI protocol.
6. If automatic slave select function is disabled (AUTOSS=0), set SS (USCI_PROTCTL[2]) to 1 before data transfer; set SS to 0 to deactivate the slave selection signal by user's application.
7. Write USCI_TXDAT register to trigger SPI transfer. In half-duplex SPI transfer, the data pin direction is determined by PORTDIR (USCI_TXDAT[16]) setting.
8. User can get the received data by reading USCI_RXDAT register as long as RXEMPTY (USCI_BUFSTS[0]) is 0. The SPI data transfer can be triggered by writing USCI_TXDAT register as long as TXFULL (USCI_BUFSTS[9]) is 0.

For Slave mode:

1. Enable USCI peripheral clock by setting CLK_APBCLK1 register.
2. Configure user-specified pins as USCI function pins by setting corresponding multiple function control registers.
3. Set FUNMODE (USCI_CTL[2:0]) to 1 to select SPI mode.
4. According to the requirements of user's application, configure the settings as follows.
 - ININV (USCI_CTLIN0[2]): If the slave selection signal is active low, set this bit to 1; otherwise, set it to 0.
 - DWIDTH (USCI_LINECTL[11:8]): Data width setting.
 - LSB (USCI_LINECTL[0]): LSB first or MSB first.
 - TSMSEL (USCI_PROTCTL[14:12]): Full-duplex SPI transfer or one channel half-duplex SPI transfer.
 - SCLKMODE (USCI_PROTCTL[7:6]): Determine the clock timing.
 - SLAVE (USCI_PROTCTL[0]): Set to 1 for Slave mode.
5. Set PROTEN (USCI_PROTCTL[31]) to 1 to enable SPI protocol.
6. Write USCI_TXDAT register for transmission. In half-duplex SPI transfer, the data pin direction is determined by PORTDIR (USCI_TXDAT[16]) setting.
7. User can get the received data by reading USCI_RXDAT register as long as RXEMPTY (USCI_BUFSTS[0]) is 0. The next datum for transmission can be written to USCI_TXDAT register as long as TXFULL (USCI_BUFSTS[9]) is 0.

6.25.5.13 Wake-up Function

The USCI Controller in SPI mode supports wake-up system function. The wake-up source in SPI protocol is the transition of input slave select signal.

6.25.6 Register Map

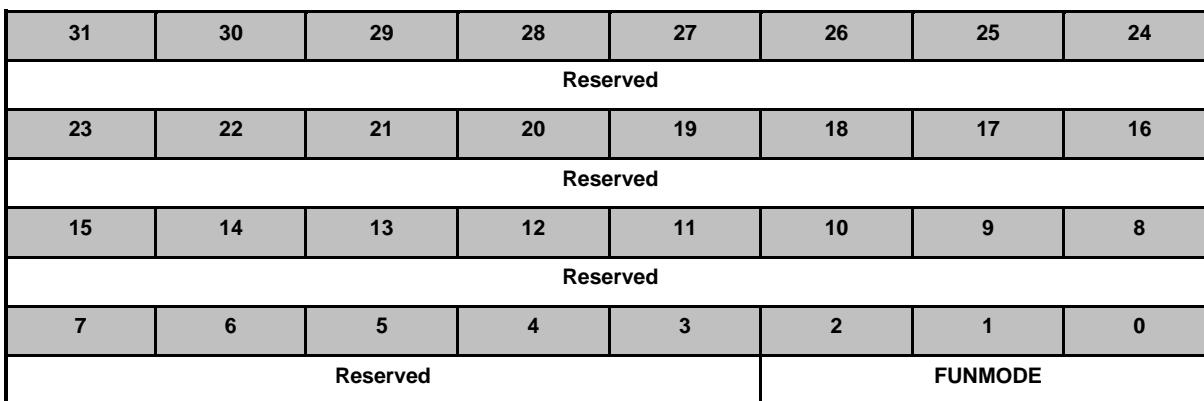

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
USCI Base Address:

USCI_PROTSTS	USCI _n _BA+0x64	R/W	USCI Protocol Status Register	0x0000_0000

6.25.7 Register Description

USCI Control Register (USCI_CTL)

Register	Offset	R/W	Description					Reset Value
USCI_CTL	USCIIn_BA+0x00	R/W	USCI Control Register					0x0000_0000

Bits	Description	
[31:3]	Reserved	Reserved.
[2:0]	FUNMODE	<p>Function Mode</p> <p>This bit field selects the protocol for this USCI controller. Selecting a protocol that is not available or a reserved combination disables the USCI. When switching between two protocols, the USCI has to be disabled before selecting a new protocol. Simultaneously, the USCI will be reset when user write 000 to FUNMODE.</p> <p>000 = The USCI is disabled. All protocol related state machines are set to idle state. 001 = The SPI protocol is selected. 010 = The UART protocol is selected. 100 = The I²C protocol is selected.</p> <p>Note: Other bit combinations are reserved.</p>

USCI Interrupt Enable Register (USCI_INTEN)

Register	Offset	R/W	Description				Reset Value

23	22	21	20	19	18	17	16
SLVTOCNT							
15	14	13	12	11	10	9	8
Reserved	TSMSEL			SUSPITV			
7	6	5	4	3	2	1	0
SCLKMODE		Reserved		AUTOSS	SS	SLV3WIRE	SLAVE

Bits	Description	
[31]	PROTEN	SPI Protocol Enable Bit 0 = SPI Protocol Disabled. 1 = SPI Protocol Enabled.
[30:29]	Reserved	Reserved.
[28]	TXUDRPOL	Transmit Under-run Data Polarity (for Slave) This bit defines the transmitting data level when no data is available for transferring. 0 = The output data level is 0 if TX under run event occurs. 1 = The output data level is 1 if TX under run event occurs.
[27:26]	Reserved	Reserved.
[25:16]	SLVTOCNT	Slave Mode Time-out Period (Slave Only) In Slave mode, this bit field is used for Slave time-out period. This bit field indicates how many clock periods (selected by TMCNTSRC, USCI_BRGEN[5]) between the two edges of input SCLK will assert the Slave time-out event. Writing 0x0 into this bit field will disable the Slave time-out function. Example: Assume SLVTOCNT is 0x0A and TMCNTSRC (USCI_BRGEN[5]) is 1, it means the time-out event will occur if the state of SPI bus clock pin is not changed more than (10+1) periods of f_{DIV_CLK} .
[15]	Reserved	Reserved.
[14:12]	TSMSEL	Transmit Data Mode Selection This bit field describes how receive and transmit data is shifted in and out. TSMSEL = 000b: Full-duplex SPI. TSMSEL = 100b: Half-duplex SPI. Other values are reserved. Note: Changing the value of this bit field will produce the TXRST and RXRST to clear the TX/RX data buffer automatically.
[11:8]	SUSPITV	Suspend Interval (Master Only) This bit field provides the configurable suspend interval between two successive transmit/receive transaction in a transfer. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock

		edge of the following transaction word. The default value is 0x3. The period of the suspend interval is obtained according to the following equation. $(\text{SUSPITV}[3:0] + 0.5) * \text{period of SPI_CLK clock cycle}$ Example: SUSPITV = 0x0 ... 0.5 SPI_CLK clock cycle. SUSPITV = 0x1 ... 1.5 SPI_CLK clock cycle. SUSPITV = 0xE ... 14.5 SPI_CLK clock cycle. SUSPITV = 0xF ... 15.5 SPI_CLK clock cycle.
[7:6]	SCLKMODE	Serial Bus Clock Mode This bit field defines the SCLK idle status, data transmit, and data receive edge. MODE0 = The idle state of SPI clock is low level. Data is transmitted with falling edge and received with rising edge. MODE1 = The idle state of SPI clock is low level. Data is transmitted with rising edge and received with falling edge. MODE2 = The idle state of SPI clock is high level. Data is transmitted with rising edge and received with falling edge. MODE3 = The idle state of SPI clock is high level. Data is transmitted with falling edge and received with rising edge.
[5:4]	Reserved	Reserved.
[3]	AUTOSS	Automatic Slave Select Function Enable (Master Only) 0 = Slave select signal will be controlled by the setting value of SS (USCI_PROTCTL[2]) bit. 1 = Slave select signal will be generated automatically. The slave select signal will be asserted by the SPI controller when transmit/receive is started, and will be de-asserted after each transmit/receive is finished.
[2]	SS	Slave Select Control (Master Only) If AUTOSS bit is cleared, setting this bit to 1 will set the slave select signal to active state, and setting this bit to 0 will set the slave select back to inactive state. If the AUTOSS function is enabled (AUTOSS = 1), the setting value of this bit will not affect the current state of slave select signal. Note: In SPI protocol, the internal slave select signal is active high.
[1]	SLV3WIRE	Slave 3-wire Mode Selection (Slave Only) The SPI protocol can work with 3-wire interface (without slave select signal) in Slave mode. 0 = 4-wire bi-direction interface. 1 = 3-wire bi-direction interface.
[0]	SLAVE	Slave Mode Selection 0 = Master mode. 1 = Slave mode.

USCI Protocol Interrupt Enable Register – USCI_PROTIEN (SPI)

[0]	Reserved	Reserved.

6.26 USCI - I²C Mode

6.26.1 Overview

On I²C bus, data is transferred between a Master and a Slave. Data bits transfer on the SCL and SDA lines are synchronously on a byte-by-byte basis. Each data byte is 8-bit. There is one SCL clock pulse for each data bit with the MSB being transmitted first, and an acknowledge bit follows each transferred byte. Each bit is sampled during the high period of SCL; therefore, the SDA line may be changed only during the low period of SCL and must be held stable during the high period of SCL. A transition on the SDA line while SCL is high is interpreted as a command (START or STOP). Please refer to Figure 6.26-1 for more detailed I²C BUS Timing.

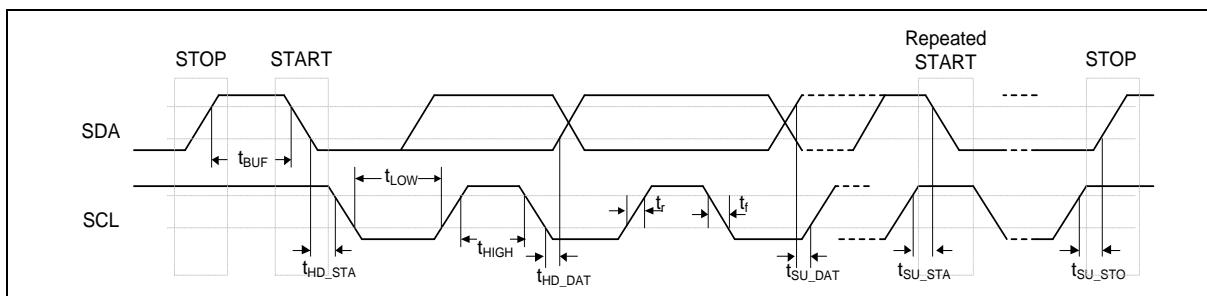

Figure 6.26-1 I²C Bus Timing

The device's on-chip I²C provides the serial interface that meets the I²C bus standard mode specification. The I²C port handles byte transfers autonomously. The I²C mode is selected by FUNMODE (USCI_CTL [2:0]) = 100B. When enable this port, the USCI interfaces to the I²C bus via two pins: SDA and SCL. When I/O pins are used as I²C ports, user must set the pins function to I²C in advance.

Note: Pull-up resistor is needed for I²C operation because the SDA and SCL are set to open-drain pins when USCI is selected to I²C operation mode .

6.26.2 Features

- Full master and slave device capability
- Supports of 7-bit addressing, as well as 10-bit addressing
- Communication in standard mode (100 kBit/s) or in fast mode (up to 400 kBit/s)
- Supports multi-master bus
- Supports one transmit buffer and two receive buffer for data payload
- Supports 10-bit bus time-out capability
- Supports bus monitor mode.
- Supports Power down wake-up by data toggle or address match
- Supports setup/hold time programmable
- Supports multiple address recognition (two slave address with mask option)

6.26.3 Block Diagram

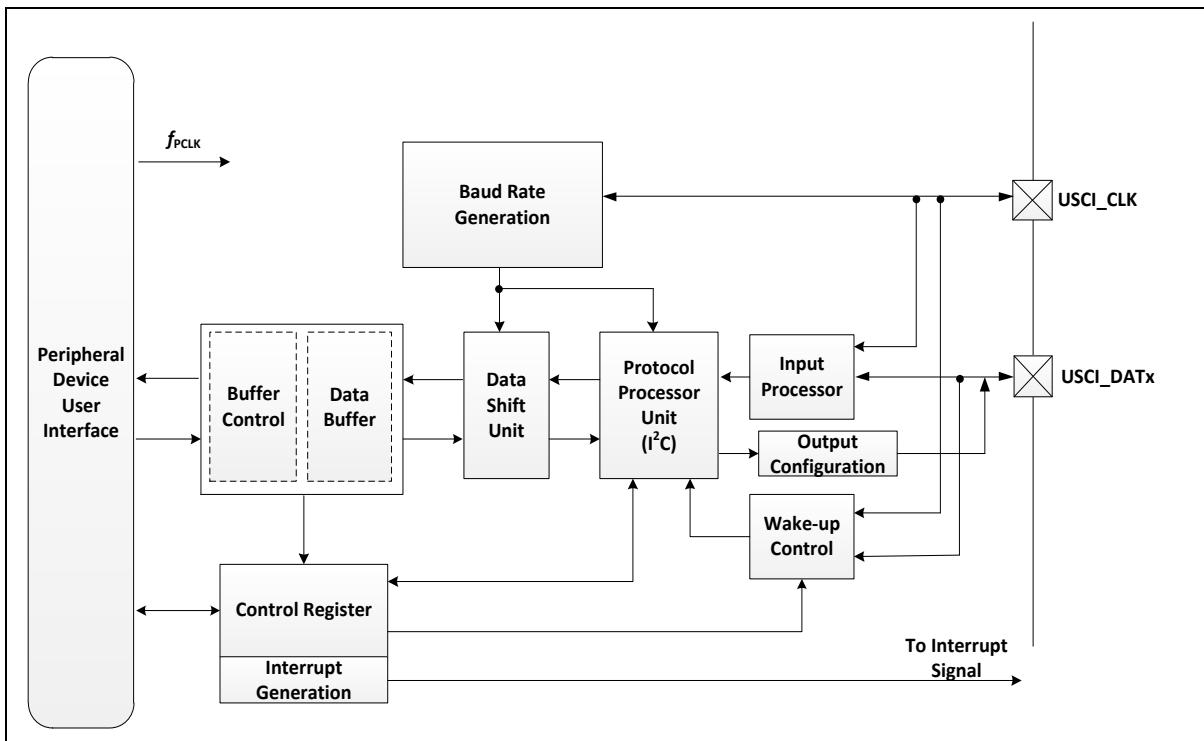

Figure 6.26-2 USCI I²C Mode Block Diagram

6.26.4 Basic Configuration

6.26.4.1 USCI0 I²C Basic Configurations

- Clock Source Configuration
 - Enable USCI0 peripheral clock in USCI0CKEN (CLK_APBCLK1[8]).
 - Enable USCI0_I2C function in USCI_CTL[2:0] register, USCI_CTL[2:0]=3'b100
- Reset Configuration
 - Reset USCI0 controller in USCI0RST (SYS_IPRST2[8]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
USCI0	USCI0_CLK	PD.0	MFP3
		PB.12	MFP5
		PA.11	MFP6
		PE.2	MFP7

		PD.7, PE.12	MFP6
		PB.1	MFP8
	USCI1_DAT0	PB.7	MFP4
		PD.5, PE.10	MFP6
		PB.2	MFP8

6.26.5 Functional Description

6.26.5.1 START or Repeated START Signal

Figure 6.26-3 shows the typical I²C protocol. Normally, a standard communication consists of four parts:

- START or Repeated START signal generation
- Slave address and R/W bit transfer
- Data transfer
- STOP signal generation

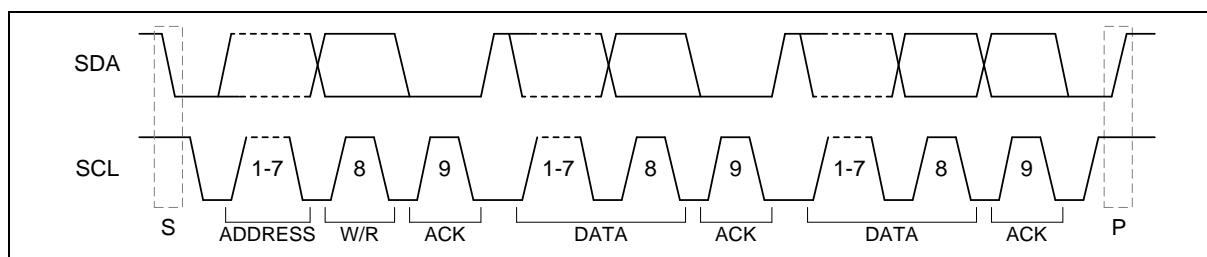

Figure 6.26-3 I²C Protocol

When the bus is free/idle, meaning no master device is engaging the bus (both SCL and SDA lines are high), a master can initiate a transfer by sending a START signal. A START signal, usually referred to as the "S" bit, is defined as a HIGH to LOW transition on the SDA line while SCL is HIGH. The START signal denotes the beginning of a new data transmission.

A Repeated START is not a STOP signal between two START signals and usually referred to as the "Sr" bit. The master uses this method to communicate with another slave or the same slave in a different transfer direction (e.g. from writing to a device to reading from a device) without releasing the bus idle flag.

6.26.5.2 STOP Signal

The master can terminate the communication by generating a STOP signal. A STOP signal, usually referred to as the "P" bit, is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH. The section between STOP and START is called bus free.

Figure 6.26-4 shows the waveform of START, Repeat START and STOP.

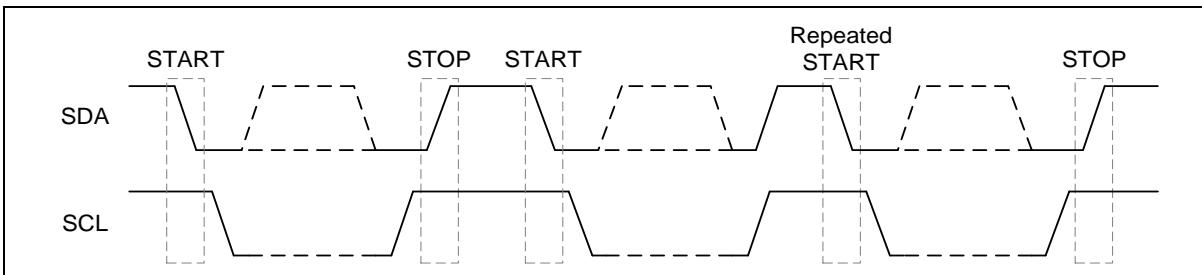

Figure 6.26-4 START and STOP Conditions

6.26.5.3 Slave Address Transfer

After a (Repeated) START condition, the master sends a slave address to identify the target device of the communication. The start address can comprise one or two address bytes (for 7-bit or for 10-bit addressing schemes). After an address byte, a slave sensitive to the transmitted address has to acknowledge the reception.

Therefore, the slave's address can be programmed in the device, where it is compared to the received address. In case of a match, the slave answers with an acknowledge (SDA = 0). Slaves that are not targeted answer with a non-acknowledge (SDA = 1). In addition to the match of the programmed address, another address byte value has to be answered with an acknowledge if the slave is capable to handle the corresponding requests. The address byte 00H indicates a general call address that can be acknowledged.

In order to allow selective acknowledges for the different values of the address byte(s), the following control mechanism is implemented:

- If the GCFUNC bit (USCI_PROTCTL [0]) is set the I²C port hardware will respond to General Call address (00H). Clear GC bit to disable general call function.
- The I²C port is equipped with one device address registers, USCI_DEVADDRn (n = 0~1). In 7-bit address mode, the first 7 bits of a received first address byte are compared to the programmed slave address (USCI_DEVADDRn [6:0]). If these bits match, the slave sends an acknowledge.
- For 10 bit addressing mode, if the slave address is programmed to 1111 0XXB, the XX bits are compared to the bits USCI_DEVADDR [9:8] to check for address match and also sends an acknowledge when ADDR10EN (USCI_PROTCTL [4]) is set. The slave waits for a second address byte compares it with USCI_DEVADDR [7:0] and sends an acknowledge accordingly to cover the 10 bit addressing mode. The user has to take care about reserved addresses (refer to I²C specification for more detailed description). Only the address 1111 0XXB is supported. Under each of these conditions, bit SLASEL (USCI_PROTSTS [14]) will be set when the addressing delivered a match. This SLASEL (USCI_PROTSTS [14]) bit is cleared automatically by a (Repeated) START or STOP condition.
- The I²C port is equipped multiple address recognition with one address mask registers I2C_ADDRMSKn (n = 0~1). When the bit in the address mask register is set to 1, it means the received corresponding address bit is "Don't care". If the bit is set to 0, it means the received corresponding register bit should be exactly the same as address register.

6.26.5.4 Data Transfer

When a slave receives a correct address with an R/W bit, the data will follow R/W bit specified to transfer. Each transferred byte is followed by an acknowledge bit on the 9th SCL clock cycle. If the slave signals a Not Acknowledge (NACK), the master can generate a STOP signal to abort the data transfer or generate a Repeated START signal and start a new transfer cycle.

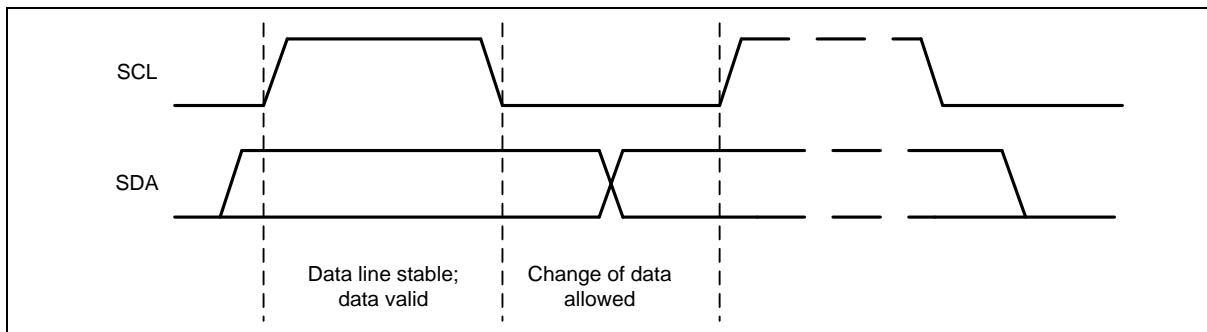

Figure 6.26-5 Bit Transfer on the I²C Bus

If the master received data, does Not Acknowledge (NACK) the slave, the slave releases the SDA line for the master to generate a STOP or Repeated START signal.

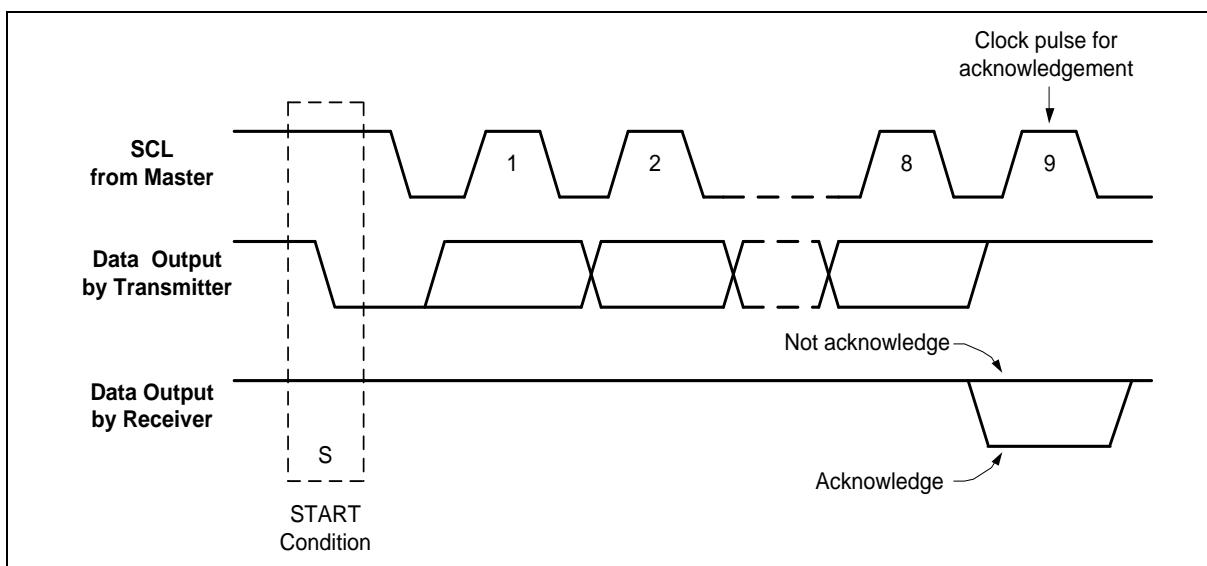

Figure 6.26-6 Acknowledge on the I²C Bus

6.26.5.5 Clock Baud Rate Bits

The data baud rate of I²C is determined by USCI_BRGEN register when I²C is in Master Mode, and it is not necessary in a Slave mode. In the Slave mode, I²C will automatically synchronize it with any clock frequency from master I²C device. The bits RCLKSEL, SPCLKSEL, PDSCNT, and DSCNT define the baud rate setting:

- RCLKSEL (USCI_BRGEN [0])
to define the input frequency f_{REF_CLK}
- SPCLKSEL (USCI_BRGEN[3:2])
to define the multiple source of the sample clock f_{SAMP_CLK}
- PDSCNT (USCI_BRGEN [9:8])

- to define the length of a data sample time (division of f_{REF_CLK} by 1, 2, 3, or 4)
- DSCNT (USCI_BRGEN [14:10])
to define the number of data sample time per bit time
The standard setting is given by RCLKSEL = 0 ($f_{REF_CLK} = f_{PCLK}$), PTCLKSEL = 0 ($f_{PROT_CLK} = f_{REF_CLK}$) and SPCLKSEL = 2'b00 ($f_{SAMP_CLK} = f_{DIV_CLK}$). Under these conditions, the baud rate is given by:

$$f_{I2C} = f_{REF_CLK} \times \frac{1}{CLKDIV + 1} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

In order to generate slower frequencies, additional divide-by-2 stages can be selected by PTCLKSEL = 1 ($f_{PROT_CLK} = f_{REF_CLK2}$), leading to:

$$f_{I2C} = \frac{f_{REF_CLK}}{2} \times \frac{1}{CLKDIV + 1} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

If SPCLKSEL = 2'b10 ($f_{SAMP_CLK} = f_{SCLK}$), and RCLKSEL = 0 ($f_{REF_CLK} = f_{PCLK}$), PTCLKSEL = 0 ($f_{PROT_CLK} = f_{REF_CLK}$). The baud rate is given by:

$$f_{I2C} = f_{REF_CLK} \times \frac{1}{CLKDIV + 1} \times \frac{1}{2} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

6.26.5.6 Byte Stretching

If a device is selected as master/slave transmit mode and should transmit a data byte but the transmit buffer TXDAT does not contain valid data to be transmitted, the device ties down SCL = 0 at the end of the previous acknowledge bit. The waiting period is finished if software writes 1 to PTRG (USCI_PROTCTL [5]).

6.26.5.7 Multi-master Arbitration

In some applications, there are two or more masters on the same I²C bus to access slaves, and the masters may transmit data simultaneously. The I²C supports multi-master by including collision detection and arbitration to prevent data corruption.

If two masters sometimes initiate I²C command at the same time, the arbitration procedure determines which master wins and can continue with the command. Arbitration is performed on the SDA signal while the SCL signal is high. Each master checks if the SDA signal on the bus corresponds to the generated SDA signal. If the SDA signal on the bus is low but it should be high, then this master has lost arbitration. Master I²C device that has lost arbitration can generate SCL pulses until the byte ends and must then release the bus and go into slave mode. The arbitration procedure can continue until all the data is transferred. This means that in multi-master system each I²C master must monitor the I²C bus for collisions and act accordingly. Figure 6.26-7 describes master1 data and master2 data are compete arbitration.

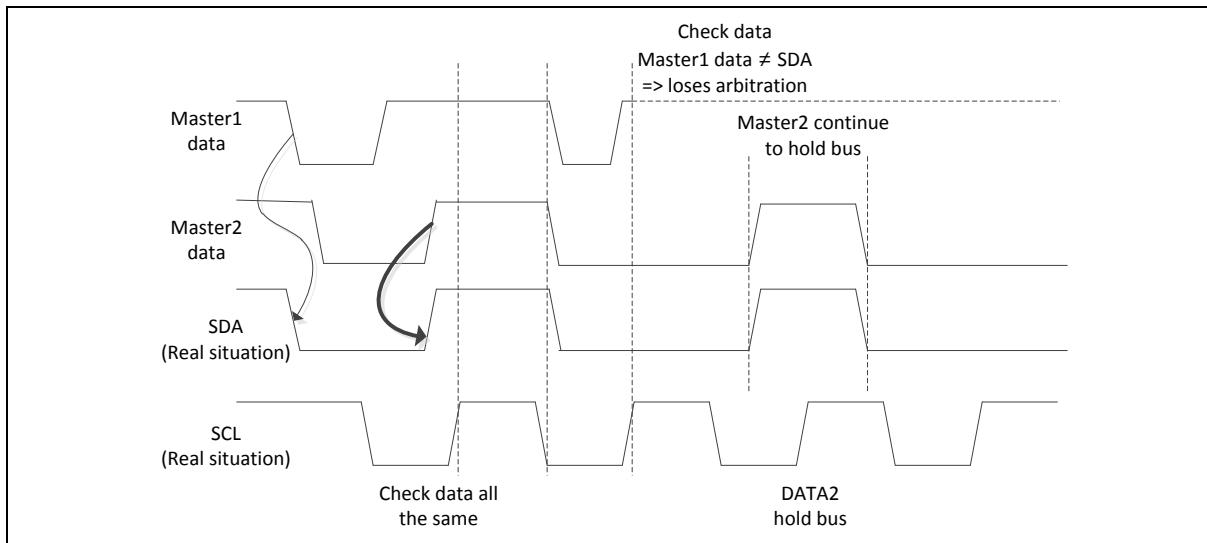

Figure 6.26-7 Arbitration Lost

In this case, during the address and data transmission, the master transmitter checks at the rising edge of SCL for each data bit if the value it is sending is equal to the value read on the SDA line. If yes, master can hold bus continuously. If this is not the case (transmitted value = 1, value read = 0), the master has lost the transmit arbitration. This is indicated by interrupt flag ARBLOIF (USCI_PROTSTS [11]) and can generate a protocol interrupt if enabled by ARBLOIEN (USCI_PROTIEN [4]).

When the transmit arbitration has been lost, the software has to initialize the complete frame again, starting with the first address byte together with the START condition for a new master transmit attempt. Arbitration also takes place for the ACK bit. If master arbitration lost and match the device address, then master will turn to slave.

6.26.5.8 Transmission Chain

The I²C bus protocol requiring a kind of in-bit-response during the arbitration phase and while a slave is transmitting, the resulting loop delay of the transmission chain can limit the reachable maximal baud rate, strongly depending on the bus characteristics (bus load, module frequency, etc.).

The shift clock SCL is generated by the master device, output on the wire, then it passes through the input stage and the input filter. Now, the edges can be detected and the SDA data signal can be generated accordingly. The SDA signal passes through the output stage and the wire to the master receiver part. There, it passes through the input stage and the input filter before it is sampled.

This complete loop has to be finished (including all settling times to obtain stable signal levels) before the SCL signal changes again. The delays in this path have to be taken into account for the calculation of the baud rate as a function of f_{PCLK} and f_{PROT_CLK} . We suggest user adopt f_{PCLK} .

6.26.5.9 Non-Acknowledge and Error Conditions

In case of a non-acknowledge (NACKIF (USCI_PROTSTS [10])) or an error (ERRIF(USCI_PROTSTS [12])), no further transmission will take place. User software doesn't invalidate the transmit buffer and disable transmissions, before configuring the transmission (by writing TXDAT) again with appropriate values to react on the previous event.

6.26.5.10 I²C Protocol Interrupt Events

The following protocol-related events are generated in I²C mode and can lead to a protocol interrupt.

Please note that the bits in register USCI_PROTSTS are not all automatically cleared by hardware and have to be cleared by software in order to monitor new incoming events.

- START condition received at a correct position in a frame (STARIF (USCI_PROTSTS [8]))
- STOP condition transferred at a correct position in a frame (STORIF (USCI_PROTSTS [9]))
- Master arbitration lost (ARBLOIF (USCI_PROTSTS [11]))
- Slave read requested (SLAREAD (USCI_PROTSTS [15]))
- Acknowledge received (ACKIF (USCI_PROTSTS [13]))
- Non-acknowledge received (NACKIF (USCI_PROTSTS [10]))
- START condition not at the expected position in a frame (ERRIF (USCI_PROTSTS [12]))
- STOP condition not at the expected position in a frame (ERRIF (USCI_PROTSTS [12]))

6.26.5.11 Operating the I²C

To operate the I²C protocol, the following issues have to be considered:

Select I²C Mode

It is recommended to configure all parameters of the I²C that do not change during run time while FUNMODE (USCI_CTL [2:0]) = 000B. The I²C control flow has to be done while FUNMODE (USCI_CTL [2:0]) = 000B to avoid unintended edges of the input signals and the I²C mode can be enabled by FUNMODE (USCI_CTL [2:0]) = 100B afterwards.

Step 1. Set FUNMODE (USCI_CTL [2:0]) = 000B

Step 2. Set FUNMODE (USCI_CTL [2:0]) = 100B

Pin Connections

The pins used for SDA and SCL have to be set to open-drain mode by USCI controller to support the wired-AND structure of the I²C bus lines.

Note: The step to enable the alternate output port functions should only be done after the I²C mode is enabled, to avoided unintended spikes on the output.

Bit Timing Configuration

In standard mode (100 kBit/s) a minimum module frequency of 2 MHz is necessary, whereas in fast mode (400 kBit/s) a minimum of 10 MHz is required. Additionally, if the digital filter stage should be used to eliminate spikes up to 50 ns, a filter frequency of 20 MHz is necessary. There could be an uncertainty in the SCL high phase timing of maximum $1/f_{PROT_CLK}$ if another I²C participant lengthens the SCL low phase on the bus. Note that the SCL maximum frequency is $f_{SAMP_CLK}/2$ and the SPCLKSEL (USCI_BRGEN [3:2]) must be set to 0 for selecting $f_{SAMP_CLK} = f_{DIV_CLK}$.

Data Format Configuration

The data format has to be configured for 8 data bits (DWIDTH (USCI_LINECTL [11:8]) = 8), and MSB shifted first (LSB (USCI_LINECTL [0]) = 0). As a result, USCI_LINECTL has to be set to 0x800.

Control Flow

The on-chip I²C ports support three operation modes, Master, Slave, and General Call Mode.

In a given application, I²C port may operate as a master or as a slave. In Slave mode, the I²C port hardware looks for its own slave address and the general call address. If one of these addresses is detected, and if the slave is willing to receive or transmit data from/to master(by setting the AA bit), acknowledge pulse will be transmitted out on the 9th clock, hence an interrupt is requested on both master and slave devices if interrupt is enabled. When the microcontroller wishes to become the bus master, hardware waits until the bus is free before entering Master mode so that a possible slave action is not be interrupted. If address arbitration is lost in Master mode, I²C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer.

To control the I²C bus transfer in each mode, user needs to set USCI_PROTCTL, USCI_PROTIEN, TXDAT registers according to current status of USCI_PROTSTS register. In other words, for each I²C

bus action, user needs to check current status by USCI_PROTSTS register, and then set USCI_PROTCTL, USCI_PROTIEN, TXDAT registers to take bus action. Finally, check the response status by USCI_PROTSTS.

The bits, STA, STO and AA in USCI_PROTCTL register are used to control the next state of the I²C hardware after interrupt signal is cleared. Upon completion of the new action, a new status will be updated in USCI_PROTSTS register will be set. If the I²C interrupt control bit of USCI_PROTIEN is set, appropriate action or software branch of the new status can be performed in the Interrupt service routine.

Figure 6.26-8 shows the current I²C STARIF (USCI_PROTSTS [8]) is set to 1 by hardware, and then set TXDAT = SLA+W (Slave address + Write bit), (PTRG, STA, STO, AA) = (1, 0, 0, x) to send the address to I²C bus, and write 1 to STARIF (USCI_PROTSTS [8]) to clear flag. If a slave on the bus matches the address and response ACK, the USCI_PROTSTS will be updated by ACKIF (USCI_PROTSTS [13]) setting.

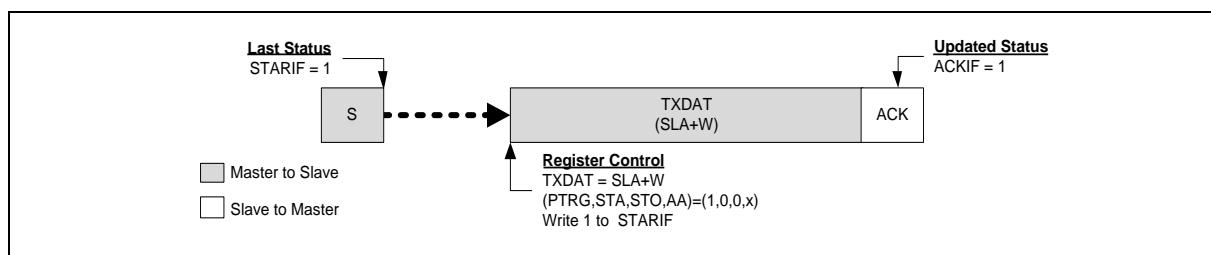

Figure 6.26-8 Control I²C Bus according to Current I²C Status

Data Transfer on the I²C Bus

Figure 6.26-9 shows a master transmits data to slave. A master addresses a slave with a 7-bit address and 1-bit write index to denote that the master wants to transmit data to the slave. The master keeps transmitting data after the slave returns acknowledge to the master.

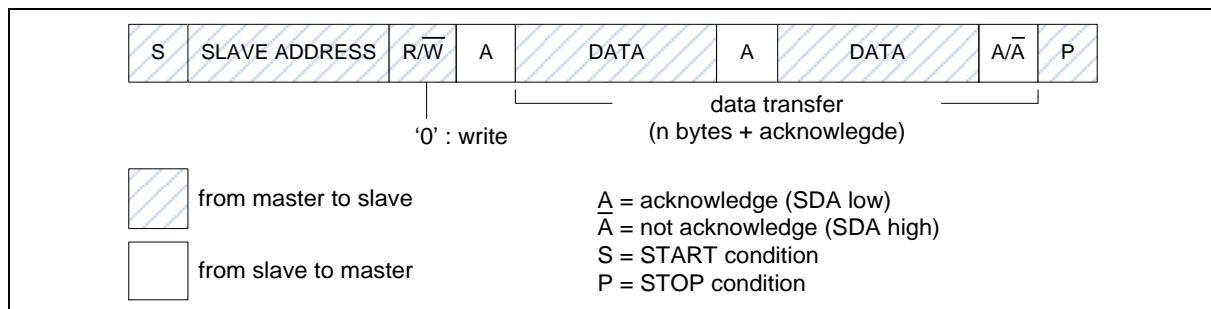

Figure 6.26-9 Master Transmits Data to Slave with a 7-bit Address

Figure 6.26-10 shows a master read data from slave. A master addresses a slave with a 7-bit address and 1-bit read index to denote that the master wants to read data from the slave. The slave will start transmitting data after the slave returns acknowledge to the master.

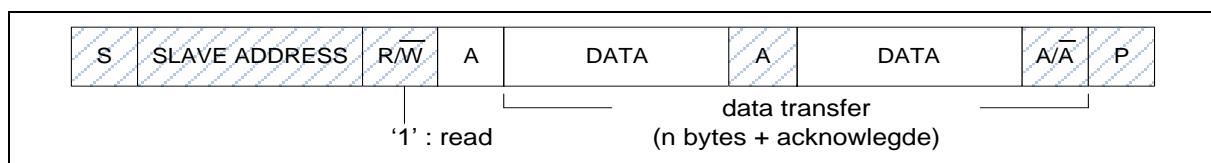

Figure 6.26-10 Master Reads Data from Slave with a 7-bit Address

Figure 6.26-11 shows a master transmits data to slave by 10-bit address. A master addresses a slave with a 10-bit address. First byte contains 10-bit address indicator (5'b11110) and 2-bit address with

write index, second byte contains 8-bit address. The master keeps transmitting data after the second byte end. Note that 7-bit and 10-bit address device can work on the same bus.

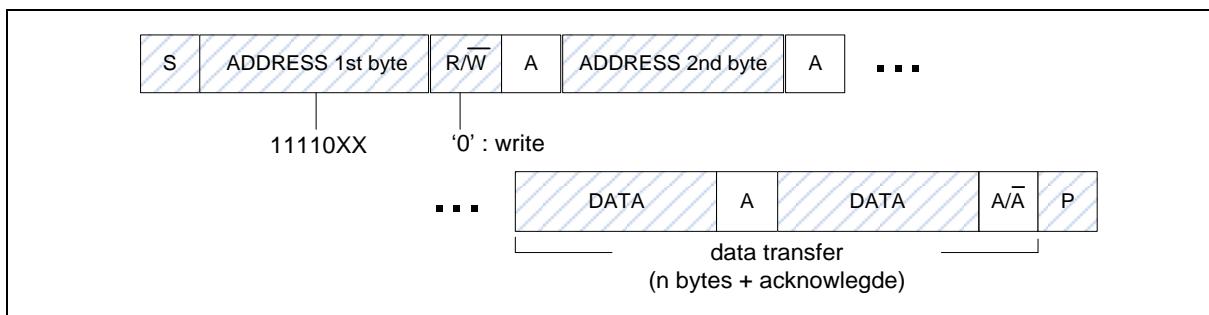

Figure 6.26-11 Master Transmits Data to Slave by 10-bit Address

Figure 6.26-12 shows a master read data from slave by 10-bit address. A master addresses a slave with a 10-bit address. First master transmits 10-bit address to slave, after that master transmits first byte with read index. The slave will start transmitting data after the first byte with read index.

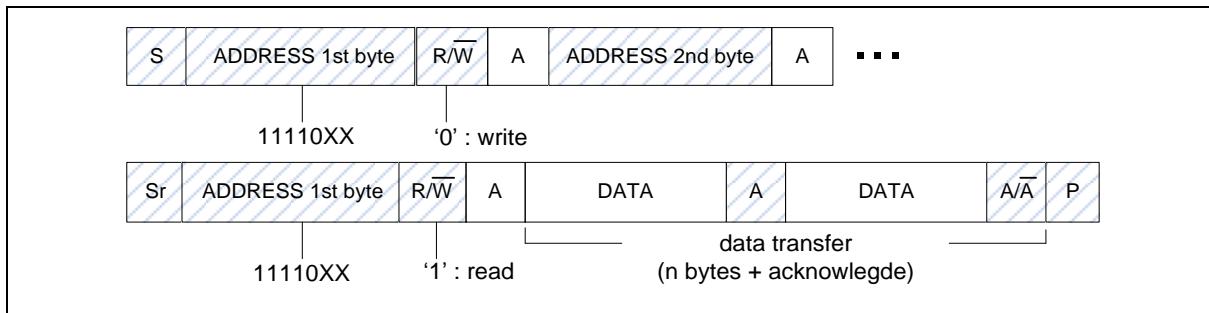

Figure 6.26-12 Master Reads Data from Slave by 10-bit Address

Master Mode

In Figure 6.26-13 and Figure 6.26-14, all possible protocols for I²C master are shown. User needs to follow proper path of the flow to implement required I²C protocol.

In other words, user can send a START signal to bus and I²C will be in Master Transmitter mode (Figure 6.26-13) or Master receiver mode (Figure 6.26-14) after START signal has been sent successfully and new status register would be set STARIF (USCI_PROTSTS [8]). Followed by START signal, user can send slave address, read/write bit, data and Repeat START, STOP to perform I²C protocol.

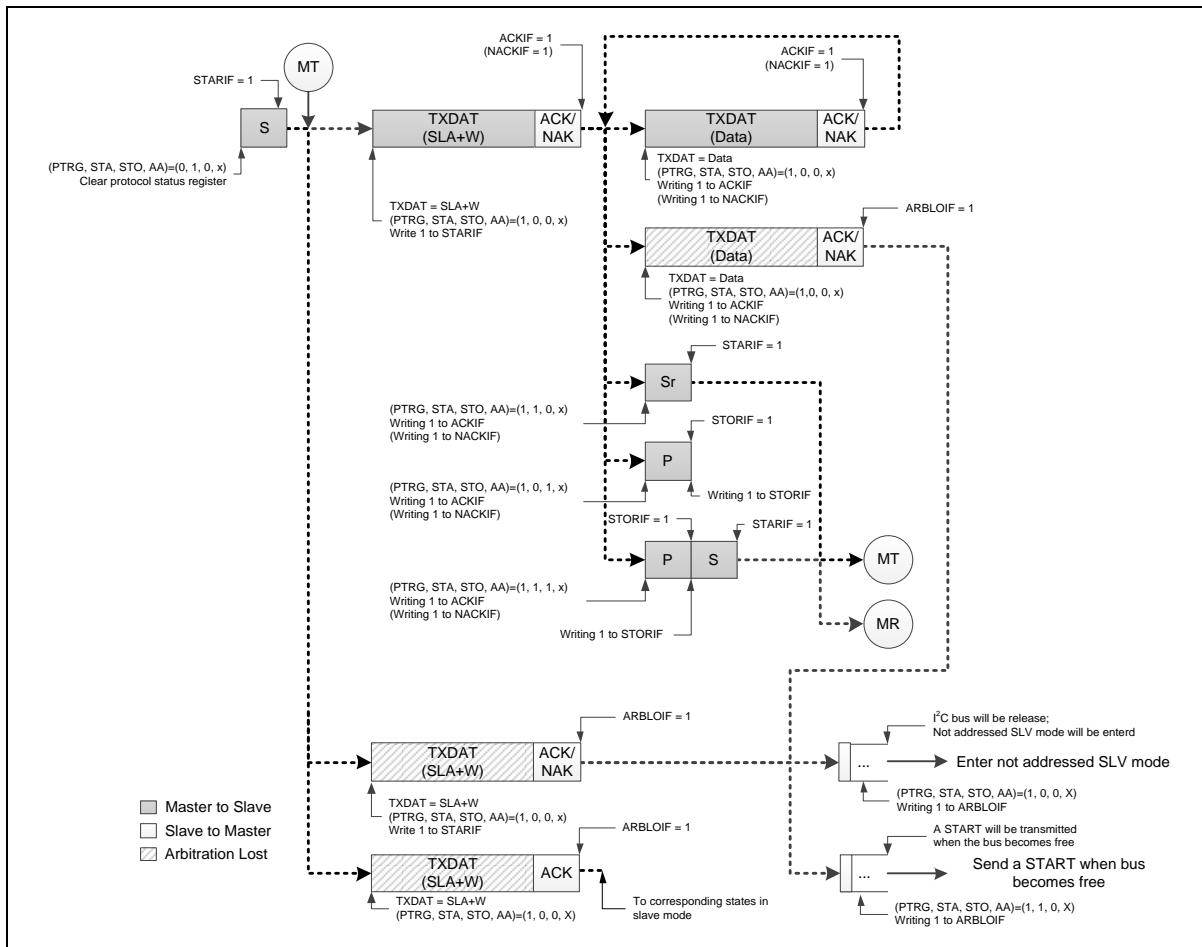

Figure 6.26-13 Master Transmitter Mode Control Flow with 7-bit Address

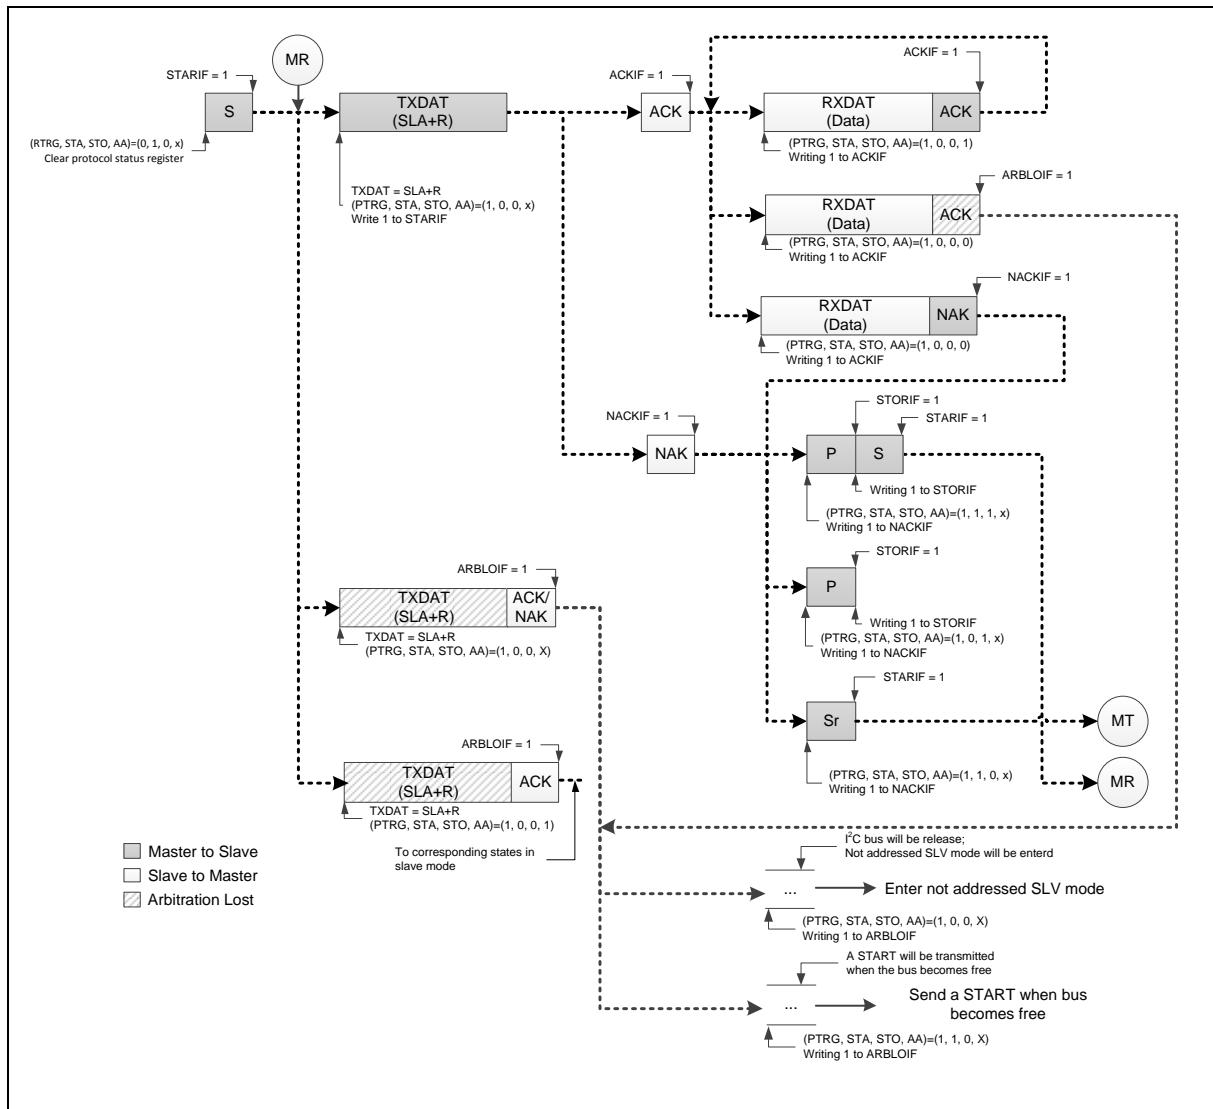

Figure 6.26-14 Master Receiver Mode Control Flow with 7-bit Address

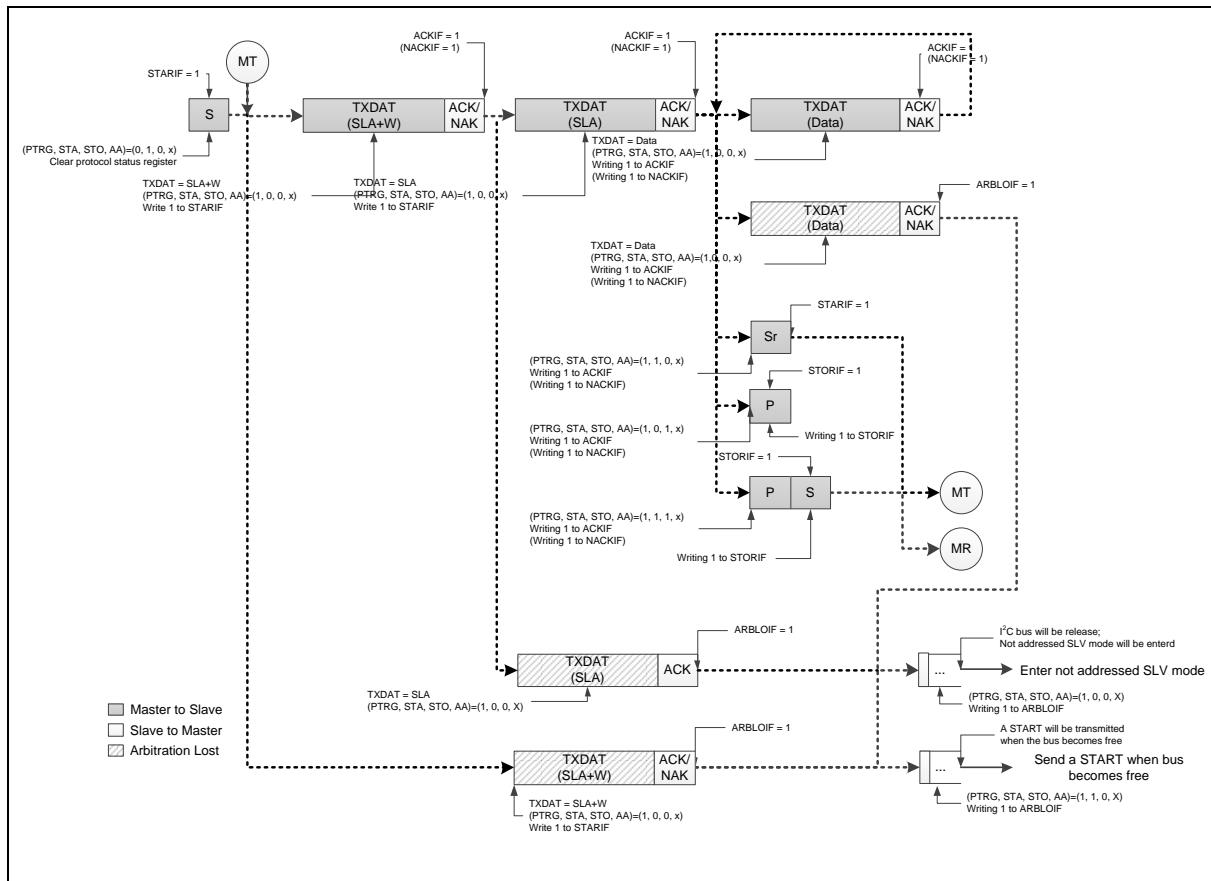

Figure 6.26-15 Master Transmitter Mode Control Flow with 10-bit Address

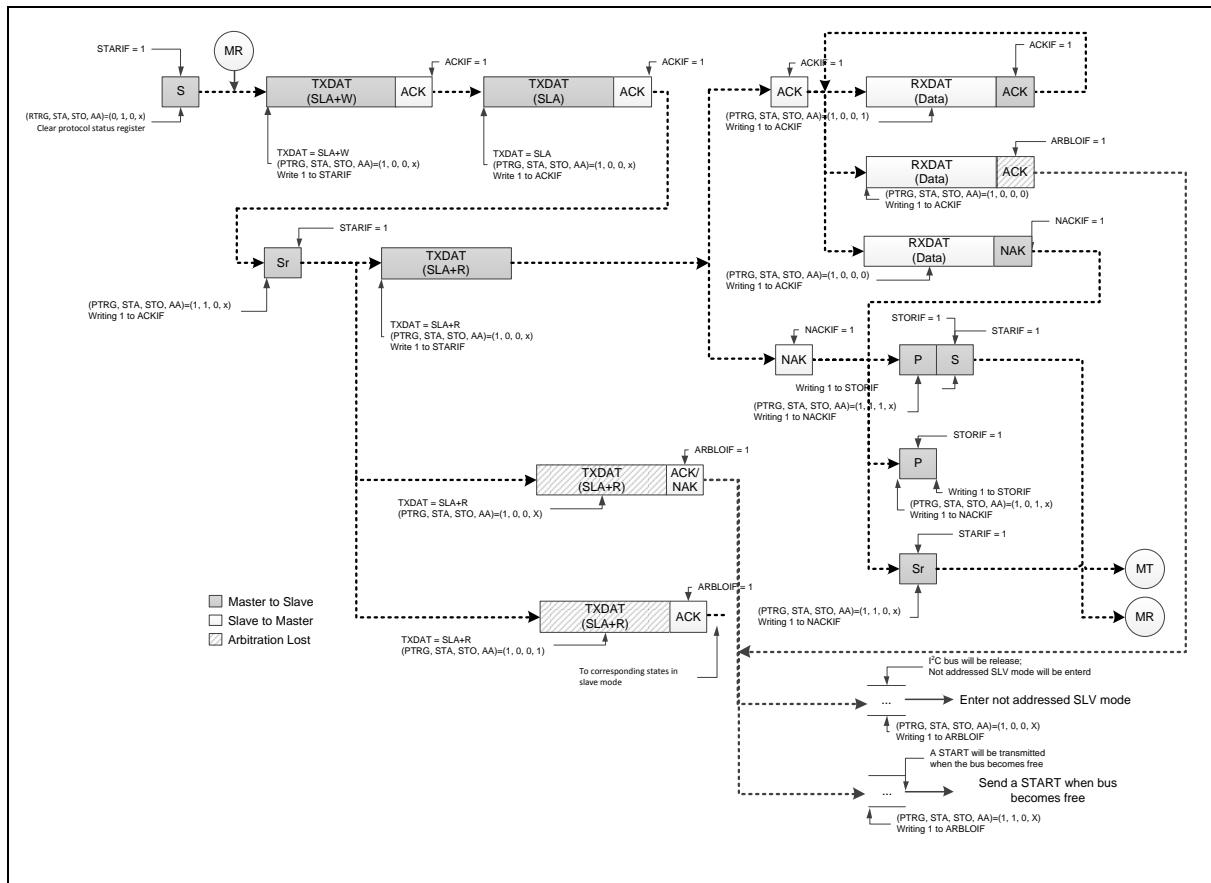

Figure 6.26-16 Master Receiver Mode Control Flow with 10-bit Address

If the I²C is in Master mode and gets arbitration lost, the bit of ARBLOIF (USCI_PROTSTS [11]) will be set. User may writing 1 to ARBLOIF (USCI_PROTSTS [11]) and set (PTRG, STA, STO, AA) = (1, 1, 0, X) to send START to re-start Master operation when bus become free. Otherwise, user may writing 1 to ARBLOIF (USCI_PROTSTS [11]) and set (PTRG, STA, STO, AA) = (1, 0, 0, X) to release I²C bus and enter not addressed Slave mode.

Slave Mode

When reset, I²C is not addressed and will not recognize the address on I²C bus. User can set device address by USCI_DEVADDRn and set (PTRG, STA, STO, AA) = (1, 0, 0, 1) to let I²C recognize the address sent by master. Figure 6.26-17 shows all the possible flow for I²C in Slave mode. Users need to follow a proper flow (as shown in Figure 6.26-17) to implement their own I²C protocol.

If bus arbitration is lost in Master mode, I²C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer. If the detected address is SLA+W (Master want to write data to Slave) or SLA+R (Master want to read data from Slave) after arbitration lost, the ARBLOIF will be set to 1.

Note: During I²C communication, the SCL clock will be released when writing '1' to PTRG (USCI_PROTCTL[5]) in Slave mode.

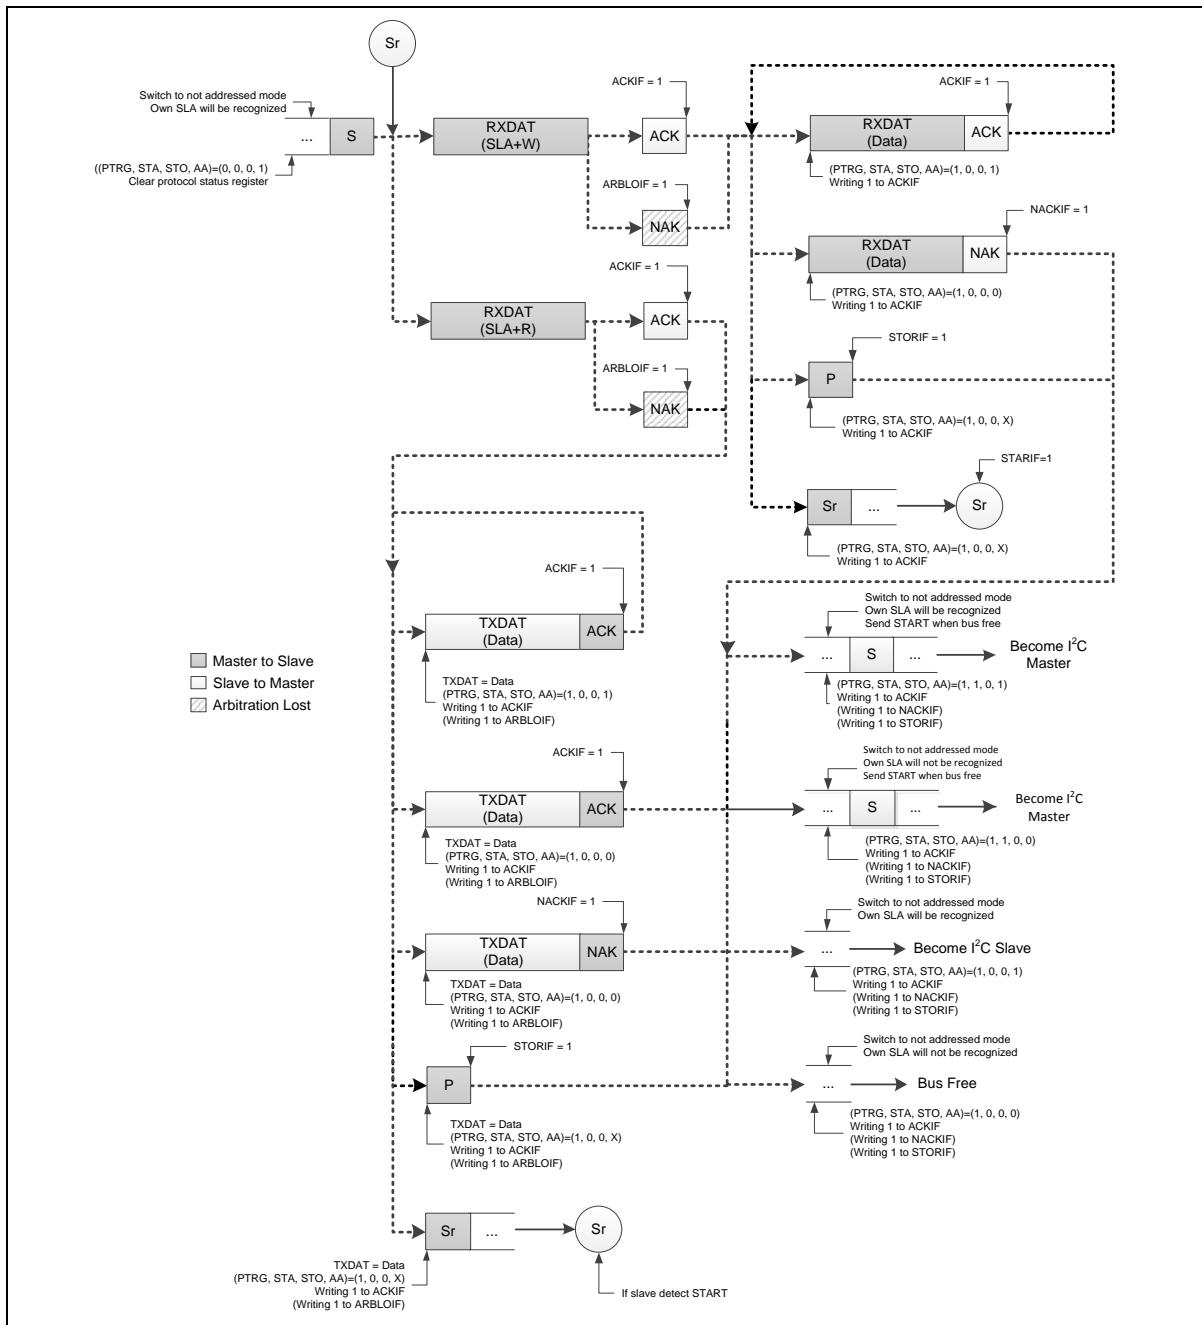

Figure 6.26-17 Save Mode Control Flow with 7-bit Address

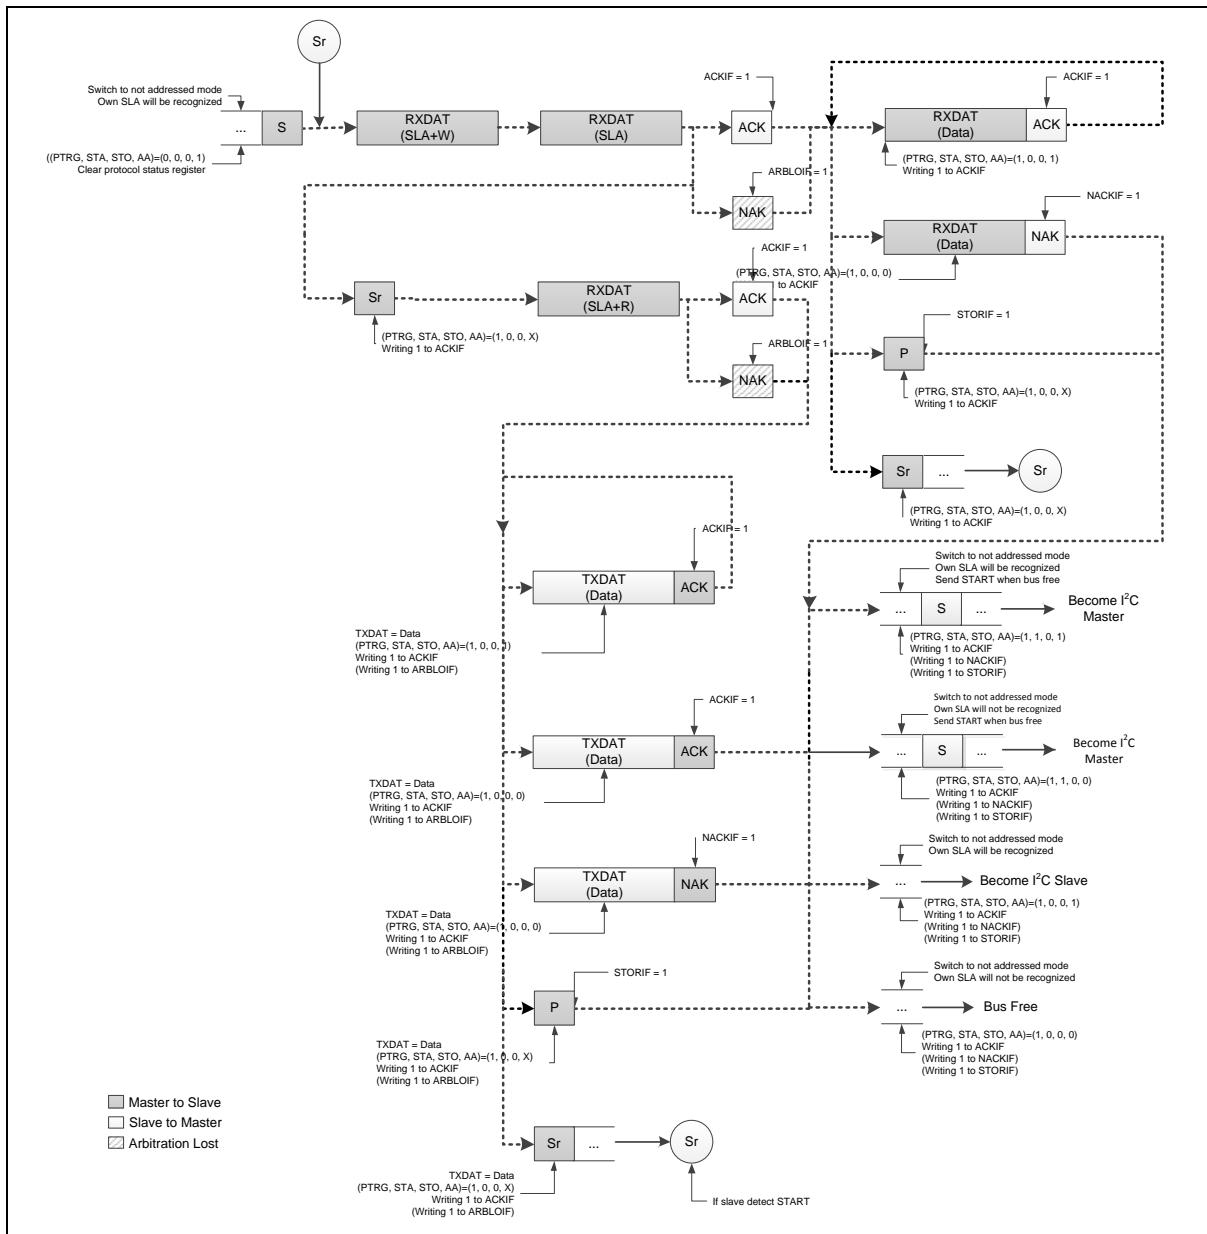

Figure 6.26-18 Save Mode Control Flow with 10-bit Address

If I²C is still transmitting and receiving data in addressed Slave mode but got a STOP or Repeat START, the register STORIF (USCI_PROTSTS [9]) or STARIF (USCI_PROTSTS [8]) will be set. User could follow the action for NACKIF (USCI_PROTSTS [10]) as shown in the above figure when got STARIF (USCI_PROTSTS [8]) is set.

Note: After slave gets interrupt flag of NACKIF (USCI_PROTSTS [10]) and start/stop symbol including STARIF (USCI_PROTSTS [8]) and STORIF (USCI_PROTSTS [9]), slave can switch to not address mode and own SLA will not be recognized. If setting this interrupt flag, slave will not receive any I²C signal or address from master. At this status, I²C should be reset by setting FUNMODE (USCI_CTL [2:0]) = 000B to leave this status.

General Call (GC) Mode

If the GCFUNC bit (USCI_PROTCTL [0]) is set, the I²C port hardware will respond to General Call address (00H). User can clear GC bit to disable general call function. When the GC bit is set and the

I²C in slave mode, it can receive the general call address by 0x00 after master send general call address to I²C bus, and then it also will follow protocol status register.

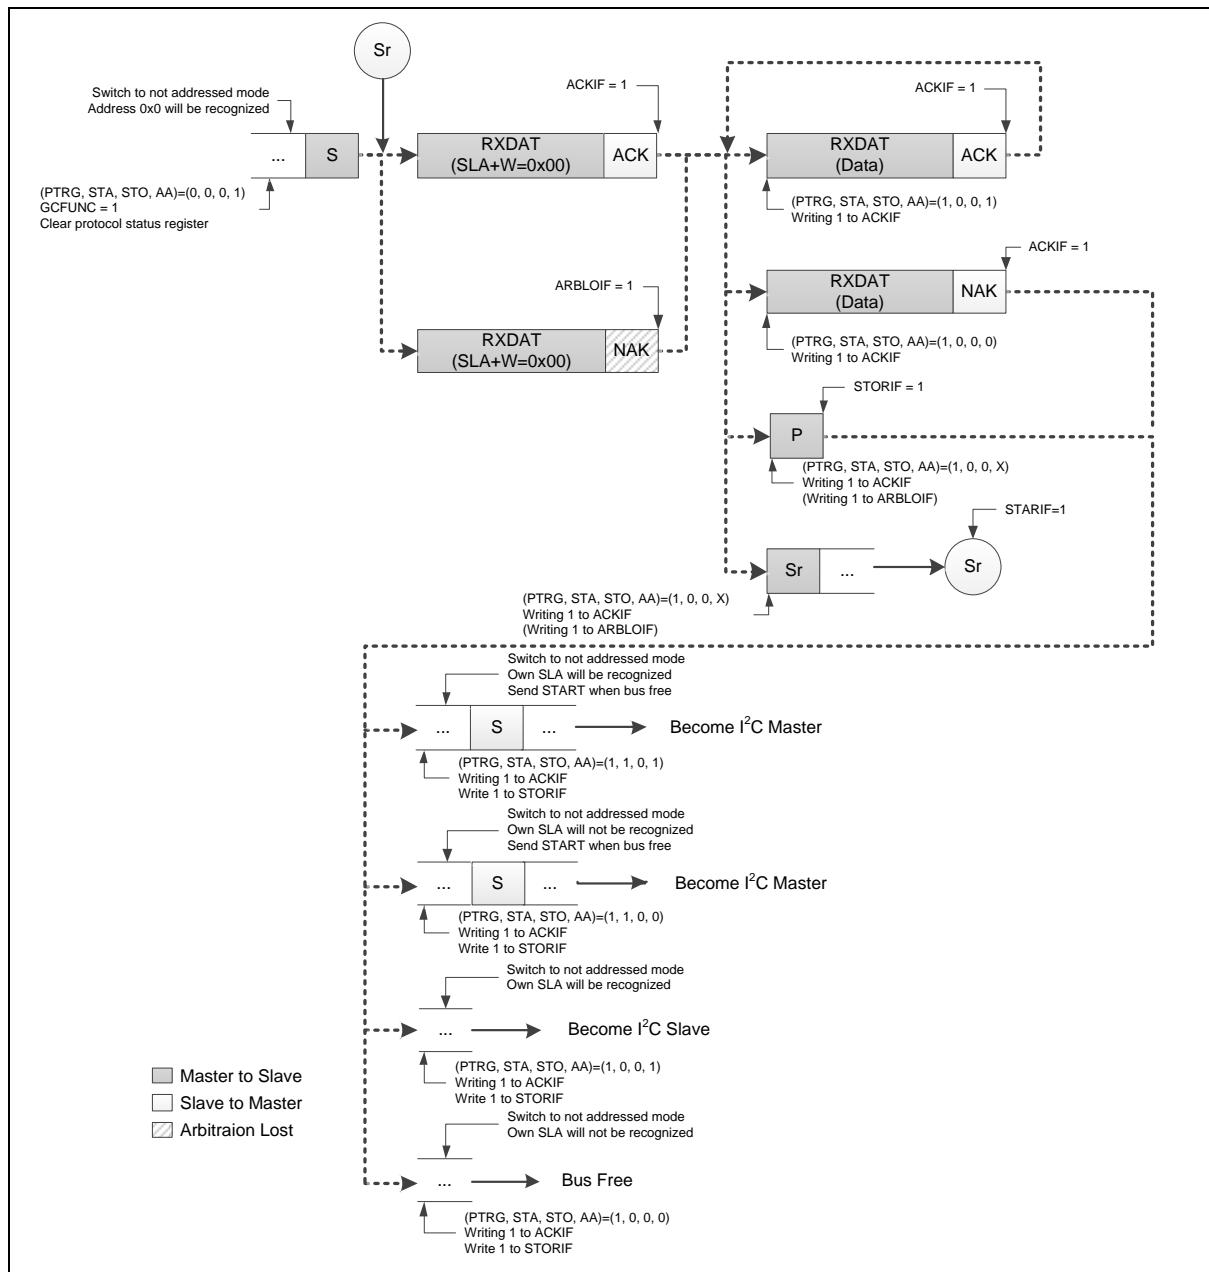

Figure 6.26-19 GC Mode with 7-bit Address

If I²C is still receiving data in GC mode but got a STOP or Repeat START, the STORIF (USCI_PROTSTS [9]) or STARIF (USCI_PROTSTS [8]) will be set. User could follow the action for NACKIF (USCI_PROTSTS [10]) in above figure when got STORIF (USCI_PROTSTS [9]) or STARIF (USCI_PROTSTS [8]) is set.

Note: After slave gets interrupt flag of NACKIF (USCI_PROTSTS [10]) and start/stop symbol including STARIF (USCI_PROTSTS [8]) and STORIF (USCI_PROTSTS [9]), slave can switch to not address mode and own SLA will not be recognized. If setting this interrupt flag, slave will not receive any I²C signal or address from master. At this time, I²C controller should be reset by setting FUNMODE (USCI_CTL [2:0]) = 000B to leave this status.

Protocol Functional Description

Monitor Mode

When I²C enters monitor mode, this device always returns NACK to master after each frame reception even address matching. Moreover, this device will store any receive data including address, command code, and data.

Interrupt in Monitor Mode

All interrupts will occur as normal process when the MONEN (USCI_PROTCTL [9]) is set. Note that the first interrupt will occur when initial START, it not the same as I²C slave, but the other interrupts are the same.

Subsequent to the address-match detection, interrupts will be generated after each data byte is received as slave mode control flow, or after each byte that the module believes it has transmitted for a slave-read transfer. In this second case, the data register will actually contain data transmitted by some other slave on the bus which was actually addressed by the master. If user wants to watch other device, user can set address mask and monitor.

If the monitor has not had time to respond to interrupt, the SCL signal will be pulled to low when SCLOUTEN (USCI_PROTCTL [8]) is set to 1. User must set PTRG (USCI_PROTCTL [5]) to release bus when SCLOUTEN (USCI_PROTCTL [8]) is set to 1. If SCLOUTEN (USCI_PROTCTL [8]) is not set to 1, user doesn't need to set PTRG (USCI_PROTCTL [5]) to 1.

When device address match, but the device response NACK, this address will be received into buffer and NACK interrupt will be generated.

Following all of these interrupts, the processor may read the data register to see what was actually transmitted on the bus.

Loss of Arbitration in Monitor Mode

In monitor mode, the I²C module will not be able to respond to a request for information by the bus master or issue an ACK. Some other slave on the bus will respond instead. Software should be aware of the fact that the module is in monitor mode and should not respond to any loss of arbitration state that is detected.

Programmable Setup and Hold Time

In order to guarantee a correct data setup and hold time, the timing must be configured. By programming HTCTL (USCI_TMCTL[24:16]) to configure hold time and STCTL (USCI_TMCTL[8:0]) to configure setup time.

The delay timing refer peripheral clock (PCLK). When device stretch master clock, the setup and hold time configuration value will not affected by stretched.

User should focus the limitation of setup and hold time configuration, the timing setting must follow I²C protocol. Once setup time configuration greater than design limitation, that means if setup time setting make SCL output less than three PCLKs, I²C controller can't work normally due to SCL must sample three times. And once hold time configuration greater than I²C clock limitation, I²C will occur bus error. Suggest that user calculate suitable timing with baud rate and protocol before setting timing. Table 6.26-1 shows the relationship between I²C baud rate and PCLK, the number of table represent one clock duty contain how many PCLKs. Setup and hold time configuration even can program some extreme values in the design, but user should follow I²C protocol standard.

I ² C Baud Rate PCLK	100k	200k	400k	800k	1200k
12 MHz	120	60	30	15	10
24 MHz	240	120	60	30	20
48 MHz	480	240	120	60	40
72 MHz	720	360	180	90	60

Table 6.26-1 Relationship between I²C Baud Rate and PCLK

For setup time wrong adjustment example, assuming one SCL cycle contains ten PCLKs and set STCTL (USCI_TMCTL[8:0]) to 3 that stretch three PCLKs for setup time setting. The setup time setting limitation: $ST_{limit} = (USCI_BRGEN[25:16]+1) - 6$.

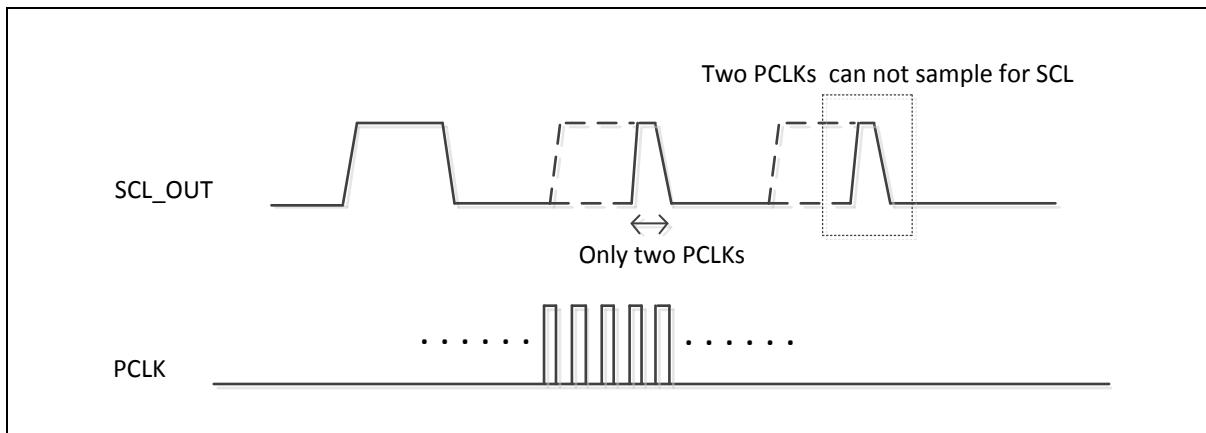

Figure 6.26-20 Setup Time Wrong Adjustment

For hold time wrong adjustment example, use I²C Baud Rate = 1200k and PCLK = 72MHz, the SCL high/low duty = 60 PCLK. When HTCTL (USCI_TMCTL[24:16]) is set to 63 and STCTL (USCI_TMCTL[8:0]) is set to 0, then SDA output delay will over SCL high duty and cause bus error. The hold time setting limitation: $HT_{limit} = (USCI_BRGEN[25:16]+1) - 9$.

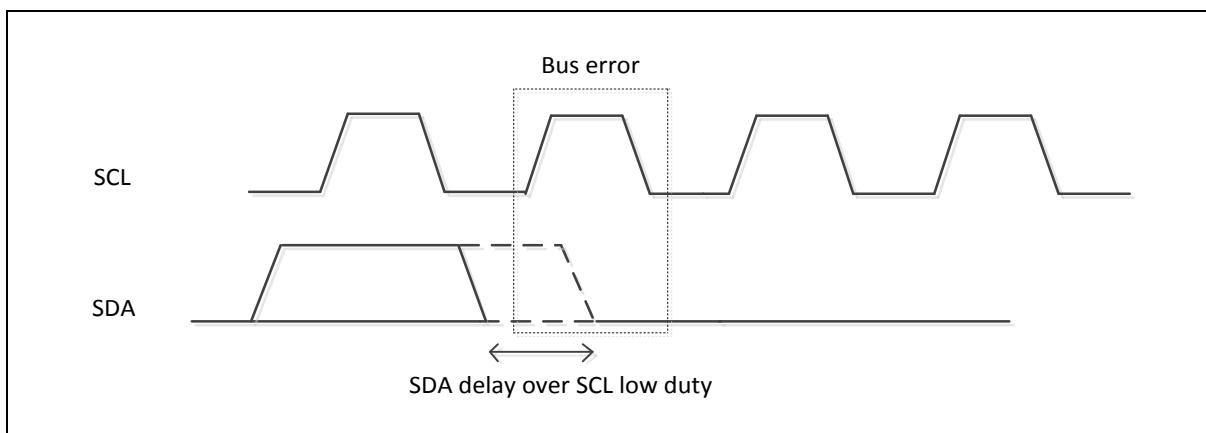

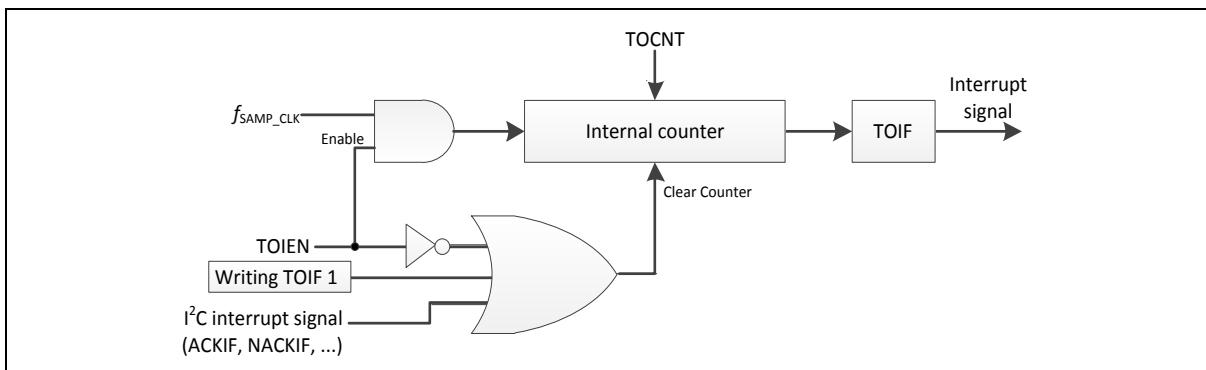

Figure 6.26-21 Hold Time Wrong Adjustment

I²C Time-out Function

There is a 10 bits time-out counter TOCNT (USCI_PROTCTL [25:16]) which can be used to deal with the I²C bus hang-up. If the time-out counter is enabled, the counter starts up counting until it equals TOCNT (USCI_PROTCTL [25:16]) and generates I²C interrupt to CPU or stops counting by clearing TOIEN (USCI_PROTIEN [0]) to 0 or setting all I²C interrupt signal (ACKIF, ERRIF, ARBLOIF, NACKIF, STORIF, STARIF). User may write 1 to clear TOIF(USCI_PROTSTS[5]) to 0. When time-out counter is enabled, writing 1 to the TOIF will reset counter and re-start up counting after TOIF is cleared. Refer to Figure 6.26-22 for the time-out counter TOCNT (USCI_PROTCTL [25:16]). $T_{TOCNT} = (TOCNT (USCI_PROTCTL [25:16]) + 1) \times 32$ (5-bit) $\times T_{PCLK}$. Note that the time counter clock source TMCNTSRC (USCI_BRGEN [5]) must be set as 0.

Figure 6.26-22 I²C Time-out Count Block Diagram

Wake-up Function

When chip enters Power-down mode and set WKEN (WKCTL[0]) to 1, other I²C master can wake up the chip by addressing the I²C device, user must configure the related setting before entering sleep mode. The ACK bit cycle of address match frame is done in power-down. The controller will stretch the SCL to low when the address is matched the device's address and the ACK cycle done. The SCL is stretched until the bit is clear by user. If the frequency of SCL is low speed and the system has wakeup from address match frame, the user shall check this bit to confirm this frame has transaction done and then to do the wake-up procedure. Therefore, when the chip is woken up by address match with one of the device address register (USCI_DEVADDRn), the user shall check the WKAKDONE (USCI_PROTSTS [16]) bit is set to 1 to confirm the address wakeup frame has done. The WKAKDONE bit indicates that the ACK bit cycle of address match frame is done in power-down. The controller will stretch the SCL to low when the address is matched the device's slave address and the ACK cycle done. The SCL is stretched until the WKAKDONE bit is clear by user. If the frequency of SCL is low speed and the system has wakeup from address match frame, the user shall check this bit to confirm this frame has transaction done and then to do the wake-up procedure. Note that user must clear WKUPIF after clearing the WKAKDONE bit to 0.

The WRSTSWK (USCI_PROTSTS [17]) bit records the Read/Write command on the address match wake-up frame. The user can use read this bit's status to prepare the next transmitted data (WRSTSWK = 0) or to wait the incoming data (WRSTSWK = 1) can be stored in time after the system is wake-up by the address match frame.

When system is woken up by other I²C master device, WKF (USCI_WKSTS [0]) is set to indicate this event. User needs write "1" to clear this bit.

Example for Random Read on EEPROM

The following steps are used to configure the USCI0_I²C related registers when using I²C protocol to read data from EEPROM.

1. Set USCI0_I²C the multi-function pin as SCL and SDA pins The muti-function configuration reference Basic Configuration.
2. Enable USCI0 APB clock. The muti-function configuration reference Basic Configuration.
3. Set USCI0RST=1 to reset USCI controller then set USCI0RST=0 let USCI controller to normal operation, The reset controller configuration reference Basic Configuration.
4. Set FUNMODE =100 to enable USCI0_I²C controller in the "USCI_CTL" register.
5. Give USCI0_I²C clock a divided register value for USCI0_I²C clock rate in the "USCI_BRGEN".
6. Enable system I2C0 IRQ in system "NVIC" control register.
7. Set ACKIEN, ERRIEN, ARBLOIEN, NACKIEN, STORIEN, STARLEN, and TOIEN to enable I²C Interrupt in the "USCI_PROTIEN" register.

8. Set USCI address registers “USCI_ADDR0 ~ USCI_ADDR1”.

Random read operation is one of the methods of access EEPROM. The method allows the master to access any address of EEPROM space. Figure 6.26-23 shows the EEPROM random read operation.

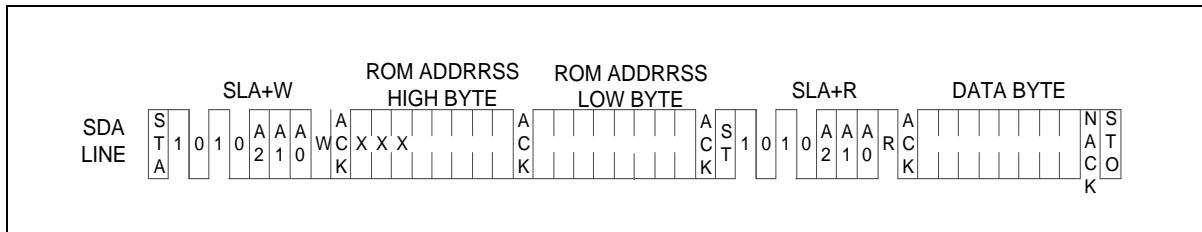

Figure 6.26-23 EEPROM Random Read

Figure 6.26-24 shows how to use I²C controller to implement the protocol of EEPROM random read.

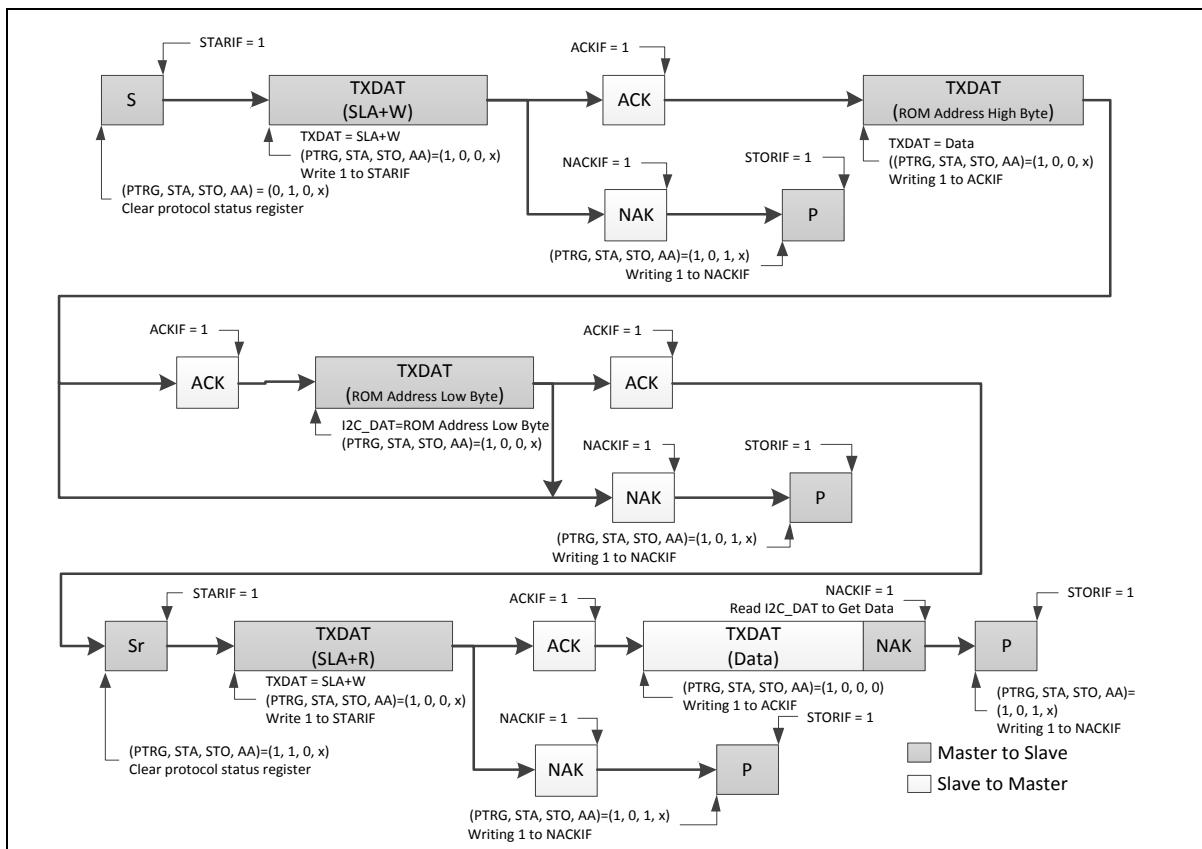

Figure 6.26-24 Protocol of EEPROM Random Read

The I²C controller, which is a master, sends START to bus. Then, it sends a SLA+W (Slave address + Write bit) to EEPROM followed by two bytes data address to set the EEPROM address to read. Finally, a Repeat START followed by SLA+R is sent to read the data from EEPROM.

6.26.6 Register Map

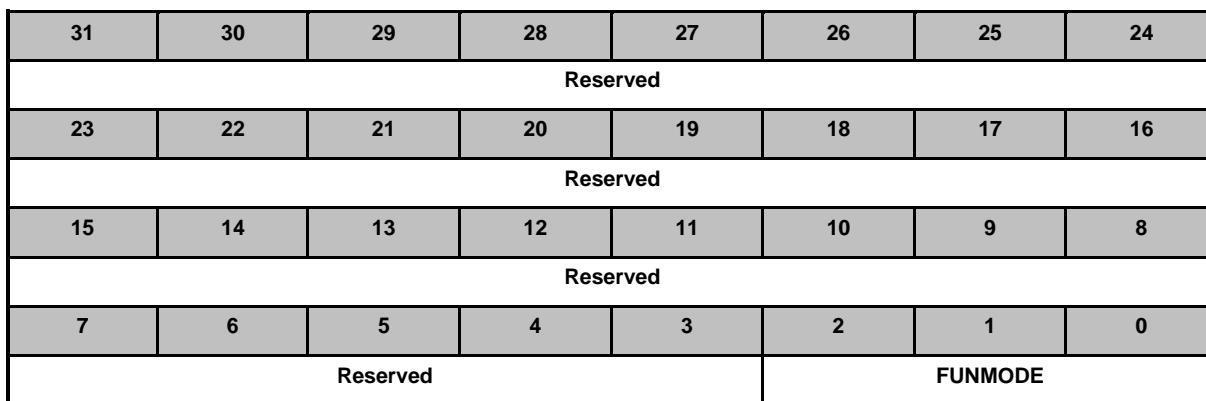

R: read only, W: write only, R/W: both read and write

Bits	Description	
[31:10]	Reserved	Reserved.
[9:0]	DEVADDR	<p>Device Address In I²C protocol, this bit field contains the programmed slave address. If the first received address byte are 1111 0AA_BX_B, the AA bits are compared to the bits DEVADDR[9:8] to check for address match, where the X is R/W bit. Then the second address byte is also compared to DEVADDR[7:0].</p> <p>Note 1: The DEVADDR [9:7] must be set 3'b000 when I²C operating in 7-bit address mode.</p> <p>Note 2: When software set 10'h000, the address can not be used.</p>

USCI Device Address Mask Register (USCI_ADDRMSK) – for I²C Only

Register	Offset	R/W	Description	Reset Value
USCI_ADDRMSK0	USCI _n _BA+0x4C	R/W	USCI Device Address Mask Register 0	0x0000_0000
USCI_ADDRMSK1	USCI _n _BA+0x50	R/W	USCI Device Address Mask Register 1	0x0000_0000

Bits	Description	
[31:10]	Reserved	Reserved.
[9:0]	ADDRMSK	<p>USCI Device Address Mask</p> <p>0 = Mask Disabled (the received corresponding register bit should be exact the same as address register.).</p> <p>1 = Mask Enabled (the received corresponding address bit is don't care.).</p> <p>USCI support multiple address recognition with two address mask register. When the bit in the address mask register is set to one, it means the received corresponding address bit is don't-care. If the bit is set to zero, that means the received corresponding register bit should be exact the same as address register.</p> <p>Note: The wake-up function can not use address mask.</p>

USCI Wake-up Control Register (USCI_WKCTL)

Register	Offset	R/W	Description					Reset Value
USCI_WKCTL	USCIIn_BA+0x54	R/W	USCI Wake-up Control Register					0x0000_0000

Bits	Description	
[31:1]	Reserved	Reserved.
[0]	WKF	Wake-up Flag When chip is woken up from Power-down mode, this bit is set to 1. Software can write 1 to clear this bit.

USCI Protocol Control Register – I²C (USCI_PROTCTL)

Register	Offset	R/W	Description				Reset Value
USCI_PROTCTL	USCI _n _BA+0x5C	R/W	USCI Protocol Control Register				0x0000_0000

31	30	29	28	27	26	25	24
PROTEN	Reserved				TOCNT		
23	22	21	20	19	18	17	16
TOCNT							
15	14	13	12	11	10	9	8
Reserved				MONEN		SCLOUTEN	
7	6	5	4	3	2	1	0
Reserved		PTRG	ADDR10EN	STA	STO	AA	GCFUNC

Bits	Description	
[31]	PROTEN	I ² C Protocol Enable Bit 0 = I ² C Protocol Disabled. 1 = I ² C Protocol Enabled.
[30:26]	Reserved	Reserved.
[25:16]	TOCNT	Time-out Clock Cycle This bit field indicates how many clock cycle selected by TMCNTSRC (USCI_BRGEN [5]) when each interrupt flags are clear. The time-out is enable when TOCNT bigger than 0. Note: The TMCNTSRC (USCI_BRGEN [5]) must be set zero on I ² C mode.
[15:10]	Reserved	Reserved.
[9]	MONEN	Monitor Mode Enable Bit This bit enables monitor mode. In monitor mode the SDA output will be put in high impedance mode. This prevents the I ² C module from outputting data of any kind (including ACK) onto the I ² C data bus. 0 = The monitor mode Disabled. 1 = The monitor mode Enabled. Note: Depending on the state of the SCLOUTEN bit, the SCL output may be also forced high, preventing the module from having control over the I ² C clock line.
[8]	SCLOUTEN	SCL Output Enable Bit This bit enables monitor pulling SCL to low. This monitor will pull SCL to low until it has had time to respond to an I ² C interrupt. 0 = SCL output will be forced high due to open drain mechanism. 1 = I ² C module may act as a slave peripheral just like in normal operation, the I ² C holds the clock line low until it has had time to clear I ² C interrupt.
[7:6]	Reserved	Reserved.

[5]	PTRG	I²C Protocol Trigger (Write Only) When a new state is present in the USCI_PROTSTS register, if the related interrupt enable bits are set, the I ² C interrupt is requested. It must write one by software to this bit after the related interrupt flags are set to 1 and the I ² C protocol function will go ahead until the STOP is active or the PROTEN is disabled. 0 = I ² C's stretch disabled and the I ² C protocol function will go ahead. 1 = I ² C's stretch active.
[4]	ADDR10EN	Address 10-bit Function Enable Bit 0 = Address match 10 bit function Disabled. 1 = Address match 10 bit function Enabled.
[3]	STA	I²C START Control Setting STA to logic 1 to enter Master mode, the I ² C hardware sends a START or repeat START condition to bus when the bus is free.
[2]	STO	I²C STOP Control In Master mode, setting STO to transmit a STOP condition to bus then I ² C hardware will check the bus condition if a STOP condition is detected this bit will be cleared by hardware automatically. In a slave mode, setting STO resets I ² C hardware to the defined "not addressed" slave mode when bus error (USCI_PROTSTS.ERRIF = 1).
[1]	AA	Assert Acknowledge Control When AA =1 prior to address or data received, an acknowledged (low level to SDA) will be returned during the acknowledge clock pulse on the SCL line when 1.) A slave is acknowledging the address sent from master, 2.) The receiver devices are acknowledging the data sent by transmitter. When AA=0 prior to address or data received, a Not acknowledged (high level to SDA) will be returned during the acknowledge clock pulse on the SCL line.
[0]	GCFUNC	General Call Function 0 = General Call Function Disabled. 1 = General Call Function Enabled. Note: When ADDR10EN (USCI_PROTCTL [4]) is set, don't set this bit.

USCI Protocol Interrupt Enable Register – I²C (USCI_PROTIEN)

Bits	Description	
[31:20]	Reserved	Reserved.
[19]	ERRARBLO	<p>Error Arbitration Lost This bit indicates bus arbitration lost due to bigger noise which is can't be filtered by input processor. The I²C can send start condition when ERRARBLO is set. Thus this bit doesn't be cared on slave mode. 0 = The bus is normal status for transmission. 1 = The bus is error arbitration lost status for transmission. Note: This bit has no interrupt signal, and it will be cleared automatically by hardware when a START condition is present.</p>
[18]	BUSHANG	<p>Bus Hang-up This bit indicates bus hang-up status. There is 4-bit counter count when SCL hold high and refer f_{SAMP_CLK}. The hang-up counter will count to overflow and set this bit when SDA is low. The counter will be reset by falling edge of SCL signal. 0 = The bus is normal status for transmission. 1 = The bus is hang-up status for transmission. Note: This bit has no interrupt signal, and it will be cleared automatically by hardware when a START condition is present.</p>
[17]	WRSTSWK	<p>Read/Write Status Bit in Address Wake-up Frame 0 = Write command be record on the address match wake-up frame. 1 = Read command be record on the address match wake-up frame.</p>
[16]	WKAKDONE	<p>Wake-up Address Frame Acknowledge Bit Done 0 = The ACK bit cycle of address match frame isn't done. 1 = The ACK bit cycle of address match frame is done in power-down. Note: This bit can't release when WKUPIF is set.</p>
[15]	SLAREAD	<p>Slave Read Request Status This bit indicates that a slave read request has been detected. 0 = A slave R/W bit is 1 has not been detected. 1 = A slave R/W bit is 1 has been detected.</p>

		Note: This bit has no interrupt signal, and it will be cleared automatically by hardware.
[14]	SLASEL	<p>Slave Select Status This bit indicates that this device has been selected as slave. 0 = The device is not selected as slave. 1 = The device is selected as slave.</p> <p>Note: This bit has no interrupt signal, and it will be cleared automatically by hardware.</p>
[13]	ACKIF	<p>Acknowledge Received Interrupt Flag This bit indicates that an acknowledge has been received in master mode. A protocol interrupt can be generated if USCI_PROTCTL.ACKIEN = 1. 0 = An acknowledge has not been received. 1 = An acknowledge has been received.</p> <p>Note: It is cleared by software writing 1 into this bit</p>
[12]	ERRIF	<p>Error Interrupt Flag This bit indicates that a Bus Error occurs when a START or STOP condition is present at an illegal position in the formation frame. Example of illegal position are during the serial transfer of an address byte, a data byte or an acknowledge bit. A protocol interrupt can be generated if USCI_PROTCTL.ERRIEN = 1. 0 = An I²C error has not been detected. 1 = An I²C error has been detected.</p> <p>Note1: It is cleared by software writing 1 into this bit Note2: This bit is set for slave mode, and user must write 1 into STO register to the defined "not addressed" slave mode.</p>
[11]	ARBLOIF	<p>Arbitration Lost Interrupt Flag This bit indicates that an arbitration has been lost. A protocol interrupt can be generated if USCI_PROTCTL.ARBLIOEN = 1. 0 = An arbitration has not been lost. 1 = An arbitration has been lost.</p> <p>Note: It is cleared by software writing 1 into this bit</p>
[10]	NACKIF	<p>Non - Acknowledge Received Interrupt Flag This bit indicates that a non - acknowledge has been received in master mode. A protocol interrupt can be generated if USCI_PROTCTL.NACKIEN = 1. 0 = A non - acknowledge has not been received. 1 = A non - acknowledge has been received.</p> <p>Note: It is cleared by software writing 1 into this bit</p>
[9]	STORIF	<p>Stop Condition Received Interrupt Flag This bit indicates that a stop condition has been detected on the I²C bus lines. A protocol interrupt can be generated if USCI_PROTCTL.STORIEN = 1. 0 = A stop condition has not yet been detected. 1 = A stop condition has been detected.</p> <p>Note1: It is cleared by software writing 1 into this bit</p>
[8]	STARIF	<p>Start Condition Received Interrupt Flag This bit indicates that a start condition or repeated start condition has been detected on master mode. However, this bit also indicates that a repeated start condition has been detected on slave mode.</p> <p>A protocol interrupt can be generated if USCI_PROTCTL.STARIEN = 1. 0 = A start condition has not yet been detected. 1 = A start condition has been detected.</p> <p>Note: It is cleared by software writing 1 into this bit</p>
[7]	Reserved	Reserved.

[6]	ONBUSY	On Bus Busy Indicates that a communication is in progress on the bus. It is set by hardware when a START condition is detected. It is cleared by hardware when a STOP condition is detected 0 = The bus is IDLE (both SCLK and SDA High). 1 = The bus is busy.
[5]	TOIF	Time-out Interrupt Flag 0 = A time-out interrupt status has not occurred. 1 = A time-out interrupt status has occurred. Note: It is cleared by software writing 1 into this bit
[0]	Reserved	Reserved.

6.27 Controller Area Network (CAN)

6.27.1 Overview

The C_CAN consists of the CAN Core, Message RAM, Message Handler, Control Registers and Module Interface. The CAN Core performs communication according to the CAN protocol version 2.0 part A and B. The bit rate can be programmed to values up to 1MBit/s. For the connection to the physical layer, additional transceiver hardware is required.

For communication on a CAN network, individual Message Objects are configured. The Message Objects and Identifier Masks for acceptance filtering of received messages are stored in the Message RAM. All functions concerning the handling of messages are implemented in the Message Handler. These functions include acceptance filtering, the transfer of messages between the CAN Core and the Message RAM, and the handling of transmission requests as well as the generation of the module interrupt.

The register set of the C_CAN can be accessed directly by the software through the module interface. These registers are used to control/configure the CAN Core and the Message Handler and to access the Message RAM.

6.27.2 Features

- Supports CAN protocol version 2.0 part A and B
- Bit rates up to 1 MBit/s
- 32 Message Objects
- Each Message Object has its own identifier mask
- Programmable FIFO mode (concatenation of Message Objects)
- Maskable interrupt
- Disabled Automatic Re-transmission mode for Time Triggered CAN applications
- Programmable loop-back mode for self-test operation
- 16-bit module interfaces to the AMBA APB bus
- Supports wake-up function

6.27.3 Block Diagram

The C_CAN interfaces with the AMBA APB bus. Figure 6.27-1 shows the block diagram of the C_CAN.

- CAN Core
 - CAN Protocol Controller and Rx/Tx Shift Register for serial/parallel conversion of messages.
- Message RAM
 - Stores Message Objects and Identifier Masks
- Registers
 - All registers used to control and to configure the C_CAN.
 - Message Handler
 - State Machine that controls the data transfer between the Rx/Tx Shift Register of the CAN Core and the Message RAM as well as the generation of interrupts as programmed in the Control and Configuration Registers.
- Module Interface

- C_CAN interfaces to the AMBA APB 16-bit bus from CPU.

		PC.3	MFP10

6.27.5 Functional Description

6.27.5.1 Software Initialization

The software initialization is started by setting the Init bit (CAN_CON[0]), either by a software or a hardware reset, or by going to bus-off state.

While the Init bit is set, all messages transfer to and from the CAN bus are stopped and the status of the CAN_TX output pin is recessive (HIGH). The Error Management Logic (EML) counters are unchanged. Setting the Init bit does not change any configuration register.

To initialize the CAN Controller, software has to set up the Bit Timing Register and each Message Object. If a Message Object is not required, the corresponding MsgVal bit (CAN_IFn_ARB2[15]) should be cleared. Otherwise, the entire Message Object has to be initialized.

Access to the Bit Timing Register and to the Baud Rate Prescaler Extension Register for configuring bit timing is enabled when both the Init and CCE (CAN_CON[6]) bits are set.

Resetting the Init bit (by software only) finishes the software initialization. Later, the Bit Stream Processor (BSP) (see Section 6.27.7.15: Configuring the Bit Timing) synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits (= Bus Idle) before it can take part in bus activities and start the message transfer.

The initialization of the Message Objects is independent of Init and can be done on the fly, but the Message Objects should all be configured to particular identifiers or set to not valid before the BSP starts the message transfer.

To change the configuration of a Message Object during normal operation, the software has to start by resetting the corresponding MsgVal bit. When the configuration is completed, MsgVal bit is set again.

6.27.5.2 CAN Message Transfer

Once the C_CAN is initialized and Init bit (CAN_CON[0]) is reset to zero, the C_CAN Core synchronizes itself to the CAN bus and starts the message transfer.

Received messages are stored in their appropriate Message Objects if they pass the Message Handler's acceptance filtering. The whole message including all arbitration bits, DLC (CAN_IFn_MCON[3:0]) and eight data bytes (CAN_IFn_DAT_A1/2; CAN_IFn_DAT_B1/2) are stored in the Message Object. If the Identifier Mask is used, the arbitration bits which are masked to "don't care" may be overwritten in the Message Object.

Software can read or write each message any time through the Interface Registers and the Message Handler guarantees data consistency in case of concurrent accesses.

Messages to be transmitted are updated by the application software. If a permanent Message Object (arbitration and control bits are set during configuration) exists for the message, only the data bytes are updated and the TxRqst bit (CAN_IFn_MCON[8]) with NewDat bit (CAN_IFn_MCON[15]) are set to start the transmission. If several transmit messages are assigned to the same Message Object (when the number of Message Objects is not sufficient), the whole Message Object has to be configured before the transmission of this message is requested.

The transmission of any number of Message Objects may be requested at the same time. Message objects are transmitted subsequently according to their internal priority. Messages may be updated or set to not valid any time, even when their requested transmission is still pending. The old data will be discarded when a message is updated before its pending transmission has started.

Depending on the configuration of the Message Object, the transmission of a message may be requested autonomously by the reception of a remote frame with a matching identifier.

Disabled Automatic Retransmission

In accordance with the CAN Specification (see ISO11898, 6.3.3 Recovery Management), the C_CAN provides means for automatic retransmission of frames that have lost arbitration or have been disturbed by errors during transmission. The frame transmission service will not be confirmed to the user before the transmission is successfully completed. This means that, by default, automatic retransmission is enabled. It can be disabled to enable the C_CAN to work within a Time Triggered CAN (TTCAN, see ISO11898-1) environment.

The Disabled Automatic Retransmission mode is enabled by setting the Disable Automatic Retransmission (DAR bit (CAN_CON[5])) to one. In this operation mode, the programmer has to consider the different behavior of bits TxRqst (CAN_IFn_MCON[8]) and NewDat (CAN_IFn_MCON[15]) of the Message Buffers:

- When a transmission starts, bit TxRqst of the respective Message Buffer is cleared, while bit NewDat remains set.
- When the transmission completed successfully, bit NewDat is cleared.
- When a transmission fails (lost arbitration or error), bit NewDat remains set.
- To restart the transmission, the software should set the bit TxRqst again.

6.27.6 Test Mode

Test Mode is entered by setting the Test bit (CAN_CON[7]). In Test Mode, bits Tx1 (CAN_TEST[6]), Tx0 (CAN_TEST[5]), LBack (CAN_TEST[4]), Silent (CAN_TEST[3]) and Basic (CAN_TEST[2]) are writeable. Bit Rx (CAN_TEST[7]) monitors the state of the CAN_RX pin and therefore is only readable. All Test Register functions are disabled when the Test bit is cleared.

6.27.6.1 Silent Mode

The CAN Core can be set in Silent Mode by programming the Silent bit (CAN_TEST[3]) to one. In Silent Mode, the C_CAN is able to receive valid data frames and valid remote frames, but it sends only recessive bits on the CAN bus and it cannot start a transmission. If the CAN Core is required to send a dominant bit (ACK bit, Error Frames), the bit is rerouted internally so that the CAN Core monitors this dominant bit, although the CAN bus may remain in recessive state. The Silent Mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. Figure 6.27-2 CAN Core in Silent Mode shows the connection of signals CAN_TX and CAN_RX to the

CAN Core in Silent Mode.

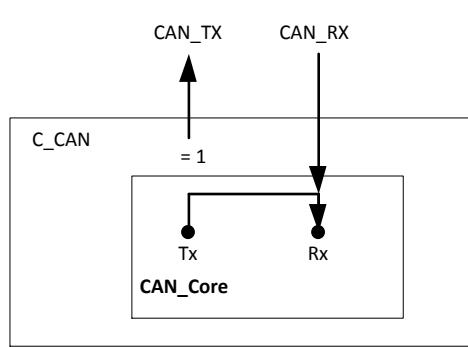

Figure 6.27-2 CAN Core in Silent Mode

6.27.6.2 Loop Back Mode

The CAN Core can be set in Loop Back Mode by programming the Test Register bit LBack (CAN_TEST[4]) to one. In Loop Back Mode, the CAN Core treats its own transmitted messages as received messages and stores them in a Receive Buffer (if they pass acceptance filtering). Figure 6.27-3 shows the connection of signals, CAN_TX and CAN_RX, to the CAN Core in Loop Back Mode.

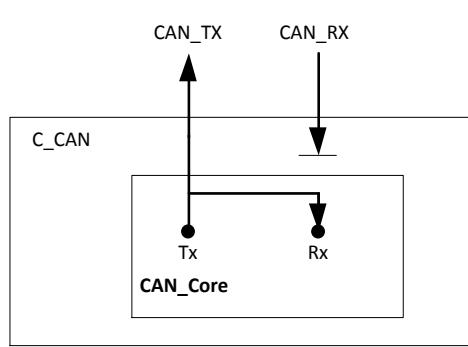

Figure 6.27-3 CAN Core in Loop Back Mode

This mode is provided for self-test functions. To be independent from external stimulation, the CAN Core ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/ remote frame) in Loop Back Mode. In this mode, the CAN Core performs an internal feedback from its Tx output to its Rx input. The actual value of the CAN_RX input pin is disregarded by the CAN Core. The transmitted messages can be monitored on the CAN_TX pin.

6.27.6.3 Loop Back Combined with Silent Mode

It is also possible to combine Loop Back Mode and Silent Mode by programming bits LBack (CAN_TEST[4]) and Silent (CAN_TEST[3]) to one at the same time. This mode can be used for a "Hot Selftest", which means that C_CAN can be tested without affecting a running CAN system connected to the CAN_TX and CAN_RX pins. In this mode, the CAN_RX pin is disconnected from the CAN Core and the CAN_TX pin is held recessive. Figure 6.27-4 shows the connection of signals CAN_TX and CAN_RX to the CAN Core in case of the combination of Loop Back Mode with Silent Mode.

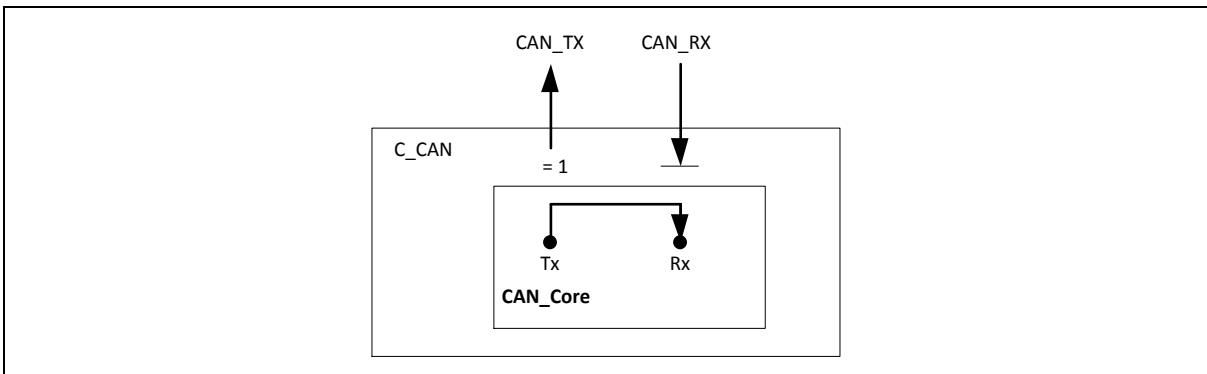

Figure 6.27-4 CAN Core in Loop Back Mode Combined with Silent Mode

6.27.6.4 Basic Mode

The CAN Core can be set in Basic Mode by programming the Basic bit (CAN_TEST[2]) to one. In this mode, the C_CAN runs without the Message RAM.

The IF1 Registers are used as Transmit Buffer. The transmission of the contents of the IF1 Registers is requested by writing the Busy bit (CAN_IFn_CREQ[15]) of the IF1 Command Request Register to one. The IF1 Registers are locked while the Busy bit is set. The Busy bit indicates that the transmission is pending.

As soon the CAN bus is idle, the IF1 Registers are loaded into the shift register of the CAN Core and the transmission is started. When the transmission has been completed, the Busy bit is reset and the locked IF1 Registers are released.

A pending transmission can be aborted at any time by resetting the Busy bit in the IF1 Command Request Register while the IF1 Registers are locked. If the software has reset the Busy bit, a possible retransmission in case of lost arbitration or in case of an error is disabled.

The IF2 Registers are used as a Receive Buffer. After the reception of a message the contents of the shift register is stored into the IF2 Registers, without any acceptance filtering.

Additionally, the actual contents of the shift register can be monitored during the message transfer. Each time a read Message Object is initiated by writing the Busy bit of the IF2 Command Request Register to one, the contents of the shift register are stored into the IF2 Registers.

In Basic Mode, the evaluation of all Message Object related control and status bits and the control bits of the IFn Command Mask Registers are turned off. The message number of the Command request registers is not evaluated. The NewDat (CAN_IFn_MCON[15]) and MsgLst (CAN_IFn_MCON[14]) bits retain their function, DLC3-0 indicates the received DLC (CAN_IFn_MCON[3:0]), and the other control bits are read as '0'.

6.27.6.5 Software Control of CAN_TX Pin

Four output functions are available for the CAN transmit pin, CAN_TX. In addition to its default function (serial data output), the CAN transmit pin can drive the CAN Sample Point signal to monitor CAN_Core's bit timing and it can drive constant dominant or recessive values. The latter two functions, combined with the readable CAN receive pin CAN_RX, can be used to check the physical layer of the CAN bus.

The output mode for the CAN_TX pin is selected by programming the Tx1 (CAN_TEST[6]) and Tx0 (CAN_TEST[5]) bits.

The three test functions of the CAN_TX pin interfere with all CAN protocol functions. CAN_TX must be left in its default function when CAN message transfer or any of the test modes (Loop Back Mode, Silent Mode or Basic Mode) are selected.

6.27.7 CAN Communications

6.27.7.1 Managing Message Objects

The configuration of the Message Objects in the Message RAM (with the exception of the bits MsgVal, NewDat, IntPnd and TxRqst) will not be affected by resetting the chip. All the Message Objects must be initialized by the application software or they must be “not valid” (MsgVal bit = ‘0’) and the bit timing must be configured before the application software clears the Init bit (CAN_CON[0]).

The configuration of a Message Object is done by programming Mask, Arbitration, Control and Data fields of one of the two interface registers to the desired values. By writing to the corresponding IFn Command Request Register, the IFn Message Buffer Registers are loaded into the addressed Message Object in the Message RAM.

When the Init bit is cleared, the CAN Protocol Controller state machine of the CAN_Core and the state machine of the Message Handler control the internal data flow of the C_CAN. Received messages that pass the acceptance filtering are stored into the Message RAM, messages with pending transmission request are loaded into the CAN_Core’s Shift Register and are transmitted through the CAN bus.

The application software reads received messages and updates messages to be transmitted through the IFn Interface Registers. Depending on the configuration, the application software is interrupted on certain CAN message and CAN error events.

6.27.7.2 Message Handler State Machine

The Message Handler controls the data transfer between the Rx/Tx Shift Register of the CAN Core, the Message RAM and the IFn Registers.

The Message Handler FSM controls the following functions:

- Data Transfer from IFn Registers to the Message RAM
- Data Transfer from Message RAM to the IFn Registers
- Data Transfer from Shift Register to the Message RAM
- Data Transfer from Message RAM to Shift Register
- Data Transfer from Shift Register to the Acceptance Filtering unit
- Scanning of Message RAM for a matching Message Object
- Handling of TxRqst flags
- Handling of interrupts.

6.27.7.3 Data Transfer from/to Message RAM

When the application software initiates a data transfer between the IFn Registers and Message RAM, the Message Handler sets the Busy bit (CAN_IFn_CREQ[15]) to ‘1’. After the transfer has completed, the Busy bit is again cleared (see Figure 6.27-5).

The respective Command Mask Register specifies whether a complete Message Object or only parts of it will be transferred. Due to the structure of the Message RAM, it is not possible to write single bits/bytes of one Message Object. It is always necessary to write a complete Message Object into the Message RAM. Therefore, the data transfer from the IFn Registers to the Message RAM requires a read-modify-write cycle. First, those parts of the Message Object that are not to be changed are read from the Message RAM and then the complete contents of the Message Buffer Registers are written into the Message Object.

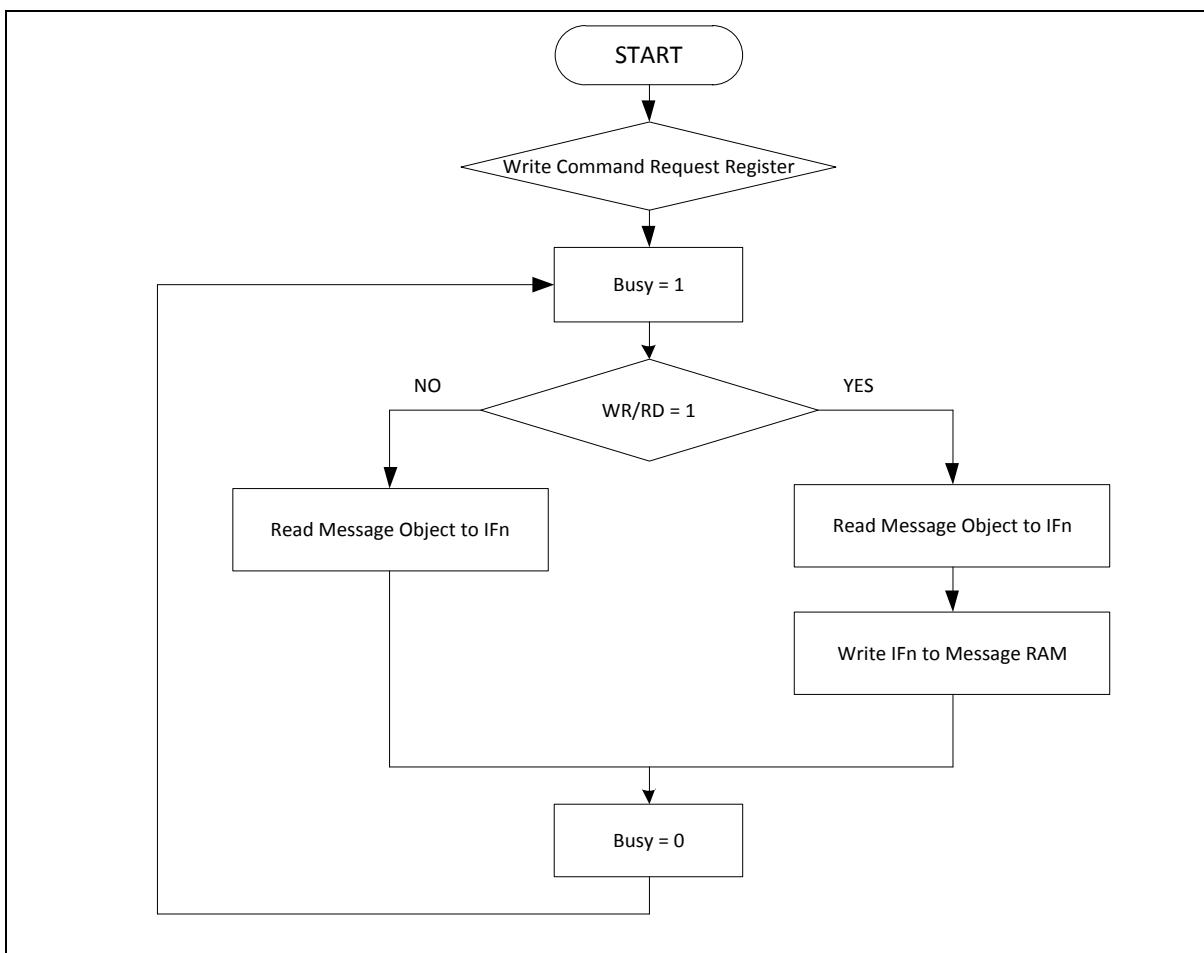

Figure 6.27-5 Data transfer between IFn Registers and Message

After a partial write of a Message Object, the Message Buffer Registers that are not selected in the Command Mask Register will set the actual contents of the selected Message Object.

After a partial read of a Message Object, the Message Buffer Registers that are not selected in the Command Mask Register will be left unchanged.

6.27.7.4 Message Transmission

If the shift register of the CAN Core cell is ready for loading and if there is no data transfer between the IFn Registers and Message RAM, the MsgVal bit (CAN_IFn_ARB2[15]) and TxRqst bits (CAN_TXREQ1/2) are evaluated. The valid Message Object with the highest priority pending transmission request is loaded into the shift register by the Message Handler and the transmission is started. The NewDat (CAN_IFn_MCON[15]) bit of the Message Object is reset.

After a successful transmission and also if no new data was written to the Message Object (NewDat = '0') since the start of the transmission, the TxRqst bit of the Message Control register (CAN_IFn_MCON[8]) will be reset. If TxE bit (CAN_IFn_MCON[11]) is set, IntPnd bit (CAN_IFn_MCON[13]) of the Interrupt Identifier register will be set after a successful transmission. If the C_CAN has lost the arbitration or if an error occurred during the transmission, the message will be retransmitted as soon as the CAN bus is free again. Meanwhile, if the transmission of a message with higher priority has been requested, the messages will be transmitted in the order of their priority.

6.27.7.5 Acceptance Filtering of Received Messages

When the arbitration and control field (Identifier + IDE + RTR + DLC) of an incoming message is completely shifted into the Rx/Tx Shift Register of the CAN Core, the Message Handler FSM starts the

scanning of the Message RAM for a matching valid Message Object.

To scan the Message RAM for a matching Message Object, the Acceptance Filtering unit is loaded with the arbitration bits from the CAN Core shift register. The arbitration and mask fields (including MsgVal (CAN_IFn_ARB2[15]), UMask (CAN_IFn_MCON[12]), NewDat (CAN_IFn_MCON[15]) and EoB (CAN_IFn_MCON[7])) of Message Object 1 are then loaded into the Acceptance Filtering unit and compared with the arbitration field from the shift register. This is repeated with each following Message Object until a matching Message Object is found or until the end of the Message RAM is reached.

If a match occurs, the scan is stopped and the Message Handler FSM proceeds depending on the type of frame (Data Frame or Remote Frame) received.

Reception of Data Frame

The Message Handler FSM stores the message from the CAN Core shift register into the respective Message Object in the Message RAM. Not only the data bytes, but all arbitration bits and the Data Length Code are stored into the corresponding Message Object. This is done to keep the data bytes connected with the identifier even if arbitration mask registers are used.

The NewDat bit (CAN_IFn_MCON[15]) is set to indicate that new data (not yet seen by the software) has been received. The application software should reset NewDat bit when the Message Object has been read. If at the time of reception, the NewDat bit was already set, MsgLst (CAN_IFn_MCON[14]) is set to indicate that the previous data (supposedly not seen by the software) is lost. If the RxIE bit (CAN_IFn_MCON[10]) is set, the IntPnd bit (CAN_IFn_MCON[13]) is set, causing the Interrupt Register to point to this Message Object.

The TxRqst bit (CAN_IFn_MCON[8]) of this Message Object is reset to prevent the transmission of a Remote Frame, while the requested Data Frame has just been received.

Reception of Remote Frame

When a Remote Frame is received, three different configurations of the matching Message Object have to be considered:

1. Dir (CAN_IFn_ARB2[13]) = '1' (direction = transmit), RmtEn (CAN_IFn_MCON[9]) = '1' and UMask (CAN_IFn_MCON[12]) = '1' or '0'
2. At the reception of a matching Remote Frame, the TxRqst bit of this Message Object is set. The rest of the Message Object remains unchanged.
3. Dir = '1' (direction = transmit), RmtEn = '0' and UMask = '0'
4. At the reception of a matching Remote Frame, the TxRqst bit of this Message Object remains unchanged; the Remote Frame is ignored.
5. Dir = '1' (direction = transmit), RmtEn = '0' and UMask = '1'
6. At the reception of a matching Remote Frame, the TxRqst bit of this Message Object is reset. The arbitration and control field (Identifier + IDE + RTR + DLC) from the shift register is stored in the Message Object of the Message RAM and the NewDat bit (CAN_IFn_MCON[15]) of this Message Object is set. The data field of the Message Object remains unchanged; the Remote Frame is treated similar to a received Data Frame.

6.27.7.6 Receive/Transmit Priority

The receive/transmit priority for the Message Objects is attached to the message number. Message Object 1 has the highest priority, while Message Object 32 has the lowest priority. If more than one transmission request is pending, they are serviced due to the priority of the corresponding Message Object.

6.27.7.7 Configuring a Transmit Object

Table 6.27-1 shows how a Transmit Object should be initialized.

Ms	Arb	Data	Mask	EoB	Dir	NewDat	MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
1	appl.	appl.	appl.	1	1	0	0	0	appl.	0	appl.	0

Table 6.27-1 Initialization of a Transmit Object

Note: appl. = application software.

The Arbitration Register values (ID28-0 (CAN_IFn_ARB1/2) and Xtd bit (CAN_IFn_ARB2[14])) are provided by the application. They define the identifier and type of the outgoing message. If an 11-bit Identifier ("Standard Frame") is used, it is programmed to ID28 - ID18. The ID17 - ID0 can then be disregarded.

If the TxIE bit (CAN_IFn_MCON[11]) is set, the IntPnd bit (CAN_IFn_MCON[13]) will be set after a successful transmission of the Message Object.

If the RmtEn bit (CAN_IFn_MCON[9]) is set, a matching received Remote Frame will cause the TxRqst bit (CAN_IFn_MCON[8]) to be set; the Remote Frame will autonomously be answered by a Data Frame.

The Data Register values (DLC3-0 (CAN_IFn_MCON[3:0]), Data(0)-(7)) are provided by the application, TxRqst and RmtEn may not be set before the data is valid.

The Mask Registers (Msk28-0, UMask, MXtd and MDir bits) may be used (UMask (CAN_IFn_MCON[12]) = '1') to allow groups of Remote Frames with similar identifiers to set the TxRqst bit. The Dir bit (CAN_IFn_ARB2[13]) should not be masked.

6.27.7.8 Updating a Transmit Object

The software may update the data bytes of a Transmit Object any time through the IFn Interface registers, neither MsgVal bit (CAN_IFn_ARB2[15]) nor TxRqst (CAN_IFn_MCON[8]) have to be reset before the update.

Even if only a part of the data bytes are to be updated, all four bytes of the corresponding IFn Data A Register or IFn Data B Register have to be valid before the contents of that register are transferred to the Message Object. Either the application software has to write all four bytes into the IFn Data Register or the Message Object is transferred to the IFn Data Register before the software writes the new data bytes.

When only the (eight) data bytes are updated, first 0x0087 is written to the Command Mask Register and then the number of the Message Object is written to the Command Request Register, concurrently updating the data bytes and setting TxRqst.

To prevent the reset of TxRqst at the end of a transmission that may already be in progress while the data is updated, NewDat (CAN_IFn_MCON[15]) has to be set together with TxRqst.

When NewDat is set together with TxRqst, NewDat will be reset as soon as the new transmission has started.

6.27.7.9 Configuring a Receive Object

Table 6.27-2 shows how a Receive Object should be initialized.

MsgVal	Arb	Data	Mask	EoB	Dir	NewDat	MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
1	appl.	appl.	appl.	1	0	0	0	appl.	0	0	0	0

Table 6.27-2 Initialization of a Receive Object

The Arbitration Registers values (ID28-0 (CAN_IFn_ARB1/2) and Xtd bit (CAN_IFn_ARB2[14])) are provided by the application. They define the identifier and type of accepted received messages. If an 11-bit Identifier ("Standard Frame") is used, it is programmed to ID28 - ID18. Then ID17 - ID0 can be disregarded. When a Data Frame with an 11-bit Identifier is received, ID17 - ID0 will be set to '0'.

If the RxIE bit (CAN_IFn_MCON[10]) is set, the IntPnd bit (CAN_IFn_MCON[13]) will be set when a received Data Frame is accepted and stored in the Message Object.

The Data Length Code (DLC3-0 (CAN_IFn_MCON[3:0])) is provided by the application. When the Message Handler stores a Data Frame in the Message Object, it will store the received Data Length Code and eight data bytes. If the Data Length Code is less than 8, the remaining bytes of the Message Object will be overwritten by unspecified values.

The Mask Registers (Msk28-0, UMask, MXtd and MDir bits) may be used (UMask (CAN_IFn_MCON[12]) = '1') to allow groups of Data Frames with similar identifiers to be accepted. The Dir bit (CAN_IFn_ARB2[13]) should not be masked in typical applications.

6.27.7.10 Handling Received Messages

The application software may read a received message any time through the IFn Interface registers. The data consistency is guaranteed by the Message Handler state machine.

Typically, the software will write first 0x007F to the Command Mask Register and then the number of the Message Object to the Command Request Register. This combination will transfer the whole received message from the Message RAM into the Message Buffer Register. Additionally, the bits NewDat (CAN_IFn_MCON[15]) and IntPnd (CAN_IFn_MCON[13]) are cleared in the Message RAM (not in the Message Buffer).

If the Message Object uses masks for acceptance filtering, the arbitration bits show which of the matching messages have been received.

The actual value of NewDat shows whether a new message has been received since the last time this Message Object was read. The actual value of MsgLst (CAN_IFn_MCON[14]) shows whether more than one message has been received since the last time this Message Object was read. MsgLst will not be automatically reset.

By means of a Remote Frame, the software may request another CAN node to provide new data for a receive object. Setting the TxRqst bit (CAN_IFn_MCON[8]) of a receive object will cause the transmission of a Remote Frame with the receive object's identifier. This Remote Frame triggers the other CAN node to start the transmission of the matching Data Frame. If the matching Data Frame is received before the Remote Frame could be transmitted, the TxRqst bit is automatically reset.

6.27.7.11 Configuring a FIFO Buffer

With the exception of the EoB bit (CAN_IFn_MCON[7]), the configuration of Receive Objects belonging to a FIFO Buffer is the same as the configuration of a (single) Receive Object, see Section 6.5.7.9: Configuring a Receive Object.

To concatenate two or more Message Objects into a FIFO Buffer, the identifiers and masks (if used) of these Message Objects have to be programmed to matching values. Due to the implicit priority of the Message Objects, the Message Object with the lowest number will be the first Message Object of the FIFO Buffer. The EoB bit of all Message Objects of a FIFO Buffer except the last have to be programmed to zero. The EoB bit of the last Message Object of a FIFO Buffer is set to one, configuring it as the End of the Block.

6.27.7.12 Receiving Messages with FIFO Buffers

Received messages with identifiers matching to a FIFO Buffer are stored into a Message Object of this FIFO Buffer starting with the Message Object with the lowest message number.

When a message is stored into a Message Object of a FIFO Buffer, the NewDat bit (CAN_IFn_MCON[15]) of this Message Object is set. By setting NewDat while EoB

(CAN_IFn_MCON[7]) is zero, the Message Object is locked for further write access by the Message Handler until the application software has written the NewDat bit back to zero.

Messages are stored into a FIFO Buffer until the last Message Object of this FIFO Buffer is reached. If none of the preceding Message Objects is released by writing NewDat to zero, all further messages for this FIFO Buffer will be written into the last Message Object of the FIFO Buffer and therefore overwrite the previous messages.

6.27.7.13 Reading from a FIFO Buffer

When the application software transfers the contents of a Message Object to the IFn Message Buffer register by writing its number to the IFn Command Request Register, the corresponding Command Mask Register should be programmed in such a way that bits NewDat (CAN_IFn_MCON[15]) and IntPnd (CAN_IFn_MCON[13]) are reset to zero (TxRqst/NewDat (CAN_IFn_CMASK[2]) = '1' and ClrIntPnd (CAN_IFn_CMASK[3]) = '1'). The values of these bits in the Message Control Register always reflect the status before resetting the bits.

To assure the correct function of a FIFO Buffer, the application software should read the Message Objects starting at the FIFO Object with the lowest message number.

Figure 6.27-6 shows how a set of Message Objects which are concatenated to a FIFO Buffer can be handled by the application software.

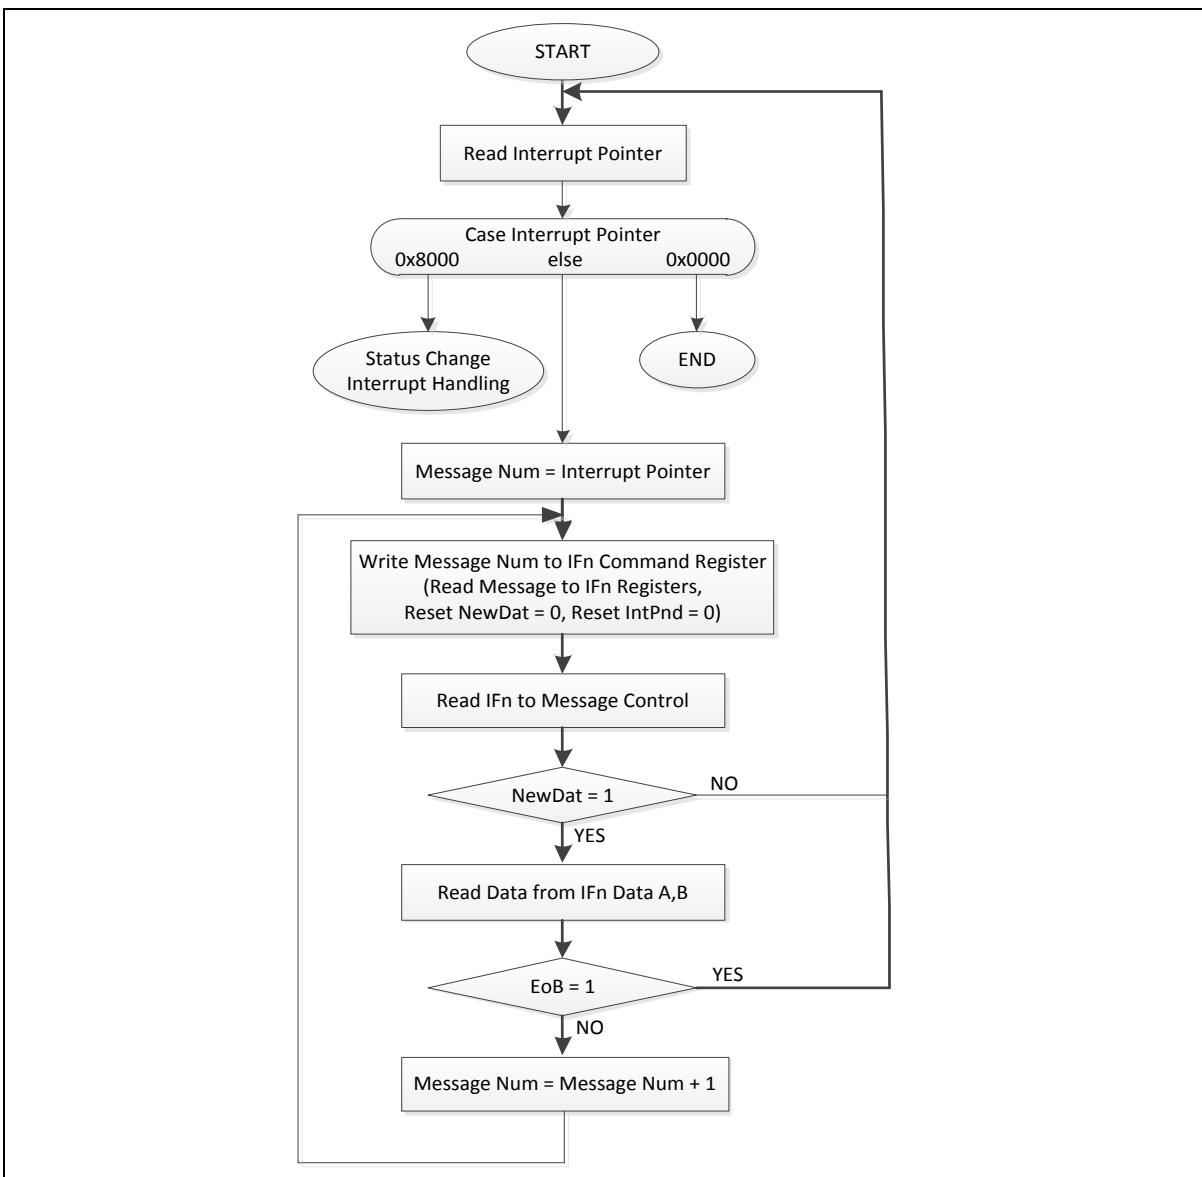

Figure 6.27-6 Application Software Handling of a FIFO Buffer

6.27.7.14 Handling Interrupts

If several interrupts are pending, the CAN Interrupt Register will point to the pending interrupt with the highest priority, disregarding their chronological order. An interrupt remains pending until the application software has cleared it.

The Status Interrupt has the highest priority. Among the message interrupts, interrupt priority of the Message Object decreases with increasing message number.

A message interrupt is cleared by clearing the IntPnd bit (CAN_IFn_MCON[13]) of the Message Object. The Status Interrupt is cleared by reading the Status Register.

The interrupt identifier, IntId, in the Interrupt Register, indicates the cause of the interrupt. When no interrupt is pending, the register will hold the value zero. If the value of the Interrupt Register is different from zero, then there is an interrupt pending and, if IE (CAN_CON[1]) is set, the CAN_INT interrupt signal is active. The interrupt remains active until the Interrupt Register is back to value zero (the cause of the interrupt is reset) or until IE is reset.

The value 0x8000 indicates that an interrupt is pending because the CAN Core has updated (not necessarily changed) the Status Register (Error Interrupt or Status Interrupt). This interrupt has the highest priority. The application software can update (reset) the status bits RxOk (CAN_STATUS[4]), TxOk (CAN_STATUS[3]) and LEC (CAN_STATUS[2:0]), but a write access of the software to the Status Register can never generate or reset an interrupt.

All other values indicate that the source of the interrupt is one of the Message Objects. IntId points to the pending message interrupt with the highest interrupt priority.

The application software controls whether a change of the Status Register may cause an interrupt (bits EIE (CAN_CON[3]) and SIE (CAN_CON[2])) and whether the interrupt line becomes active when the Interrupt Register is different from zero (bit IE in the CAN Control Register). The Interrupt Register will be updated even when IE is reset.

The application software has two possibilities to follow the source of a message interrupt. First, it can follow the IntId in the Interrupt Register and second it can poll the Interrupt Pending Register.

An interrupt service routine that is reading the message that is the source of the interrupt may read the message and reset the Message Object's IntPnd at the same time (bit ClrIntPnd (CAN_IFn_CMASK[3])). When IntPnd is cleared, the Interrupt Register will point to the next Message Object with a pending interrupt.

6.27.7.15 Configuring the Bit Timing

Even if minor errors in the configuration of the CAN bit timing do not result in immediate failure, the performance of a CAN network can be reduced significantly.

In many cases, the CAN bit synchronization will amend a faulty configuration of the CAN bit timing to such a degree that only occasionally an error frame is generated. However, in the case of arbitration, when two or more CAN nodes simultaneously try to transmit a frame, a misplaced sample point may cause one of the transmitters to become error passive.

The analysis of such sporadic errors requires a detailed knowledge of the CAN bit synchronization inside a CAN node and interaction of the CAN nodes on the CAN bus.

6.27.7.16 Bit Time and Bit Rate

CAN supports bit rates in the range of lower than 1 Kbit/s up to 1000 Kbit/s. Each member of the CAN network has its own clock generator, usually a quartz oscillator. The timing parameter of the bit time (i.e. the reciprocal of the bit rate) can be configured individually for each CAN node, creating a common bit rate even though the oscillator periods of the CAN nodes (fosc) may be different.

The frequencies of these oscillators are not absolutely stable, small variations are caused by changes in temperature or voltage and by deteriorating components. As long as the variations remain inside a specific oscillator tolerance range (df), the CAN nodes are able to compensate for the different bit rates by re-synchronizing to the bit stream.

According to the CAN specification, the bit time is divided into four segments (see Figure 6.27-7). The Synchronization Segment, the Propagation Time Segment, the Phase Buffer Segment 1 and the Phase Buffer Segment 2. Each segment consists of a specific, programmable number of time quanta (Table 6.27-3). The length of the time quantum (tq), which is the basic time unit of the bit time, is defined by the CAN controller's APB clock fAPB and the BRP bit (CAN_BTME[5:0]) : tq = BRP / fAPB.

The Synchronization Segment, Sync_Seg, is that part of the bit time where edges of the CAN bus level are expected to occur. The distance between an edge that occurs outside of Sync_Seg, and the Sync_Seg is called the phase error of that edge. The Propagation Time Segment, Prop_Seg, is intended to compensate for the physical delay time within the CAN network. The Phase Buffer Segments Phase_Seg1 and Phase_Seg2 surround the Sample Point. The (Re-)Synchronization Jump Width (SJW) defines how far a re-synchronization may move the Sample Point inside the limits defined by the Phase Buffer Segments to compensate for edge phase errors.

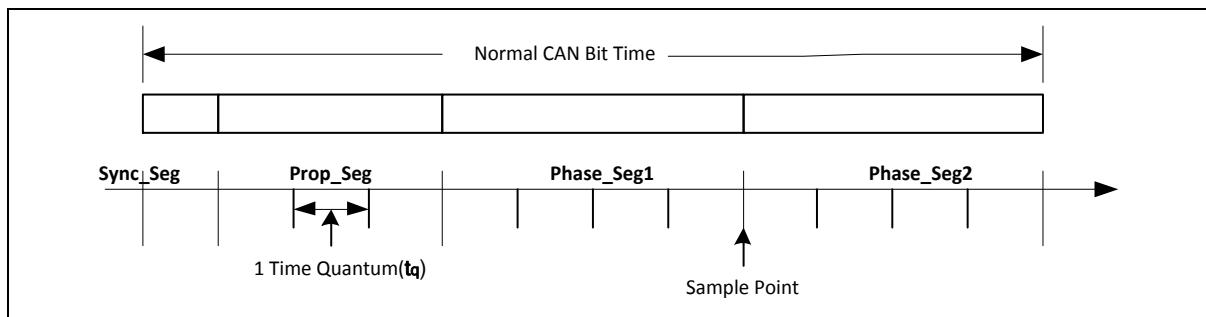

Figure 6.27-7 Bit Timing

Parameter	Range	Remark
BRP	[1..32]	Defines the length of the time quantum t_q
Sync_Seg	$1 t_q$	Fixed length, synchronization of bus input to APB clock
Prop_Seg	[1..8] t_q	Compensates for the physical delay time
Phase_Seg1	[1..8] t_q	Which may be lengthened temporarily by synchronization
Phase_Seg2	[1..8] t_q	Which may be shortened temporarily by synchronization
SJW	[1..4] t_q	Which may not be longer than either Phase Buffer Segment
This table describes the minimum programmable ranges required by the CAN protocol		

Table 6.27-3 CAN Bit Time Parameters

A given bit rate may be met by different bit time configurations, but for the proper function of the CAN network the physical delay time and the oscillator's tolerance range have to be considered.

6.27.7.17 Propagation Time Segment

This part of the bit time is used to compensate physical delay time within the network. These delay time consist of the signal propagation time on the bus and the internal delay time of the CAN nodes.

Any CAN node synchronized to the bit stream on the CAN bus will be out of phase with the transmitter of that bit stream, caused by the signal propagation time between the two nodes. The CAN protocol's non-destructive bitwise arbitration and the dominant acknowledge bit provided by receivers of CAN messages requires that a CAN node transmitting a bit stream must also be able to receive dominant bits transmitted by other CAN nodes that are synchronized to that bit stream. The example in Figure 6.27-8 shows the phase shift and propagation time between two CAN nodes.

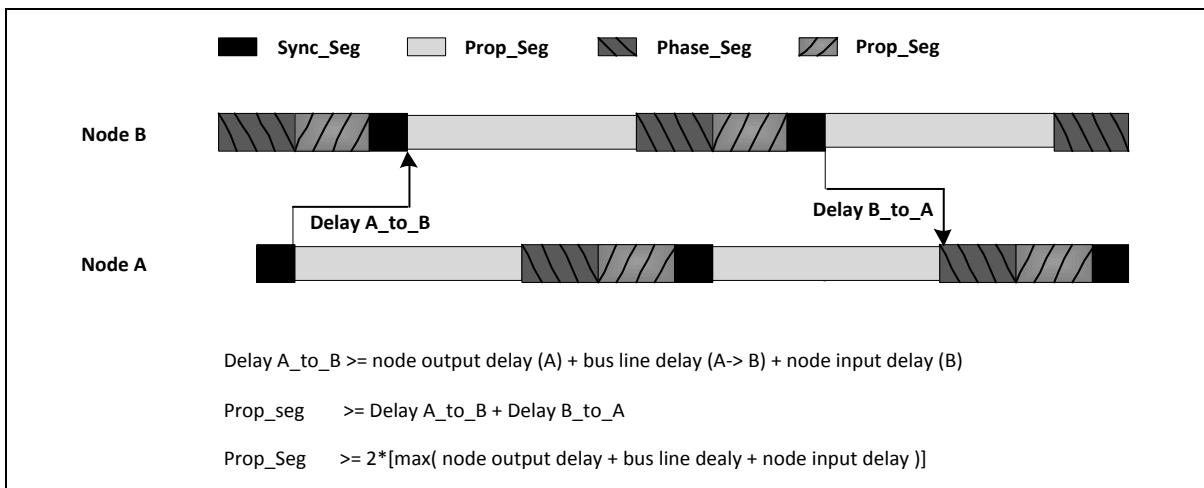

Figure 6.27-8 Propagation Time Segment

In this example, both nodes A and B are transmitters, performing an arbitration for the CAN bus. Node A has sent its Start of Frame bit less than one bit time earlier than node B, therefore node B has synchronized itself to the received edge from recessive to dominant. Since node B has received this edge delay ($A_{to}B$) after it has been transmitted, B's bit timing segments are shifted with respect to A. Node B sends an identifier with higher priority and so it will win the arbitration at a specific identifier bit when it transmits a dominant bit while node A transmits a recessive bit. The dominant bit transmitted by node B will arrive at node A after the delay ($B_{to}A$).

Due to oscillator tolerances, the actual position of node A's Sample Point can be anywhere inside the nominal range of node A's Phase Buffer Segments, so the bit transmitted by node B must arrive at node A before the start of Phase_Seg1. This condition defines the length of Prop_Seg.

If the edge from recessive to dominant transmitted by node B arrives at node A after the start of Phase_Seg1, it can happen that node A samples a recessive bit instead of a dominant bit, resulting in a bit error and the destruction of the current frame by an error flag.

The error occurs only when two nodes arbitrate for the CAN bus that have oscillators of opposite ends of the tolerance range and that are separated by a long bus line. This is an example of a minor error in the bit timing configuration (Prop_Seg is too short) that causes sporadic bus errors.

Some CAN implementations provide an optional 3 Sample Mode but the C_CAN does not. In this mode, the CAN bus input signal passes a digital low-pass filter, using three samples and a majority logic to determine the valid bit value. This results in an additional input delay of 1 tq, requiring a longer Prop_Seg.

6.27.7.18 Phase Buffer Segments and Synchronization

The Phase Buffer Segments (Phase_Seg1 and Phase_Seg2) and the Synchronization Jump Width (SJW) are used to compensate for the oscillator tolerance. The Phase Buffer Segments may be lengthened or shortened by synchronization.

Synchronizations occur on edges from recessive to dominant, their purpose is to control the distance between edges and Sample Points.

Edges are detected by sampling the actual bus level in each time quantum and comparing it with the bus level at the previous Sample Point. A synchronization may be done only if a recessive bit was sampled at the previous Sample Point and if the bus level at the actual time quantum is dominant.

An edge is synchronous if it occurs inside of Sync_Seg, otherwise the distance between edge and the end of Sync_Seg is the edge phase error, measured in time quanta. If the edge occurs before Sync_Seg, the phase error is negative, else it is positive.

Two types of synchronization exist, Hard Synchronization and Re-synchronization.

A Hard Synchronization is done once at the start of a frame and inside a frame only when Re-synchronizations occur.

Hard Synchronization

After a hard synchronization, the bit time is restarted with the end of Sync_Seg, regardless of the edge phase error. Thus hard synchronization forces the edge, which has caused the hard synchronization to lie within the synchronization segment of the restarted bit time.

Bit Re-synchronization

Re-synchronization leads to a shortening or lengthening of the bit time such that the position of the sample point is shifted with regard to the edge.

When the phase error of the edge which causes Re-synchronization is positive, Phase_Seg1 is lengthened. If the magnitude of the phase error is less than SJW, Phase_Seg1 is lengthened by the magnitude of the phase error, else it is lengthened by SJW.

When the phase error of the edge, which causes Re-synchronization is negative, Phase_Seg2 is shortened. If the magnitude of the phase error is less than SJW, Phase_Seg2 is shortened by the magnitude of the phase error, else it is shortened by SJW.

When the magnitude of the phase error of the edge is less than or equal to the programmed value of SJW, the results of Hard Synchronization and Re-synchronization are the same. If the magnitude of the phase error is larger than SJW, the Re-synchronization cannot compensate the phase error completely, an error (phase error - SJW) remains.

Only one synchronization may be done between two Sample Points. The Synchronizations maintain a minimum distance between edges and Sample Points, giving the bus level time to stabilize and filtering out spikes that are shorter than (Prop_Seg + Phase_Seg1).

Apart from noise spikes, most synchronizations are caused by arbitration. All nodes synchronize "hard" on the edge transmitted by the "leading" transceiver that started transmitting first, but due to propagation delay time, they cannot become ideally synchronized. The "leading" transmitter does not necessarily win the arbitration, therefore the receivers have to synchronize themselves to different transmitters that subsequently "take the lead" and that are differently synchronized to the previously "leading" transmitter. The same happens at the acknowledge field, where the transmitter and some of the receivers will have to synchronize to that receiver that "takes the lead" in the transmission of the dominant acknowledge bit.

Synchronizations after the end of the arbitration will be caused by oscillator tolerance, when the differences in the oscillator's clock periods of transmitter and receivers sum up during the time between synchronizations (at most ten bits). These summarized differences may not be longer than the SJW, limiting the oscillator's tolerance range.

The examples in Figure 6.27-9 show how the Phase Buffer Segments are used to compensate for phase errors. There are three drawings of each two consecutive bit timings. The upper drawing shows the synchronization on a "late" edge, the lower drawing shows the synchronization on an "early" edge, and the middle drawing is the reference without synchronization.

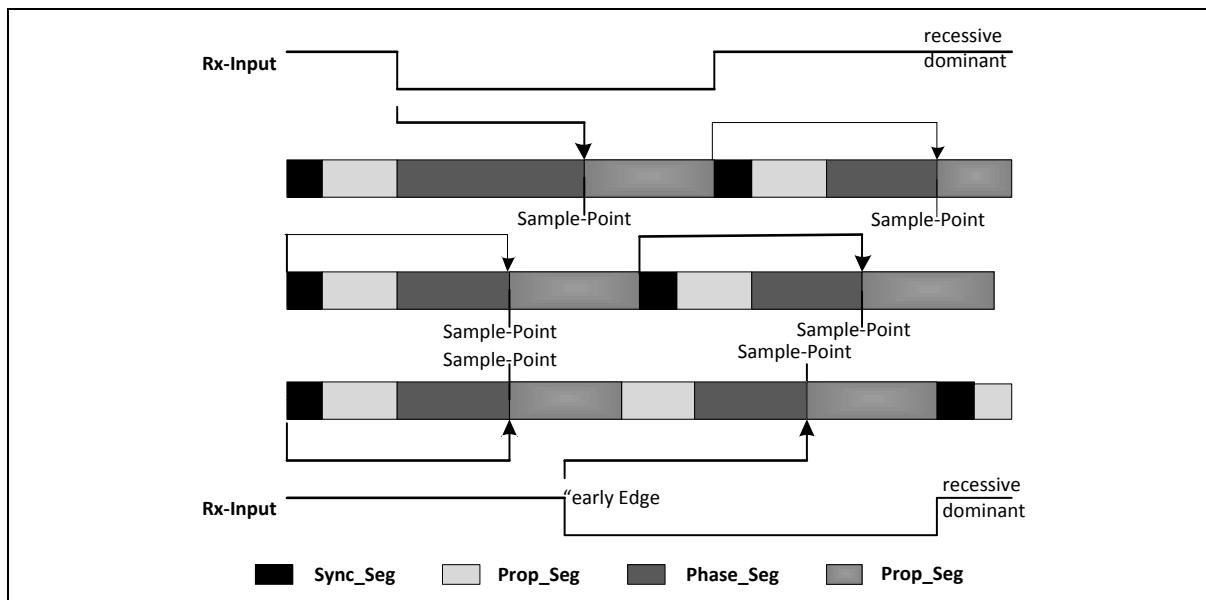

Figure 6.27-9 Synchronization on “late” and “early” Edges

In the first example an edge from recessive to dominant occurs at the end of Prop_Seg. The edge is “late” since it occurs after the Sync_Seg. Reacting to the “late” edge, Phase_Seg1 is lengthened so that the distance from the edge to the Sample Point is the same as it would have been from the Sync_Seg to the Sample Point if no edge had occurred. The phase error of this “late” edge is less than SJW, so it is fully compensated and the edge from dominant to recessive at the end of the bit, which is one nominal bit time long, occurs in the Sync_Seg.

In the second example an edge from recessive to dominant occurs during Phase_Seg2. The edge is “early” since it occurs before a Sync_Seg. Reacting to the “early” edge, Phase_Seg2 is shortened and Sync_Seg is omitted, so that the distance from the edge to the Sample Point is the same as it would have been from an Sync_Seg to the Sample Point if no edge had occurred. As in the previous example, the magnitude of this “early” edge’s phase error is less than SJW, so it is fully compensated.

The Phase Buffer Segments are lengthened or shortened temporarily only; at the next bit time, the segments return to their nominal programmed values.

In these examples, the bit timing is seen from the point of view of the CAN implementation’s state machine, where the bit time starts and ends at the Sample Points. The state machine omits Sync_Seg when synchronising on an “early” edge because it cannot subsequently redefine that time quantum of Phase_Seg2 where the edge occurs to be the Sync_Seg.

The examples in Figure 6.27-11 show how short dominant noise spikes are filtered by synchronisations. In both examples the spike starts at the end of Prop_Seg and has the length of (Prop_Seg + Phase_Seg1).

In the first example, the Synchronization Jump Width is greater than or equal to the phase error of the spike’s edge from recessive to dominant. Therefore the Sample Point is shifted after the end of the spike; a recessive bus level is sampled.

In the second example, SJW is shorter than the phase error, so the Sample Point cannot be shifted far enough; the dominant spike is sampled as actual bus level.

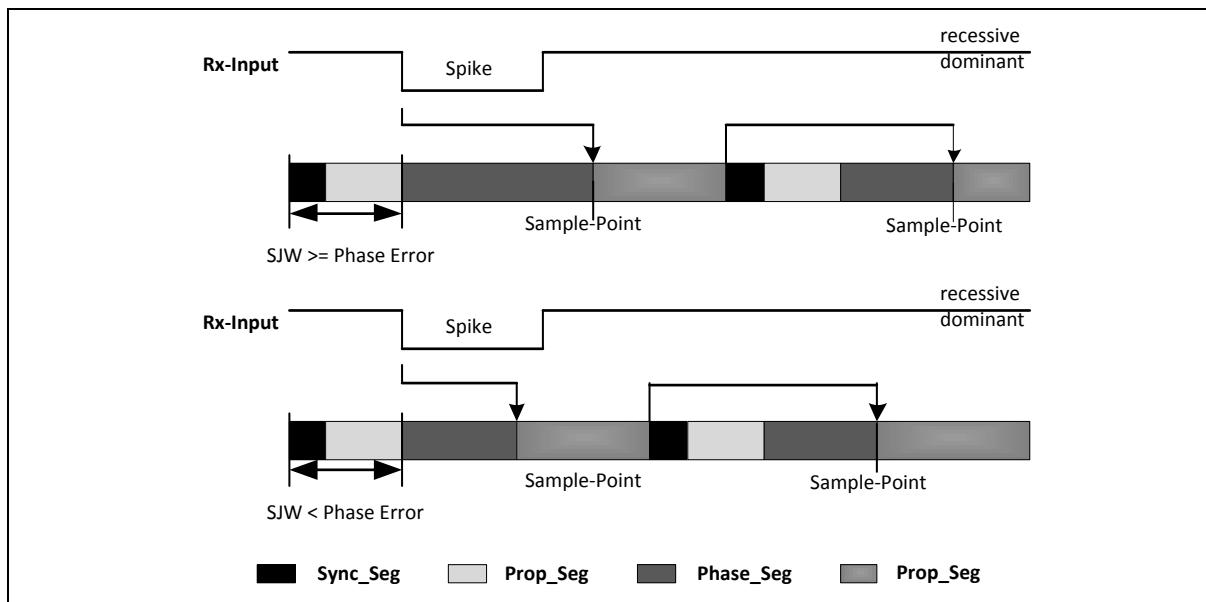

Figure 6.27-10 Filtering of Short Dominant Spikes

6.27.7.19 Oscillator Tolerance Range

The oscillator tolerance range was increased when the CAN protocol was developed from version 1.1 to version 1.2 (version 1.0 was never implemented in silicon). The option to synchronize on edges from dominant to recessive became obsolete, only edges from recessive to dominant are considered for synchronization. The protocol update to version 2.0 (A and B) had no influence on the oscillator tolerance.

The tolerance range df for an oscillator frequency f_{osc} around the nominal frequency f_{nom} is:

$$(1 - df) \cdot f_{nom} \leq f_{osc} \leq (1 + df) \cdot f_{nom}$$

It depends on the proportions of Phase_Seg1, Phase_Seg2, SJW and the bit time. The maximum tolerance df is defined by two conditions (both shall be met):

$$I: df \leq \frac{\min(\text{Phase_Seg1}, \text{Phase_Seg2})}{2 * (13 * \text{bit_time} - \text{Phase_Seg2})}$$

$$II: df \leq \frac{\text{SJW}}{20 * \text{bit_time}}$$

Note: These conditions base on the APB clock = f_{osc} .

It has to be considered that SJW may not be larger than the smaller of the Phase Buffer Segments and that the Propagation Time Segment limits that part of the bit time that may be used for the Phase Buffer Segments.

The combination Prop_Seg = 1 and Phase_Seg1 = Phase_Seg2 = SJW = 4 allows the largest possible oscillator tolerance of 1.58%. This combination with a Propagation Time Segment of only 10% of the bit time is not suitable for short bit times; it can be used for bit rates of up to 125 Kbit/s (bit time = 8us) with a bus length of 40 m.

6.27.7.20 Configuring the CAN Protocol Controller

In most CAN implementations and also in the C_CAN, the bit timing configuration is programmed in two register bytes. The sum of Prop_Seg and Phase_Seg1 (as TSEG1 (CAN_BTIME[11:8])) is combined with Phase_Seg2 (as TSEG2 (CAN_BTIME[14:12])) in one byte, SJW (CAN_BTIME[7:6]) and BRP (CAN_BTIME[5:0]) are combined in the other byte.

In these bit timing registers, the four components TSEG1, TSEG2, SJW and BRP have to be

programmed to a numerical value that is one less than its functional value. Therefore, instead of values in the range of [1..n], values in the range of [0..n-1] are programmed. That way, e.g. SJW (functional range of [1..4]) is represented by only two bits.

Therefore the length of the bit time is (programmed values) $[TSEG1 + TSEG2 + 3] tq$ or (functional values) $[Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq$.

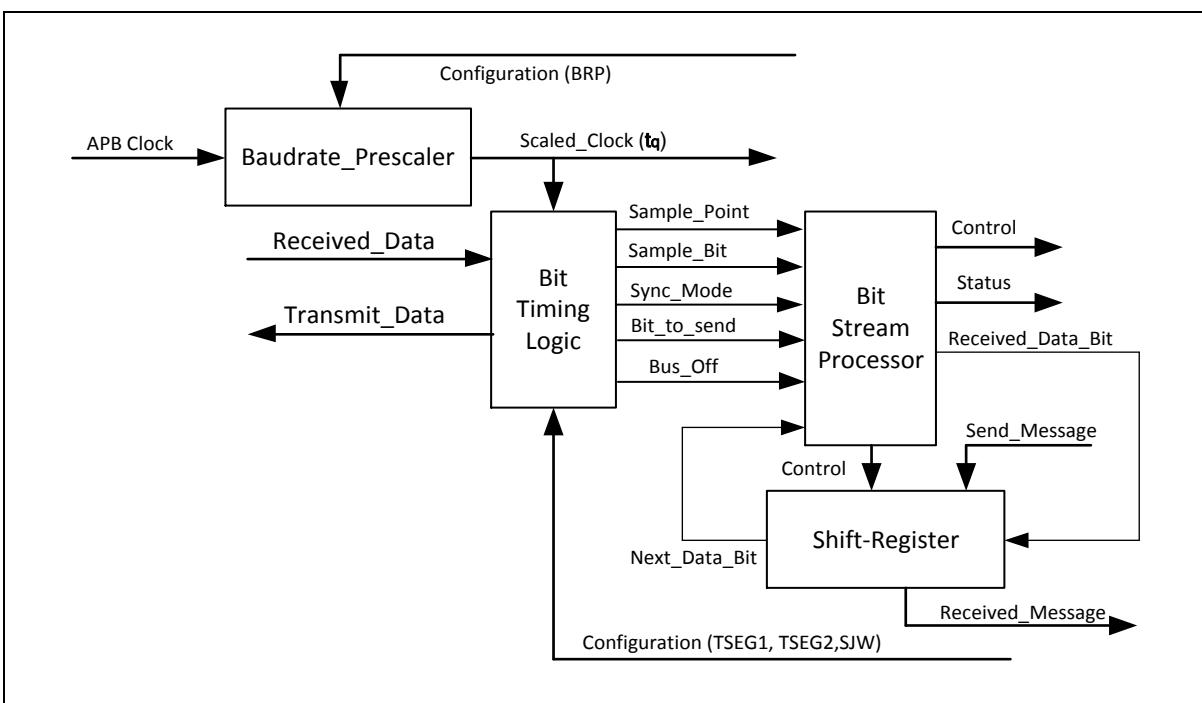

Figure 6.27-11 Structure of the CAN Core's CAN Protocol Controller

The data in the bit timing registers is the configuration input of the CAN protocol controller. The Baud Rate Prescaler (configured by BRP) defines the length of the time quantum, the basic time unit of the bit time; the Bit Timing Logic (configured by TSEG1, TSEG2 and SJW) defines the number of time quanta in the bit time.

The processing of the bit time, the calculation of the position of the Sample Point, and occasional synchronizations are controlled by the BTL (Bit Timing Logic) state machine, which is evaluated once each time quantum. The rest of the CAN protocol controller, the BSP (Bit Stream Processor) state machine is evaluated once each bit time, at the Sample Point.

The Shift Register sends the messages serially and parallelizes received messages. Its loading and shifting is controlled by the BSP.

The BSP translates messages into frames and vice versa. It generates and discards the enclosing fixed format bits, inserts and extracts stuff bits, calculates and checks the CRC code, performs the error management, and decides which type of synchronization is to be used. It is evaluated at the Sample Point and processes the sampled bus input bit. The time that is needed to calculate the next bit to be sent after the Sample point (e.g. data bit, CRC (Cyclic Redundancy Check) bit, stuff bit, error flag or idle) is called the Information Processing Time (IPT).

The IPT is application specific but may not be longer than 2 tq ; the IPT for the C_CAN is 0 tq . Its length is the lower limit of the programmed length of Phase_Seg2. In case of a synchronization, Phase_Seg2 may be shortened to a value less than IPT, which does not affect bus timing.

6.27.7.21 Calculating Bit Timing Parameters

Usually, the calculation of the bit timing configuration starts with a desired bit rate or bit time. The resulting bit time (1/bit rate) must be an integer multiple of the APB clock period.

The bit time may consist of 4 to 25 time quanta, the length of the time quantum tq is defined by the Baud Rate Prescaler with $t_q = (\text{Baud Rate Prescaler})/\text{fapb_clk}$. Several combinations may lead to the desired bit time, allowing iterations of the following steps.

First part of the bit time to be defined is the Prop_Seg. Its length depends on the delay time measured in the APB clock. A maximum bus length as well as a maximum node delay has to be defined for expandible CAN bus systems. The resulting time for Prop_Seg is converted into time quanta (rounded up to the nearest integer multiple of tq).

The Sync_Seg is 1 tq long (fixed), leaving (bit time – Prop_Seg – 1) tq for the two Phase Buffer Segments. If the number of remaining tq is even, the Phase Buffer Segments have the same length, Phase_Seg2 = Phase_Seg1, else Phase_Seg2 = Phase_Seg1 + 1.

The minimum nominal length of Phase_Seg2 has to be regarded as well. Phase_Seg2 may not be shorter than the IPT of the CAN controller, which, depending on the actual implementation, is in the range of [0..2] tq.

The length of the Synchronization Jump Width is set to its maximum value, which is the minimum of 4 and Phase_Seg1.

The oscillator tolerance range necessary for the resulting configuration is calculated by the formulas given in Section “Oscillator Tolerance Range”.

If more than one configuration is possible, that configuration allowing the highest oscillator tolerance range should be chosen.

CAN nodes with different system clocks require different configurations to come to the same bit rate. The calculation of the propagation time in the CAN network, based on the nodes with the longest delay time, is done once for the whole network.

The oscillator tolerance range of the CAN systems is limited by that node with the lowest tolerance range.

The calculation may shows that bus length or bit rate have to be decreased or that the stability of the oscillator frequency has to be increased in order to find a protocol compliant configuration of the CAN bit timing. The resulting configuration is written into the Bit Timing Register: (Phase_Seg2-1) & (Phase_Seg1+Prop_Seg-1) & (SynchronisationJumpWidth-1) & (Prescaler-1)

Example for Bit Timing at High Baud Rate

In this example, the frequency of APB_CLK is 10 MHz, BRP (CAN_BTIME[5:0]) is 0, and the bit rate is 1 MBit/s.

t_q	100 ns	$= t_{\text{APB_CLK}}$
delay of bus driver	50ns	
delay of receiver circuit	30ns	
delay of bus line (40m)	220ns	
t_{Prop}	600ns	$= 6 \cdot t_q$
t_{SJW}	100ns	$= 1 \cdot t_q$
t_{TSeg1}	700ns	$= t_{\text{Prop}} + t_{\text{SJW}}$
t_{TSeg2}	200ns	$= \text{Information Processing Time} + 1 \cdot t_q$
$t_{\text{Sync-Seg}}$	100ns	$= 1 \cdot t_q$
bit time	1000ns	$= t_{\text{Sync-Seg}} + t_{\text{TSeg1}} + t_{\text{TSeg2}}$
tolerance for APB_CLK	0.39%	$= \frac{\text{Min}(PB1, PB2)}{2 \times 13 \times (\text{bit time} - PB2)}$

$$= \frac{0.1\mu s}{2 \times 13 \times (1\mu s - 0.2\mu s)}$$

In this example, the concatenated bit time parameters are (2-1)₃ & (7-1)₄ & (1-1)₂ & (1-1)₆, and the Bit Timing Register is programmed to 0x1600.

Note:

PB1/2: indicate the phase buffer segment 1/2

The subscript of (2-1)₃ indicates the number of bits in the corresponding bit of Bit Timing Register.

6.27.7.22 CAN Interface Reset State

After the hardware reset, the C_CAN registers hold the reset values which are given in the register description in 0.

Additionally the bus-off state is reset and the output CAN_TX is set to recessive (HIGH). The value 0x0001 (Init = '1') in the CAN Control Register enables the software initialization. The C_CAN does not influence the CAN bus until the application software resets the Init bit (CAN_CON[0]) to '0'.

The data stored in the Message RAM is not affected by a hardware reset. After powered on, the contents of the Message RAM are undefined.

Example for Bit Timing at Low Baud Rate

In this example, the frequency of APB_CLK is 2 MHz, BRP (CAN_BTIME[5:0]) is 1, and the bit rate is 100 Kbit/s.

t_q	1	$\mu s = 2 \cdot t_{APB_CLK}$
delay of bus driver	200ns	
delay of receiver circuit	80ns	
delay of bus line (40m)	220ns	
t_{Prop}	1 $\mu s = 1 \cdot t_q$	
t_{SJW}	4 $\mu s = 4 \cdot t_q$	
t_{TSeg1}	5 $\mu s = t_{Prop} + t_{SJW}$	
t_{TSeg2}	4 $\mu s =$ Information Processing Time + 3 $\cdot t_q$	
$t_{Sync-Seg}$	1 $\mu s = 1 \cdot t_q$	
bit time	10 $\mu s = t_{Sync-Seg} + t_{TSeg1} + t_{TSeg2}$	
tolerance for APB_CLK	1.58	$\% = \frac{Min(PB1, PB2)}{2 \times 13 \times (bit\ time - PB2)}$
		$= \frac{4\mu s}{2 \times (13 \times (10\mu s - 4\mu s))}$

In this example, the concatenated bit time parameters are (4-1)₃ & (5-1)₄ & (4-1)₂ & (2-1)₆, and the Bit Timing Register is programmed to 0x34C1.

6.27.8 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

Table 6.27-4 CAN Register Map for Each Bit Function

Note: Reserved bits are read as '0' except for IFn Mask 2 Register where they are read as '1'.

Res. = Reserved

6.27.9 Register Description

The C_CAN allocates an address space of 256 bytes. The registers are organized as 16-bit registers.

The two sets of interface registers (IF1 and IF2) control the software access to the Message RAM. They buffer the data to be transferred to and from the RAM, avoiding conflicts between software accesses and message reception/transmission.

CAN Control Register (CAN_CON)

Register	Offset	R/W	Description					Reset Value
CAN_CON	CAN_BA+0x00	R/W	Control Register					0x0000_0001

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Test	CCE	DAR	Reserved	EIE	SIE	IE	Init

Bits	Description
[31:8]	Reserved Reserved.
[7]	Test Test Mode Enable Bit 0 = Normal Operation. 1 = Test Mode.
[6]	CCE Configuration Change Enable Bit 0 = No write access to the Bit Timing Register. 1 = Write access to the Bit Timing Register (CAN_BTIME) allowed. (while Init bit (CAN_CON[0]) = 1).
[5]	DAR Automatic Re-transmission Disable Bit 0 = Automatic Retransmission of disturbed messages Enabled. 1 = Automatic Retransmission Disabled.
[4]	Reserved Reserved.
[3]	EIE Error Interrupt Enable Bit 0 = Disabled - No Error Status Interrupt will be generated. 1 = Enabled - A change in the bits BOff (CAN_STATUS[7]) or EWarn (CAN_STATUS[6]) in the Status Register will generate an interrupt.
[2]	SIE Status Change Interrupt Enable Bit 0 = Disabled - No Status Change Interrupt will be generated. 1 = Enabled - An interrupt will be generated when a message transfer is successfully completed or a CAN bus error is detected.
[1]	IE Module Interrupt Enable Bit 0 = Function interrupt Disabled. 1 = Function interrupt Enabled.
[0]	Init Init Initialization 0 = Normal Operation. 1 = Initialization is started.

Note: The bus-off recovery sequence (see CAN Specification Rev. 2.0) cannot be shortened by

setting or resetting the Init bit (CAN_CON[0]). If the device goes in the bus-off state, it will set Init of its own accord, stopping all bus activities. Once Init has been cleared by the CPU, the device will then wait for 129 occurrences of Bus Idle (129 * 11 consecutive recessive bits) before resuming normal operations. At the end of the bus-off recovery sequence, the Error Management Counters will be reset.

During the waiting time after resetting Init, each time a sequence of 11 recessive bits has been monitored, a Bit0Error code is written to the Status Register, enabling the CPU to readily check up whether the CAN bus is stuck at dominant or continuously disturbed and to monitor the proceeding of the bus-off recovery sequence.

CAN Status Register (CAN_STATUS)

Register	Offset	R/W	Description				Reset Value
CAN_STATUS	CAN_BA+0x04	R/W	Status Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
BOff	EWarn	EPass	RxOK	TxOK	LEC		

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	BOff	Bus-off Status (Read Only) 0 = The CAN module is not in bus-off state. 1 = The CAN module is in bus-off state.
[6]	EWarn	Error Warning Status (Read Only) 0 = Both error counters are below the error warning limit of 96. 1 = At least one of the error counters in the EML has reached the error warning limit of 96.
[5]	EPass	Error Passive (Read Only) 0 = The CAN Core is error active. 1 = The CAN Core is in the error passive state as defined in the CAN Specification.
[4]	RxOK	Received a Message Successfully 0 = No message has been successfully received since this bit was last reset by the CPU. This bit is never reset by the CAN Core. 1 = A message has been successfully received since this bit was last reset by the CPU (independent of the result of acceptance filtering).
[3]	TxOK	Transmitted a Message Successfully 0 = Since this bit was reset by the CPU, no message has been successfully transmitted. This bit is never reset by the CAN Core. 1 = Since this bit was last reset by the CPU, a message has been successfully (error free and acknowledged by at least one other node) transmitted.
[2:0]	LEC	Last Error Code (Type of the Last Error to Occur on the CAN Bus) The LEC field holds a code, which indicates the type of the last error to occur on the CAN bus. This field will be cleared to '0' when a message has been transferred (reception or transmission) without error. The unused code '7' may be written by the CPU to check for updates. Table 6.27-5 Last Error Code describes the error code.

Error Code	Meanings
------------	----------

0	No Error
1	Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed.
2	Form Error: A fixed format part of a received frame has the wrong format.
3	AckError: The message this CAN Core transmitted was not acknowledged by another node.
4	Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.
5	Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), though the device wanted to send a dominant level (data or identifier bit logical value '0'), but the monitored Bus value was recessive. During bus-off recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceedings of the bus-off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed).
6	CRCError: The CRC check sum was incorrect in the message received, the CRC received for an incoming message does not match with the calculated CRC for the received data.
7	Unused: When the LEC shows the value '7', no CAN bus event was detected since the CPU wrote this value to the LEC.

Table 6.27-5 Last Error Code

Status Interrupts

A Status Interrupt is generated by bits BOff (CAN_STATUS[7]) and EWarn (CAN_STATUS[6]) (Error Interrupt) or by RxOk (CAN_STATUS[4]), TxOk (CAN_STATUS[3]) and LEC (CAN_STATUS[2:0]) (Status Change Interrupt) assumed that the corresponding enable bits in the CAN Control Register are set. A change of bit EPass (CAN_STATUS[5]) or a write to RxOk, TxOk or LEC will never generate a Status Interrupt.

Reading the Status Register will clear the Status Interrupt value (8000h) in the Interrupt Register, if it is pending.

CAN Error Counter Register (CAN_ERR)

Register	Offset	R/W	Description					Reset Value
CAN_ERR	CAN_BA+0x08	R	Error Counter Register					0x0000_0000

31	30	29	28	27	26	25	24

15	14	13	12	11	10	9	8
RP	REC						
7	6	5	4	3	2	1	0
TEC							

Bits	Description	
[31:16]	Reserved	Reserved.
[15]	RP	Receive Error Passive 0 = The Receive Error Counter is below the error passive level. 1 = The Receive Error Counter has reached the error passive level as defined in the CAN Specification.
[14:8]	REC	Receive Error Counter Actual state of the Receive Error Counter. Values between 0 and 127.
[7:0]	TEC	Transmit Error Counter Actual state of the Transmit Error Counter. Values between 0 and 255.

Bit Timing Register (CAN_BTIME)

Register	Offset	R/W	Description					Reset Value
CAN_BTIME	CAN_BA+0x0C	R/W	Bit Timing Register					0x0000_2301

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved	TSeg2			TSeg1			
7	6	5	4	3	2	1	0
SJW		BRP					

Bits	Description	
[31:15]	Reserved	Reserved.
[14:12]	TSeg2	Time Segment After Sample Point 0x0-0x7: Valid values for TSeg2 are [0...7]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
[11:8]	TSeg1	Time Segment Before the Sample Point Minus Sync_Seg 0x01-0x0F: valid values for TSeg1 are [1...15]. The actual interpretation by the hardware of this value is such that one more than the value programmed is used.
[7:6]	SJW	(Re)Synchronization Jump Width 0x0-0x3: Valid programmed values are [0...3]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
[5:0]	BRP	Baud Rate Prescaler 0x01-0x3F: The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Baud Rate Prescaler are [0...63]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

Note: With a module clock APB_CLK of 8 MHz, the reset value of 0x2301 configures the C_CAN for a bit rate of 500 Kbit/s. The registers are only writable if bits CCE (CAN_CON[6]) and Init (CAN_CON[0]) are set.

Interrupt Identify Register (CAN_IIDR)

Register	Offset	R/W	Description				Reset Value
CAN_IIDR	CAN_BA+0x10	R	Interrupt Identifier Register				0x0000_0000

31	30	29	28	27	26	25	24

IntId							
7	6	5	4	3	2	1	0
IntId							

Bits	Description
[15:0]	<p>IntId</p> <p>Interrupt Identifier (Indicates the Source of the Interrupt)</p> <p>If several interrupts are pending, the CAN Interrupt Register will point to the pending interrupt with the highest priority, disregarding their chronological order. An interrupt remains pending until the application software has cleared it. If IntId is different from 0x0000 and IE (CAN_CON[1]) is set, the IRQ interrupt signal to the EIC is active. The interrupt remains active until IntId is back to value 0x0000 (the cause of the interrupt is reset) or until IE is reset.</p> <p>The Status Interrupt has the highest priority. Among the message interrupts, the Message Object's interrupt priority decreases with increasing message number.</p> <p>A message interrupt is cleared by clearing the Message Object's IntPnd bit (CAN_IFn_MCON[13]). The Status Interrupt is cleared by reading the Status Register.</p>

IntId Value	Meanings
0x0000	No Interrupt is Pending
0x0001-0x0020	Number of Message Object which caused the interrupt.
0x0021-0x7FFF	Unused
0x8000	Status Interrupt
0x8001-0xFFFF	Unused

Table 6.27-6 Source of Interrupts

Test Register (CAN_TEST)

Register	Offset	R/W	Description				Reset Value
CAN_TEST	CAN_BA+0x14	R/W	Test Register (Register Map Note 1)				0x0000_0080

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Rx	Tx		LBack	Silent	Basic	Reserved	

Bits	Description
[31:8]	Reserved Reserved.
[7]	Rx Monitors the Actual Value of CAN_RX Pin (Read Only) *(1) 0 = The CAN bus is dominant (CAN_RX = '0'). 1 = The CAN bus is recessive (CAN_RX = '1').
[6:5]	Tx Tx[1:0]: Control of CAN_TX Pin 00 = Reset value, CAN_TX pin is controlled by the CAN Core. 01 = Sample Point can be monitored at CAN_TX pin. 10 = CAN_TX pin drives a dominant ('0') value. 11 = CAN_TX pin drives a recessive ('1') value.
[4]	LBack Loop Back Mode Enable Bit 0 = Loop Back Mode Disabled. 1 = Loop Back Mode Enabled.
[3]	Silent Silent Mode 0 = Normal operation. 1 = The module is in Silent Mode.
[2]	Basic Basic Mode 0 = Basic Mode Disabled. 1= IF1 Registers used as Tx Buffer, IF2 Registers used as Rx Buffer.
[1:0]	Reserved Reserved.

Reset value: 0000 0000 R000 0000 b (R:current value of RX pin)

Note: Write access to the Test Register is enabled by setting the Test bit (CAN_CON[7]). The different test functions may be combined, but Tx[1-0] "00" (CAN_TEST[6:5]) disturbs message transfer.

Baud Rate Prescaler Extension REGISTER (CAN_BRPE)

Register	Offset	R/W	Description					Reset Value
CAN_BRPE	CAN_BA+0x18	R/W	Baud Rate Prescaler Extension Register					0x0000_0000

31	30	29	28	27	26	25	24

15	14	13	12	11	10	9	8	
Reserved								
7	6	5	4	3	2	1	0	
Reserved					BRPE			

Bits	Description	
[31:4]	Reserved	Reserved.
[3:0]	BRPE	BRPE: Baud Rate Prescaler Extension 0x00-0x0F: By programming BRPE, the Baud Rate Prescaler can be extended to values up to 1023. The actual interpretation by the hardware is that one more than the value programmed by BRPE (MSBs) and BTIME (LSBs) is used.

Message Interface Register Sets

There are two sets of Interface Registers, which are used to control the CPU access to the Message RAM. The Interface Registers avoid conflict between the CPU accesses to the Message RAM and CAN message reception and transmission by buffering the data to be transferred. A complete Message Object or parts of the Message Object may be transferred between the Message RAM and the IFn Message Buffer registers in one single transfer.

The function of the two interface register sets is identical except for the Basic test mode. They can be used the way one set of registers is used for data transfer to the Message RAM while the other set of registers is used for the data transfer from the Message RAM, allowing both processes to be interrupted by each other. Table 6.27-7 provides an overview of the two Interface Register sets.

Each set of Interface Registers consists of Message Buffer Registers controlled by their own Command Registers. The Command Mask Register specifies the direction of the data transfer and which parts of a Message Object will be transferred. The Command Request Register is used to select a Message Object in the Message RAM as target or source for the transfer and to start the action specified in the Command Mask Register.

Address	IF1 Register Set	Address	IF2 Register Set
CAN_BA+0x20	IF1 Command Request	CAN_BA+0x80	IF2 Command Request
CAN_BA+0x24	IF1 Command Mask	CAN_BA+0x84	IF2 Command Mask

Table 6.27-7 IF1 and IF2 Message Interface Register

IFn Command Request Register (CAN_IFn_CREQ)

Register	Offset	R/W	Description				Reset Value
CAN_IFn_CREQ	CAN_BA+0x20 + (0x60 *(n-1))	R/W	IFn (Register Map Note 2) Command Request Registers				0x0000_0001

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Busy	Reserved						
7	6	5	4	3	2	1	0
Reserved		Message Number					

Bits	Description	
[31:16]	Reserved	Reserved.
[15]	Busy	Busy Flag 0 = Read/write action has finished. 1 = Writing to the IFn Command Request Register is in progress. This bit can only be read by the software.
[14:6]	Reserved	Reserved.
[5:0]	Message Number	Message Number 0x01-0x20: Valid Message Number, the Message Object in the Message RAM is selected for data transfer. 0x00: Not a valid Message Number, interpreted as 0x20. 0x21-0x3F: Not a valid Message Number, interpreted as 0x01-0x1F.

A message transfer is started as soon as the application software has written the message number to the Command Request Register. With this write operation, the Busy bit (CAN_IFn_CREQ[15]) is automatically set to notify the CPU that a transfer is in progress. After a waiting time of 3 to 6 APB_CLK periods, the transfer between the Interface Register and the Message RAM is completed. The Busy bit is cleared.

Note: When a Message Number that is not valid is written into the Command Request Register, the Message Number will be transformed into a valid value and that Message Object will be transferred.

IFn Command Mask Register (CAN_IFn_CMASK)

The control bits of the IFn Command Mask Register specify the transfer direction and select which of the IFn Message Buffer Registers are source or target of the data transfer.

Register	Offset	R/W	Description				Reset Value
CAN_IFn_CMASK	CAN_BA+0x24 + (0x60 *(n-1))	R/W	IFn Command Mask Registers				0x0000_0000

Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
WR/RD	Mask	Arb	Control	ClrIntPnd	TxRqst/NewDat	DAT_A	DAT_B

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	WR/RD	Write / Read Mode 0 = Read: Transfer data from the Message Object addressed by the Command Request Register into the selected Message Buffer Registers. 1 = Write: Transfer data from the selected Message Buffer Registers to the Message Object addressed by the Command Request Register.
[6]	Mask	Access Mask Bits Write Operation: 0 = Mask bits unchanged. 1 = Transfer Identifier Mask + MDir + MXtd to Message Object. Read Operation: 0 = Mask bits unchanged. 1 = Transfer Identifier Mask + MDir + MXtd to IFn Message Buffer Register.
[5]	Arb	Access Arbitration Bits Write Operation: 0 = Arbitration bits unchanged. 1 = Transfer Identifier + Dir (CAN_IFn_ARB2[13]) + Xtd (CAN_IFn_ARB2[14]) + MsgVal (CAN_IFn_ARB2[15]) to Message Object. Read Operation: 0 = Arbitration bits unchanged. 1 = Transfer Identifier + Dir + Xtd + MsgVal to IFn Message Buffer Register.
[4]	Control	Control Access Control Bits Write Operation: 0 = Control Bits unchanged. 1 = Transfer Control Bits to Message Object.

		Read Operation: 0 = Control Bits unchanged. 1 = Transfer Control Bits to IFn Message Buffer Register.
[3]	ClrIntPnd	Clear Interrupt Pending Bit Write Operation: When writing to a Message Object, this bit is ignored. Read Operation: 0 = IntPnd bit (CAN_IFn_MCON[13]) remains unchanged. 1 = Clear IntPnd bit in the Message Object.
[2]	TxRqst/NewDat	Access Transmission Request Bit When Write Operation 0 = TxRqst bit unchanged. 1 = Set TxRqst bit. Note: If a transmission is requested by programming bit TxRqst/NewDat in the IFn Command Mask Register, bit TxRqst in the IFn Message Control Register will be ignored. Access New Data Bit when Read Operation. 0 = NewDat bit remains unchanged. 1 = Clear NewDat bit in the Message Object. Note: A read access to a Message Object can be combined with the reset of the control bits IntPnd and NewDat. The values of these bits transferred to the IFn Message Control Register always reflect the status before resetting these bits.
[1]	DAT_A	Access Data Bytes [3:0] Write Operation: 0 = Data Bytes [3:0] unchanged. 1 = Transfer Data Bytes [3:0] to Message Object. Read Operation: 0 = Data Bytes [3:0] unchanged. 1 = Transfer Data Bytes [3:0] to IFn Message Buffer Register.
[0]	DAT_B	Access Data Bytes [7:4] Write Operation: 0 = Data Bytes [7:4] unchanged. 1 = Transfer Data Bytes [7:4] to Message Object. Read Operation: 0 = Data Bytes [7:4] unchanged. 1 = Transfer Data Bytes [7:4] to IFn Message Buffer Register.

IFn Mask 1 Register (CAN_IFn_MASK1)

Register	Offset	R/W	Description	Reset Value
CAN_IFn_MASK1	CAN_BA+0x28 + (0x60 *(n-1))	R/W	IFn Mask 1 Registers	0x0000_FFFF

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	Msk	Identifier Mask 15-0 0 = The corresponding bit in the identifier of the message object cannot inhibit the match in the acceptance filtering. 1 = The corresponding identifier bit is used for acceptance filtering.

IFn Mask 2 Register (CAN_IFn_MASK2)

Bits	Description	
[31:16]	Reserved	Reserved.
[15]	MXtd	Mask Extended Identifier 0 = The extended identifier bit (IDE) has no effect on the acceptance filtering. 1 = The extended identifier bit (IDE) is used for acceptance filtering. Note: When 11-bit ("standard") Identifiers are used for a Message Object, the identifiers of received Data Frames are written into bits ID28 to ID18 (CAN_IFn_ARB2[12:2]). For acceptance filtering, only these bits together with mask bits Msk28 to Msk18 (CAN_IFn_MASK2[12:2]) are considered.
[14]	MDir	Mask Message Direction 0 = The message direction bit (Dir (CAN_IFn_ARB2[13])) has no effect on the acceptance filtering. 1 = The message direction bit (Dir) is used for acceptance filtering.
[13]	Reserved	Reserved.
[12:0]	Msk	Identifier Mask 28-16 0 = The corresponding bit in the identifier of the message object cannot inhibit the match in the acceptance filtering. 1 = The corresponding identifier bit is used for acceptance filtering.

IFn Arbitration 1 Register (CAN_IFn_ARB1)

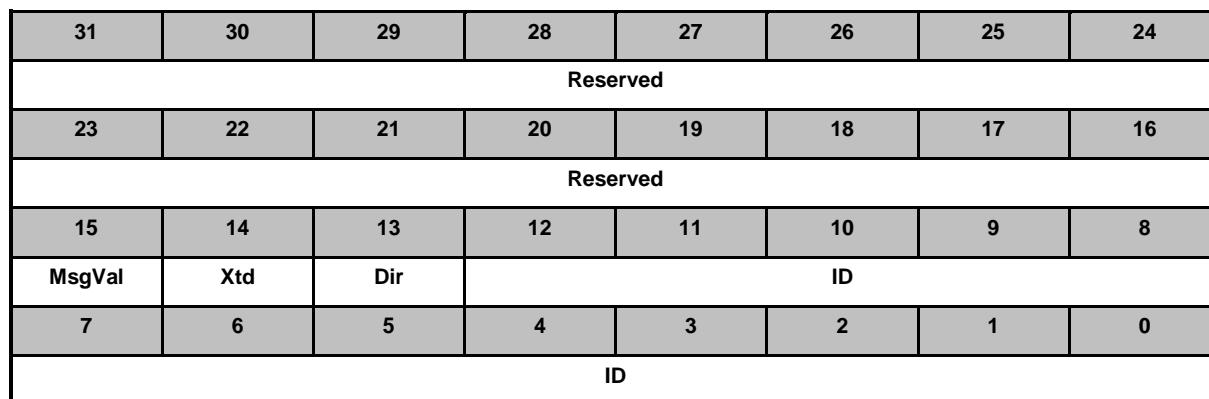

Register	Offset	R/W	Description				Reset Value
CAN_IFn_ARB1	CAN_BA+0x30 + (0x60 *(n-1))	R/W	IFn Arbitration 1 Registers				0x0000_0000

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	ID	Message Identifier 15-0 ID28 - ID0, 29-bit Identifier ("Extended Frame"). ID28 - ID18, 11-bit Identifier ("Standard Frame")

IFn Arbitration 2 Register (CAN_IFn_ARB2)

Register	Offset	R/W	Description				Reset Value
CAN_IFn_ARB2	CAN_BA+0x34 + (0x60 *(n-1))	R/W	IFn Arbitration 2 Registers				0x0000_0000

Bits	Description	
[31:16]	Reserved	Reserved.
[15]	MsgVal	<p>Message Valid 0 = The Message Object is ignored by the Message Handler. 1 = The Message Object is configured and should be considered by the Message Handler.</p> <p>Note: The application software must reset the MsgVal bit of all unused Messages Objects during the initialization before it resets bit Init (CAN_CON[0]). This bit must also be reset before the identifier Id28-0 (CAN_IFn_ARB1/2), the control bits Xtd (CAN_IFn_ARB2[14]), Dir (CAN_IFn_ARB2[13]), or the Data Length Code DLC3-0 (CAN_IFn_MCON[3:0]) are modified, or if the Messages Object is no longer required.</p>
[14]	Xtd	<p>Extended Identifier 0 = The 11-bit (“standard”) Identifier will be used for this Message Object. 1 = The 29-bit (“extended”) Identifier will be used for this Message Object.</p>
[13]	Dir	<p>Message Direction 0 = Direction is receive. On TxRqst, a Remote Frame with the identifier of this Message Object is transmitted. On reception of a Data Frame with matching identifier, that message is stored in this Message Object. 1 = Direction is transmit. On TxRqst, the respective Message Object is transmitted as a Data Frame. On reception of a Remote Frame with matching identifier, the TxRqst bit (CAN_IFn_CMASK[2]) of this Message Object is set (if RmtEn (CAN_IFn_MCON[9]) = one).</p>
[12:0]	ID	<p>Message Identifier 28-16 ID28 - ID0, 29-bit Identifier (“Extended Frame”). ID28 - ID18, 11-bit Identifier (“Standard Frame”)</p>

IFn Message Control Register (CAN_IFn_MCON)

Register	Offset	R/W	Description				Reset Value
CAN_IFn_MCON	CAN_BA+0x38 + (0x60 *(n-1))	R/W	IFn Message Control Registers				0x0000_0000

Bits	Description	
[31:16]	Reserved	Reserved.
[15]	NewDat	<p>New Data 0 = No new data has been written into the data portion of this Message Object by the Message Handler since last time this flag was cleared by the application software. 1 = The Message Handler or the application software has written new data into the data portion of this Message Object.</p>
[14]	MsgLst	<p>Message Lost 0 = No message lost since last time this bit was reset by the CPU. 1 = The Message Handler stored a new message into this object when NewDat was still set, the CPU has lost a message. Note: Only valid for Message Objects with direction = receive.</p>
[13]	IntPnd	<p>Interrupt Pending 0 = This message object is not the source of an interrupt. 1 = This message object is the source of an interrupt. The Interrupt Identifier in the Interrupt Register will point to this message object if there is no other interrupt source with higher priority.</p>
[12]	UMask	<p>Use Acceptance Mask 0 = Mask ignored. 1 = Use Mask (Msk28-0, MXtd, and MDir) for acceptance filtering. Note: If the UMask bit is set to one, the Message Object's mask bits have to be programmed during initialization of the Message Object before MsgVal bit (CAN_IFn_ARB2[15]) is set to one.</p>
[11]	TxE	<p>Transmit Interrupt Enable Bit 0 = IntPnd (CAN_IFn_MCON[13]) will be left unchanged after the successful transmission of a frame. 1 = IntPnd will be set after a successful transmission of a frame.</p>
[10]	RxE	<p>Receive Interrupt Enable Bit 0 = IntPnd (CAN_IFn_MCON[13]) will be left unchanged after a successful reception of a frame.</p>

		1 = IntPnd will be set after a successful reception of a frame.
[9]	RmtEn	<p>Remote Enable Bit</p> <p>0 = At the reception of a Remote Frame, TxRqst (CAN_IFn_MCON[8]) is left unchanged. 1 = At the reception of a Remote Frame, TxRqst is set.</p>
[8]	TxRqst	<p>Transmit Request</p> <p>0 = This Message Object is not waiting for transmission. 1 = The transmission of this Message Object is requested and is not yet done.</p>
[7]	EoB	<p>End of Buffer</p> <p>0 = Message Object belongs to a FIFO Buffer and is not the last Message Object of that FIFO Buffer. 1 = Single Message Object or last Message Object of a FIFO Buffer.</p> <p>Note: This bit is used to concatenate two or more Message Objects (up to 32) to build a FIFO Buffer. For single Message Objects (not belonging to a FIFO Buffer), this bit must always be set to one.</p>
[6:4]	Reserved	Reserved.
[3:0]	DLC	<p>Data Length Code</p> <p>0-8: Data Frame has 0-8 data bytes. 9-15: Data Frame has 8 data bytes</p> <p>Note: The Data Length Code of a Message Object must be defined the same as in all the corresponding objects with the same identifier at other nodes. When the Message Handler stores a data frame, it will write the DLC to the value given by the received message.</p> <p>Data(0): 1st data byte of a CAN Data Frame Data(1): 2nd data byte of a CAN Data Frame Data(2): 3rd data byte of a CAN Data Frame Data(3): 4th data byte of a CAN Data Frame Data(4): 5th data byte of a CAN Data Frame Data(5): 6th data byte of a CAN Data Frame Data(6): 7th data byte of a CAN Data Frame Data(7): 8th data byte of a CAN Data Frame</p> <p>Note: The Data(0) byte is the first data byte shifted into the shift register of the CAN Core during a reception while the Data(7) byte is the last. When the Message Handler stores a Data Frame, it will write all the eight data bytes into a Message Object. If the Data Length Code is less than 8, the remaining bytes of the Message Object will be overwritten by unspecified values.</p>

[15:8]	Data(7)	Data Byte 7 8th data byte of CAN Data Frame.
[7:0]	Data(6)	Data Byte 6 7th data byte of CAN Data Frame.

In a CAN Data Frame, Data [0] is the first, Data [7] is the last byte to be transmitted or received. In CAN's serial bit stream, the MSB of each byte will be transmitted first.

Message Object in the Message Memory

There are 32 Message Objects in the Message RAM. To avoid conflicts between application software access to the Message RAM and CAN message reception and transmission, the CPU cannot directly access the Message Objects, these accesses are handled through the IFn Interface Registers. Table 6.27-8 provides an overview of the structures of a Message Object.

Message Object												
UMask	Msk [28:0]	MXtd	MDir	EoB	NewDat		MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
MsgVal	ID [28:0]	Xtd	Dir	DLC [3:0]	Data(0)	Data(1)	Data(2)	Data(3)	Data(4)	Data(5)	Data(6)	Data(7)

Table 6.27-8 Structure of a Message Object in the Message Memory

The Arbitration Registers ID28-0 (CAN_IFn_ARB1/2), Xtd (CAN_IFn_ARB2[14]) and Dir (CAN_IFn_ARB2[13]) are used to define the identifier and type of outgoing messages and are used (together with the mask registers Msk28-0 (CAN_IFn_MASK1/2), MXtd (CAN_IFn_MASK2[15]) and MDir (CAN_IFn_MASK2[14])) for acceptance filtering of incoming messages. A received message is stored in the valid Message Object with matching identifier and Direction = receive (Data Frame) or Direction = transmit (Remote Frame). Extended frames can be stored only in Message Objects with Xtd = one, standard frames in Message Objects with Xtd = zero. If a received message (Data Frame or Remote Frame) matches with more than one valid Message Object, it is stored into that with the lowest message number.

Message Handler Registers

All Message Handler registers are read only. Their contents (TxRqst (CAN_IFn_MCON[8]), NewDat (CAN_IFn_MCON[15]), IntPnd (CAN_IFn_MCON[13]) and MsgVal (CAN_IFn_ARB2[15]) bits of each Message Object and the Interrupt Identifier) are status information provided by the Message Handler FSM.

Transmission Request Register 1 (CAN_TXREQ1)

These registers hold the TxRqst bits of the 32 Message Objects. By reading the TxRqst bits, the software can check which Message Object in a Transmission Request is pending. The TxRqst bit of a specific Message Object can be set/reset by the application software through the IFn Message Interface Registers or by the Message Handler after reception of a Remote Frame or after a successful transmission.

Register	Offset	R/W	Description					Reset Value
CAN_TXREQ1	CAN_BA+0x100	R	Transmission Request Register 1					0x0000_0000

New Data Register 1 (CAN_NDAT1)

These registers hold the NewDat bits of the 32 Message Objects. By reading out the NewDat bits, the software can check for which Message Object the data portion was updated. The NewDat bit of a specific Message Object can be set/reset by the software through the IFn Message Interface Registers or by the Message Handler after reception of a Data Frame or after a successful transmission.

Register	Offset	R/W	Description					Reset Value
CAN_NDAT1	CAN_BA+0x120	R	New Data Register 1					0x0000_0000

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	NewData16-1	New Data Bits 16-1 (of All Message Objects) 0 = No new data has been written into the data portion of this Message Object by the Message Handler since the last time this flag was cleared by the application software. 1 = The Message Handler or the application software has written new data into the data portion of this Message Object.

New Data Register 2 (CAN_NDAT2)

Interrupt Pending Register 1 (CAN_IPND1)

These registers contain the IntPnd bits of the 32 Message Objects. By reading the IntPnd bits, the software can check for which Message Object an interrupt is pending. The IntPnd bit of a specific Message Object can be set/reset by the application software through the IFn Message Interface Registers or by the Message Handler after reception or after a successful transmission of a frame. This will also affect the value of IntId in the Interrupt Register.

Register	Offset	R/W	Description					Reset Value
CAN_IPND1	CAN_BA+0x140	R	Interrupt Pending Register 1					0x0000_0000

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	IntPnd16-1	Interrupt Pending Bits 16-1 (of All Message Objects) 0 = This message object is not the source of an interrupt. 1 = This message object is the source of an interrupt.

6.28 Secure Digital Host Controller (SDH)

6.28.1 Overview

The Secure Digital Host Controller (SD Host) has DMAC unit and SD unit. The DMAC unit provides a DMA (Direct Memory Access) function for SD to exchange data between system memory and shared buffer (128 bytes), and the SD unit controls the interface of SD/SDHC. The SDHOST controller can support SD/SDHC and cooperated with DMAC to provide a fast data transfer between system memory and cards.

6.28.2 Features

- AMBA AHB master/slave interface compatible, for data transfer and register read/write.
- Supports single DMA channel.
- Supports hardware Scatter-Gather function.
- Using single 128 Bytes shared buffer for data exchange between system memory and cards.
- Synchronous design for DMA with single clock domain, AHB bus clock (HCLK).
- Interface with DMAC for register read/write and data transfer.
- Supports SD/SDHC card.
- Completely asynchronous design for Secure Digital with two clock domains, HCLK and Engine clock, note that frequency of HCLK should be higher than the frequency of peripheral clock.

6.28.3 Block Diagram

The block diagram and Card Pad Assignment of SDHOST Controller is shown as follows.

		PA.6, PE.14	MFP5

Table 6.28-2 SD1 Pin Configuration

6.28.5 Functional Description

The SD host provides an interface for SD/SDHC card access with 1-bit/4-bit data bus width.

The SD controller uses an independent clock source named SDCLK as engine clock. SDCLK can be completely asynchronous with system clock HCLK, software can change SD clock arbitrary. However,

HCLK should be faster than SDCLK.

6.28.5.1 Basic Operation

This SD controller can generate all types of 48-bit command to SD card and retrieve all types of response from SD card. After response in, the content of response will be stored at SDRSP0 and SDRSP1. SD controller will calculate CRC7 and check its correctness for response. If CRC7 is error, CDRIF (SDH_INTSTS[1]) will be set and CRC7 (SDH_INTSTS[2]) will be '0'. For response R1b, software should notice that after response in, SD card will put busy signal on data line DAT0; software should check this status with clock polling until it became high. For response R3, CRC7 is invalid; but SD controller will still calculate CRC7 and get an error result, software should ignore this error and clear CDRIF flag (SDH_INTSTS[1]).

The SD controller is composed of two state machines – command/response part and data part. For command/response part, the trigger bits are COEN, RIEN, R2_EN, CLK74OE and CLK8_OE in SDH_CTL register. If software enables all of these bits, the execution priority will be CLK74OE > COEN > RIEN/R2_EN > CLK8_OE, note that RIEN and R2_EN can't be triggered at the same time. For data part, there are DIEN and DOEN for choose. Software can only trigger one of them at one time. If DIEN is triggered, SD controller waits start bit from data line DAT0 immediately, and then get specified amount data from SD card. After data-in, SD controller will check CRC16 correctness; if it is error, CDRIF (SDH_INTSTS[1]) will be set and CRC16 (SDH_INTSTS[3]) will be '0'. If DOEN is triggered, SD controller will wait response in finished, and then send specified amount data to SD card. After data-out, SD controller will get CRC status from SD card and check its correctness; it should be '010', otherwise CDRIF (SDH_INTSTS[1]) will be set and CRCSTAT (SDH_INTSTS[6:4]) will be the value it received.

If R2_EN is triggered, SD controller will receive response R2 (136 bits) from SD card, CRC7 and end bit will be dropped. The receiving data will be placed at DMA's buffer, starting from address offset 0x0.

6.28.5.2 Multiple Block Transfer

The SD controller also provides multiple block transfer function (change BLKLEN to change the block length). Software can use this function to accelerate data transfer throughput. If CRC7, CRC16 or CRC status is error, SD controller will stop transfer and set CDRIF (SDH_INTSTS[1]), software should do engine reset when this situation occurred.

There is a hardware time-out mechanism for response in and data in inside SD engine. Software can specify a 24-bit time-out value at TOUT, and then SD controller will decide when to time-out according to this value.

6.28.5.3 DMA Controller

The SD host DMA controller provides a DMA (Direct Memory Access) function for SD host controller to exchange data between system memory (SRAM) and shared buffer (128 bytes). Arbitration of DMA request between SD host is done by DMA's bus master. Software just simply fills in the starting address and enables DMA, and then let DMA to handle the data transfer automatically.

There is a 128 bytes shared buffer inside DMA, it can provide multi-block transfers for SD host. Software can access these shared buffers directly when SD host is not in busy.

6.28.5.4 Programming Flow

Here is a simple example programming flow without DMA Scatter-Gather enable.

1. Set DMAEN (SDH_DMACTL[0]) to enable DMA.
2. Fill corresponding starting address in SDH_DMASA for SD host.
3. Trigger SD host to start DMA transfer.
4. Wait until transfer is finished.

Here is a simple example programming flow with DMA Scatter-Gather enable.

1. Set DMAEN (SDH_DMACTL[0]) to enable DMA (SDH_DMACTL[0]) and SGEN (SDH_DMACTL[3]) to enable Scatter-Gather function.

2. Fill corresponding starting address of Physical Address Descriptor (PAD) table in SDH_DMASA for SD host.
3. When bit-0 of SDH_DMASA is 1, the PAD will fetch in out of order, otherwise, it's fetched in order from PAD. The first time of writing bit-0 with 1 or not is not available for this function. The bits will be available in PAD table.
4. Trigger SD host to start DMA transfer.
5. Wait until transfer is finished.

The format of PAD table is shown in Figure 6.28-2. Note that the total byte count of all Pads must be equal to the byte count filled in SD host. EOT should be set to 1 in the last descriptor.

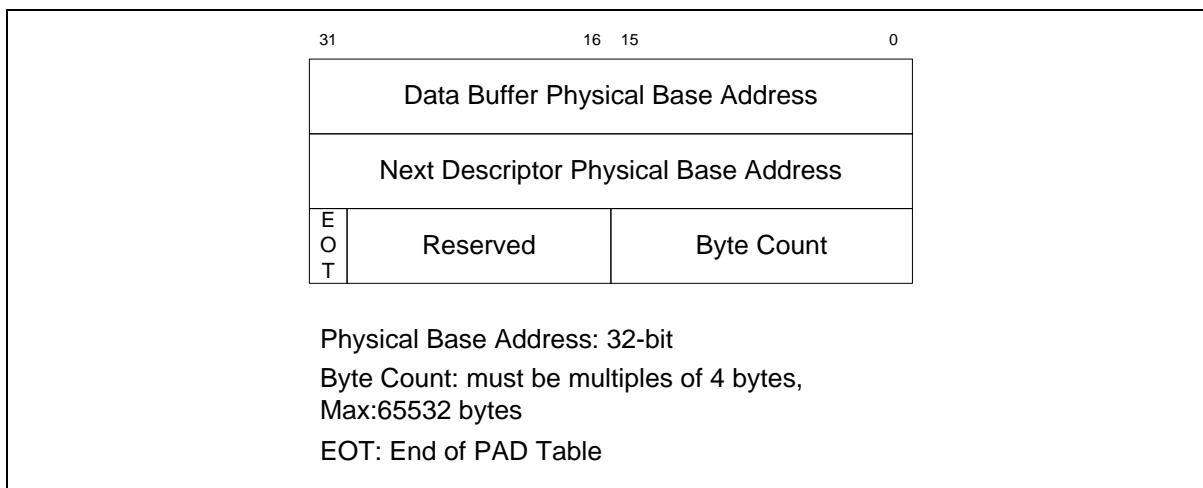

Figure 6.28-2 PAD (Physical Address Descriptor) Table Format

6.28.6 Register Map

R: read only, W: write only, R/W: both read and write

Bits	Description	
[31:10]	Reserved	Reserved.
[9]	DMABUSY	DMA Transfer Is in Progress This bit indicates if SD Host is granted and doing DMA transfer or not. 0 = DMA transfer is not in progress. 1 = DMA transfer is in progress.
[8:4]	Reserved	Reserved.
[3]	SGEN	Scatter-gather Function Enable Bit 0 = Scatter-gather function Disabled (DMA will treat the starting address in DMASAR as starting pointer of a single block memory). 1 = Scatter-gather function Enabled (DMA will treat the starting address in DMASAR as a starting address of Physical Address Descriptor (PAD) table. The format of these Pads' will be described later).
[2]	Reserved	Reserved.
[1]	DMARST	Software Engine Reset 0 = No effect. 1 = Reset internal state machine and pointers. The contents of control register will not be cleared. This bit will auto be cleared after few clock cycles. Note: The software reset DMA related registers.
[0]	DMAEN	DMA Engine Enable Bit 0 = DMA Disabled. 1 = DMA Enabled. Note1: If this bit is cleared, DMA will ignore all requests from SD host and force bus master into IDLE state. Note2: If target abort occurred, DMAEN will be cleared.

DMA Transfer Starting Address Register (SDH_DMASA)

Register	Offset	R/W	Description					Reset Value
SDH_DMASA	SDHx_BA+0x408	R/W	DMA Transfer Starting Address Register					0x0000_0000

Bits	Description	
[31:28]	Reserved	Reserved.
[27:24]	SDNWR	NWR Parameter for Block Write Operation This value indicates the NWR parameter for data block write operation in SD clock counts. The actual clock cycle will be SDNWR+1.
[23:16]	BLKCNT	Block Counts to Be Transferred or Received This field contains the block counts for data-in and data-out transfer. For READ_MULTIPLE_BLOCK and WRITE_MULTIPLE_BLOCK command, software can use this function to accelerate data transfer and improve performance. Don't fill 0x0 to this field. Note: For READ_MULTIPLE_BLOCK and WRITE_MULTIPLE_BLOCK command, the actual total length is BLKCNT * (BLKLEN +1).
[15]	DBW	SD Data Bus Width (for 1-bit / 4-bit Selection) 0 = Data bus width is 1-bit. 1 = Data bus width is 4-bit.
[14]	CTLRST	Software Engine Reset 0 = No effect. 1 = Reset the internal state machine and counters. The contents of control register will not be cleared (but RIEN, DIEN, DOEN and R2_EN will be cleared). This bit will be auto cleared after few clock cycles.
[13:8]	CMDCODE	SD Command Code The bits contain the SD command code (0x00 – 0x3F).
[7]	CLKKEEP	SD Clock Enable Control 0 = SD host decided when to output clock and when to disable clock output automatically. 1 = SD clock always keeps free running.

[6]	CLK8OEN	Generating 8 Clock Cycles Output Enable Bit 0 = No effect. (Please use DMARST (SDH_CTL [0]) to clear this bit.) 1 = Enabled. The SD host will output 8 clock cycles. Note: When operation is finished, this bit will be cleared automatically, so don't write 0 to this bit (the controller will be abnormal).
[5]	CLK74OEN	Initial 74 Clock Cycles Output Enable Bit 0 = No effect. (Please use DMARST (SDH_CTL [0]) to clear this bit.) 1 = Enabled. The SD host will output 74 clock cycles to SD card. Note: When operation is finished, this bit will be cleared automatically, so don't write 0 to this bit (the controller will be abnormal).
[4]	R2EN	Response R2 Input Enable Bit 0 = No effect. (Please use DMARST (SDH_CTL [0]) to clear this bit.) 1 = Enabled. The SD host will wait to receive a response R2 from SD card and store the response data into DMC's Flash buffer (exclude CRC7). Note: When operation is finished, this bit will be cleared automatically, so don't write 0 to this bit (the controller will be abnormal).
[3]	DOEN	Data Output Enable Bit 0 = No effect. (Please use DMARST (SDH_CTL [0]) to clear this bit.) 1 = Enabled. The SD host will transfer block data and the CRC16 value to SD card. Note: When operation is finished, this bit will be cleared automatically, so don't write 0 to this bit (the controller will be abnormal).
[2]	DIEN	Data Input Enable Bit 0 = No effect. (Please use DMARST (SDH_CTL [0]) to clear this bit.) 1 = Enabled. The SD host will wait to receive block data and the CRC16 value from SD card. Note: When operation is finished, this bit will be cleared automatically, so don't write 0 to this bit (the controller will be abnormal).
[1]	RIEN	Response Input Enable Bit 0 = No effect. (Please use DMARST (SDH_CTL [0]) to clear this bit.) 1 = Enabled. The SD host will wait to receive a response from SD card. Note: When operation is finished, this bit will be cleared automatically, so don't write 0 to this bit (the controller will be abnormal).
[0]	COEN	Command Output Enable Bit 0 = No effect. (Please use DMARST (SDH_CTL [0]) to clear this bit.) 1 = Enabled. The SD host will output a command to SD card. Note: When operation is finished, this bit will be cleared automatically, so don't write 0 to this bit (the controller will be abnormal).

SD Command Argument Register (SDH_CMDARG)

Register	Offset	R/W	Description				Reset Value
SDH_CMDARG	SDHx_BA+0x824	R/W	SD Command Argument Register				0x0000_0000

Bits	Description	
[31:0]	ARGUMENT	<p>SD Command Argument</p> <p>This register contains a 32-bit value specifies the argument of SD command from host controller to SD card. Before trigger COEN (SDH_CTL [0]), software should fill argument in this field.</p>

SD Interrupt Control Register (SDH_INTEN)

Register	Offset	R/W	Description				Reset Value
SDH_INTEN	SDHx_BA+0x828	R/W	SD Interrupt Control Register				0x0000_0A00

DAT0STS	CRCSTS			CRC16	CRC7	CRCIF	BLKDIF

Bits	Description	
[31:19]	Reserved	Reserved.
[18]	DAT1STS	DAT1 Pin Status of SD Card (Read Only) This bit indicates the DAT1 pin status of SD card.
[17]	Reserved	Reserved.
[16]	CDSTS	Card Detect Status of SD (Read Only) This bit indicates the card detect pin status of SD, and is used for card detection. When there is a card inserted in or removed from SD, software should check this bit to confirm if there is really a card insertion or removal. If CDSRC (SDH_INTEN[30]) = 0, to select DAT3 for card detection: 0 = Card removed. 1 = Card inserted. If CDSRC (SDH_INTEN[30]) = 1, to select GPIO for card detection: 0 = Card inserted. 1 = Card removed.
[15:14]	Reserved	Reserved.
[13]	DITOIF	Data Input Time-out Interrupt Flag (Read Only) This bit indicates that SD host counts to time-out value when receiving data (waiting start bit). 0 = Not time-out. 1 = Data input time-out. Note: This bit is read only, but can be cleared by writing '1' to it.
[12]	RTOIF	Response Time-out Interrupt Flag (Read Only) This bit indicates that SD host counts to time-out value when receiving response or R2 (waiting start bit). 0 = Not time-out. 1 = Response time-out. Note: This bit is read only, but can be cleared by writing '1' to it.

[11:9]	Reserved	Reserved.
[8]	CDIF	<p>SD Card Detection Interrupt Flag (Read Only)</p> <p>This bit indicates that SD card is inserted or removed. Only when CDIEN (SDH_INTEN[8]) is set to 1, this bit is active.</p> <p>0 = No card is inserted or removed. 1 = There is a card inserted in or removed from SD.</p> <p>Note: This bit is read only, but can be cleared by writing '1' to it.</p>
[7]	DAT0STS	<p>DAT0 Pin Status of Current Selected SD Port (Read Only)</p> <p>This bit is the DAT0 pin status of current selected SD port.</p>
[6:4]	CRCSTS	<p>CRC Status Value of Data-out Transfer (Read Only)</p> <p>SD host will record CRC status of data-out transfer. Software could use this value to identify what type of error is during data-out transfer.</p> <p>010 = Positive CRC status. 101 = Negative CRC status. 111 = SD card programming error occurs.</p>
[3]	CRC16	<p>CRC16 Check Status of Data-in Transfer (Read Only)</p> <p>SD host will check CRC16 correctness after data-in transfer.</p> <p>0 = Fault. 1 = OK.</p>
[2]	CRC7	<p>CRC7 Check Status (Read Only)</p> <p>SD host will check CRC7 correctness during each response in. If that response does not contain CRC7 information (ex. R3), then software should turn off CRCIEN (SDH_INTEN[1]) and ignore this bit.</p> <p>0 = Fault. 1 = OK.</p>
[1]	CRCIF	<p>CRC7, CRC16 and CRC Status Error Interrupt Flag (Read Only)</p> <p>This bit indicates that SD host has occurred CRC error during response in, data-in or data-out (CRC status error) transfer. When CRC error is occurred, software should reset SD engine. Some response (ex. R3) doesn't have CRC7 information with it; SD host will still calculate CRC7, get CRC error and set this flag. In this condition, software should ignore CRC error and clears this bit manually.</p> <p>0 = No CRC error is occurred. 1 = CRC error is occurred.</p> <p>Note: This bit is read only, but can be cleared by writing '1' to it.</p>
[0]	BLKDIF	<p>Block Transfer Done Interrupt Flag (Read Only)</p> <p>This bit indicates that SD host has finished all data-in or data-out block transfer. If there is a CRC16 error or incorrect CRC status during multiple block data transfer, the transfer will be broken and this bit will also be set.</p> <p>0 = Not finished yet. 1 = Done.</p> <p>Note: This bit is read only, but can be cleared by writing '1' to it.</p>

SD Receiving Response Token Register 0 (SDH_RESP0)

Register	Offset	R/W	Description	Reset Value
SDH_RESP0	SDHx_BA+0x830	R	SD Receiving Response Token Register 0	0x0000_0000

Bits	Description	
[31:0]	RESPTK0	SD Receiving Response Token 0 SD host controller will receive a response token for getting a reply from SD card when RIEN (SDH_CTL[1]) is set. This field contains response bit 47-16 of the response token.

Bits	Description	
[23:0]	TOUT	<p>SD Response/Data-in Time-out Value</p> <p>A 24-bit value specifies the time-out counts of response and data input. SD host controller will wait start bit of response or data-in until this value reached. The time period depends on SD engine clock frequency. Do not write a small number into this field, or you may never get response or data due to time-out.</p> <p>Note: Filling 0x0 into this field will disable hardware time-out function.</p>

6.29 External Bus Interface (EBI)

6.29.1 Overview

This chip is equipped with an external bus interface (EBI) for external device use. To save the connections between an external device and a chip, EBI is operating at address bus and data bus multiplex mode. The EBI supports three chip selects that can connect three external devices with different timing setting requirements.

6.29.2 Features

- Supports up to three memory banks
- Supports dedicated external chip select pin with polarity control for each bank
- Supports accessible space up to 1 Mbytes for each bank, actually external addressable space is dependent on package pin out
- Supports 8-/16-bit data width
- Supports byte write in 16-bit data width mode
- Supports Address/Data multiplexed Mode
- Supports Timing parameters individual adjustment for each memory block
- Supports LCD interface i80 mode
- Supports PDMA mode
- Supports variable external bus base clock (MCLK) which based on HCLK
- Supports configurable idle cycle for different access condition: Idle of Write command finish (W2X) and Idle of Read-to-Read (R2R)
- Supports address bus and data bus separate mode

6.29.3 Block Diagram

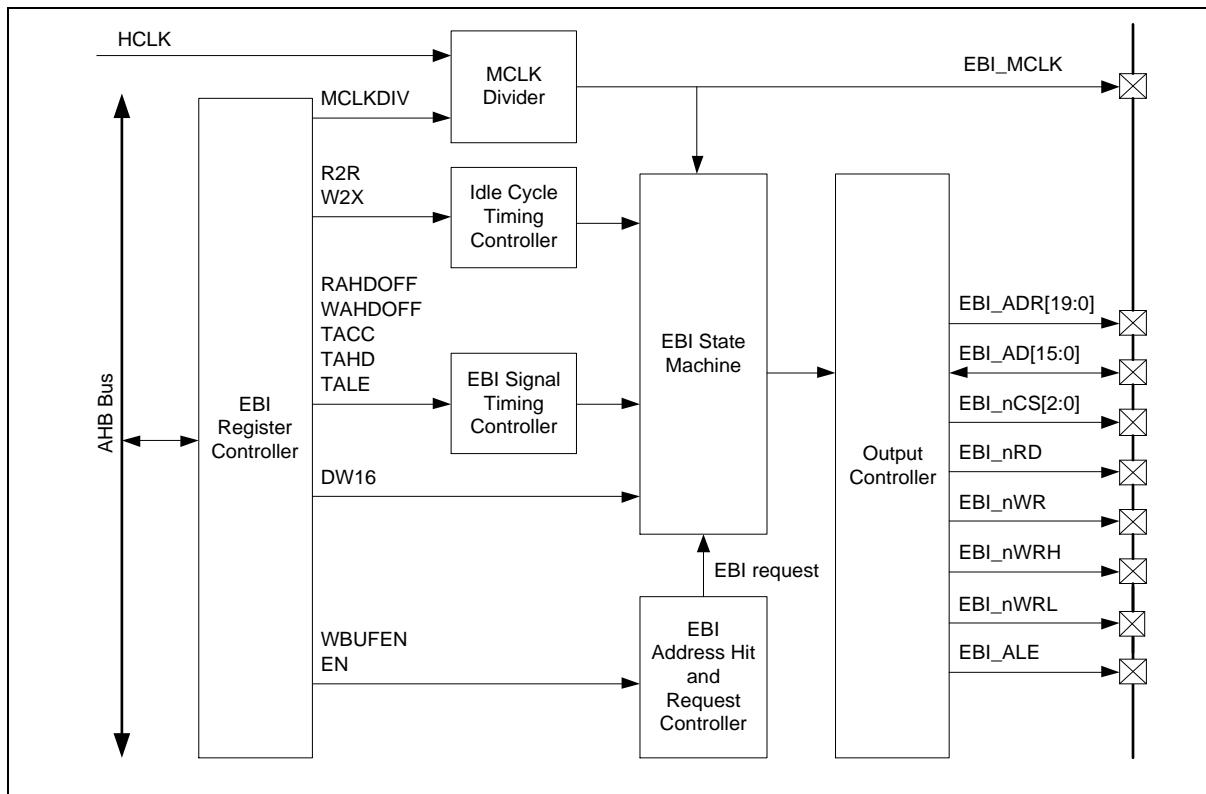

Figure 6.29-1 EBI Block Diagram

6.29.4 Basic Configuration

- Clock Source Configuration
 - Enable EBI controller clock in EBICKEN (CLK_AHCLK[3]).
- Reset Configuration
 - Reset EBI controller in QSPI0RST (SYS_IPRST0[3]).
- Pin Configuration

6.29.5 Functional Description

6.29.5.1 EBI Area and Address Hit

The EBI mapping address is located at 0x6000_0000 ~ 0x602F_FFFF and the total memory space is 3MB. When system request address hits EBI's memory space, the corresponding EBI chip select signal is assert and EBI state machine operates.

Chip Select	Address Mapping
EBI_nCS0	0x6000_0000 ~ 0x600F_FFFF
EBI_nCS1	0x6010_0000 ~ 0x601F_FFFF
EBI_nCS2	0x6020_0000 ~ 0x602F_FFFF

Table 6.29-1 EBI Address Mapping

To map the whole EBI memory space, it requires 20-bit address for 8-bit data width device and 19-bit address for 16-bit data width device. For package that output less than 20-bit address, EBI will map device to mirror space. For example, the package with 18-bit EBI address, EBI will mapped external device (for Bank0/EBI_nCS0) to 0x6000_0000 ~ 0x6003_FFFF, 0x6004_0000 ~ 0x6007_FFFF, 0x6008_0000 ~ 0x600B_FFFF and 0x600C_0000 ~ 0x600F_FFFF simultaneously.

6.29.5.2 EBI Data Width Connection - Address Bus and Data Bus Multiplex Mode

The EBI supports the device whose address bus and data bus are multiplexed. For the external device with separated address and data bus, the connection to device needs additional latch device to latch the address. In this case, the pin EBI_ALE is connected to the latch device to latch the address value. Pin EBI_AD is the input of the latch device, and the output of the latch device is connected to the address of external device.

For 16-bit device, the EBI_AD [15:0] is shared by address and 16-bit data, and EBI_ADR [18:16] is dedicated for address and could be connected to 16-bit device directly. The EBI_ADR[19] will be ignored when EBI data width is set as 16-bit width. For 8-bit device, only EBI_AD [7:0] is shared by address and 8-bit data, EBI_AD[15:8] and EBI_ADR[19:16] are dedicated for address and could be connected to 8-bit device directly. Figure 6.29-2 shows the connection of 16-bit data width device and Figure 6.29-3 shows the connection of 8-bit data width device.

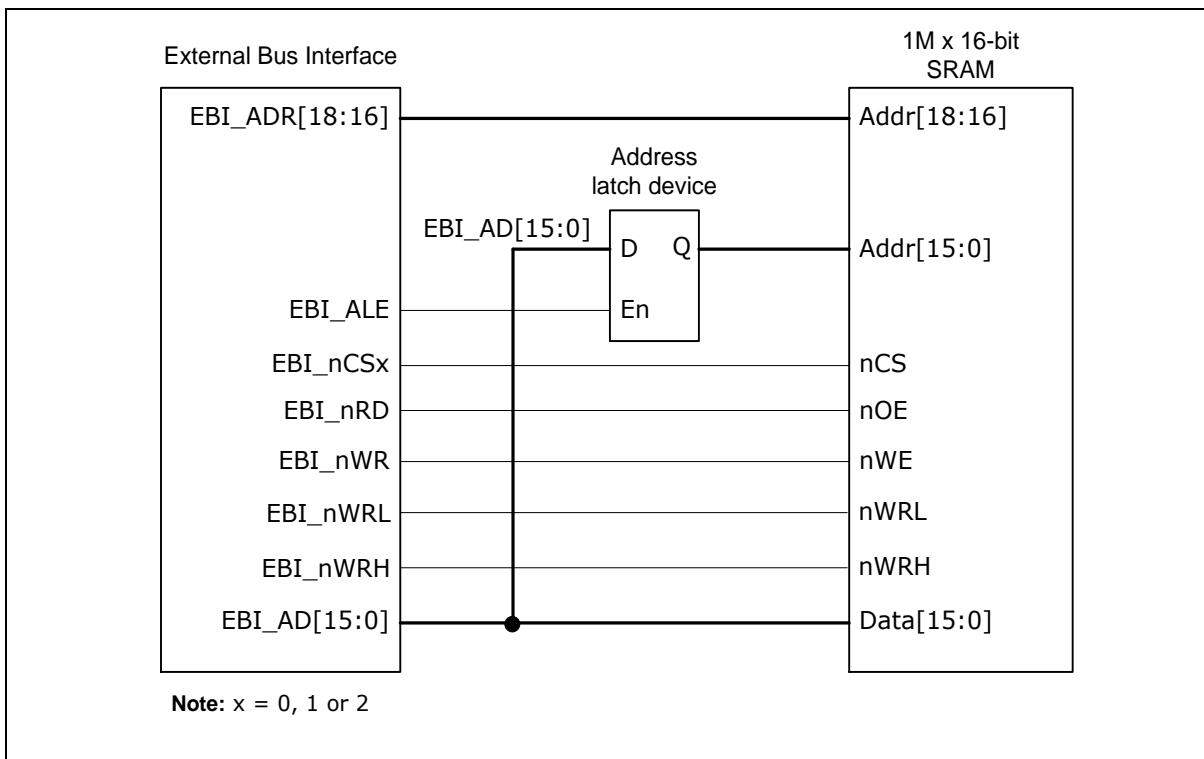

Figure 6.29-2 Connection of 16-bit EBI Data Width with 16-bit Device

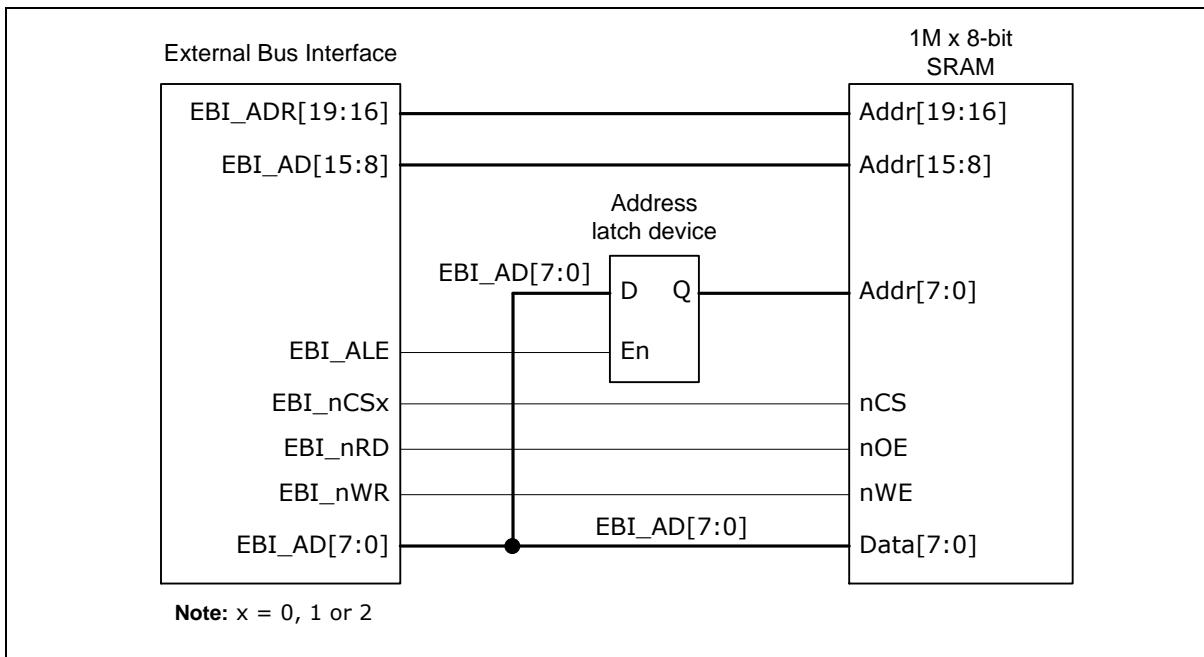

Figure 6.29-3 Connection of 8-bit EBI Data Width with 8-bit Device

When system access data width is larger than EBI data width, the EBI controller will finish a system access command by operating EBI access more than once. For example, if system requests a 32-bit data through EBI device, the EBI controller will operate accessing four times when setting EBI data width with 8-bit.

6.29.5.3 EBI Data Width Connection - Address Bus and Data Bus Separate Mode

The EBI supports address and data bus separate mode. User can enable this mode by setting ADSEOPEN (EBI_CTLx[3]). When separate mode is enabled, EBI_AD is dedicated for data bus and connected directly to device data bus, EBI_ADR is dedicated for address bus.

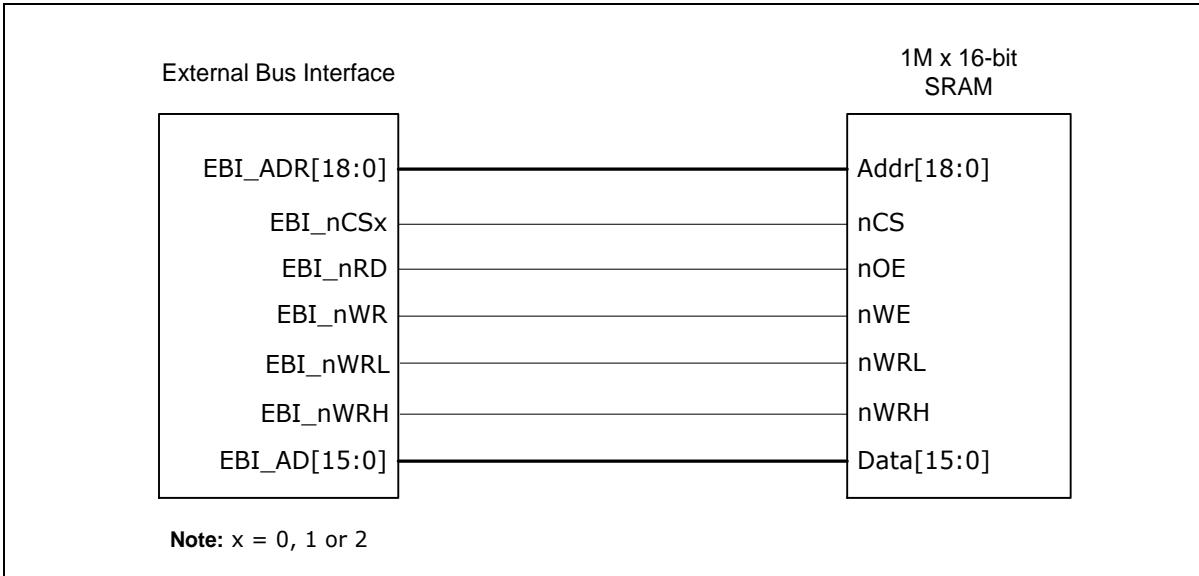

Figure 6.29-4 Connection of 16-bit EBI Data Width with 16-bit Device in Separate mode

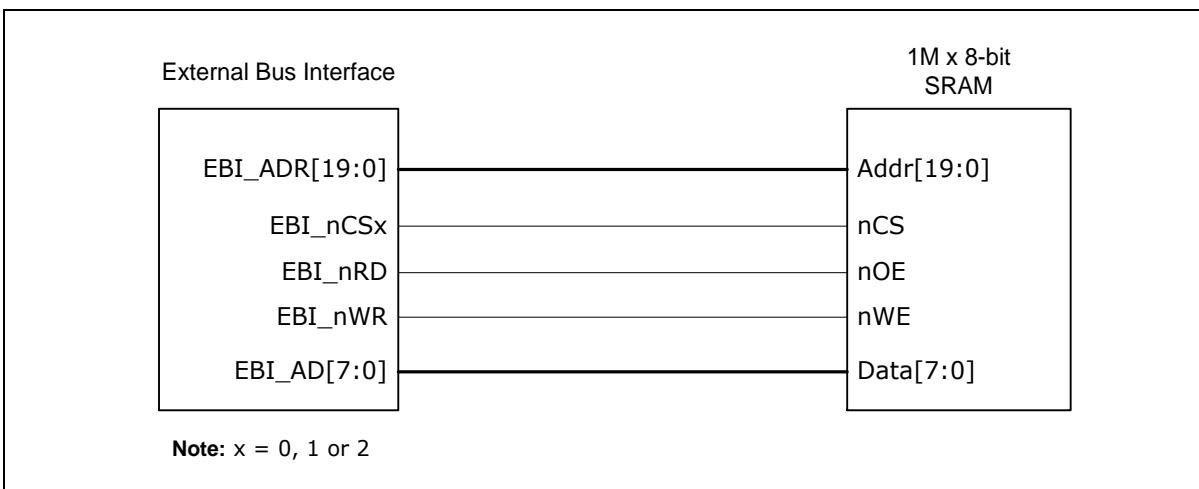

Figure 6.29-5 Connection of 8-bit EBI Data Width with 8-bit Device in Separate mode

6.29.5.4 EBI Operating Control

MCLK Control

In the chip, all EBI signals will be synchronized by EBI_MCLK when EBI is operating. When chip connects to the external device with slower operating frequency, the EBI_MCLK can divide most to HCLK/128 by setting MCLKDIV (EBI_CTLx[10:8]). Therefore, chip can be suitable for a wide frequency range of EBI device. If EBI_MCLK is set to HCLK/1, EBI signals are synchronized by positive edge of EBI_MCLK, else by negative edge of EBI_MCLK.

Operation and Access Timing Control

At the start of EBI access, chip select (EBI_nCS0, EBI_nCS1 and EBI_nCS2) asserts to low and wait one EBI_MCLK for address setup time (t_{ASU}) for address stable. Then EBI_ALE asserts to high after

address is stable and keeps for a period of time (tALE) for address latch. After latch address, EBI_ALE asserts to low and wait one EBI_MCLK for latch hold time (tLHD) and another one EBI_MCLK cycle (tA2D) that is inserted behind address hold time to be the bus turn-around time for address change to data. Then EBI_nRD asserts to low when read access or EBI_nWR asserts to low when write access. Then EBI_nRD or EBI_nWR asserts to high after keeps access time (tACC) for reading output stable or writing finish. After that, EBI signals keep for data access hold time (tAHD) and chip select asserts to high, address is released by current access control.

The EBI controller provides a flexible timing control for different external device. In EBI timing control, tASU, tLHD and tA2D are fixed to 1 EBI_MCLK cycle, tAHD can modulate to 1~8 EBI_MCLK cycles by setting TAHD (EBI_TCTLx[10:8]), tACC can modulate to 1~32 EBI_MCLK cycles by setting TACC (EBI_TCTLx[7:3]), and tALE can modulate to 1~8 EBI_MCLK cycles by setting TALE (EBI_CTL0[18:16]). Some external device can support zero data access hold time accessing, the EBI controller can skip tAHD to increase access speed by setting WAHDOFF (EBI_TCTLx[23]) and RAHDOFF (EBI_TCTLx[22]).

For each chip select, the EBI provides individual register with timing control except that tALE can only be controlled by EBI_CTL0.

Parameter	Value	Unit	Description
tASU	1	MCLK	Address Latch Setup Time.
tALE	1 ~ 8	MCLK	ALE High Period. Controlled by TALE (EBI_CTL0[18:16]).
tLHD	1	MCLK	Address Latch Hold Time.
tA2D	1	MCLK	Address To Data Delay (Bus Turn-Around Time).
tACC	1 ~ 32	MCLK	Data Access Time. Controlled by TACC (EBI_TCTLx[7:3]).
tAHD	1 ~ 8	MCLK	Data Access Hold Time. Controlled by TAHD (EBI_TCTLx[10:8]).
IDLE	0 ~ 15	MCLK	Idle Cycle. Controlled by R2R (EBI_TCTLx[27:24]) and W2X (EBI_TCTLx[15:12]).

Table 6.29-2 Timing Control Parameter

Figure 6.29-6 shows an example of setting 16-bit data width. In this example, EBI_AD bus is used for being address [15:0] and data [15:0]. When EBI_ALE assert to high, EBI_AD is address output. After address is latched, EBI_ALE asserts to low and the EBI_AD bus change to high impedance to wait device output data in read access operation, or it is used for being write data output.

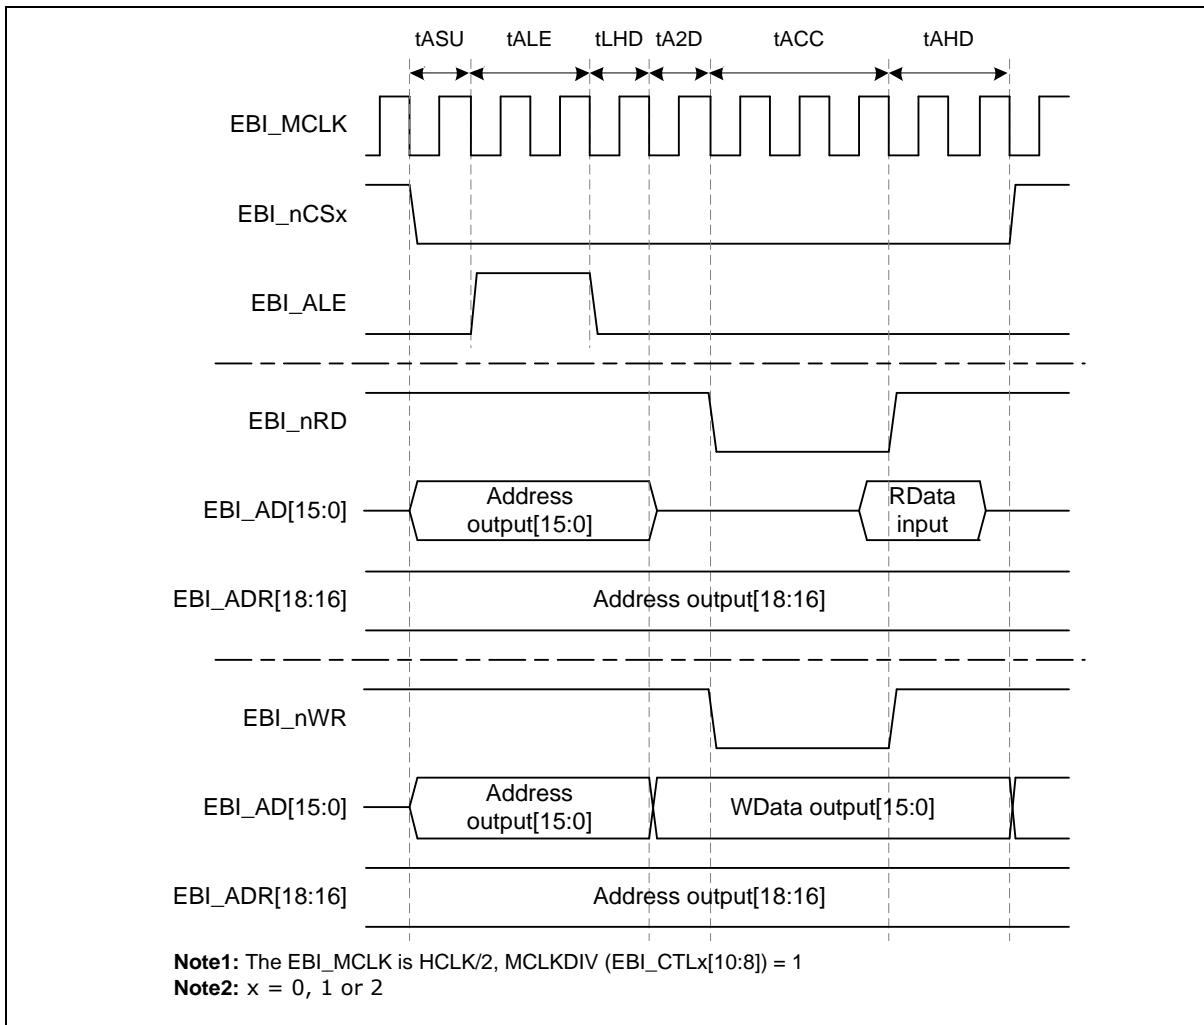

Figure 6.29-6 Timing Control Waveform for 16-bit Data Width

Figure 6.29-7 shows an example of setting 8-bit data width. The difference between 8-bit and 16-bit data width is EBI_AD[15:8]. In 8-bit data width setting, EBI_AD[15:8] is always Address [15:8] output so that external latch needs only 8-bit width.

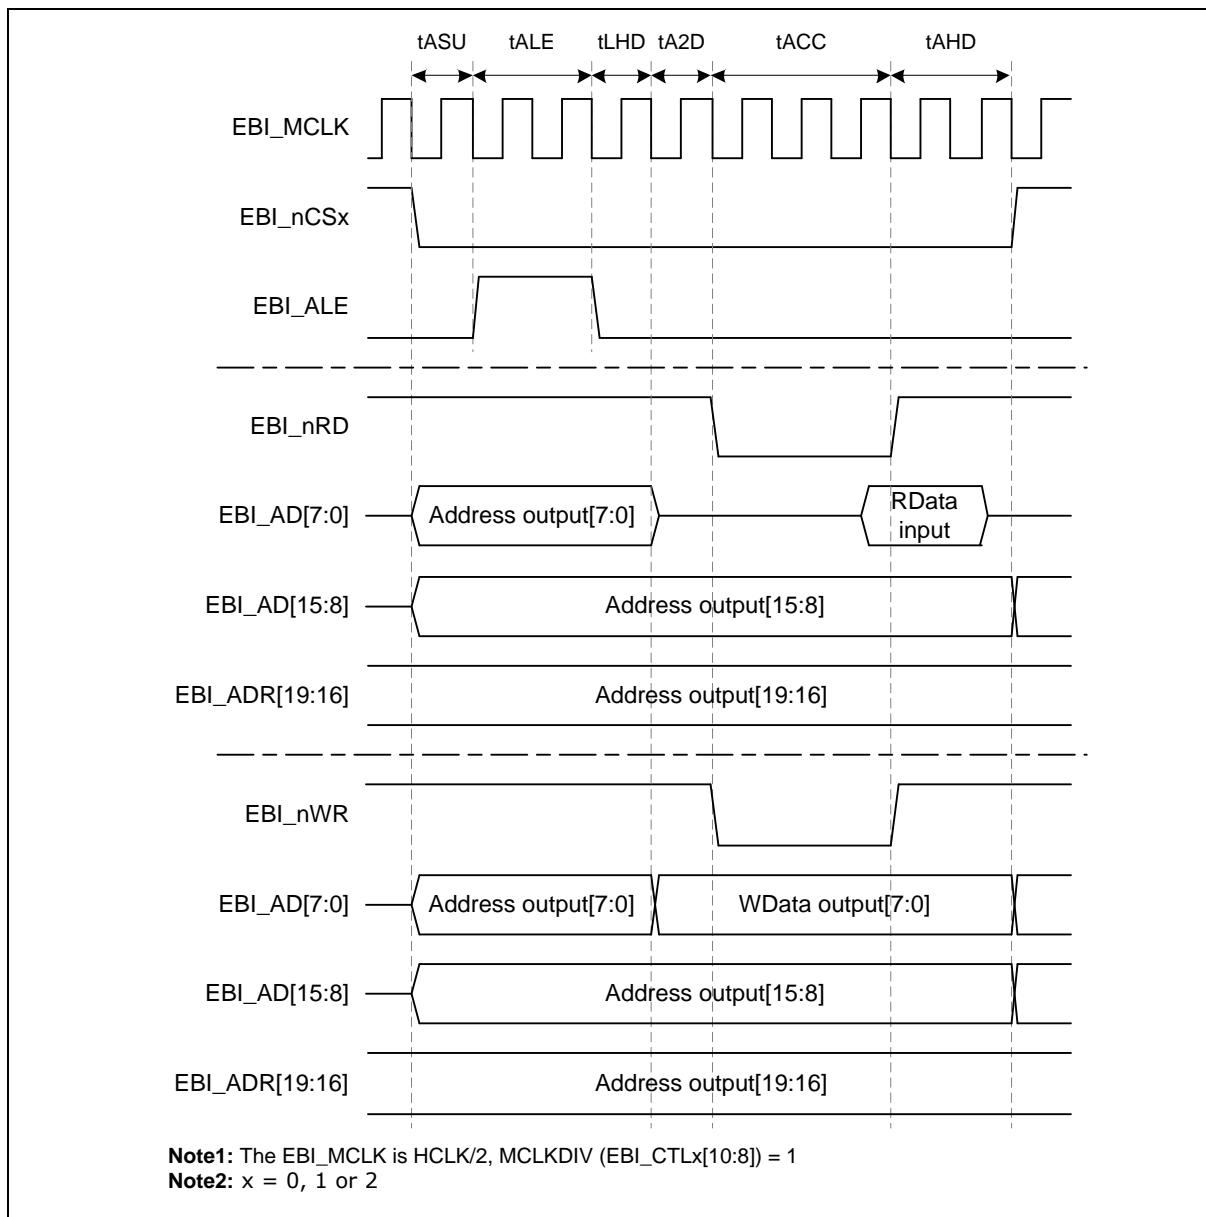

Figure 6.29-7 Timing Control Waveform for 8-bit Data Width

Byte Access

The EBI supports byte access when connected to 16-bit device. The pin EBI_nWRH and EBI_nWRL assertion indicate high byte enable and low byte enable in 16-bit data bus. Figure 6.29-8 shows the write operation of 8-bit width data in EBI_AD[15:8] with EBI_nWRH assertion.

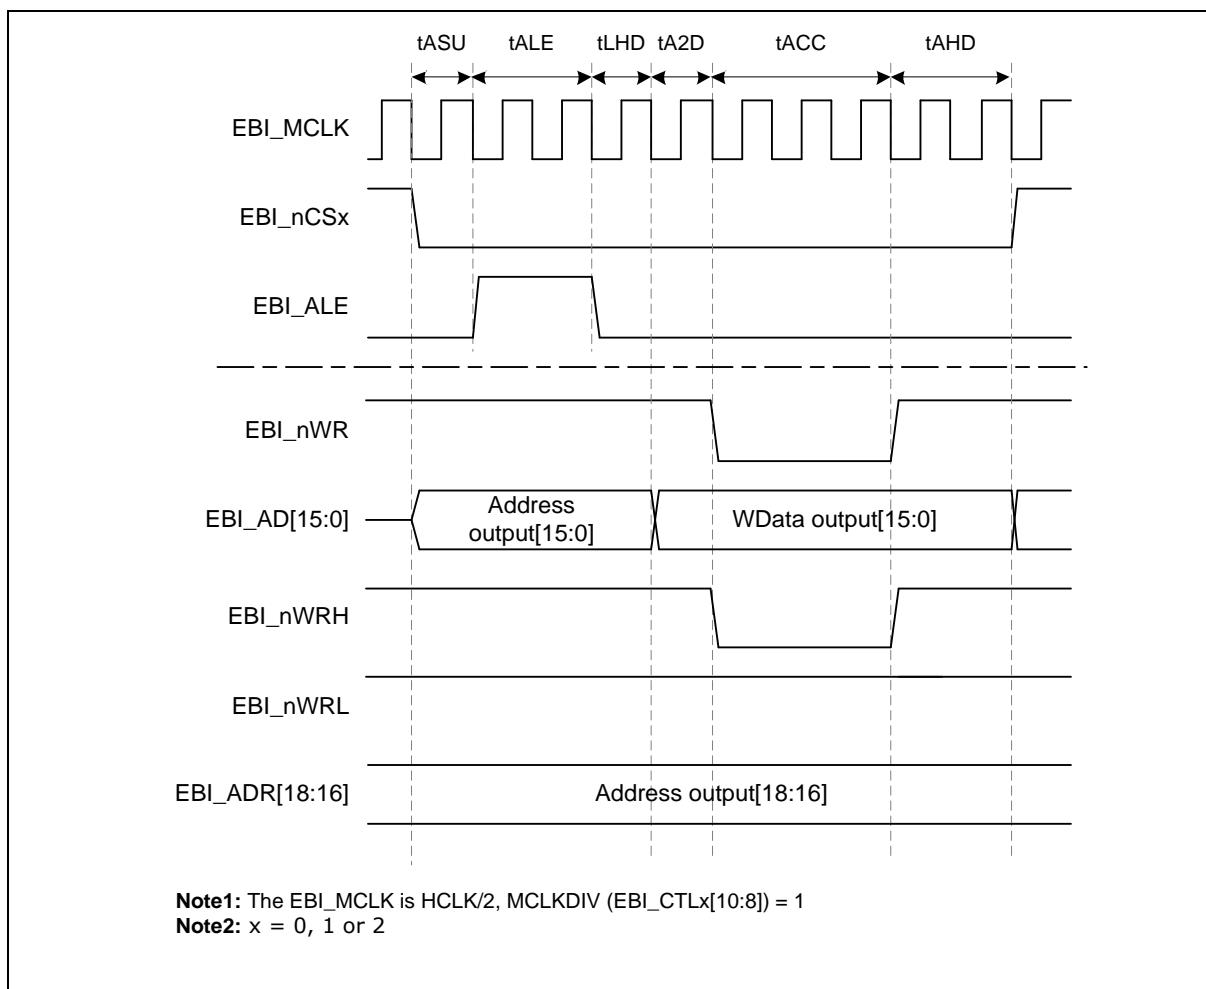

Figure 6.29-8 Timing Control Waveform for Byte Write in 16-bit Data Mode

Insert Idle Cycle

When EBI accesses continuously, there may occur bus conflict if the device access time is much slow with system operating. The EBI controller supplies additional idle cycle to solve this problem. During idle cycle, all control signals of EBI are inactive. Figure 6.29-9 shows idle cycles.

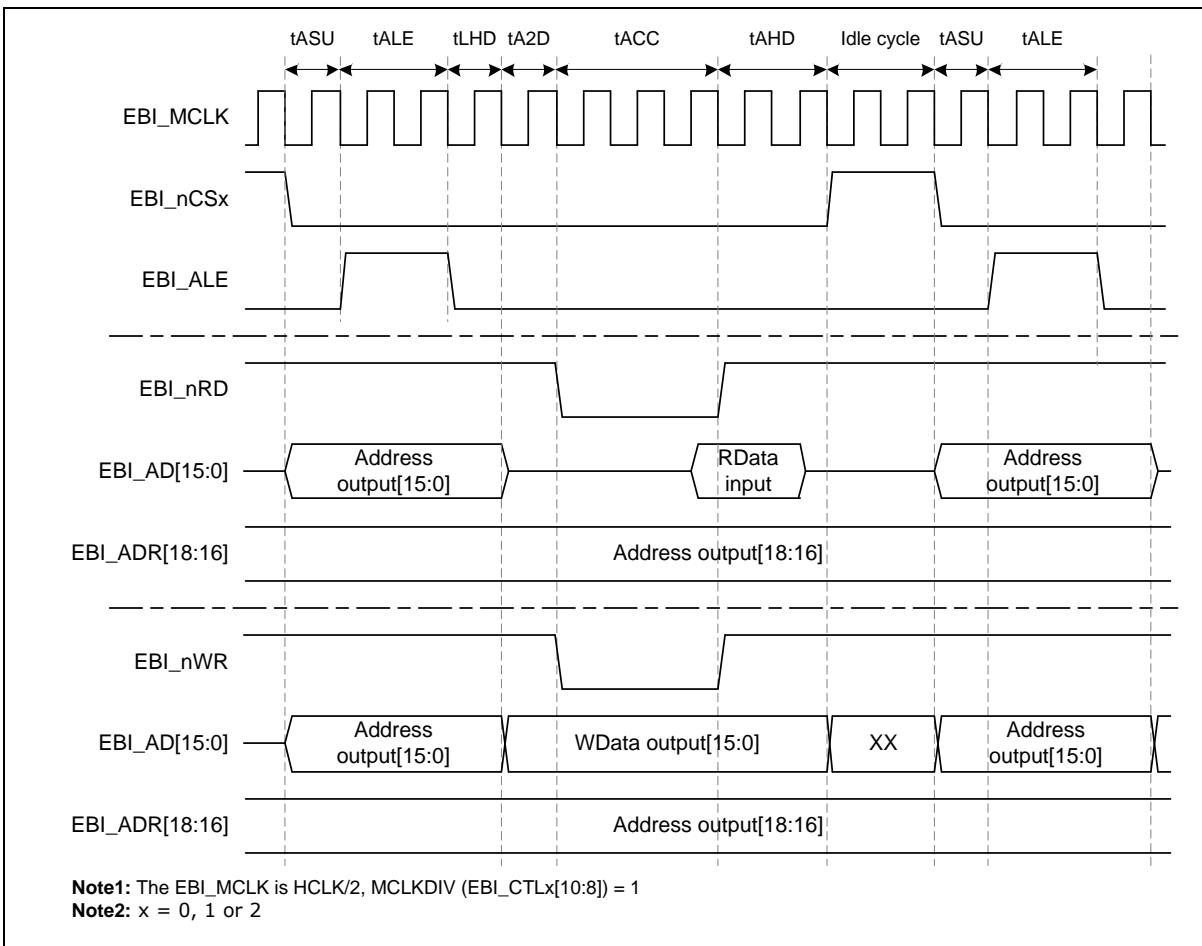

Figure 6.29-9 Timing Control Waveform for Insert Idle Cycle

There are two conditions that EBI can insert idle cycle by timing control:

1. After write access
2. After read access and before next read access (R2R idle cycle)

By setting W2X (EBI_TCTLx[15:12]), and R2R (EBI_TCTLx[27:24]), the time of idle cycle can be specified from 0~15 EBI_MCLK.

Chip Select Polarity Control

The EBI supports chip select polarity control for connecting to variable external device. When CSPOLINV (EBI_CTLx[2]) is set to 0, the chip select pins (EBI_nCSx) works as low active behavior. It means the external device can be access under EBI_nCSx at low state. When CSPOLINV (EBI_CTLx[2]) is set to 1, the chip select pin (EBI_nCS) works as high active behavior. It means the external device can be access under EBI_nCSx at high state.

Write Buffer

When user writes data to an external device through EBI bus, the EBI controller will start processing the write action immediately and the CPU is held until current EBI write action is finished. User can enable write buffer function to improve CPU and EBI access performance. When EBI write buffer

function is enabled, the CPU can continuously execute other instruction during EBI controller process the write action to external device. There is one exception condition for this case. If CPU executes another data access through EBI bus when EBI process write action, the CPU will be held.

User can enable write buffer by setting WBUFEN (EBI_CTL0[24]).

Address Data Separate Mode

When EBI is set as separate mode, the tALE, tLHD, tA2D cycles are ignored. EBI_AD and EBI_ADR are dedicated for data and address bus separately.

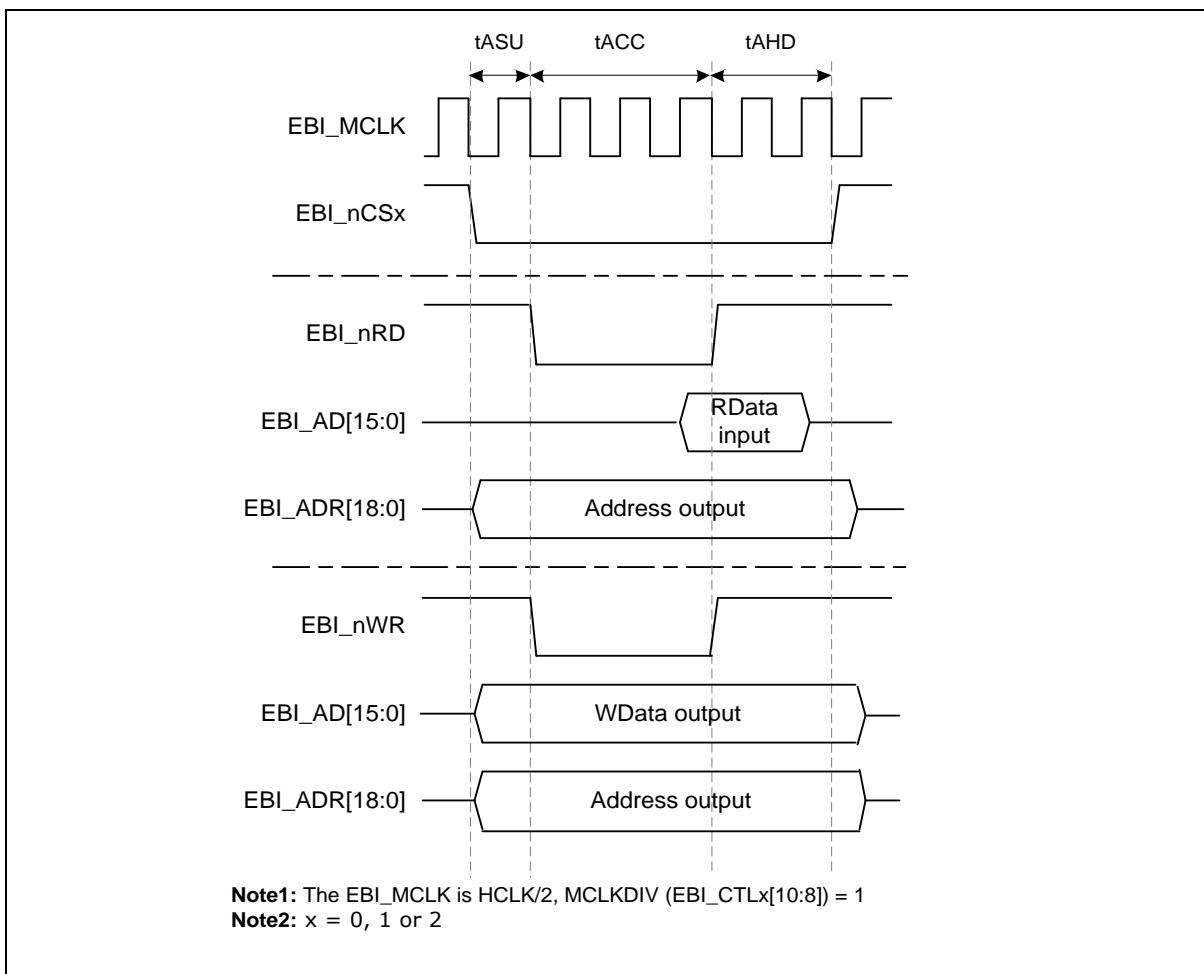

Figure 6.29-10 Timing Control Waveform for 16-bit Data Width for Separate Mode

Continuous Data Access Mode

The EBI supports continuous data access mode for the device which needs faster data access and do not need address control interface. User can enable this mode by setting CACCESS (EBI_CTLx[4]) for each bank. When EBI set as continuous data access mode, the tASU, tALE, tLHD cycles are ignored and EBI can access data continuously within one read or write command. There will be dummy cycle between each access command. The timing waveform is shown as Figure 6.29-11.

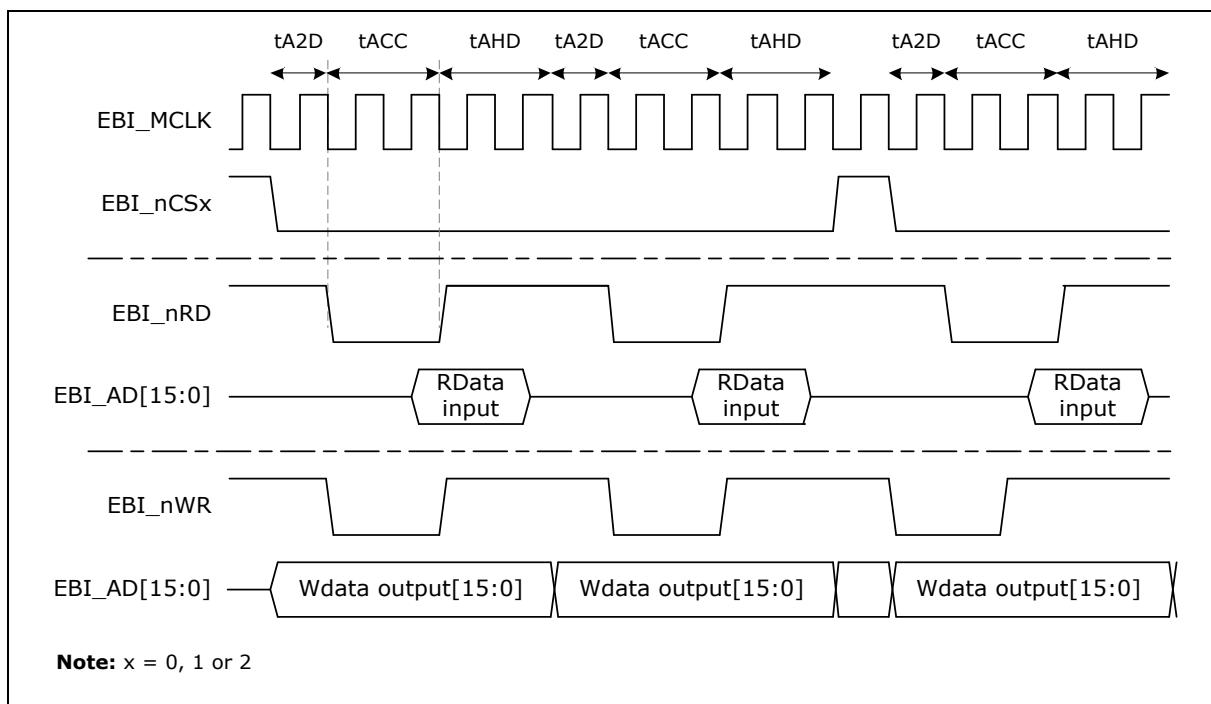

Figure 6.29-11 Timing Control Waveform for Continuous Data Access Mode

Bits	Description	
[31:30]	Reserved	Reserved.
[27:24]	R2R	Idle Cycle Between Read-to-read This field defines the number of R2R idle cycle. R2R idle cycle = (R2R * EBI_MCLK). When read action is finished and the next action is going to read, R2R idle cycle is inserted and EBI_nCS return to idle state.
[23]	WAHDOFF	Access Hold Time Disable Control When Write 0 = Data Access Hold Time (tAHD) during EBI writing Enabled. 1 = Data Access Hold Time (tAHD) during EBI writing Disabled.
[22]	RAHDOFF	Access Hold Time Disable Control When Read 0 = Data Access Hold Time (tAHD) during EBI reading Enabled. 1 = Data Access Hold Time (tAHD) during EBI reading Disabled.
[21:16]	Reserved	Reserved.
[15:12]	W2X	Idle Cycle After Write This field defines the number of W2X idle cycle. W2X idle cycle = (W2X * EBI_MCLK). When write action is finished, W2X idle cycle is inserted and EBI_nCS return to idle state.
[11]	Reserved	Reserved.
[10:8]	TAHD	EBI Data Access Hold Time TAHD defines data access hold time (tAHD). tAHD = (TAHD + 1) * EBI_MCLK.
[7:3]	TACC	EBI Data Access Time TACC defines data access time (tACC).

		tACC = (TACC +1) * EBI_MCLK.
[2:0]	Reserved	Reserved.

6.30 USB 1.1 Device Controller (USBD)

6.30.1 Overview

There is one set of USB 2.0 full-speed device controller and transceiver in this device. It is compliant with USB 2.0 full-speed device specification and supports control/bulk/interrupt/ isochronous transfer types.

In this device controller, there are two main interfaces: the APB bus and USB bus which comes from the USB PHY transceiver. For the APB bus, the CPU can program control registers through it. There are 1KBytes internal SRAM as data buffer in this controller. For IN or OUT transfer, it is necessary to write data to SRAM or read data from SRAM through the APB interface or SIE. User needs to set the effective starting address of SRAM for each endpoint buffer through buffer segmentation register (USBD_BUFSEGx).

There are 12 endpoints in this controller. Each of the endpoint can be configured as IN or OUT endpoint. All the operations including Control, Bulk, Interrupt and Isochronous transfer are implemented in this block. The block of “Endpoint Control” is also used to manage the data sequential synchronization, endpoint states, current start address, transaction status, and data buffer status for each endpoint.

There are four different interrupt events in this controller. They are the no-event-wake-up, device plug-in or plug-out event, USB events, like IN ACK, OUT ACK etc, and BUS events, like suspend and resume, etc. Any event will cause an interrupt, and users just need to check the related event flags in interrupt event status register (USBD_INTSTS) to acknowledge what kind of interrupt occurring, and then check the related USB Endpoint Status Register (USBD_EPSTS0 and USBD_EPSTS1) to acknowledge what kind of event occurring in this endpoint.

A software-disconnect function is also supported for this USB controller. It is used to simulate the disconnection of this device from the host. If user enables SE0 bit (USBD_SE0), the USB controller will force the output of USB_D+ and USB_D- to level low and its function is disabled. After disable the SE0 bit, host will enumerate the USB device again.

For more information on the Universal Serial Bus, please refer to *Universal Serial Bus Specification Revision 1.1*.

6.30.2 Features

- Compliant with USB 2.0 Full-Speed specification
- Provides 1 interrupt vector with 4 different interrupt events (NEVWK, VBUSDET, USB and BUS)
- Supports Control/Bulk/Interrupt/Isochronous transfer type
- Supports suspend function when no bus activity existing for 3 ms
- Supports 12 endpoints for configurable Control/Bulk/Interrupt/Isochronous transfer types and maximum 1 Kbyte buffer size
- Provides remote wake-up capability

6.30.3 Block Diagram

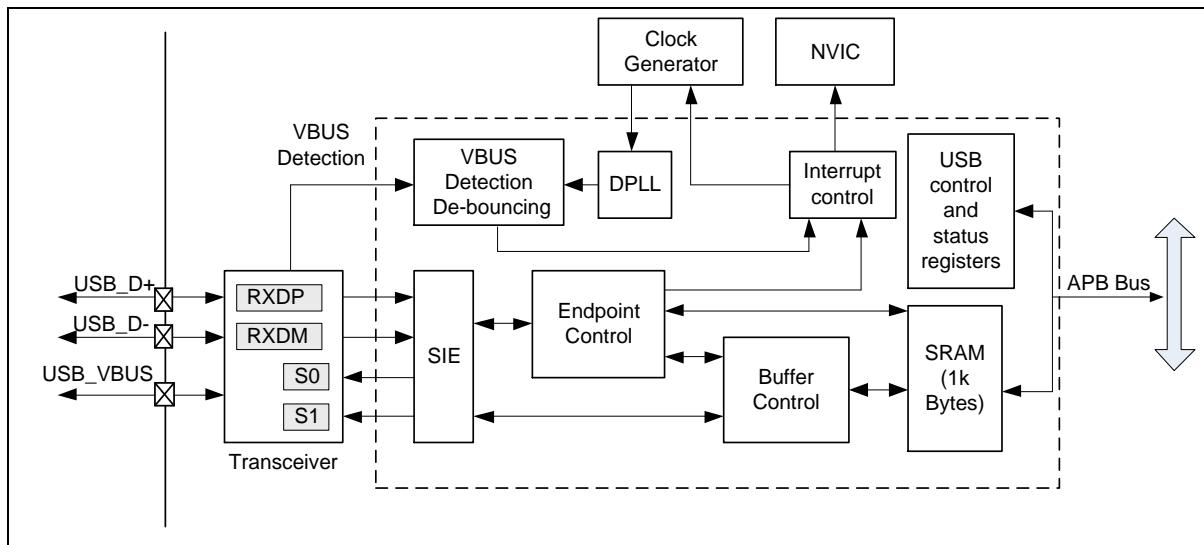

Figure 6.30-1 USB Block Diagram

6.30.4 Basic Configuration

The role of USB frame is determined by **USBROLE** (SYS_USBPHY[1:0]). The internal USB 3.3V LDO can be enabled by **LDO33EN** (SYS_USBPHY[8]). These two configurations are write-protection bits. Before writing to these bits, user must disable the register protection function. Refer to the description of **SYS_REGLCTL** register for details. The USBD clock source is derived from PLL. User has to set the PLL related configurations before USB device controller is enabled. Set the **USBDCKEN** (CLK_APBCLK0[27]) bit to enable USBD clock and 4-bit pre-scaler **USBDIV** (CLK_CLKDIV0[7:4]) to generate the proper USBD clock rate.

6.30.4.1 USB Device 1.1 Basic Configuration

- Clock source Configuration
 - Setting PLL controller (CLK_PLLCTL).
 - Select the clock divider number of USBD peripheral clock on **USBDIV**(CLK_CLKDIV0[7:4])
 - Enable USBD peripheral clock in **USBDCKEN** (CLK_APBCLK0[27]).
- Reset Configuration
 - Reset USBD controller in **USBDRST** (SYS_IPRST1[27]).
- Pin configuration

Group	Pin Name	GPIO	MFP
USB	USB_D+	PA.14	MFP14
	USB_D-	PA.13	MFP14
	USB_OTG_ID	PA.15	MFP14
	USB_VBUS	PA.12	MFP14

6.30.5 Functional Description

6.30.5.1 Serial Interface Engine (SIE)

The SIE is the front-end of the device controller and handles most of the USB packet protocol. The SIE typically comprehends signaling up to the transaction level. The functions that it handles could include:

- Packet recognition and transaction sequencing
- SOP, EOP, RESET, RESUME signal detection/generation
- Clock/Data separation
- NRZI Data encoding/decoding and bit-stuffing
- CRC generation and checking (for Token and Data)
- Packet ID (PID) generation and checking/decoding
- Serial-Parallel/Parallel-Serial conversion

6.30.5.2 Endpoint Control

This controller supports 12 endpoints. Each of the endpoint can be configured as Control, Bulk, Interrupt, or Isochronous transfer type. All the operations including Control, Bulk, Interrupt and Isochronous transfer are implemented in this block. It is also used to manage the data sequential synchronization, endpoint state control, current endpoint start address, current transaction status, and data buffer status in each endpoint.

6.30.5.3 Digital Phase Lock Loop (DPLL)

The bit rate of USB data is 12 MHz. The DPLL uses the 48 MHz which comes from the clock controller to lock the input data RXDP and RXDM. The 12 MHz bit rate clock is also converted from DPLL.

6.30.5.4 VBUS Detection De-bouncing

A USB device may be plugged-in or unplugged from the USB host. To monitor the state of a USB device when it is detached from the USB host, the device controller provides hardware de-bouncing for USB VBUS detection interrupt to avoid bounce problems on USB plug-in or unplug. VBUS detection interrupt appears about 10 ms later than USB plug-in or plug-out. User can acknowledge USB plug-in/plug-out by reading USBD_VBUSDET register. The VBUSDET flag represents the current state on the bus without de-bouncing. If VBUSDET is 1, it means the USB cable is plugged-in. If user polls the flag to check USB state, software de-bouncing must be added if needed.

6.30.5.5 Interrupt control

This USB provides 1 interrupt vector with 4 interrupt events (NEVWK, VBUSDET, USB and BUS). The NEVWK event occurs after waking up the system from Power-down mode (The power mode function is defined in system power-down control register, CLK_PWRCTL). The VBUSDET event is used for USB plug-in or unplug. The USB event notifies users of some USB requests, such as IN ACK, OUT ACK., and the BUS event notifies users of some bus events, such as suspend and, resume. The related bits must be set in the interrupt enable register (USBD_INTEN) of USB Device Controller to enable USB interrupts.

NEVWK interrupt is only presented when no the other USB interrupt events happened more than 20ms after the chip is waked up from Power-down mode. After the chip enters Power-down mode, any change on USB_VBUS, USB_D+ and USB_D- can wake up this chip if USB wake-up function is enabled. If this change is not intentionally, no interrupt but NEVWK interrupt will occur. After waking up by USB, this interrupt will occur when no the other USB interrupt events are presented for more than 20ms. Figure 6.30-2 shows the control flow of wake-up interrupt.

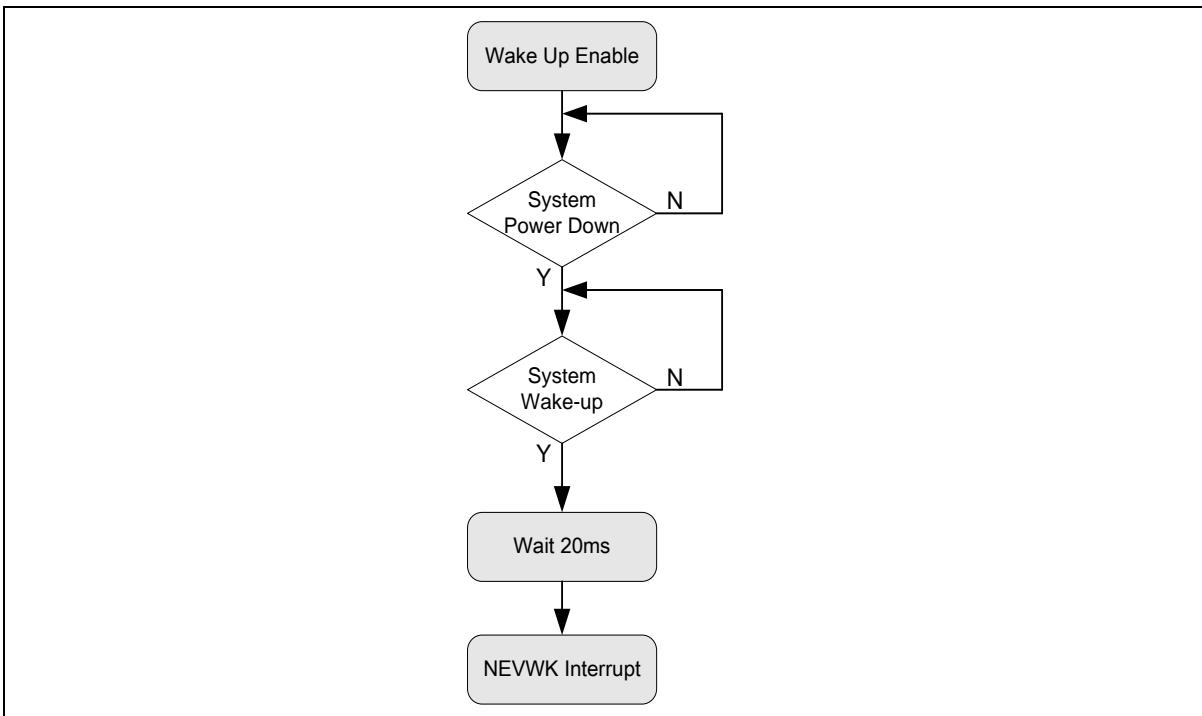

Figure 6.30-2 NEVWK Interrupt Operation Flow

The USB interrupt is used to notify users of any USB event on the bus, and user can read EPSTS (USBD_EPSTS0 and USBD_EPSTS1) and EPEVT11~0 (USBD_INTSTS[27:16]) to take necessary responses.

Same as USB interrupt, BUS interrupt notifies users of some bus events, like USB reset, suspend, time-out, and resume. A user can read USBD_ATTR to acknowledge bus events.

6.30.5.6 Power Saving

User can write 0 to USBD_ATTR[4] to disable PHY under special circumstances, like suspend, to conserve power.

6.30.5.7 Buffer Control

There is 1 Kbyte of SRAM in the controller and the 12 endpoints share this buffer. User shall configure each endpoint's effective starting address in the buffer segmentation register before the USB function active. The "Buffer Control" block is used to control each endpoint's effective starting address and its SRAM size is defined in the USBD_MXPLDx register.

Figure 6.30-3 depicts the starting address for each endpoint according the content of USBD_BUFSEGx and USBD_MXPLDx registers. If the USBD_BUFSEG0 is programmed as 0x08h and USBD_MXPLD0 is set as 0x40h, the SRAM size of endpoint 0 is start from USBD_BA+0x108h and end in USBD_BA+0x148h.

Note: The USBD SRAM base is USBD_BA+0x100h.

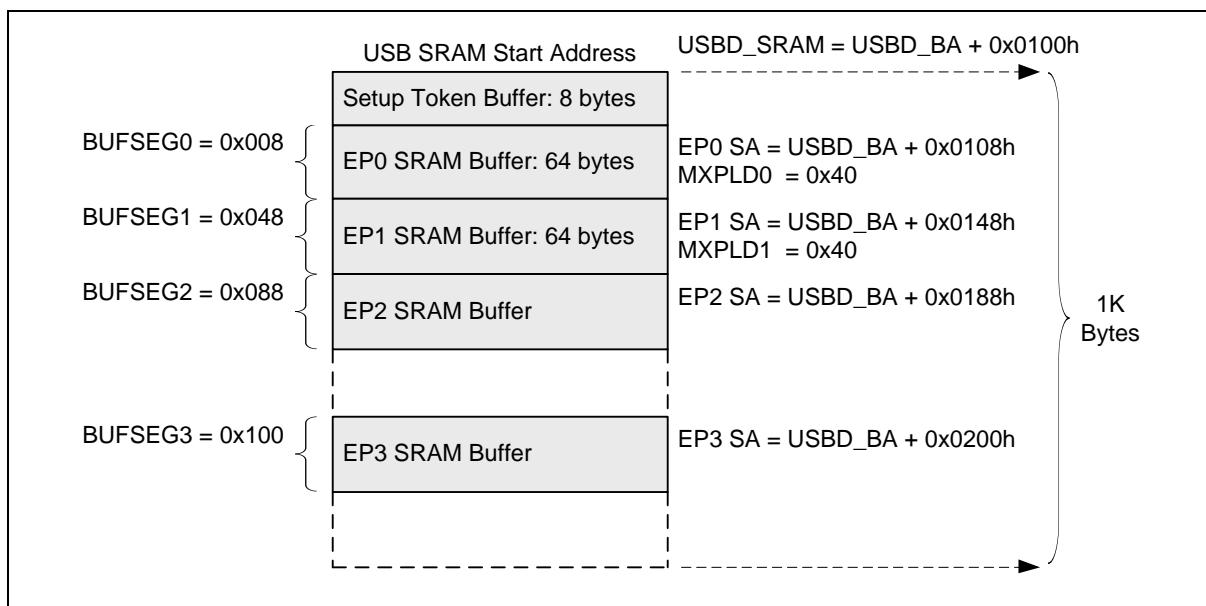

Figure 6.30-3 Endpoint SRAM Structure

6.30.5.8 Handling Transactions with USB Device Peripheral

User can use interrupt or polling USBD_INTSTS to monitor the USB transactions. When transactions occur, USBD_INTSTS will be set by hardware and send an interrupt request to CPU (if related interrupt enabled), or user can polling USBD_INTSTS to get these events without interrupt. The following is the control flow with interrupt enabled.

When USB host has requested data from a device controller, user needs to prepare related data in the specified endpoint buffer in advance. After buffering the required data, user needs to write the actual data length in the specified USBD_MXPLDx register. Once this register is written, the internal signal “In_Rdy” will be asserted and the buffering data will be transmitted immediately after receiving associated IN token from Host. Note that after transferring the specified data, the signal “In_Rdy” will de-assert automatically by hardware.

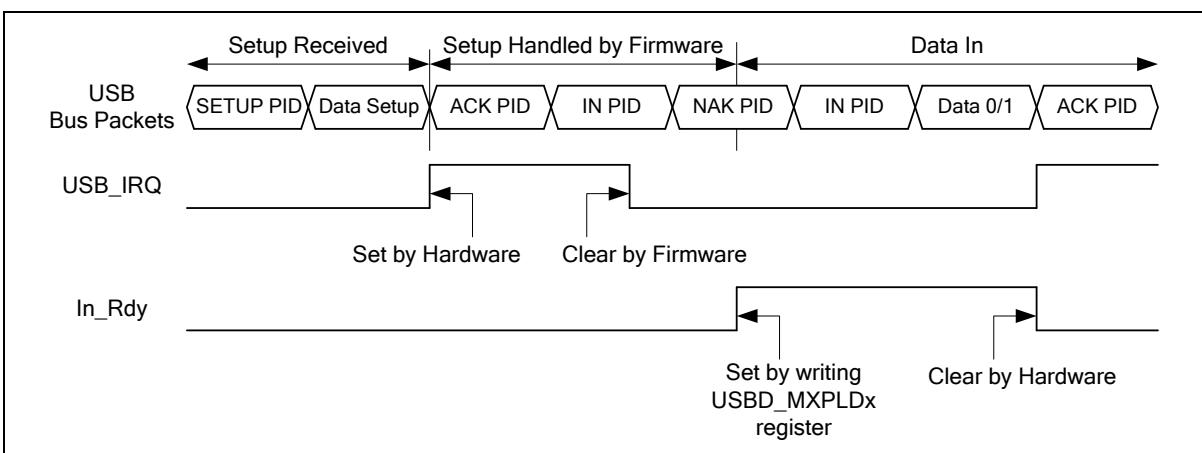

Figure 6.30-4 Setup Transaction Followed by Data IN Transaction

Alternatively, when USB host wants to transmit data to the OUT endpoint in the device controller, hardware will buffer these data to the specified endpoint buffer. After this transaction is completed, hardware will record the data length in specified USBD_MXPLDx register and de-assert the internal signal “Out_Rdy”. This will avoid hardware accepting next transaction until user moves out the current data in the related endpoint buffer. Once users have processed this transaction, the specified USBD_MXPLDx register needs to be written by firmware to assert the signal “Out_Rdy” again to accept the next transaction.

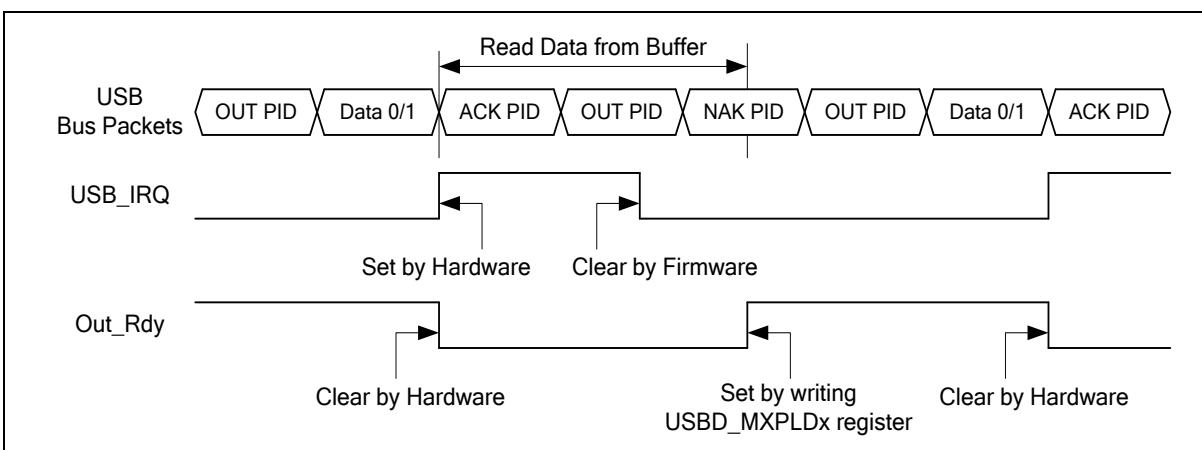

Figure 6.30-5 Data Out Transfer

6.30.5.9 Link Power Management(LPM)

Power Management(LPM) which is similar to the suspend/resume function, but has transitional

latencies of tens of microseconds between power states (instead of three to greater than 20 millisecond latencies of the USB2.0 suspend/resume)

New fast mechanism for transitioning the bus on a root port from an enable state (called L0), to a new sleep state(called L1), detail define for L0 and L1 state see Table 6.30-1, the register USBD_ATTR & USBD_LPMATTR can let user know current power state for LPM mechanism.

LPM State	Description
L0(On)	In this state, the port is enabled for propagation of transaction signaling traffic. A port in L0 is either actively transmitting or receiving data (L0-Active) or able to do so but not currently transmitting or receiving information (L0-Idle). While in this state Start-of-Frame (SOF) packets are issued by the host at a rate corresponding to the speed of the client device
L1(Sleep)	L1 is similar to L2 (below) but supports finer granularity in use. When in L1, the line state is identical to L2. Entry to L1 is started by a request to a hub or host port to transition to L1. A LPM transaction is sent to the downstream device. The requested transition can only occur if the device response with an ACK handshake. Exit from L1 is via remote wake, resume signaling, reset signaling or disconnect. L1 does not impose any specific power draw requirements (from VBUS) on the attached device as L2 does. Either the host or device can initiate resume signaling when in L1. Although the signaling levels of resume are the same as L2, the duration of the signaling and transitional latencies associated with the L1 to L0 transition are much shorter
L2(Suspend)	This is the formalized name for USB 2.0 Suspend, Entry to L2 is nominally triggered by a command to a hub or host port to transition to suspend. The device discovers the suspend condition via observing 3ms of inactivity. The resultant line state is either Low or Full-speed idle. L2 also imposes power draw requirements (from VBUS) on the attached device. Exit from this state is via remote wake, resume signaling, reset signaling or disconnect.
L3(Off)	In this state, the port is not capable of performing any data signaling. It corresponds to the powered-off, disconnected, and disabled states

Table 6.30-1 USB Link Power Manager (Lx) States

The state transaction process please refer to Figure 6.30-6, and for more information on the USB Link Power Manager(LPM), please refer to USB2.0 Link Power Mangement ECN.

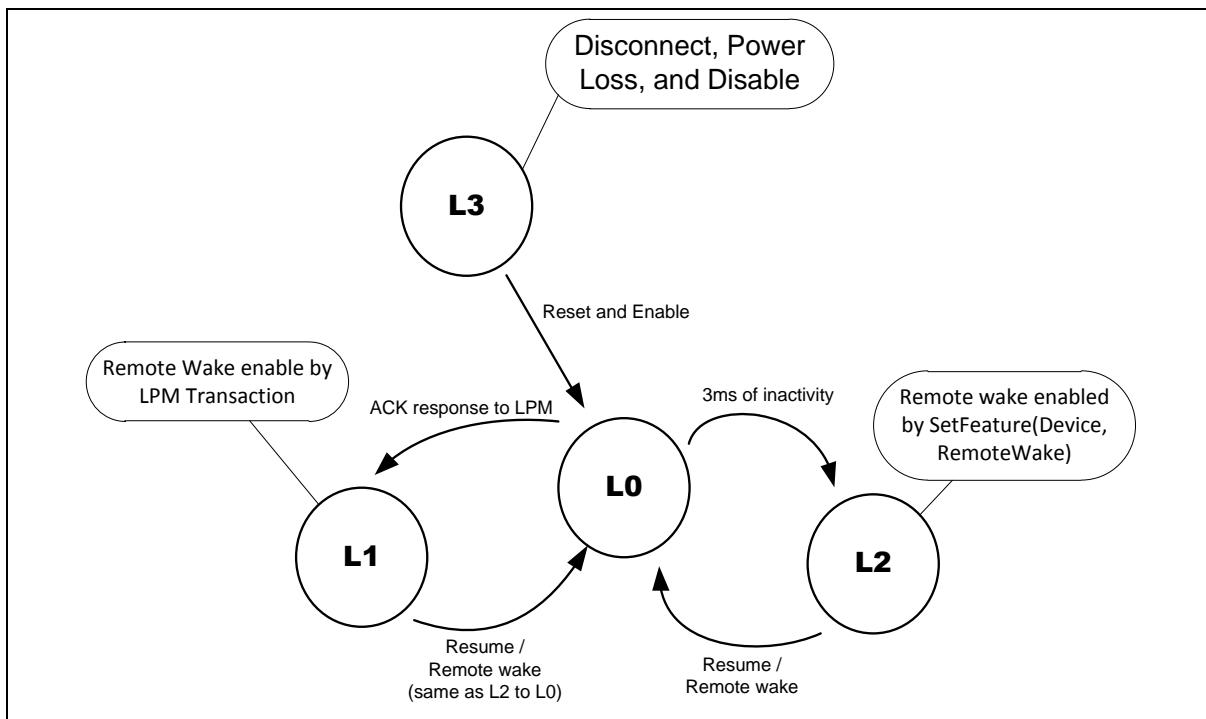

Figure 6.30-6 LPM State Transition Diagram

Reserved							
7	6	5	4	3	2	1	0
Reserved			SOFIF	NEVWKIF	VBDETIF	USBIF	BUSIF

Bits	Description	
[31]	SETUP	Setup Event Status 0 = No Setup event. 1 = Setup event occurred, cleared by write 1 to USBD_INTSTS[31].
[30:28]	Reserved	Reserved.
[27]	EPEVT11	Endpoint 11's USB Event Status 0 = No event occurred in endpoint 11. 1 = USB event occurred on Endpoint 11, check USBD_EPSTS1[15:12] to know which kind of USB event was occurred, cleared by write 1 to USBD_INTSTS[27] or USBD_INTSTS[1].
[26]	EPEVT10	Endpoint 10's USB Event Status 0 = No event occurred in endpoint 10. 1 = USB event occurred on Endpoint 10, check USBD_EPSTS1[11:8] to know which kind of USB event was occurred, cleared by write 1 to USBD_INTSTS[26] or USBD_INTSTS[1].
[25]	EPEVT9	Endpoint 9's USB Event Status 0 = No event occurred in endpoint 9. 1 = USB event occurred on Endpoint 9, check USBD_EPSTS1[7:4] to know which kind of USB event was occurred, cleared by write 1 to USBD_INTSTS[25] or USBD_INTSTS[1].
[24]	EPEVT8	Endpoint 8's USB Event Status 0 = No event occurred in endpoint 8. 1 = USB event occurred on Endpoint 8, check USBD_EPSTS1[3:0] to know which kind of USB event was occurred, cleared by write 1 to USBD_INTSTS[24] or USBD_INTSTS[1].
[23]	EPEVT7	Endpoint 7's USB Event Status 0 = No event occurred in endpoint 7. 1 = USB event occurred on Endpoint 7, check USBD_EPSTS0[31:28] to know which kind of USB event was occurred, cleared by write 1 to USBD_INTSTS[23] or USBD_INTSTS[1].

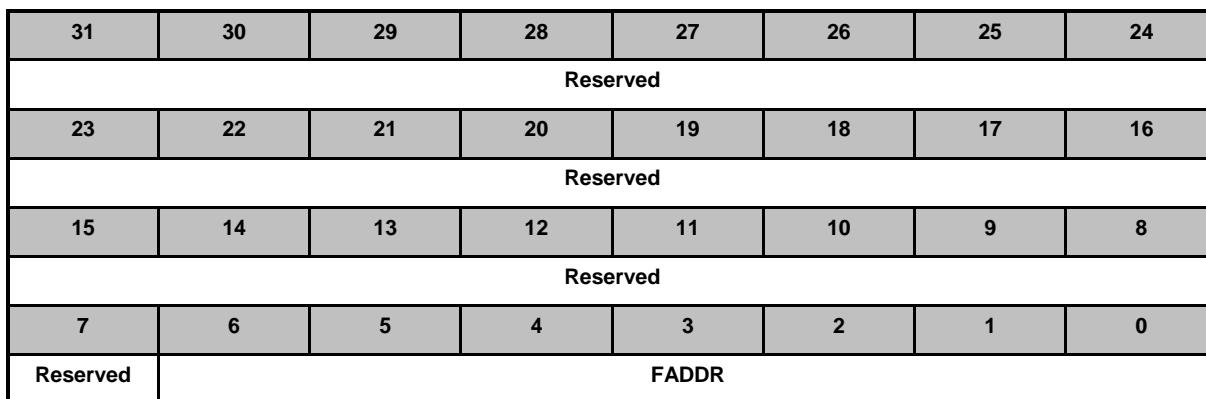

[22]	EPEVT6	Endpoint 6's USB Event Status 0 = No event occurred in endpoint 6. 1 = USB event occurred on Endpoint 6, check USBD_EPSTS0[27:24] to know which kind of USB event was occurred, cleared by write 1 to USBD_INTSTS[22] or USBD_INTSTS[1].
[21]	EPEVT5	Endpoint 5's USB Event Status 0 = No event occurred in endpoint 5. 1 = USB event occurred on Endpoint 5, check USBD_EPSTS0[23:20] to know which kind of USB event was occurred, cleared by write 1 to USBD_INTSTS[21] or USBD_INTSTS[1].
[20]	EPEVT4	Endpoint 4's USB Event Status 0 = No event occurred in endpoint 4. 1 = USB event occurred on Endpoint 4, check USBD_EPSTS0[19:16] to know which kind of USB event was occurred, cleared by write 1 to USBD_INTSTS[20] or USBD_INTSTS[1].
[19]	EPEVT3	Endpoint 3's USB Event Status 0 = No event occurred in endpoint 3. 1 = USB event occurred on Endpoint 3, check USBD_EPSTS0[15:12] to know which kind of USB event was occurred, cleared by write 1 to USBD_INTSTS[19] or USBD_INTSTS[1].
[18]	EPEVT2	Endpoint 2's USB Event Status 0 = No event occurred in endpoint 2. 1 = USB event occurred on Endpoint 2, check USBD_EPSTS0[11:8] to know which kind of USB event was occurred, cleared by write 1 to USBD_INTSTS[18] or USBD_INTSTS[1].
[17]	EPEVT1	Endpoint 1's USB Event Status 0 = No event occurred in endpoint 1. 1 = USB event occurred on Endpoint 1, check USBD_EPSTS0[7:4] to know which kind of USB event was occurred, cleared by write 1 to USBD_INTSTS[17] or USBD_INTSTS[1].
[16]	EPEVT0	Endpoint 0's USB Event Status 0 = No event occurred in endpoint 0. 1 = USB event occurred on Endpoint 0, check USBD_EPSTS0[3:0] to know which kind of USB event was occurred, cleared by write 1 to USBD_INTSTS[16] or USBD_INTSTS[1].
[15:5]	Reserved	Reserved.
[4]	SOFIF	Start of Frame Interrupt Status 0 = SOF event does not occur. 1 = SOF event occurred, cleared by write 1 to USBD_INTSTS[4].
[3]	NEVWKIF	No-event-wake-up Interrupt Status 0 = NEVWK event does not occur. 1 = No-event-wake-up event occurred, cleared by write 1 to USBD_INTSTS[3].
[2]	VBDETIF	VBUS Detection Interrupt Status 0 = There is not attached/detached event in the USB. 1 = There is attached/detached event in the USB bus and it is cleared by write 1 to USBD_INTSTS[2].
[1]	USBIF	USB Event Interrupt Status The USB event includes the SETUP Token, IN Token, OUT ACK, ISO IN, or ISO OUT events in the bus. 0 = No USB event occurred. 1 = USB event occurred, check EPSTS0~5[2:0] to know which kind of USB event was

		occurred, cleared by write 1 to USBD_INTSTS[1] or EPSTS0~11 and SETUP (USBD_INTSTS[31]).
[0]	BUSIF	BUS Interrupt Status The BUS event means that there is one of the suspense or the resume function in the bus. 0 = No BUS event occurred. 1 = Bus event occurred; check USBD_ATTR[3:0] to know which kind of bus event was occurred, cleared by write 1 to USBD_INTSTS[0].

USB Device Function Address Register (USBD_FADDR)

A 7-bit value is used as the address of a device on the USB BUS.

Register	Offset	R/W	Description					Reset Value
USBD_FADDR	USBD_BA+0x008	R/W	USB Device Function Address Register					0x0000_0000

Bits	Description	
[31:7]	Reserved	Reserved.
[6:0]	FADDR	USB Device Function Address

USB Endpoint Status Register (USBD_EPSTS)

Register	Offset	R/W	Description				Reset Value
USBD_EPSTS	USBD_BA+0x00C	R	USB Device Endpoint Status Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
OV Reserved							

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	OV	Overrun It indicates that the received data is over the maximum payload number or not. 0 = No overrun. 1 = Out Data is more than the Max Payload in MXPLD register or the Setup Data is more than 8 Bytes.
[6:0]	Reserved	Reserved.

USB Bus Status and Attribution Register (USBD_ATTR)

Register	Offset	R/W	Description					Reset Value
USBD_ATTR	USBD_BA+0x010	R/W	USB Device Bus Status and Attribution Register					0x0000_0040

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved		L1RESUME	L1SUSPEND	LPMACK	BYTEM	Reserved	DPPUEN
7	6	5	4	3	2	1	0
USBEN	Reserved	RWAKEUP	PHYEN	TOUT	RESUME	SUSPEND	USBRST

Bits	Description	
[31:14]	Reserved	Reserved.
[13]	L1RESUME	LPM L1 Resume (Read Only) 0 = Bus no LPM L1 state resume. 1 = LPM L1 state Resume from LPM L1 state suspend.
[12]	L1SUSPEND	LPM L1 Suspend (Read Only) 0 = Bus no L1 state suspend. 1 = This bit is set by the hardware when LPM command to enter the L1 state is successfully received and acknowledged.
[11]	LPMACK	LPM Token Acknowledge Enable Bit The NYET/ACK will be returned only on a successful LPM transaction if no errors in both the EXT token and the LPM token and a valid bLinkState = 0001 (L1) is received, else ERROR and STALL will be returned automatically, respectively. 0= the valid LPM Token will be NYET. 1= the valid LPM Token will be ACK.
[10]	BYTEM	CPU Access USB SRAM Size Mode Selection 0 = Word mode: The size of the transfer from CPU to USB SRAM can be Word only. 1 = Byte mode: The size of the transfer from CPU to USB SRAM can be Byte only.
[9]	Reserved	Reserved.
[8]	DPPUEN	Pull-up Resistor on USB_DP Enable Bit 0 = Pull-up resistor in USB_D+ bus Disabled. 1 = Pull-up resistor in USB_D+ bus Active.
[7]	USBEN	USB Controller Enable Bit 0 = USB Controller Disabled. 1 = USB Controller Enabled.
[6]	Reserved	Reserved.
[5]	RWAKEUP	Remote Wake-up

		0 = Release the USB bus from K state. 1 = Force USB bus to K (USB_D+ low, USB_D-: high) state, used for remote wake-up.
[4]	PHYEN	PHY Transceiver Function Enable Bit 0 = PHY transceiver function Disabled. 1 = PHY transceiver function Enabled.
[3]	TOUT	Time-out Status (Read Only) 0 = No time-out. 1 = No Bus response more than 18 bits time.
[2]	RESUME	Resume Status (Read Only) 0 = No bus resume. 1 = Resume from suspend.
[1]	SUSPEND	Suspend Status (Read Only) 0 = Bus no suspend. 1 = Bus idle more than 3ms, either cable is plugged off or host is sleeping.
[0]	USBRST	USB Reset Status (Read Only) 0 = Bus no reset. 1 = Bus reset when SE0 (single-ended 0) more than 2.5us.

USB Device VBUS Detection Register (USBD_VBUSDET)

Register	Offset	R/W	Description	Reset Value
USBD_VBUSDET	USBD_BA+0x014	R	USB Device VBUS Detection Register	0x0000_0000

USBD_MXPLD11	USBD_BA+0x5B4	R/W	Endpoint 11 Maximal Payload Register	0x0000_0000

Bits	Description	
[31:9]	Reserved	Reserved.
[8:0]	MXPLD	<p>Maximal Payload Define the data length which is transmitted to host (IN token) or the actual data length which is received from the host (OUT token). It also used to indicate that the endpoint is ready to be transmitted in IN token or received in OUT token.</p> <p>(1) When the register is written by CPU, For IN token, the value of MXPLD is used to define the data length to be transmitted and indicate the data buffer is ready. For OUT token, it means that the controller is ready to receive data from the host and the value of MXPLD is the maximal data length comes from host.</p> <p>(2) When the register is read by CPU,</p>

		For IN token, the value of MXPLD is indicated by the data length be transmitted to host For OUT token, the value of MXPLD is indicated the actual data length receiving from host. Note: Once MXPLD is written, the data packets will be transmitted/received immediately after IN/OUT token arrived.

Reserved						SSTALL	CLRRDY

Bits	Description	
[31:2]	Reserved	Reserved.
[1]	SSTALL	Set STALL 0 = Disable the device to response STALL. 1 = Set the device to respond STALL automatically.
[0]	CLRRDY	Clear Ready When the USBD_MXPLDx register is set by user, it means that the endpoint is ready to transmit or receive data. If the user wants to disable this transaction before the transaction start, users can set this bit to 1 to disable it and it is auto clear to 0. For IN token, write '1' to clear the IN token had ready to transmit the data to USB. For OUT token, write '1' to clear the OUT token had ready to receive the data from USB. This bit is write 1 only and is always 0 when it is read back.

6.31 High Speed USB 2.0 Device Controller (HSUSBD)

6.31.1 Overview

The USB device controller interfaces the AHB bus and the UTMI bus. The USB controller contains both the AHB master interface and AHB slave interface. CPU programs the USB controller registers through the AHB slave interface. For IN or OUT transfer, the USB device controller needs to write data to memory or read data from memory through the AHB master interface. The USB device controller is complaint with USB 2.0 specification and it contains 12 configurable endpoints in addition to control endpoint. These endpoints could be configured to BULK, INTERRUPT or ISO. The USB device controller has a built-in DMA to relieve the load of CPU.

6.31.2 Features

- USB Specification reversion 2.0 compliant
- Supports 12 configurable endpoints in addition to Control Endpoint
- Each of the endpoints can be Isochronous, Bulk or Interrupt and either IN or OUT direction
- Three different operation modes of an in-endpoint — Auto Validation mode, Manual Validation mode, Fly mode
- Supports DMA operation
- 4092 Bytes Configurable RAM used as endpoint buffer
- Supports Endpoint Maximum Packet Size up to 1024 bytes

6.31.3 Block Diagram

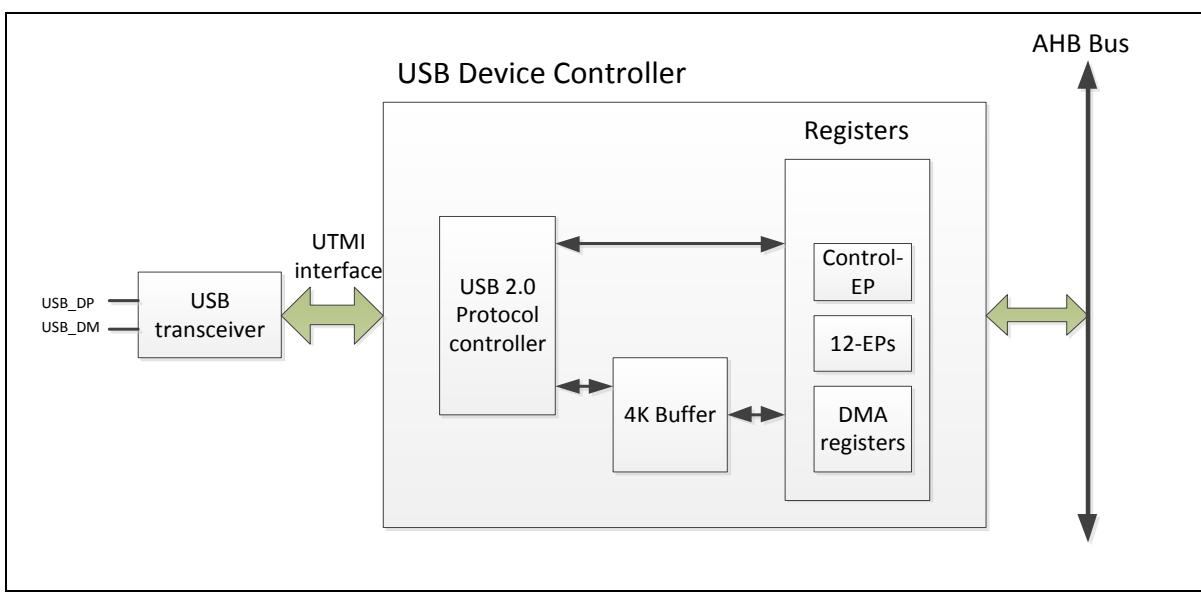

Figure 6.31-1 USB Device Controller Block Diagram

6.31.4 Basic Configuration

- Clock Source Configuration
 - Enable HSUSBD clock in HSUSBDCKEN (CLK_AHBCLOCK[10]).
- Reset Configuration
 - Reset HSUSBD controller in HSUSBDRST (SYS_IPRST0[10]).

6.31.5 Functional Description

6.31.5.1 Operation of Different In-transfer Modes

The data for any in-transfer is written into the internal buffer when in turn is sent to the host on receipt of an in-token. There are three different modes by which the data sent to the host is validated by CPU.

- Auto-Validation Mode
- Manual-Validation Mode
- Fly Mode

6.31.5.2 Auto-Validation Mode

If an endpoint is selected to be operating in auto-validation mode, the endpoint responds only with data payload to be equal to EPMPS register. The endpoint controller wait until the amount of data is equal to EPMPS value and then validates the data. If CPU needs to send a short-packet at the end of a transfer, the SHORTTXEN bit of HSUSBD_EPxRSPCTL[6] should be set. When this bit set, any remaining data in the buffer is validated and is sent to the host, for the forthcoming in-token.

This mode requires least intervention of CPU, as most of the work is done by the USB device controller. The mode can be selected, when the data payload sent to host is always equal to MPS size.

SHORTTXEN	Data Availability In Buffer	Data Sent/NAK Sent
0	< Max. Packet Size	NAK sent
0	>= Max. Packet Size	Data payload of max. packet size
1	< Max. Packet Size	Available data of < max. packet size
1	>= Max. Packet Size	Data payload of max. packet size sent

6.31.5.3 Manual-Validation Mode

If the endpoint is selected to be operating in manual-validation mode, the endpoint responds only when the data in the buffer is validated by CPU every time. The CPU has to write data into the buffer and then write the count of the data into EPxTxCNT register. Once the data is validating by writing a count into the EPxTxCNT register, the data is sent to the host on receipt of an in-token.

This mode requires intervention of CPU for each transfer. But this would be useful, if the data-count to be sent each time is not fixed, and it is being decided by CPU.

EPxTxCNT Written	Data Availability In Buffer	Data Sent/NAK Sent
NO	-	NAK
YES	EPxTxCNT	Data payload of EPxTxCNT sent

6.31.5.4 Fly Mode

The fly mode of operation is simplest mode of operation, where there is no validation procedure. The buffer is being filled by CPU. If an in-token is send from the host, the data in the buffer is automatically validated and sent to the host. If the data in the buffer spans more than one packet of maximum packet size, the controller automatically packs to equal to MPS and send it to the host.

This mode requires the least intervention by CPU. This mode is best suited for isochronous data transfer, where the speed of data transfer is more important than the packet size.

Data Availability In Buffer	Data Sent
< Max. Packet Size	Data available sent
>= Max. Packet Size	Data payload of max. packet size sent.

6.31.5.5 Scatter-Gather Function

User enables DMA scatter gather function by setting SGEN (HSUSBD_DMACTL[6]) =1, and sets HSUSBD_DMACNT as 8 bytes, and the memory address and length will be recorded in the descriptor. The format is shown in Table 6.31-1.

	Format		
	[31]	[30]	[29:0]
Word0	MEM_ADDR[31:0]		
Word1	EOT	RD	Reserved
			Count[19:0]

Table 6.31-1 Scatter Gather Descriptor Format

MEM_ADDR: It specifies the memory address (AHB address).

EOT: end of transfer. When this bit is set to high, it means this is the last descriptor.

RD: “1” means read from memory into buffer. “0” means read from buffer into memory.

6.31.6 Registers Map

R: read only, W: write only, R/W: both read and write

Bits	Description	
[31:14]	Reserved	Reserved.
[13]	EPLIF	<p>Endpoint L Interrupt</p> <p>When set, the corresponding Endpoint L's interrupt status register should be read to determine the cause of the interrupt.</p> <p>0 = No interrupt event occurred.</p> <p>1 = The related interrupt event occurred.</p>
[12]	EPKIF	<p>Endpoint K Interrupt</p> <p>When set, the corresponding Endpoint K's interrupt status register should be read to determine the cause of the interrupt.</p> <p>0 = No interrupt event occurred.</p> <p>1 = The related interrupt event occurred.</p>
[11]	EPJIF	<p>Endpoint J Interrupt</p> <p>When set, the corresponding Endpoint J's interrupt status register should be read to determine the cause of the interrupt.</p> <p>0 = No interrupt event occurred.</p> <p>1 = The related interrupt event occurred.</p>
[10]	EPIIF	<p>Endpoint I Interrupt</p> <p>When set, the corresponding Endpoint I's interrupt status register should be read to determine the cause of the interrupt.</p> <p>0 = No interrupt event occurred.</p> <p>1 = The related interrupt event occurred.</p>
[9]	EPHIF	<p>Endpoint H Interrupt</p> <p>When set, the corresponding Endpoint H's interrupt status register should be read to determine the cause of the interrupt.</p> <p>0 = No interrupt event occurred.</p> <p>1 = The related interrupt event occurred.</p>

[8]	EPGIF	Endpoint G Interrupt When set, the corresponding Endpoint G's interrupt status register should be read to determine the cause of the interrupt. 0 = No interrupt event occurred. 1 = The related interrupt event occurred.
[7]	EPFIF	Endpoint F Interrupt When set, the corresponding Endpoint F's interrupt status register should be read to determine the cause of the interrupt. 0 = No interrupt event occurred. 1 = The related interrupt event occurred.
[6]	EPEIF	Endpoint E Interrupt When set, the corresponding Endpoint E's interrupt status register should be read to determine the cause of the interrupt. 0 = No interrupt event occurred. 1 = The related interrupt event occurred.
[5]	EPDIF	Endpoint D Interrupt When set, the corresponding Endpoint D's interrupt status register should be read to determine the cause of the interrupt. 0 = No interrupt event occurred. 1 = The related interrupt event occurred.
[4]	EPCIF	Endpoint C Interrupt When set, the corresponding Endpoint C's interrupt status register should be read to determine the cause of the interrupt. 0 = No interrupt event occurred. 1 = The related interrupt event occurred.
[3]	EPBIF	Endpoint B Interrupt When set, the corresponding Endpoint B's interrupt status register should be read to determine the cause of the interrupt. 0 = No interrupt event occurred. 1 = The related interrupt event occurred.
[2]	EPAIF	Endpoint a Interrupt When set, the corresponding Endpoint A's interrupt status register should be read to determine the cause of the interrupt. 0 = No interrupt event occurred. 1 = The related interrupt event occurred.
[1]	CEPIF	Control Endpoint Interrupt This bit conveys the interrupt status for control endpoint. When set, Control-ep's interrupt status register should be read to determine the cause of the interrupt. 0 = No interrupt event occurred. 1 = The related interrupt event occurred.
[0]	USBIF	USB Interrupt This bit conveys the interrupt status for USB specific events endpoint. When set, USB interrupt status register should be read to determine the cause of the interrupt. 0 = No interrupt event occurred. 1 = The related interrupt event occurred.

Global Interrupt Enable Register (HSUSBD_GINTEN)

Register	Offset	R/W	Description				Reset Value
HSUSBD_GINTEN	HSUSBD_BA+0x008	R/W	Global Interrupt Enable Register				0x0000_0001

Bits	Description	
[31:14]	Reserved	Reserved.
[13]	EPLIEN	Interrupt Enable Control for Endpoint L When set, this bit enables a local interrupt to be generated when an interrupt is pending for the endpoint L 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.
[12]	EPKIEN	Interrupt Enable Control for Endpoint K When set, this bit enables a local interrupt to be generated when an interrupt is pending for the endpoint K 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.
[11]	EPJIEN	Interrupt Enable Control for Endpoint J When set, this bit enables a local interrupt to be generated when an interrupt is pending for the endpoint J 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.
[10]	EPIIEN	Interrupt Enable Control for Endpoint I When set, this bit enables a local interrupt to be generated when an interrupt is pending for the endpoint I 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.
[9]	EPHIEN	Interrupt Enable Control for Endpoint H When set, this bit enables a local interrupt to be generated when an interrupt is pending for the endpoint H 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.

[8]	EPGIEN	Interrupt Enable Control for Endpoint G When set, this bit enables a local interrupt to be generated when an interrupt is pending for the endpoint G 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.
[7]	EPFIEN	Interrupt Enable Control for Endpoint F When set, this bit enables a local interrupt to be generated when an interrupt is pending for the endpoint F 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.
[6]	EPEIEN	Interrupt Enable Control for Endpoint E When set, this bit enables a local interrupt to be generated when an interrupt is pending for the endpoint E 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.
[5]	EPDIEN	Interrupt Enable Control for Endpoint D When set, this bit enables a local interrupt to be generated when an interrupt is pending for the endpoint D 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.
[4]	EPCIEN	Interrupt Enable Control for Endpoint C When set, this bit enables a local interrupt to be generated when an interrupt is pending for the endpoint C 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.
[3]	EPBIEN	Interrupt Enable Control for Endpoint B When set, this bit enables a local interrupt to be generated when an interrupt is pending for the endpoint B 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.
[2]	EPAIEN	Interrupt Enable Control for Endpoint a When set, this bit enables a local interrupt to be generated when an interrupt is pending for the endpoint A. 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.
[1]	CEPIEN	Control Endpoint Interrupt Enable Bit When set, this bit enables a local interrupt to be generated when an interrupt is pending for the control endpoint. 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.
[0]	USBIEN	USB Interrupt Enable Bit When set, this bit enables a local interrupt to be generated when a USB event occurs on the bus. 0 = The related interrupt Disabled. 1 = The related interrupt Enabled.

USB Bus Interrupt Status Register (HSUSBD_BUSINTSTS)

Register	Offset	R/W	Description			Reset Value
HSUSBD_BUSINTSTS	HSUSBD_BA+0x010	R/W	USB Bus Interrupt Status Register			0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8
Reserved							VBUSDETIF
7	6	5	4	3	2	1	0
Reserved	PHYCLKVLDIF	DMADONEIF	HISPDIF	SUSPENDIF	RESUMEIF	RSTIF	SOFIF

Bits	Description	
[31:9]	Reserved	Reserved.
[8]	VBUSDETIF	VBUS Detection Interrupt Status 0 = No VBUS is plug-in. 1 = VBUS is plug-in. Note: Write 1 to clear this bit to 0.
[7]	Reserved	Reserved.
[6]	PHYCLKVLDIF	Usable Clock Interrupt 0 = Usable clock is not available. 1 = Usable clock is available from the transceiver. Note: Write 1 to clear this bit to 0.
[5]	DMADONEIF	DMA Completion Interrupt 0 = No DMA transfer over. 1 = DMA transfer is over. Note: Write 1 to clear this bit to 0.
[4]	HISPDIF	High-speed Settle 0 = No valid high-speed reset protocol is detected. 1 = Valid high-speed reset protocol is over and the device has settled in high-speed. Note: Write 1 to clear this bit to 0.
[3]	SUSPENDIF	Suspend Request This bit is set as default and it has to be cleared by writing '1' before the USB reset. This bit is also set when a USB Suspend request is detected from the host. 0 = No USB Suspend request is detected from the host. 1= USB Suspend request is detected from the host. Note: Write 1 to clear this bit to 0.

[2]	RESUMEIF	Resume When set, this bit indicates that a device resume has occurred. 0 = No device resume has occurred. 1 = Device resume has occurred. Note: Write 1 to clear this bit to 0.
[1]	RSTIF	Reset Status When set, this bit indicates that either the USB root port reset is end. 0 = No USB root port reset is end. 1 = USB root port reset is end. Note: Write 1 to clear this bit to 0.
[0]	SOFIF	SOF Receive Control This bit indicates when a start-of-frame packet has been received. 0 = No start-of-frame packet has been received. 1 = Start-of-frame packet has been received. Note: Write 1 to clear this bit to 0.

USB Bus Interrupt Enable Register (HSUSBD_BUSINTEN)

Register	Offset	R/W	Description					Reset Value

Bits	Description	
[31:9]	Reserved	Reserved.
[8]	VBUSDETIEN	VBUS Detection Interrupt Enable Bit This bit enables the VBUS floating detection interrupt. 0 = VBUS floating detection interrupt Disabled. 1 = VBUS floating detection interrupt Enabled.
[7]	Reserved	Reserved.
[6]	PHYCLKVLDIEN	Usable Clock Interrupt This bit enables the usable clock interrupt. 0 = Usable clock interrupt Disabled. 1 = Usable clock interrupt Enabled.
[5]	DMADONEIEN	DMA Completion Interrupt This bit enables the DMA completion interrupt 0 = DMA completion interrupt Disabled. 1 = DMA completion interrupt Enabled.
[4]	HISPDien	High-speed Settle This bit enables the high-speed settle interrupt. 0 = High-speed settle interrupt Disabled. 1 = High-speed settle interrupt Enabled.
[3]	SUSPENDIE N	Suspend Request This bit enables the Suspend interrupt. 0 = Suspend interrupt Disabled. 1 = Suspend interrupt Enabled.
[2]	RESUMEIEN	Resume This bit enables the Resume interrupt. 0 = Resume interrupt Disabled. 1 = Resume interrupt Enabled.

[1]	RSTIEN	Reset Status This bit enables the USB-Reset interrupt. 0 = USB-Reset interrupt Disabled. 1 = USB-Reset interrupt Enabled.
[0]	SOFIEN	SOF Interrupt This bit enables the SOF interrupt. 0 = SOF interrupt Disabled. 1 = SOF interrupt Enabled.

USB Operational Register (HSUSBD_OPER)

Register	Offset	R/W	Description				Reset Value
HSUSBD_OPER	HSUSBD_BA+0x018	R/W	USB Operational Register				0x0000_0002

31	30	29	28	27	26	25	24

15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved				CURSPD	HISPDEN	RESUMEEN	

Bits	Description	
[31:3]	Reserved	Reserved.
[2]	CURSPD	USB Current Speed 0 = The device has settled in Full Speed. 1 = The USB device controller has settled in High-speed.
[1]	HISPDEN	USB High-speed 0 = The USB device controller to suppress the chirp-sequence during reset protocol, thereby allowing the USB device controller to settle in full-speed, even though it is connected to a USB2.0 Host. 1 = The USB device controller to initiate a chirp-sequence during reset protocol.
[0]	RESUMEEN	Generate Resume 0 = No Resume sequence to be initiated to the host. 1 = A Resume sequence to be initiated to the host if device remote wakeup is enabled. This bit is self-clearing.

USB Frame Count Register (HSUSBD_FRAMECNT)

Register	Offset	R/W	Description	Reset Value
HSUSBD_FRAMECNT	HSUSBD_BA+0x01C	R	USB Frame Count Register	0x0000_0000

Reserved				TESTMODE			

Bits	Description	
[31:3]	Reserved	Reserved.
[2:0]	TESTMODE	<p>Test Mode Selection</p> <p>000 = Normal Operation. 001 = Test_J. 010 = Test_K. 011 = Test_SE0_NAK. 100 = Test_Packet. 101 = Test_Force_Enable. 110 = Reserved. 111 = Reserved.</p> <p>Note: This field is cleared when root port reset is detected.</p>

Control-ep Data Buffer (HSUSBD_CEPDAT)

Register	Offset	R/W	Description					Reset Value
HSUSBD_CEPDAT	HSUSBD_BA+0x028	R/W	Control-Endpoint Data Buffer					0x0000_0000

31	30	29	28	27	26	25	24
DAT							
23	22	21	20	19	18	17	16
DAT							
15	14	13	12	11	10	9	8
DAT							
7	6	5	4	3	2	1	0
DAT							

Bits	Description	
[31:0]	DAT	Control-endpoint Data Buffer Control endpoint data buffer for the buffer transaction (read or write). Note: Only word or byte access are supported.

Control-endpoint Control Register (HSUSBD_CEPCTL)

Register	Offset	R/W	Description					Reset Value
HSUSBD_CEPCTL	HSUSBD_BA+0x02C	R/W	Control-Endpoint Control Register					0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved				FLUSH	ZEROLEN	STALLEN	NAKCLR

Bits	Description	
[31:4]	Reserved	Reserved.
[3]	FLUSH	CEP-flush Bit 0 = No the packet buffer and its corresponding HSUSBD_CEPDATCNT register to be cleared. 1 = The packet buffer and its corresponding HSUSBD_CEPDATCNT register to be cleared. This bit is self-cleaning.
[2]	ZEROLEN	Zero Packet Length This bit is valid for Auto Validation mode only. 0 = No zero length packet to the host during Data stage to an IN token. 1 = USB device controller can send a zero length packet to the host during Data stage to an IN token. This bit gets cleared once the zero length data packet is sent. So, the local CPU need not write again to clear this bit.
[1]	STALLEN	Stall Enable Bit When this stall bit is set, the control endpoint sends a stall handshake in response to any in or out token thereafter. This is typically used for response to invalid/unsupported requests. When this bit is being set the NAK clear bit has to be cleared at the same time since the NAK clear bit has highest priority than STALL. It is automatically cleared on receipt of a next setup-token. So, the local CPU need not write again to clear this bit. 0 = No sends a stall handshake in response to any in or out token thereafter. 1 = The control endpoint sends a stall handshake in response to any in or out token thereafter. Note: Only when CPU writes data[1:0] is 2'b10 or 2'b00, this bit can be updated.

[0]	NAKCLR	<p>No Acknowledge Control</p> <p>This bit plays a crucial role in any control transfer.</p> <p>0 = The bit is being cleared by the local CPU by writing zero, the USB device controller will be responding with NAKs for the subsequent status phase. This mechanism holds the host from moving to the next request, until the local CPU is also ready to process the next request.</p> <p>1 = This bit is set to one by the USB device controller, whenever a setup token is received. The local CPU can take its own time to finish off any house-keeping work based on the request and then clear this bit.</p> <p>Note: Only when CPU writes data[1:0] is 2'b10 or 2'b00, this bit can be updated.</p>

7	6	5	4	3	2	1	0
NAKIF	RXPKIF	TXPKIF	PINGIF	INTKIF	OUTTKIF	SETUPPKIF	SETUPTKIF

Bits	Description	
[31:13]	Reserved	Reserved.
[12]	BUFEMPTYIF	Buffer Empty Interrupt 0 = The control-endpoint buffer is not empty. 1 = The control-endpoint buffer is empty. Note: Write 1 to clear this bit to 0.
[11]	BUFFULLIF	Buffer Full Interrupt 0 = The control-endpoint buffer is not full. 1 = The control-endpoint buffer is full. Note: Write 1 to clear this bit to 0.
[10]	STSDONEIF	Status Completion Interrupt 0 = Not a USB transaction has completed successfully. 1 = The status stage of a USB transaction has completed successfully. Note: Write 1 to clear this bit to 0.
[9]	ERRIF	USB Error Interrupt 0 = No error had occurred during the transaction. 1 = An error had occurred during the transaction. Note: Write 1 to clear this bit to 0.
[8]	STALLIF	STALL Sent Interrupt 0 = Not a stall-token is sent in response to an IN/OUT token. 1 = A stall-token is sent in response to an IN/OUT token. Note: Write 1 to clear this bit to 0.
[7]	NAKIF	NAK Sent Interrupt 0 = Not a NAK-token is sent in response to an IN/OUT token. 1 = A NAK-token is sent in response to an IN/OUT token. Note: Write 1 to clear this bit to 0.

[6]	RXPKIF	Data Packet Received Interrupt 0 = Not a data packet is successfully received from the host for an OUT-token and an ACK is sent to the host. 1 = A data packet is successfully received from the host for an OUT-token and an ACK is sent to the host. Note: Write 1 to clear this bit to 0.
[5]	TXPKIF	Data Packet Transmitted Interrupt 0 = Not a data packet is successfully transmitted to the host in response to an IN-token and an ACK-token is received for the same. 1 = A data packet is successfully transmitted to the host in response to an IN-token and an ACK-token is received for the same. Note: Write 1 to clear this bit to 0.
[4]	PINGIF	Ping Token Interrupt 0 = The control-endpoint does not receive a ping token from the host. 1 = The control-endpoint receives a ping token from the host. Note: Write 1 to clear this bit to 0.
[3]	INTKIF	In Token Interrupt 0 = The control-endpoint does not receive an IN token from the host. 1 = The control-endpoint receives an IN token from the host. Note: Write 1 to clear this bit to 0.
[2]	OUTTKIF	Out Token Interrupt 0 = The control-endpoint does not receive an OUT token from the host. 1 = The control-endpoint receives an OUT token from the host. Note: Write 1 to clear this bit to 0.
[1]	SETUPPKIF	Setup Packet Interrupt This bit must be cleared (by writing 1) before the next setup packet can be received. If the bit is not cleared, then the successive setup packets will be overwritten in the setup packet buffer. 0 = Not a Setup packet has been received from the host. 1 = A Setup packet has been received from the host. Note: Write 1 to clear this bit to 0.
[0]	SETUPTKIF	Setup Token Interrupt 0 = Not a Setup token is received. 1 = A Setup token is received. Writing 1 clears this status bit Note: Write 1 to clear this bit to 0.

Control-endpoint In-transfer Data Count (HSUSBD_CEPTXCNT)

Register	Offset	R/W	Description					Reset Value
HSUSBD_CEPTXCNT	HSUSBD_BA+0x038	R/W	Control-Endpoint In-transfer Data Count					0x0000_0000

7	6	5	4	3	2	1	0
PINGIF	INTKIF	OUTTKIF	RXPKIF	TXPKIF	SHORTTXIF	BUFEEMPTYIF	BUFFULLIF

Bits	Description	
[31:13]	Reserved	Reserved.
[12]	SHORTRXIF	Bulk Out Short Packet Received 0 = No bulk out short packet is received. 1 = Received bulk out short packet (including zero length packet). Note: Write 1 to clear this bit to 0.

[11]	ERRIF	ERR Sent 0 = No any error in the transaction. 1 = There occurs any error in the transaction. Note: Write 1 to clear this bit to 0.
[10]	NYETIF	NYET Sent 0 = The space available in the RAM is sufficient to accommodate the next on coming data packet. 1 = The space available in the RAM is not sufficient to accommodate the next on coming data packet. Note: Write 1 to clear this bit to 0.
[9]	STALLIF	USB STALL Sent 0 = The last USB packet could be accepted or provided because the endpoint was stalled, and was acknowledged with a STALL. 1 = The last USB packet could not be accepted or provided because the endpoint was stalled, and was acknowledged with a STALL. Note: Write 1 to clear this bit to 0.
[8]	NAKIF	USB NAK Sent 0 = The last USB IN packet could be provided, and was acknowledged with an ACK. 1 = The last USB IN packet could not be provided, and was acknowledged with a NAK. Note: Write 1 to clear this bit to 0.
[7]	PINGIF	PING Token Interrupt 0 = A Data PING token has not been received from the host. 1 = A Data PING token has been received from the host. Note: Write 1 to clear this bit to 0.
[6]	INTKIF	Data IN Token Interrupt 0 = Not Data IN token has been received from the host. 1 = A Data IN token has been received from the host. Note: Write 1 to clear this bit to 0.
[5]	OUTTKIF	Data OUT Token Interrupt 0 = A Data OUT token has not been received from the host. 1 = A Data OUT token has been received from the host. This bit also set by PING token (in high-speed only). Note: Write 1 to clear this bit to 0.
[4]	RXPKIF	Data Packet Received Interrupt 0 = No data packet is received from the host by the endpoint. 1 = A data packet is received from the host by the endpoint. Note: Write 1 to clear this bit to 0.
[3]	TXPKIF	Data Packet Transmitted Interrupt 0 = Not a data packet is transmitted from the endpoint to the host. 1 = A data packet is transmitted from the endpoint to the host. Note: Write 1 to clear this bit to 0.

[2]	SHORTTXIF	Short Packet Transferred Interrupt 0 = The length of the last packet was not less than the Maximum Packet Size (EPMPS). 1 = The length of the last packet was less than the Maximum Packet Size (EPMPS). Note: Write 1 to clear this bit to 0.
[1]	BUFEMPTYIF	Buffer Empty For an IN endpoint, a buffer is available to the local side for writing up to FIFO full of bytes. 0 = The endpoint buffer is not empty. 1 = The endpoint buffer is empty. For an OUT endpoint: 0 = The currently selected buffer has not a count of 0. 1 = The currently selected buffer has a count of 0, or no buffer is available on the local side (nothing to read). Note: This bit is read-only.
[0]	BUFFULLIF	Buffer Full For an IN endpoint, the currently selected buffer is full, or no buffer is available to the local side for writing (no space to write). For an OUT endpoint, there is a buffer available on the local side, and there are FIFO full of bytes available to be read (entire packet is available for reading). 0 = The endpoint packet buffer is not full. 1 = The endpoint packet buffer is full. Note: This bit is read-only.

Bits	Description						
[31:13]	Reserved	Reserved.					

[12]	SHORTRXIEN	Bulk Out Short Packet Interrupt Enable Bit When set, this bit enables a local interrupt to be set whenever bulk out short packet occurs on the bus for this endpoint. 0 = Bulk out interrupt Disabled. 1 = Bulk out interrupt Enabled.
[11]	ERRIEN	ERR Interrupt Enable Bit When set, this bit enables a local interrupt to be set whenever ERR condition occurs on the bus for this endpoint. 0 = Error event interrupt Disabled. 1 = Error event interrupt Enabled.
[10]	NYETIEN	NYET Interrupt Enable Bit When set, this bit enables a local interrupt to be set whenever NYET condition occurs on the bus for this endpoint. 0 = NYET condition interrupt Disabled. 1 = NYET condition interrupt Enabled.
[9]	STALLIEN	USB STALL Sent Interrupt Enable Bit When set, this bit enables a local interrupt to be set when a stall token is sent to the host. 0 = STALL token interrupt Disabled. 1 = STALL token interrupt Enabled.
[8]	NAKIEN	USB NAK Sent Interrupt Enable Bit When set, this bit enables a local interrupt to be set when a NAK token is sent to the host. 0 = NAK token interrupt Disabled. 1 = NAK token interrupt Enabled.
[7]	PINGIEN	PING Token Interrupt Enable Bit When set, this bit enables a local interrupt to be set when a PING token has been received from the host. 0 = PING token interrupt Disabled. 1 = PING token interrupt Enabled.
[6]	INTKien	Data IN Token Interrupt Enable Bit When set, this bit enables a local interrupt to be set when a Data IN token has been received from the host. 0 = Data IN token interrupt Disabled. 1 = Data IN token interrupt Enabled.
[5]	OUTTKIEN	Data OUT Token Interrupt Enable Bit When set, this bit enables a local interrupt to be set when a Data OUT token has been received from the host. 0 = Data OUT token interrupt Disabled. 1 = Data OUT token interrupt Enabled.
[4]	RXPKIEN	Data Packet Received Interrupt Enable Bit When set, this bit enables a local interrupt to be set when a data packet has been transmitted to the host. 0 = Data packet has been transmitted to the host interrupt Disabled. 1 = Data packet has been transmitted to the host interrupt Enabled.

[3]	TXPKIEN	Data Packet Transmitted Interrupt Enable Bit When set, this bit enables a local interrupt to be set when a data packet has been received from the host. 0 = Data packet has been received from the host interrupt Disabled. 1 = Data packet has been received from the host interrupt Enabled.
[2]	SHORTTXIEN	Short Packet Transferred Interrupt Enable Bit When set, this bit enables a local interrupt to be set when a short data packet has been transferred to/from the host. 0 = Short data packet interrupt Disabled. 1 = Short data packet interrupt Enabled.
[1]	BUFEMPTYIEN	Buffer Empty Interrupt When set, this bit enables a local interrupt to be set when a buffer empty condition is detected on the bus. 0 = Buffer empty interrupt Disabled. 1 = Buffer empty interrupt Enabled.
[0]	BUFFULLIEN	Buffer Full Interrupt When set, this bit enables a local interrupt to be set when a buffer full condition is detected on the bus. 0 = Buffer full interrupt Disabled. 1 = Buffer full interrupt Enabled.

Endpoint A~L Data Available Count Register (HSUSBD_EPADATCNT~ HSUSBD_EPLDATCNT)

Register	Offset	R/W	Description	Reset Value
HSUSBD_EPADATCNT	HSUSBD_BA+0x070	R	Endpoint A Data Available Count Register	0x0000_0000

DISBUF	SHORTTXEN	ZEROLEN	HALT	TOGGLE	MODE		FLUSH

Bits	Description		
[31:8]	Reserved	Reserved.	

[7]	DISBUF	Buffer Disable Bit This bit is used to receive unknown size OUT short packet. The received packet size is reference HSUSBD_EPxDATCNT register. 0 = Buffer Not Disabled when Bulk-OUT short packet is received. 1 = Buffer Disabled when Bulk-OUT short packet is received.
[6]	SHORTTXEN	Short Packet Transfer Enable This bit is applicable only in case of Auto-Validate Method. This bit is set to validate any remaining data in the buffer which is not equal to the MPS of the endpoint, and happens to be the last transfer. This bit gets cleared once the data packet is sent. 0 = Not validate any remaining data in the buffer which is not equal to the MPS of the endpoint. 1 = Validate any remaining data in the buffer which is not equal to the MPS of the endpoint.
[5]	ZEROLEN	Zero Length This bit is used to send a zero-length packet response to an IN-token. When this bit is set, a zero packet is sent to the host on reception of an IN-token. This bit gets cleared once the zero length data packet is sent. 0 = A zero packet is not sent to the host on reception of an IN-token. 1 = A zero packet is sent to the host on reception of an IN-token.
[4]	HALT	Endpoint Halt This bit is used to send a STALL handshake as response to the token from the host. When an Endpoint Set Feature (ep_halt) is detected by the local CPU, it must write a '1' to this bit. 0 = Not send a STALL handshake as response to the token from the host. 1 = Send a STALL handshake as response to the token from the host.
[3]	TOGGLE	Endpoint Toggle This bit is used to clear the endpoint data toggle bit. Reading this bit returns the current state of the endpoint data toggle bit. The local CPU may use this bit to initialize the end-point's toggle in case of reception of a Set Interface request or a Clear Feature (ep_halt) request from the host. Only when toggle bit is "1", this bit can be written into the inverted write data bit[3]. 0 = Not clear the endpoint data toggle bit. 1 = Clear the endpoint data toggle bit.
[2:1]	MODE	Mode Control The two bits decide the operation mode of the in-endpoint. 00 = Auto-Validate Mode. 01 = Manual-Validate Mode. 10 = Fly Mode. 11 = Reserved. These bits are not valid for an out-endpoint. The auto validate mode will be activated when the reserved mode is selected.
[0]	FLUSH	Buffer Flush Writing 1 to this bit causes the packet buffer to be flushed and the corresponding EP_AVAIL register to be cleared. This bit is self-clearing. This bit should always be written after an configuration event. 0 = The packet buffer is not flushed. 1 = The packet buffer is flushed by user.

Endpoint A~L Maximum Packet Size Register (HSUSBD_EPAMPS~ HSUSBD_EPLMPS)

Register	Offset	R/W	Description	Reset Value

6.32 USB 2.0 Host Controller (USBH)

6.32.1 Overview

This chip is equipped with a USB 2.0 HS/FS Host Controller (USBH) that supports Enhanced Host Controller Interface (EHCI) and Open Host Controller Interface (OpenHCI, OHCI) Specification, a register-level description of a host controller, to manage the devices and data transfer of Universal Serial Bus (USB).

The USBH supports an integrated Root Hub with a USB port, a DMA for real-time data transfer between system memory and USB bus, port power control and port over current detection.

The USBH is responsible for detecting the connect and disconnect of USB devices, managing data transfer, collecting status and activity of USB bus, providing power control and detecting over current of attached USB devices.

6.32.2 Features

- Compliant with Universal Serial Bus (USB) Specification Revision 2.0.
- Supports Enhanced Host Controller Interface (EHCI) Specification Revision 1.0
- Supports Open Host Controller Interface (OpenHCI) Specification Revision 1.0.
- Supports high-speed (480Mbps), full-speed (12Mbps) and low-speed (1.5Mbps) USB devices.
- Supports Control, Bulk, Interrupt, Isochronous and Split transfers.
- Supports an integrated Root Hub.
- Supports a port routing logic to route full/low speed device to OHCI controller.
- Supports two USB host port shared with USB device (OTG function).
- Supports port power control and port over current detection.
- Supports DMA for real-time data transfer.

6.32.3 Block Diagram

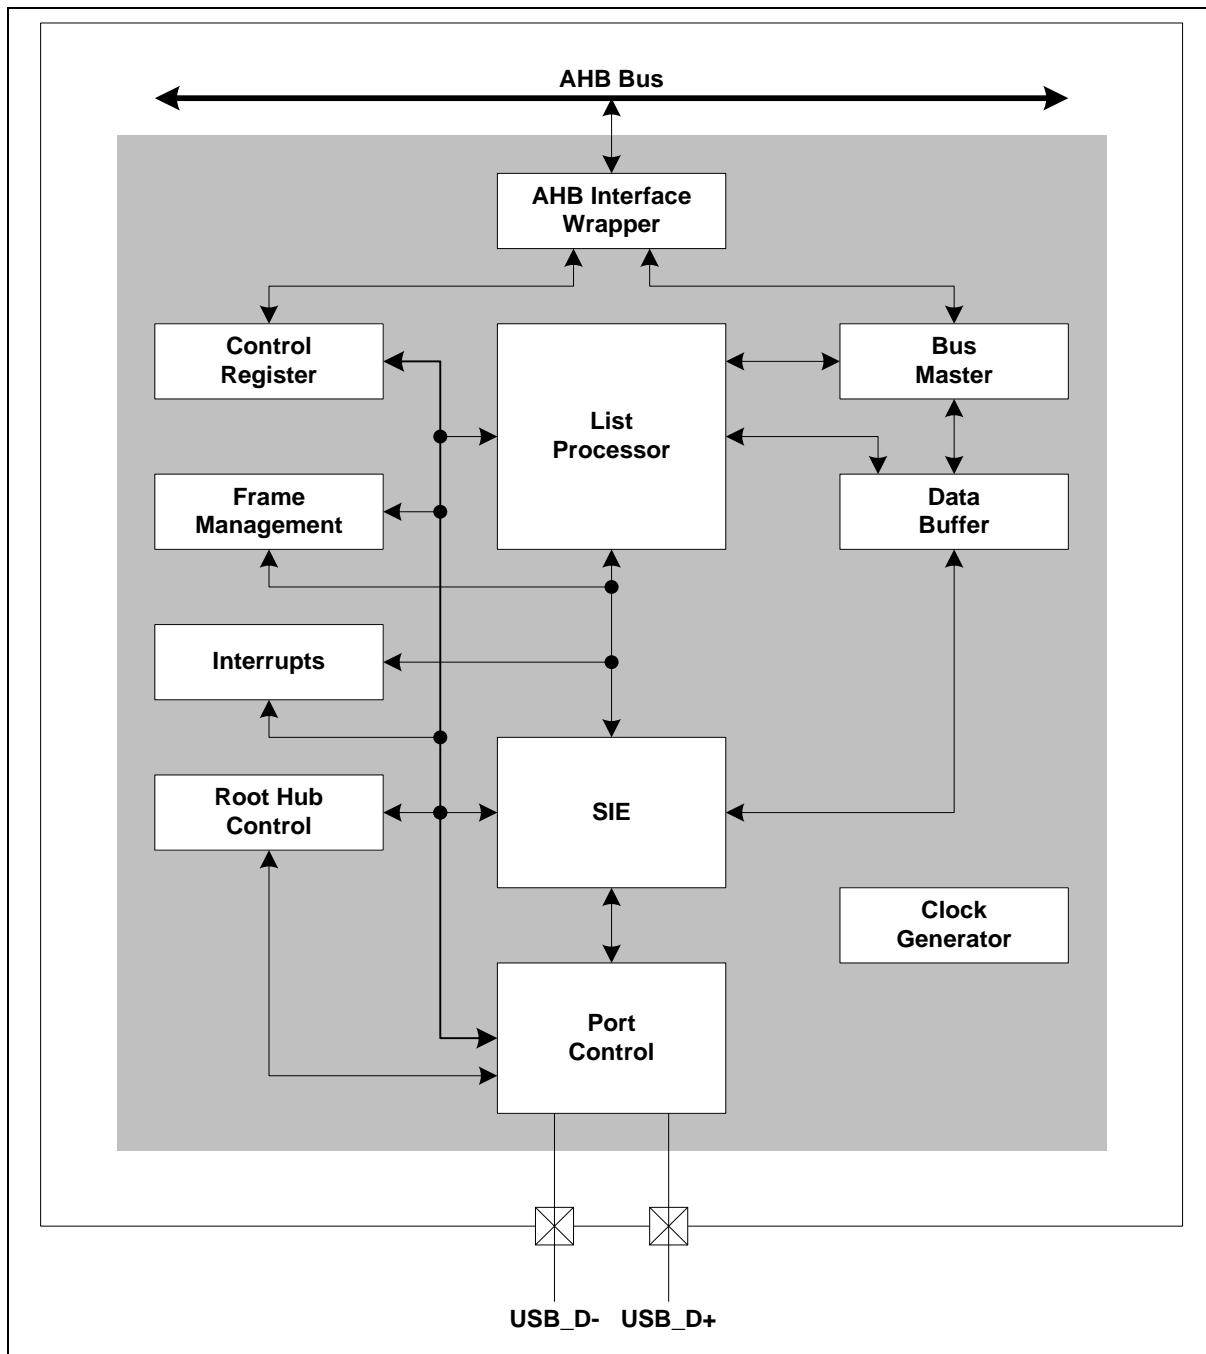

Figure 6.32-1 USB 2.0 FS Host Controller Block Diagram

6.32.4 Basic Configuration

6.32.4.1 USBH EHCI Controller Basic Configuration

- Clock source Configuration
 - Select the source of USBH engine clock on USBSEL (CLK_CLKSEL0[8]).
 - Select the clock divider number of USBH engine clock on USBDIV (CLK_CLKDIV0[7:4]).
 - Enable USBH engine clock in HSUSBHCKEN (CLK_AHBCLK[16]).
- Reset Configuration
 - Reset USBH controller in UHC20RST (SYS_IPRST0[16]).

6.32.4.2 USBH OHCI Controller Basic Configuration

- Clock source Configuration
 - Select the source of USBH engine clock on USBSEL (CLK_CLKSEL0[8]).
 - Select the clock divider number of USBH engine clock on USBDIV (CLK_CLKDIV0[7:4]).
 - Enable USBH engine clock in HSUSBHCKEN (CLK_AHBCLK[16]).
- Reset Configuration
 - Reset USBH controller in UHC20RST (SYS_IPRST0[16]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
USB	USB_D+	PA.14	MFP14

	USB_VBUS_EN	PB.6, PB.15	MFP14
	USB_VBUS_ST	PB.7, PC.14, PD.4	MFP14

6.32.5 Functional Description

6.32.5.1 EHCI Controller

The EHCI is interfaced with the system through AHB interface. Whenever the CPU wants to initiate a register read or register write, it uses the AHB slave I/F signals and performs the necessary operation (register read writes). The CPU acts as a bus master, having initiated this transfer. At that time, EHCI acts as a target and responds to the transfer initiated by the system software. For example, if the CPU wants to write into one of the memory mapped registers of EHCI, it says the address and value to be written into that addressed register. EHCI targets the register by using that address and fills the register with the value specified by the software. If it is a register read, EHCI gets the value from the addressed register and puts it on the system bus.

Likewise, when the EHCI wants to perform a data transfer, it acts as a master and initiates a data transfer. At that time, the system memory acts as a bus target. EHCI, as a master can perform two types of data transfers, from EHCI to the system memory and from system memory to the EHCI. When the EHCI wants the data to be moved from the downstream USB2.0 device to the system memory, it initiates a memory write transfer by accessing the memory interfacing signals. EHCI writes the control word (write), data and data count to be moved to the system memory. The memory controller accepts the data and moves it to the memory. If the data has to be moved from memory to

the downstream device, the EHCI issue a read transfer to system bus. The memory controller gives data through the memory interfacing signals. EHCI accepts the data and moves them to the downstream device.

6.32.5.2 OHCI Controller

AHB Interface

The OpenHCI Host Controller is connected to the system by the AHB bus. The design requires both master and slave bus operations. As a master, the Host Controller is responsible for running cycles on the AHB bus to access EDs and TDs as well as transferring data between memory and the local data buffer. As a slave, the Host Controller monitors the cycles on the AHB bus and determines when to respond to these cycles. Configuration and non-real-time control access to the Host Controller operational registers are through the AHB bus slave interface.

Host Controller

The host controller includes 5 functional blocks, including List Processing, Frame Management, Interrupt Processing, Host Controller Bus Master and Data Buffer.

The List Processor manages the data structures from the Host Controller Driver and coordinates all activity within the Host Controller.

The Frame Management is responsible for managing the frame specific tasks required by the USB specification and the OpenHCI specification. These tasks are:

- Management of the OpenHCI frame specific Operational Registers
- Operation of the Largest Data Packet Counter.
- Performing frame qualifications on USB Transaction requests to the SIE.
- Generate SOF token requests to the SIE.

Interrupts are the communication method for HC-initiated communication with the Host Controller Driver. There are several events that may trigger an interrupt from the Host Controller. Each specific event sets a specific bit in the HcInterruptStatus register.

The Host Controller Bus Master is the central block in the data path. The Host Controller Bus Master coordinates all access to the AHB Interface. There are two sources of bus mastering within Host Controller: the List Processor and the Data Buffer Engine.

The Data Buffer serves as the data interface between the Bus Master and the SIE. It is a combination of a 64-byte latched based bi-directional asynchronous FIFO and a single DWORD AHB Holding Register.

USB Interface

The USB interface includes the integrated Root Hub with an USB port, Port 1 as well as the Serial Interface Engine (SIE) and USB clock generator. The interface combines responsibility for executing bus transactions requested by the HC as well as the hub and port management specified by USB.

The SIE is responsible for managing all transactions to the USB. It controls the bus protocol, packet generation/extraction, data parallel-to-serial conversion, CRC coding, bit stuffing, and NRZI encoding. All transactions on the USB are requested from the List Processor and Frame Manager.

The Root Hub is a collection of ports that are individually controlled and a hub that maintains control/status over functions common to all ports.

6.32.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
HCFS		BLE	CLE	IE	PLE	CBSR	

Bits	Description	
[31:8]	Reserved	Reserved.
[7:6]	HCFS	<p>Host Controller Functional State</p> <p>This field sets the Host Controller state. The Controller may force a state change from USBSUSPEND to USBRESUME after detecting resume signaling from a downstream port. States are:</p> <p>00 = USBSUSPEND. 01 = USBOPERATIONAL. 10 = USBRESUME. 11 = USBRESET.</p>
[5]	BLE	<p>Bulk List Enable Bit</p> <p>0 = Processing of the Bulk list after next SOF (Start-Of-Frame) Disabled. 1 = Processing of the Bulk list in the next frame Enabled.</p>
[4]	CLE	<p>Control List Enable Bit</p> <p>0 = Processing of the Control list after next SOF (Start-Of-Frame) Disabled. 1 = Processing of the Control list in the next frame Enabled.</p>
[3]	IE	<p>Isochronous List Enable Bit</p> <p>Both ISOEn and PLE (HcControl[2]) high enables Host Controller to process the Isochronous list. Either ISOEn or PLE (HcControl[2]) is low disables Host Controller to process the Isochronous list.</p> <p>0 = Processing of the Isochronous list after next SOF (Start-Of-Frame) Disabled. 1 = Processing of the Isochronous list in the next frame Enabled, if the PLE (HcControl[2]) is high, too.</p>

[2]	PLE	Periodic List Enable Bit When set, this bit enables processing of the Periodic (interrupt and isochronous) list. The Host Controller checks this bit prior to attempting any periodic transfers in a frame. 0 = Processing of the Periodic (Interrupt and Isochronous) list after next SOF (Start-Of-Frame) Disabled. 1 = Processing of the Periodic (Interrupt and Isochronous) list in the next frame Enabled. Note: To enable the processing of the Isochronous list, user has to set both PLE and IE (HcControl[3]) high.
[1:0]	CBSR	Control Bulk Service Ratio This specifies the service ratio between Control and Bulk EDs. Before processing any of the non-periodic lists, HC must compare the ratio specified with its internal count on how many nonempty Control EDs have been processed, in determining whether to continue serving another Control ED or switching to Bulk EDs. The internal count will be retained when crossing the frame boundary. In case of reset, HCD is responsible for restoring this Value. 00 = Number of Control EDs over Bulk EDs served is 1:1. 01 = Number of Control EDs over Bulk EDs served is 2:1. 10 = Number of Control EDs over Bulk EDs served is 3:1. 11 = Number of Control EDs over Bulk EDs served is 4:1.

Host Controller Command Status Register (HcCommandStatus)

Register	Offset	R/W	Description				Reset Value
HcCommandStatus	USBH_BA+0x008	R/W	Host Controller Command Status Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved						SOC	
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved					BLF	CLF	HCR

Bits	Description	
[31:18]	Reserved	Reserved.
[17:16]	SOC	Schedule Overrun Count These bits are incremented on each scheduling overrun error. It is initialized to 00b and wraps around at 11b. This will be incremented when a scheduling overrun is detected even if SO (HcInterruptStatus[0]) has already been set.
[15:3]	Reserved	Reserved.
[2]	BLF	Bulk List Filled Set high to indicate there is an active TD on the Bulk list. This bit may be set by either software or the Host Controller and cleared by the Host Controller each time it begins processing the head of the Bulk list. 0 = No active TD found or Host Controller begins to process the head of the Bulk list. 1 = An active TD added or found on the Bulk list.
[1]	CLF	Control List Filled Set high to indicate there is an active TD on the Control List. It may be set by either software or the Host Controller and cleared by the Host Controller each time it begins processing the head of the Control List. 0 = No active TD found or Host Controller begins to process the head of the Control list. 1 = An active TD added or found on the Control list.
[0]	HCR	Host Controller Reset This bit is set to initiate the software reset of Host Controller. This bit is cleared by the Host Controller, upon completion of the reset operation. This bit, when set, didn't reset the Root Hub and no subsequent reset signaling be asserted to its downstream ports. 0 = Host Controller is not in software reset state. 1 = Host Controller is in software reset state.

Host Controller Interrupt Status Register (HcInterruptStatus)

Register	Offset	R/W	Description				Reset Value
HcInterruptStatus	USBH_BA+0x00C	R/W	Host Controller Interrupt Status Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16

Bits	Description	
[31:4]	DH	Done Head Pointer to indicate the physical address of the last completed Transfer Descriptor that was added to the Done queue.
[3:0]	Reserved	Reserved.

Host Controller Frame Interval Register (HcFmInterval)

Register	Offset	R/W	Description					Reset Value
HcFmInterval	USBH_BA+0x034	R/W	Host Controller Frame Interval Register					0x0000_2EDF

31	30	29	28	27	26	25	24	
FIT	FSMPS							
23	22	21	20	19	18	17	16	
FSMPS								
15	14	13	12	11	10	9	8	
Reserved		FI						
7	6	5	4	3	2	1	0	
FI								

Bits	Description	
[31]	FIT	Frame Interval Toggle This bit is toggled by Host Controller Driver when it loads a new value into FI (HcFmInterval[13:0]). 0 = Host Controller Driver didn't load new value into FI (HcFmInterval[13:0]). 1 = Host Controller Driver loads a new value into FI (HcFmInterval[13:0]).
[30:16]	FSMPS	FS Largest Data Packet This field specifies a value that is loaded into the Largest Data Packet Counter at the beginning of each frame.
[15:14]	Reserved	Reserved.
[13:0]	FI	Frame Interval This field specifies the length of a frame as (bit times - 1). For 12,000 bit times in a frame, a value of 11,999 is stored here.

Host Controller Frame Remaining Register (HcFmRemaining)

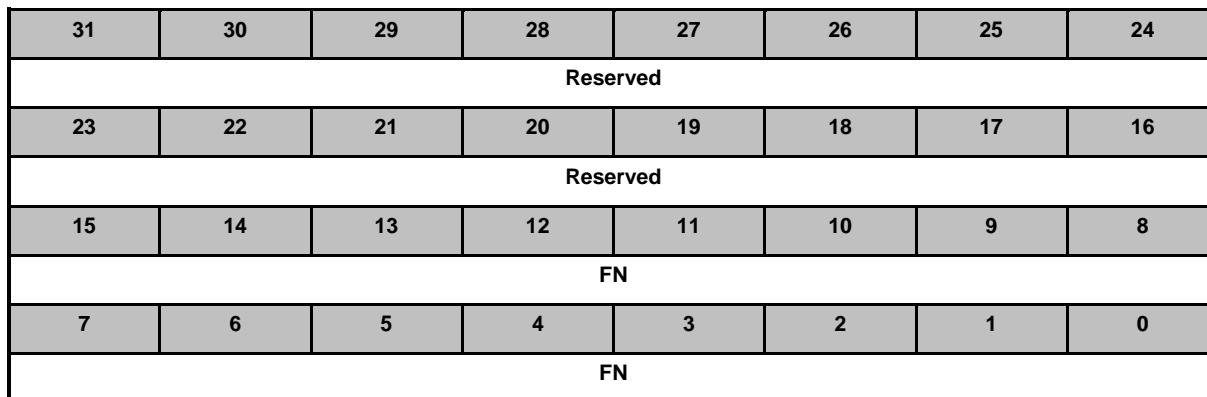

Register	Offset	R/W	Description					Reset Value
HcFmRemaining	USBH_BA+0x038	R	Host Controller Frame Remaining Register					0x0000_0000

31	30	29	28	27	26	25	24
FRT	Reserved						
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved		FR					
7	6	5	4	3	2	1	0
FR							

Bits	Description	
[31]	FRT	Frame Remaining Toggle This bit is loaded from the FIT (HcFmInterval[31]) whenever FR (HcFmRemaining[13:0]) reaches 0.
[30:14]	Reserved	Reserved.
[13:0]	FR	Frame Remaining When the Host Controller is in the USBOPERATIONAL state, this 14-bit field decrements each 12 MHz clock period. When the count reaches 0, (end of frame) the counter reloads with Frame Interval. In addition, the counter loads when the Host Controller transitions into USBOPERATIONAL.

Host Controller Frame Number Register (HcFmNumber)

Register	Offset	R/W	Description	Reset Value
HcFmNumber	USBH_BA+0x03C	R	Host Controller Frame Number Register	0x0000_0000

Bits	Description	
[31:16]	Reserved	Reserved.
[15:0]	FN	Frame Number This 16-bit incrementing counter field is incremented coincident with the re-load of FR (HcFmRemaining[13:0]). The count rolls over from 'FFFFh' to '0h.'

Host Controller Periodic Start Register (HcPeriodicStart)

Register	Offset	R/W	Description				Reset Value
HcPeriodicStart	USBH_BA+0x040	R/W	Host Controller Periodic Start Register				0x0000_0000

Bits	Description
[31]	CRWE Clear Remote Wake-up Enable Bit This bit is use to clear DRWE (HcRhStatus[15]). This bit always read as zero. Write Operation: 0 = No effect. 1 = Clear DRWE (HcRhStatus[15]).
[31:18]	Reserved Reserved.
[17]	OCIC over Current Indicator Change This bit is set by hardware when a change has occurred in OCI (HcRhStatus[1]). Write 1 to clear this bit to zero. 0 = OCI (HcRhStatus[1]) didn't change. 1 = OCI (HcRhStatus[1]) change.
[16]	LPSC Set Global Power In global power mode (PSM (HcRhDescriptorA[8]) = 0), this bit is written to one to enable power to all ports. This bit always read as zero. Write Operation: 0 = No effect. 1 = Set global power.
[15]	DRWE Device Remote Wakeup Enable Bit This bit controls if port's Connect Status Change as a remote wake-up event. Write Operation: 0 = No effect. 1 = Connect Status Change as a remote wake-up event Enabled. Read Operation: 0 = Connect Status Change as a remote wake-up event Disabled. 1 = Connect Status Change as a remote wake-up event Enabled.

[14:2]	Reserved	Reserved.
[1]	OCI	over Current Indicator This bit reflects the state of the over current status pin. This field is only valid if NOCP (HcRhDesA[12]) and OCPM (HcRhDesA[11]) are cleared. 0 = No over current condition. 1 = Over current condition.
[0]	LPS	Clear Global Power In global power mode (PSM (HcRhDescriptorA[8]) = 0), this bit is written to one to clear all ports' power. This bit always read as zero. Write Operation: 0 = No effect. 1 = Clear global power.

Host Controller Root Hub Port Status (HcRhPrt [1])

Register	Offset	R/W	Description				Reset Value
HcRhPortStatus1	USBH_BA+0x058	R/W	Host Controller Root Hub Port Status [1]				0x0000_0000

Reserved			PRS	POCI	PSS	PES	CCS

Bits	Description	
[31:21]	Reserved	Reserved.
[20]	PRSC	Port Reset Status Change This bit indicates that the port reset signal has completed. Write 1 to clear this bit to zero. 0 = Port reset is not complete. 1 = Port reset is complete.
[19]	OCIC	Port over Current Indicator Change This bit is set when POCI (HcRhPortStatus1[3]) changes. Write 1 to clear this bit to zero. 0 = POCI (HcRhPortStatus1[3]) didn't change. 1 = POCI (HcRhPortStatus1[3]) changes.
[18]	PSSC	Port Suspend Status Change This bit indicates the completion of the selective resume sequence for the port. Write 1 to clear this bit to zero. 0 = Port resume is not completed. 1 = Port resume completed.
[17]	PESC	Port Enable Status Change This bit indicates that the port has been disabled (PES (HcRhPortStatus1[1]) cleared) due to a hardware event. Write 1 to clear this bit to zero. 0 = PES (HcRhPortStatus1[1]) didn't change. 1 = PES (HcRhPortStatus1[1]) changed.

[16]	CSC	Connect Status Change This bit indicates connect or disconnect event has been detected (CCS (HcRhPortStatus1[0]) changed). Write 1 to clear this bit to zero. 0 = No connect/disconnect event (CCS (HcRhPortStatus1[0]) didn't change). 1 = Hardware detection of connect/disconnect event (CCS (HcRhPortStatus1[0]) changed).
[15:10]	Reserved	Reserved.
[9]	LSDA	Low Speed Device Attached (Read) or Clear Port Power (Write) This bit defines the speed (and bus idle) of the attached device. It is only valid when CCS (HcRhPortStatus1[0]) is set. This bit is also used to clear port power. Write Operation: 0 = No effect. 1 = Clear PPS (HcRhPortStatus1[8]). Read Operation: 0 = Full Speed device. 1 = Low-speed device.
[8]	PPS	Port Power Status This bit reflects the power state of the port regardless of the power switching mode. Write Operation: 0 = No effect. 1 = Port Power Enabled. Read Operation: 0 = Port power is Disabled. 1 = Port power is Enabled.
[7:5]	Reserved	Reserved.
[4]	PRS	Port Reset Status This bit reflects the reset state of the port. Write Operation: 0 = No effect. 1 = Set port reset. Read Operation 0 = Port reset signal is not active. 1 = Port reset signal is active.
[3]	POCI	Port over Current Indicator (Read) or Clear Port Suspend (Write) This bit reflects the state of the over current status pin dedicated to this port. This field is only valid if NOCP (HcRhDescriptorA[12]) is cleared and OCPM (HcRhDescriptorA[11]) is set. This bit is also used to initiate the selective result sequence for the port. Write Operation: 0 = No effect. 1 = Clear port suspend. Read Operation: 0 = No over current condition. 1 = Over current condition.

[2]	PSS	Port Suspend Status This bit indicates the port is suspended Write Operation: 0 = No effect. 1 = Set port suspend. Read Operation: 0 = Port is not suspended. 1 = Port is selectively suspended.
[1]	PES	Port Enable Status Write Operation: 0 = No effect. 1 = Set port enable. Read Operation: 0 = Port Disabled. 1 = Port Enabled.
[0]	CCS	CurrentConnectStatus (Read) or ClearPortEnable Bit (Write) Write Operation: 0 = No effect. 1 = Clear port enable. Read Operation: 0 = No device connected. 1 = Device connected.

Host Controller PHY Control Register (HcPhyControl)

23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
N_CC				N_PCC			
7	6	5	4	3	2	1	0
Reserved			PPC	N_PORTS			

Bits	Description	
[31:16]	Reserved	Reserved.
[15:12]	N_CC	<p>Number of Companion Controller</p> <p>This field indicates the number of companion controllers associated with this USB 2.0 host controller.</p> <p>A zero in this field indicates there are no companion host controllers. Port-ownership hand-off is not supported. Only high-speed devices are supported on the host controller root ports.</p> <p>A value larger than zero in this field indicates there are companion USB 1.1 host controller(s). Port-ownership hand-offs are supported. High, Full- and Low-speed devices are supported on the host controller root ports.</p>
[11:8]	N_PCC	<p>Number of Ports Per Companion Controller</p> <p>This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software.</p> <p>For example, if N_PORTS has a value of 6 and N_CC has a value of 2 then N_PCC could have a value of 3. The convention is that the first N_PCC ports are assumed to be routed to companion controller 1, the next N_PCC ports to companion controller 2, etc. In the previous example, the N_PCC could have been 4, where the first 4 are routed to companion controller 1 and the last two are routed to companion controller 2.</p> <p>The number in this field must be consistent with N_PORTS and N_CC.</p>
[7:5]	Reserved	Reserved.
[4]	PPC	<p>Port Power Control</p> <p>This field indicates whether the host controller implementation includes port power control. A one in this bit indicates the ports have port power switches. A zero in this bit indicates the port do not have port power switches. The value of this field affects the functionality of the Port Power field in each port status and control register.</p>
[3:0]	N_PORTS	<p>Number of Physical Downstream Ports</p> <p>This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space (see Table 2-8). Valid values are in the range of 1H to FH.</p> <p>A zero in this field is undefined.</p>

EHCI Capability Parameters Register (EHCCPR)

Reserved							
7	6	5	4	3	2	1	0
Reserved	IAAD	ASEN	PSEN	FLSZ		HCRST	RUN

Bits	Description	
[31:24]	Reserved	Reserved.
[23:16]	ITC	<p>Interrupt Threshold Control (R/W)</p> <p>This field is used by system software to select the maximum rate at which the host controller will issue interrupts. The only valid values are defined below. If software writes an invalid value to this register, the results are undefined. Value Maximum Interrupt Interval</p> <p>0x00 = Reserved. 0x01 = 1 micro-frame. 0x02 = 2 micro-frames. 0x04 = 4 micro-frames. 0x08 = 8 micro-frames (default, equates to 1 ms). 0x10 = 16 micro-frames (2 ms). 0x20 = 32 micro-frames (4 ms). 0x40 = 64 micro-frames (8 ms). Any other value in this register yields undefined results. Software modifications to this bit while HCHalted bit is equal to zero results in undefined behavior.</p>
[15:7]	Reserved	Reserved.
[6]	IAAD	<p>Interrupt on Asynchronous Advance Doorbell (R/W)</p> <p>This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell.</p> <p>When the host controller has evicted all appropriate cached schedule state, it sets the Interrupt on Asynchronous Advance status bit in the USBSTS register. If the Interrupt on Asynchronous Advance Enable bit in the USBINTR register is a one then the host controller will assert an interrupt at the next interrupt threshold.</p> <p>The host controller sets this bit to a zero after it has set the Interrupt on Asynchronous Advance status bit in the USBSTS register to a one.</p> <p>Software should not write a one to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results.</p>

[5]	ASEN	Asynchronous Schedule Enable (R/W) This bit controls whether the host controller skips processing the Asynchronous Schedule. Values mean: 0 = Do not process the Asynchronous Schedule. 1 = Use the ASYNCLISTADDR register to access the Asynchronous Schedule.
[4]	PSEN	Periodic Schedule Enable (R/W) This bit controls whether the host controller skips processing the Periodic Schedule. Values mean: 0 = Do not process the Periodic Schedule. 1 = Use the PERIODICLISTBASE register to access the Periodic Schedule.
[3:2]	FLSZ	Frame List Size (R/W or RO) This field is R/W only if Programmable Frame List Flag in the HCCPARAMS registers is set to a one. This field specifies the size of the frame list. The size the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index. Values mean: 00 = 1024 elements (4096 bytes) Default value. 01 = 512 elements (2048 bytes). 10 = 256 elements (1024 bytes) – for resource-constrained environment. 11 = Reserved.
[1]	HCRST	Host Controller Reset (HCRESET) (R/W) This control bit is used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset. When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. All operational registers, including port registers and port state machines are set to their initial values. Port ownership reverts to the companion host controller(s), with the side effects. Software must reinitialize the host controller in order to return the host controller to an operational state. This bit is set to zero by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register. Software should not set this bit to a one when the HC Halted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller will result in undefined behavior.
[0]	RUN	Run/Stop (R/W) When set to a 1, the Host Controller proceeds with execution of the schedule. The Host Controller continues execution as long as this bit is set to a 1. When this bit is set to 0, the Host Controller completes the current and any actively pipelined transactions on the USB and then halts. The Host Controller must halt within 16 micro-frames after software clears the Run bit. The HC Halted bit in the status register indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state. Software must not write a one to this field unless the host controller is in the Halted state (i.e. HC Halted in the USBSTS register is a one). Doing so will yield undefined results. 0 = Stop. 1 = Run.

USB Status Register (USTSR)

Register	Offset	R/W	Description				Reset Value
USTSR	HSUSBH_BA+0x024	R/W	USB Status Register				0x0000_1000

Bits	Description	
[31:16]	Reserved	Reserved.
[15]	ASS	Asynchronous Schedule Status (Read Only) The bit reports the current real status of the Asynchronous Schedule. If this bit is a zero then the status of them Asynchronous Schedule is disabled. If this bit is a one then the status of the Asynchronous Schedule is enabled. The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled (1) or disabled (0).
[14]	PSS	Periodic Schedule Status (Read Only) The bit reports the current real status of the Periodic Schedule. If this bit is a zero then the status of the Periodic Schedule is disabled. If this bit is a one then the status of the Periodic Schedule is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the USBCMD register. When this bit and the Periodic Schedule Enable bit are the same value, the Periodic Schedule is either enabled (1) or disabled (0).
[13]	RECLA	Reclamation (Read Only) This is a read-only status bit, which is used to detect an empty asynchronous schedule.
[12]	HCHalted	HCHalted (Read Only) This bit is a zero whenever the Run/Stop bit is a one. The Host Controller sets this bit to one after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g. internal error).
[11:6]	Reserved	Reserved.
[5]	IAA	Interrupt on Asynchronous Advance (R/WC) System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Asynchronous Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source.
[4]	HSERR	Host System Error (R/WC) The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module.

[3]	FLR	Frame List Rollover (R/WC) The Host Controller sets this bit to a one when the Frame List Index rolls over from its maximum value to zero. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the Frame List Size field of the USBCMD register) is 1024, the Frame Index Register rolls over every time FRINDEX[13] toggles. Similarly, if the size is 512, the Host Controller sets this bit to a one every time FRINDEX[12] toggles.
[2]	PCD	Port Change Detect (R/WC) The Host Controller sets this bit to a one when any port for which the Port Owner bit is set to zero has a change bit transition from a zero to a one or a Force Port Resume bit transition from a zero to a one as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to a one after system software has relinquished ownership of a connected port by writing a one to a port's Port Owner bit. This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force port resume, over-current change, enable/disable change and connect status change).
[1]	UERRINT	USB Error Interrupt (USBERRINT) (R/WC) The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (e.g., error counter underflow). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and USBINT bit are set.
[0]	USBINT	USB Interrupt (USBINT) (R/WC) The Host Controller sets this bit to 1 on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set. The Host Controller also sets this bit to 1 when a short packet is detected (actual number of bytes received was less than the expected number of bytes).

Bits	Description	
[31:20]	Reserved	Reserved.
[19:16]	PTC	<p>Port Test Control (R/W)</p> <p>When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0x6 ~ 0xF are reserved):</p> <ul style="list-style-type: none"> Bits Test Mode 0x0 = Test mode not enabled. 0x1 = Test J_STATE. 0x2 = Test K_STATE. 0x3 = Test SE0_NAK. 0x4 = Test Packet. 0x5 = Test FORCE_ENABLE.
[15:14]	Reserved	Reserved.
[13]	PO	<p>Port Owner (R/W)</p> <p>This bit unconditionally goes to a 0b when the Configured bit in the CONFIGFLAG register makes a 0 to 1 transition. This bit unconditionally goes to 1 whenever the Configured bit is zero.</p> <p>System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port.</p>
[12]	PP	<p>Port Power (PP)</p> <p>Host controller has port power control switches. This bit represents the Current setting of the switch (0 = off, 1 = on). When power is not available on a port (i.e. PP equals a 0), the port is nonfunctional and will not report attaches, detaches, etc.</p> <p>When an over-current condition is detected on a powered port and PPC is a one, the PP bit in each affected port may be transitioned by the host controller from a 1 to 0 (removing power from the port).</p>

		Line Status (Read Only) These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits[11:10] USB State Interpretation 00 = SEO Not Low-speed device, perform EHCI reset. 01 = K-state Low-speed device, release ownership of port. 10 = J-state Not Low-speed device, perform EHCI reset. 11 = Undefined Not Low-speed device, perform EHCI reset. This value of this field is undefined if Port Power is zero.
[11:10]	LSTS	Reserved.
[9]	Reserved	Port Reset (R/W) When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to ensure the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USBSTS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHalted bit is a one. This field is zero if Port Power is zero. 0 = Port is not in Reset. 1 = Port is in Reset.
[8]	PRST	Suspend (R/W) Port Enabled Bit and Suspend bit of this register define the port states as follows: 00 = Port Disable. 01 = Port Disable. 10 = Port Enable. 11 = Port Suspend. When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when: Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined. This field is zero if Port Power is zero. 0 = Port not in suspend state. 1 = Port in suspend state.
[7]	SUSPEND	

		Force Port Resume (R/W) This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero. This field is zero if Port Power is zero. 0 = No resume (K-state) detected/driven on port. 1 = Resume detected/driven on port.
[6]	FPR	Over-current Change (R/WC) 1 = This bit gets set to a one when there is a change to Over-current Active. Software clears this bit by writing a one to this bit position.
[5]	OCC	Over-current Active (Read Only) This bit will automatically transition from a one to a zero when the over current condition is removed. 0 = This port does not have an over-current condition. 1 = This port currently has an over-current condition.
[3]	PEC	Port Enable/Disable Change (R/WC) For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a Port Error). Software clears this bit by writing a 1 to it. This field is zero if Port Power is zero. 0 = No change. 1 = Port enabled/disabled status has changed.
[2]	PE	Port Enabled/Disabled (R/W) Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a one to this field. The host controller will only set this bit to a one when the reset sequence determines that the attached device is a high-speed device. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. When the port is disabled (0b) downstream propagation of data is blocked on this port, except for reset. This field is zero if Port Power is zero. 0 = Port Disabled. 1 = Port Enabled.

[1]	CSC	Connect Status Change (R/W) Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be "setting" an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it. This field is zero if Port Power is zero. 0 = No change. 1 = Change in Current Connect Status.
[0]	CCS	Current Connect Status (Ready Only) This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. This field is zero if Port Power is zero. 0 = No device is present. 1 = Device is present on port.

6.33 USB On-The-Go (OTG)

6.33.1 Overview

The OTG controller interfaces to USB PHY and USB controllers which consist of a USB 1.1 host controller and a USB 2.0 FS device controller. The OTG controller supports HNP and SRP protocols defined in the “On-The-Go and Embedded Host Supplement to the USB 2.0 Revision 2.0 Specification”.

USB frame, including USB host, USB device, and OTG controller, can be configured as Host-only, Device-only, ID-dependent or OTG Device mode defined in USBROLE (SYS_USBPHY[1:0]). In Host-only mode, USB frame acts as USB host. USB frame can support both full-speed and low-speed transfer. In Device-only mode, USB frame acts as USB device. USB frame only supports full-speed transfer. In ID-dependent mode, USB frame can be USB Host or USB device depending on USB_ID pin state. In OTG device mode, the role of USB frame depends on the definition of OTG specification. USB frame only supports full-speed transfer when OTG device acts as a peripheral.

6.33.2 Features

- Built-in USB PHY
- Configurable to operate as:
 - Host-only
 - Device-only
 - ID-dependent: The role of USB frame is only dependent on USB_ID pin value--as USB Host (USB_ID pin is low) or USB Device (USB_ID pin is high). Not support HNP or SRP protocol.
 - OTG device: dependent on USB_ID pin status to be A-device (USB_ID pin is low) or B-device (USB_ID pin is high). Support HNP and SRP protocols.

6.33.3 Block Diagram

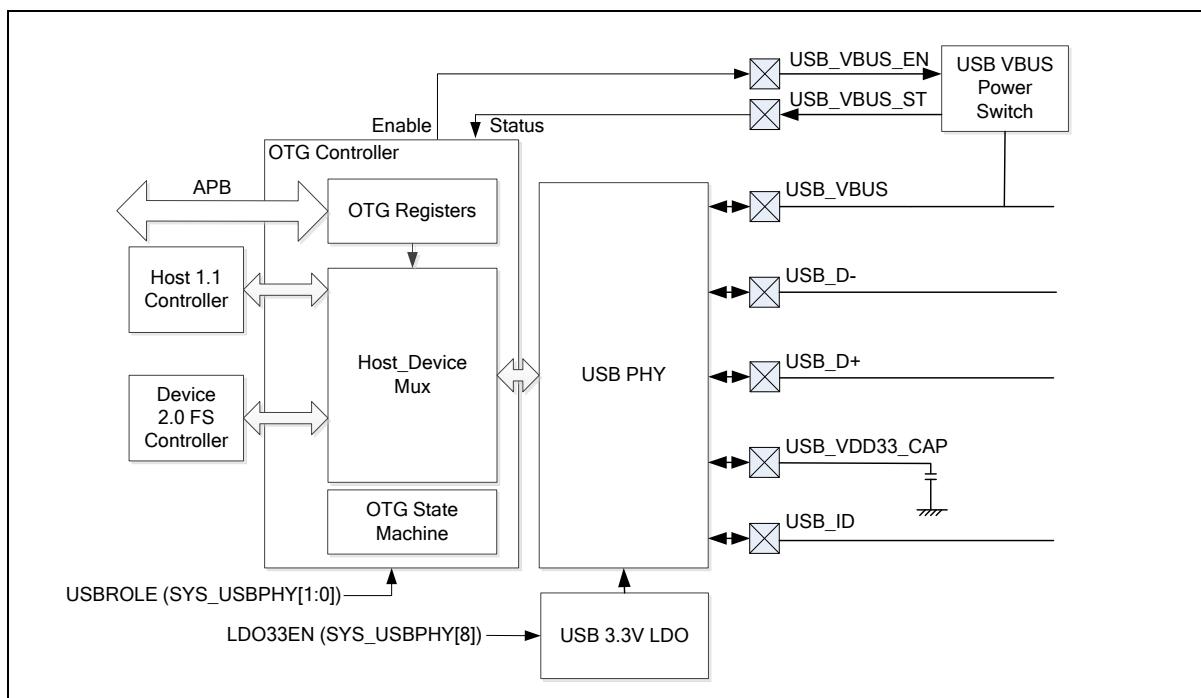

Figure 6.33-1 USB OTG Block Diagram

6.33.4 Basic Configuration

The OTG peripheral clock can be enabled by OTGCKEN (CLK_APBCLK0[26]). The role of USB frame is determined by USBROLE (SYS_USBPHY[1:0]). The internal USB 3.3V LDO can be enabled by LDO33EN (SYS_USBPHY[8]). These two configurations are write-protection bits. Before writing to these bits, user must disable the register protection function. Refer to the description of SYS_REGLCTL register for details. USB_VBUS_EN and USB_VBUS_ST pin functions are configured in SYS_GPA_MFPL or SYS_GPC_MFPL registers.

6.33.5 Functional Description

The role of USB frame depends on the setting of USBROLE (SYS_USBPHY[1:0]) and USB_ID pin status. The USBROLE configuration has precedence over USB_ID pin status. User can configure the OTG controller to USB Host mode, USB Device mode, ID dependent mode or OTG Device mode. In USB Host mode, the host controller will interact with USB PHY directly. In USB Device mode, the device controller will interact with USB PHY directly. In these cases, the OTG controller is used simply as a multiplexer. In ID dependent mode, USB_ID pin status will decide USB frame to act as USB host or USB device. If the USB_ID pin is FALSE state (low level), USB frame will act as USB host. If the USB_ID pin is TRUE state (high level), USB frame will act as USB device. In OTG Device mode, the OTG controller will handle OTG HNP and SRP protocols. If the USB_ID pin is FALSE state (low level), the OTG controller will act as an OTG A-device. If the USB_ID pin is TRUE state (high level), the OTG controller will act as an OTG B-device.

6.33.5.1 The Role of USB Frame

USB Device Mode

When USBROLE (SYS_USBPHY[1:0]) is set to 0, USB frame acts as USB device. The USB host function is not available.

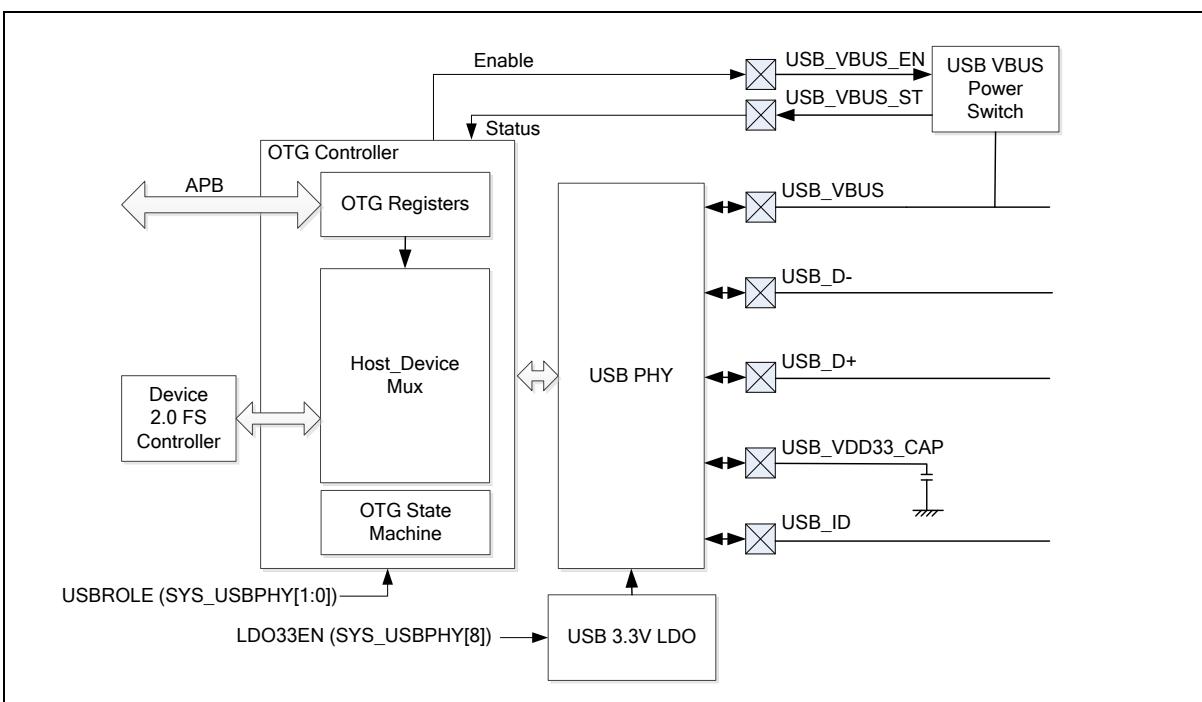

Figure 6.33-2 USB Device Mode

USB Host Mode

When USBROLE (SYS_USBPHY[1:0]) is set to 1, USB frame acts as USB host. USB device function is not available.

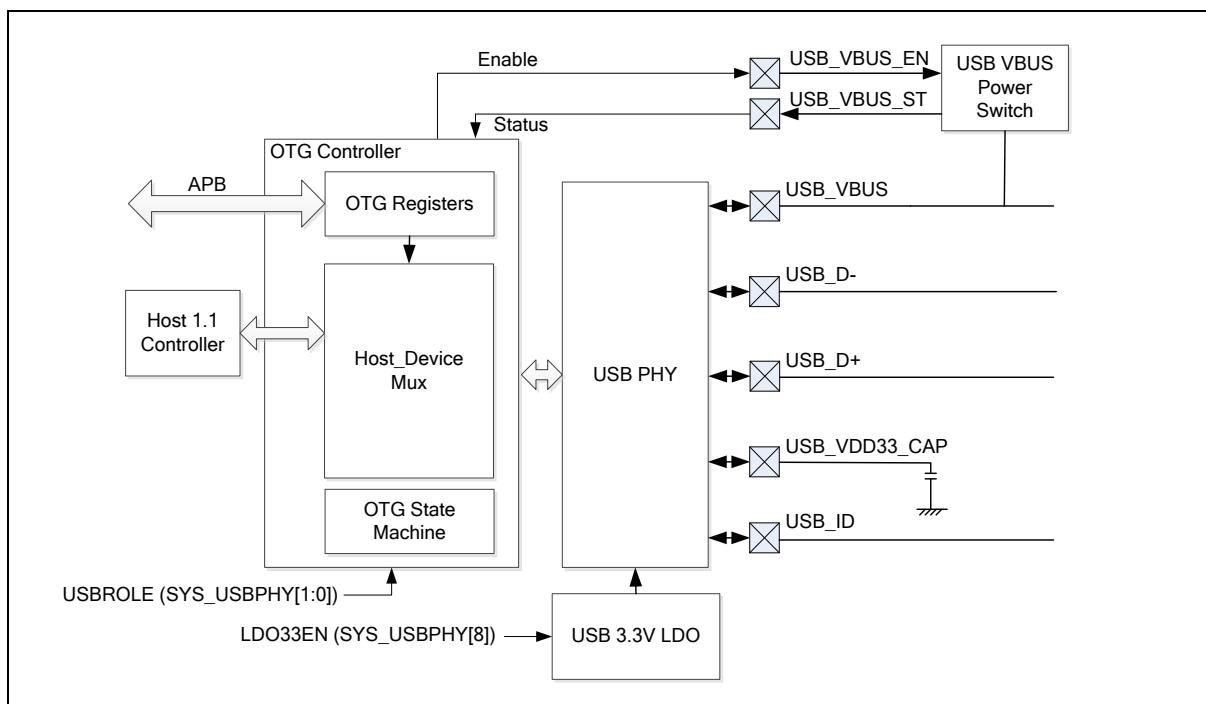

Figure 6.33-3 USB Host Mode

ID Dependent Mode

When USBROLE (SYS_USBPHY[1:0]) is set to 2, the role of USB frame depends on USB_ID pin status. The ID detection function can be enabled by set IDDETEN (OTG_PHYCTL[1]) to 1. The USB_ID pin status reflects on IDSTS (OTG_STATUS[1]). When USB frame acts as USB host (USB_ID pin is low level), the block diagram is the same as USB Host mode. When USB frame acts as USB device (USB_ID pin is high level), the block diagram is the same as USB Device mode.

OTG Device Mode

When USBROLE (SYS_USBPHY[1:0]) is set to 3, the role of USB frame depends on USB_ID pin status. The ID detection function can be enabled by set IDDETEN (OTG_PHYCTL[1]) to 1. The USB_ID pin status reflects on IDSTS (OTG_STATUS[1]). When USB_ID pin status is low level, the OTG controller acts as OTG A-device. When USB_ID pin status is high level, the OTG controller acts as OTG B-device. Please refer to OTG specification to get detail behavior of A-device and B-device.

6.33.5.2 Session Request Protocol (SRP)

When the USB frame is configured as OTG Device mode, OTG controller supports SRP to conserve power. Refer to OTG specification for details of SRP.

A-Device Session Request Protocol

1. A-device turns off USB bus power to conserve power. B-device recognizes such condition by checking VBUS status.
2. B-device requests A-device to supply USB bus power by Data line pulsing when B-device wants to connect to A-device.
3. A-device recognizes USB bus power request through checking SRPDETIF (OTG_INTSTS[13]).
4. A-device starts to drive VBUS by setting BUSREG (OTG_CTL[1]) to 1 once SRPDETIF (OTG_INTSTS[13]) is set to 1 by hardware. If VBUS reaches valid level in specific time interval and B-device is connected, A-device will become USB host, HOSTIF (OTG_INTSTS[7]) will be set to 1. If VBUS cannot reach valid level in specific time interval, it means overcurrent condition occurs.

Then VBUS error bit, VBEIF (OTG_IS[1]), will be set to 1.

B-device Session Request Protocol

1. A-device turns off USB bus power to conserve power. B-device recognizes such condition by checking VBUSVLD (OTG_STATUS[5]).
2. B-device can request A-device to supply USB bus power by setting BUSREQ(OTG_CTL[1]) to 1.
3. B-device will generate data line pulsing as defined in OTG specification.
4. A-device will start to drive VBUS after detecting data line pulsing and B-device can recognize such condition by checking VBUSVLD (OTG_STATUS[5]). If A-device drives VBUS to valid level in specific time interval, B-device becomes USB peripheral, PDEVIF (OTG_INTSTS[6]) will be set to 1. If A-device does not drive VBUS to valid level in specific time interval, SRP failure flag, SRPFIF (OTG_INTSTS[2]), will be set to 1 and B-device will go to idle state defined in OTG specification.

6.33.5.3 Host Negotiation Protocol (HNP)

When the USB frame is configured as OTG Device mode, the host function can be transferred between two directly connected OTG device without changing the cable connection. Refer to OTG specification for details of HNP.

A-device Host Negotiation Protocol

1. A-Host defined in OTG specification sends SetFeature b_hnp_enable command to enable B-device HNP capability. B-device responses ACK to indicate B-device supports HNP. User needs to set HNPREQEN (OTG_CTL[2]) to 1 to enable HNP protocol.
2. A-Host goes to a_suspend state by setting BUSREQ (OTG_CTL[1]) to 0 and put USB bus into J-state (USB_D+ high and USB_D- low) when A-Host has finished all desired operations.
3. A-Host becomes A-Peripheral if A-Host detects B-peripheral dis-connected by checking USB_D+ and USB_D- low in specific time interval. If A-Host cannot detect B-Peripheral dis-connected in specific time interval, A-Host will back to idle state.

B-device Host Negotiation Protocol

1. After B-Peripheral receives SetFeature b_hnp_enable command successfully, user enables B-peripheral HNP function by setting HNPREQEN (OTG_CTL[2]) to 1.
2. User sets BUSREG (OTG_CTL[1]) to 1 after detecting USB bus in J-state(USB_D+ high and USB_D- low). Then USB_D+ pull high resistor will be removed to cause USB disconnect state (USB_D+ low and USB_D- low).
3. If B-device detects A-device is connected (USB_D+ high) in specific time interval, B-device will become B-Host. If B-device cannot detect A-device is connected (USB_D+ high) in specific time interval, HNP failure flag, HNPFIIF (OTG_INTSTS[3]), will be set to 1.

6.33.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

6.33.7 Register Description

OTG Control Register (OTG_CTL)

Register	Offset	R/W	Description			Reset Value
OTG_CTL	OTG_BA+0x00	R/W	OTG Control Register			0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved	WKEN	OTGEN	Reserved	HNPREQEN	BUSREQ	VBUSDROP	

Bits	Description	
[31:6]	Reserved	Reserved.
[5]	WKEN	OTG ID Pin Wake-up Enable Bit 0 = OTG ID pin status change wake-up function Disabled. 1 = OTG ID pin status change wake-up function Enabled.
[4]	OTGEN	OTG Function Enable Bit User needs to set this bit to enable OTG function while USB frame configured as OTG device. When USB frame not configured as OTG device, this bit is must be low. 0= OTG function Disabled. 1 = OTG function Enabled.
[3]	Reserved	Reserved.
[2]	HNPREQEN	OTG HNP Request Enable Bit When USB frame as A-device, set this bit when A-device allows to process HNP protocol—A-device changes role from Host to Peripheral. This bit will be cleared when OTG state changes from a_suspend to a_peripheral or goes back to a_idle state. When USB frame as B-device, set this bit after the OTG A-device successfully sends a SetFeature (b_hnp_enable) command to the OTG B-device to start role change—B-device changes role from Peripheral to Host. This bit will be cleared when OTG state changes from b_peripheral to b_wait_acon or goes back to b_idle state. 0 = HNP request Disabled. 1 = HNP request Enabled (A-device can change role from Host to Peripheral or B-device can change role from Peripheral to Host). Note: Refer to OTG specification to get a_suspend, a_peripheral, a_idle and b_idle state.
[1]	BUSREQ	OTG Bus Request If OTG A-device wants to do data transfers via USB bus, setting this bit will drive VBUS high to detect USB device connection. If user won't use the bus any more, clearing this bit will drop VBUS to save power. This bit will be cleared when A-device goes to A_wait_vfall state. This bit will be also cleared if VBUSDROP (OTG_CTL[0]) bit is set or IDSTS (OTG_STATUS[1]) changed. If user of an OTG-B Device wants to request VBUS, setting this bit will run SRP protocol.

Bits	Description
	<p>This bit will be cleared if SRP failure (OTG A-device does not provide VBUS after B-device issues ARP in specified interval, defined in OTG specification). This bit will be also cleared if VBUSDROP (OTG_CTL[0]) bit is set IDSTS (OTG_STATUS[1]) changed.</p> <p>0 = Do not launch VBUS in OTG A-device or not request SRP in OTG B-device. 1 = Launch VBUS in OTG A-device or request SRP in OTG B-device.</p>
[0]	<p>Drop VBUS Control</p> <p>If user application running on this OTG A-device wants to conserve power, set this bit to drop VBUS. BUSREQ (OTG_CTL[1]) will be also cleared no matter A-device or B-device.</p> <p>0 = Do not drop the VBUS. 1 = Drop the VBUS.</p>

OTG PHY Control Register (OTG_PHYCTL)

Bits	Description
	1 = Mini-B/Micro-B plug is attached.
[0]	OVERCUR Overcurrent Condition The voltage on VBUS cannot reach a minimum VBUS valid threshold, 4.4V minimum, within a maximum time of 100ms after OTG A-device drives VBUS high. 0 = OTG A-device drives VBUS successfully. 1 = OTG A-device cannot drives VBUS high in this interval.

6.34 High Speed USB On-The-Go (HSOTG)

6.34.1 Overview

The HSOTG controller interfaces to USB PHY and USB controllers which consist of a USB 2.0 host controller and a USB 2.0 HS device controller. The OTG controller supports HNP and SRP protocols defined in the “On-The-Go and Embedded Host Supplement to the USB 2.0 Revision 1.3 Specification”.

USB frame, including USB host, USB device, and OTG controller, can be configured as Host-only, Device-only, ID-dependent or OTG Device mode defined in HSUSBROLE (SYS_USBPHY[17:16]). In Host-only mode, USB frame acts as USB host. USB frame can support high-speed, full-speed and low-speed transfer. In Device-only mode, USB frame acts as USB device. USB frame supports high-speed and full-speed transfer. In ID-dependent mode, USB frame can be USB Host or USB device depends on USB_ID pin state. In OTG device mode, the role of USB frame depends on the definition of OTG specification. USB frame supports high-speed and full-speed transfer when OTG device acts as a peripheral.

6.34.2 Features

- Built in USB PHY
- Configurable to operate as:
 - Host-only
 - Device-only
 - ID-dependent: The role of USB frame is only dependent on USB_ID pin value--as USB Host (USB_ID pin is low) or USB Device (USB_ID pin is high). Not support HNP or SRP protocol.
 - OTG device: dependent on USB_ID pin status to be A-device (USB_ID pin is low) or B-device (USB_ID pin is high). Support HNP and SRP protocols.

6.34.3 Block Diagram

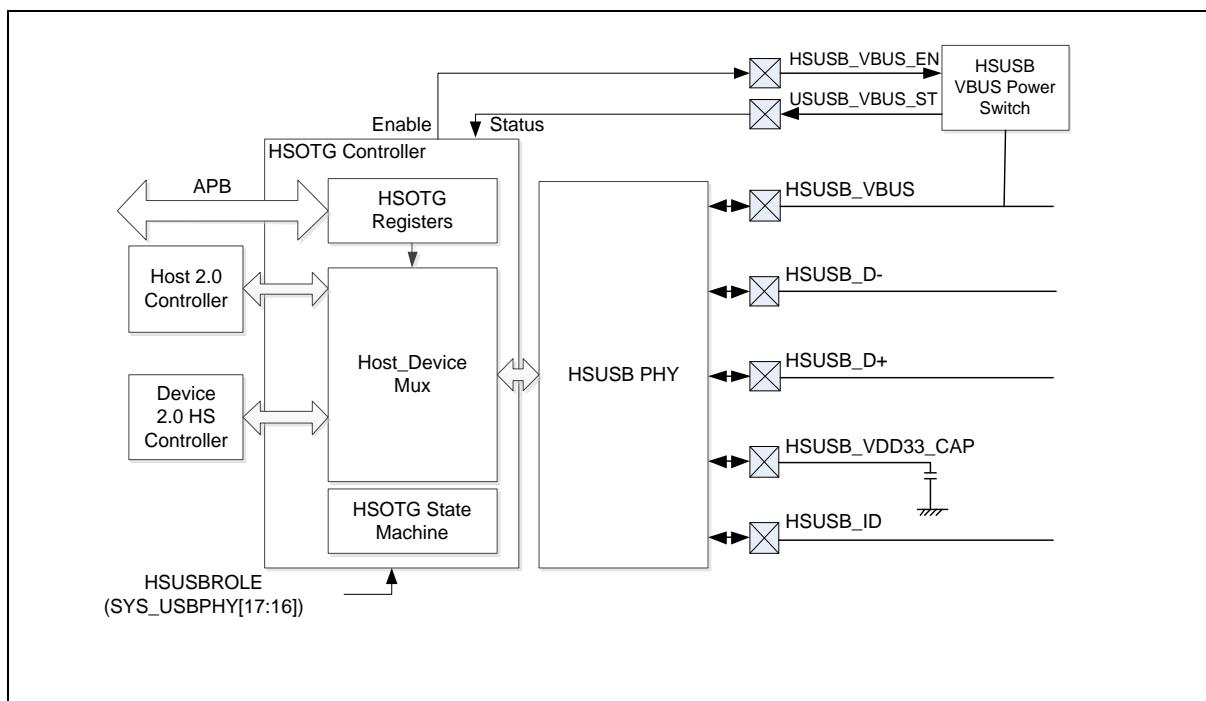

Figure 6.34-1 USB OTG Block Diagram

6.34.4 Basic Configuration

- Clock Source Configuration
 - Enable HSOTG clock in HSOTGCKEN(CLK_AHBCLK[30]).
- Reset Configuration
 - Reset HSOTG in HSOTGRST (SYS_IPRST2[30]).

The OTG peripheral clock can be enabled by HSOTGCKEN (CLK_APBCLK0[30]). The role of USB frame is determined by HSUSBROLE (SYS_USBPHY[17:16]). These two configurations are write-protection bits. Before writing to these bits, user must disable the register protection function. Refer to the description of SYS_REGLCTL register for details. USB_VBUS_EN and USB_VBUS_ST pin functions are configured in SYS_GPA_MFPL or SYS_GPC_MFPL registers.

6.34.5 Functional Description

The role of USB frame depends on the setting of HSUSBROLE (SYS_USBPHY[17:16]) and USB_ID pin status. The HSUSBROLE configuration has precedence over USB_ID pin status. User can configure the OTG controller to USB Host mode, USB Device mode, ID dependent mode or OTG Device mode. In USB Host mode, the host controller will interact with USB PHY directly. In USB Device mode, the device controller will interact with USB PHY directly. In these cases, the OTG controller is used simply as a multiplexer. In ID dependent mode, USB_ID pin status will decide USB frame to act as USB host or USB device. If the USB_ID pin is FALSE state (low level), USB frame will act as USB host. If the USB_ID pin is TRUE state (high level), USB frame will act as USB device. In OTG Device mode, the OTG controller will handle OTG HNP and SRP protocols. If the USB_ID pin is FALSE state (low level), the OTG controller will act as an OTG A-device. If the USB_ID pin is TRUE state (high level), the OTG controller will act as an OTG B-device.

6.34.5.1 The Role of USB Frame

USB Device Mode

When USBROLE (SYS_USBPHY[1:0]) is set to 0, USB frame acts as USB device. USB host function is not available.

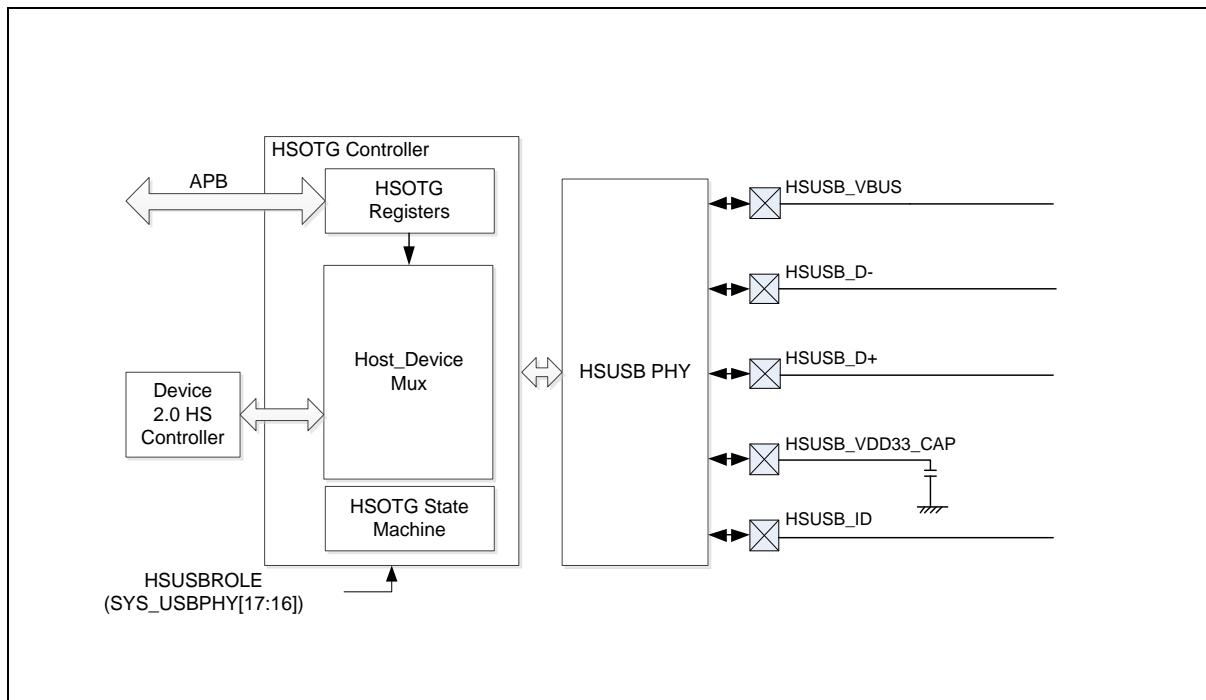

Figure 6.34-2 USB Device Mode

USB Host Mode

When HSUSBROLE (SYS_USBPHY[17:16]) is set to 1, USB frame acts as USB host. USB device function is not available.

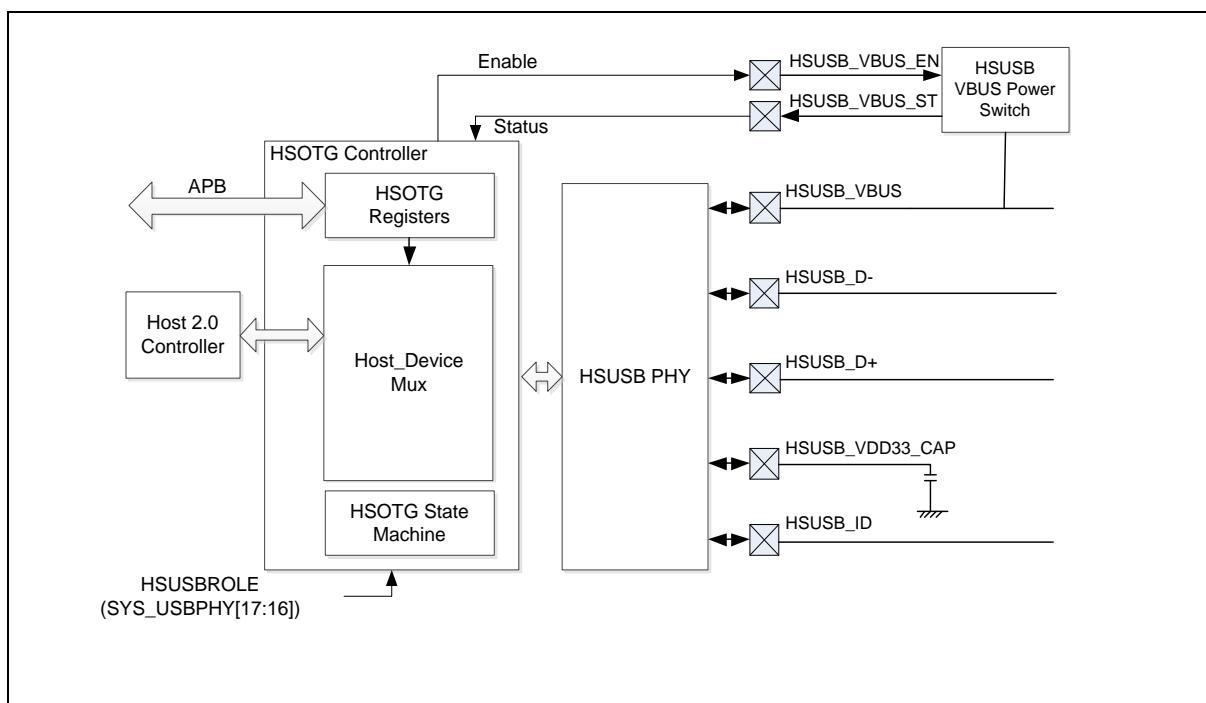

Figure 6.34-3 USB Host Mode

ID Dependent Mode

When HSUSBROLE (SYS_USBPHY[17:16]) is set to 2, the role of USB frame depends on USB_ID pin status. The ID detection function can be enabled by set IDDETEN (HSOTG_PHYCTL[1]) to 1. The USB_ID pin status reflects on IDSTS (HSOTG_STATUS[1]). When USB frame acts as USB host (USB_ID pin is low level), the block diagram is the same as USB Host mode. When USB frame acts as USB device (USB_ID pin is high level), the block diagram is the same as USB Device mode.

OTG Device Mode

When HSUSBROLE (SYS_USBPHY[17:16]) is set to 3, the role of USB frame depends on USB_ID pin status. The ID detection function can be enabled by set IDDETEN (HSOTG_PHYCTL[1]) to 1. The USB_ID pin status reflects on IDSTS (HSOTG_STATUS[1]). When USB_ID pin status is low level, the OTG controller acts as OTG A-device. When USB_ID pin status is high level, the OTG controller acts as OTG B-device. Please refer to OTG specification to get detail behavior of A-device and B-device.

6.34.5.2 Session Request Protocol (SRP)

When the USB frame is configured as OTG Device mode, OTG controller supports SRP to conserve power. Refer to OTG specification for details of SRP.

A-Device Session Request Protocol

1. A-device turns off USB bus power to conserve power. B-device recognizes such condition by checking VBUS status.
2. B-device requests A-device to supply USB bus power by Data line pulsing when B-device wants to connect to A-device.
3. A-device recognizes USB bus power request through checking SRPDETIF (HSOTG_INTSTS[13]).
4. A-device starts to drive VBUS by setting BUSREG (HSOTG_CTL[1]) to 1 once SRPDETIF (HSOTG_INTSTS[13]) is set to 1 by hardware. If VBUS reaches valid level in specific time interval and B-device is connected, A-device will become USB host, HOSTIF (HSOTG_INTSTS[7]) will be set to 1. If VBUS cannot reach valid level in specific time interval, it means overcurrent condition occurs. Then VBUS error bit, VBEIF (HSOTG_IS[1]), will be set to 1.

B-device Session Request Protocol

1. A-device turns off USB bus power to conserve power. B-device recognizes such condition by checking VBUSVLD (HSOTG_STATUS[5]).
2. B-device can request A-device to supply USB bus power by setting BUSREQ(HSOTG_CTL[1]) to 1.
3. B-device will generate data line pulsing as defined in OTG specification.
4. A-device will start to drive VBUS after detecting data line pulsing and B-device can recognize such condition by checking VBUSVLD (HSOTG_STATUS[5]). If A-device drives VBUS to valid level in specific time interval, B-device becomes USB peripheral, PDEVIF (HSOTG_INTSTS[6]) will be set to 1. If A-device does not drive VBUS to valid level in specific time interval, SRP failure flag, SRPFIF (HSOTG_INTSTS[2]), will be set to 1 and B-device will go to idle state defined in OTG specification.

6.34.5.3 Host Negotiation Protocol (HNP)

When the USB frame is configured as OTG Device mode, the host function can be transferred between two directly connected OTG device without changing the cable connection. Refer to OTG specification for details of HNP.

A-device Host Negotiation Protocol

1. A-Host defined in OTG specification sends SetFeature b_hnp_enable command to enable B-device HNP capability. B-device responses ACK to indicate B-device supports HNP. User needs to set HNPREQEN (HSOTG_CTL[2]) to 1 to enable HNP protocol.
2. A-Host goes to a_suspend state by setting BUSREQ (HSOTG_CTL[1]) to 0 and put USB bus

into J-state (USB_D+ high and USB_D- low) when A-Host has finished all desired operations.

3. A-Host becomes A-Peripheral if A-Host detects B-peripheral dis-connected by checking USB_D+ and USB_D- low in specific time interval. If A-Host cannot detect B-Peripheral dis-connected in specific time interval, A-Host will back to idle state.

B-device Host Negotiation Protocol

1. After B-Peripheral receives SetFeature b_hnp_enable command successfully, user enables B-peripheral HNP function by setting HNPREQEN (HSOTG_CTL[2]) to 1.
2. User sets BUSREG (HSOTG_CTL[1]) to 1 after detecting USB bus in J-state(USB_D+ high and USB_D- low). Then USB_D+ pull high resistor will be removed to cause USB disconnect state (USB_D+ low and USB_D- low).
3. If B-device detects A-device is connected (USB_D+ high) in specific time interval, B-device will become B-Host. If B-device cannot detect A-device is connected (USB_D+ high) in specific time interval, HNP failure flag, HNPFI (HSOTG_INTSTS[3]), will be set to 1.

6.34.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved	WKEN	OTGEN	Reserved	HNPREQEN	BUSREQ	VBUSDROP	

Bits	Description	
[31:6]	Reserved	Reserved.
[5]	WKEN	OTG ID Pin Wake-up Enable Bit 0 = OTG ID pin status change wake-up function Disabled. 1 = OTG ID pin status change wake-up function Enabled.
[4]	OTGEN	OTG Function Enable Bit User needs to set this bit to enable OTG function while USB frame configured as OTG device. When USB frame not configured as OTG device, this bit is must be low. 0= OTG function Disabled. 1 = OTG function Enabled.
[3]	Reserved	Reserved.
[2]	HNPREQEN	OTG HNP Request Enable Bit When USB frame as A-device, set this bit when A-device allows to process HNP protocol—A-device changes role from Host to Peripheral. This bit will be cleared when OTG state changes from a_suspend to a_peripheral or goes back to a_idle state. When USB frame as B-device, set this bit after the OTG A-device successfully sends a SetFeature (b_hnp_enable) command to the OTG B-device to start role change—B-device changes role from Peripheral to Host. This bit will be cleared when OTG state changes from b_peripheral to b_wait_acon or goes back to b_idle state. 0 = HNP request Disabled. 1 = HNP request Enabled (A-device can change role from Host to Peripheral or B-device can change role from Peripheral to Host). Note: Refer to OTG specification to get a_suspend, a_peripheral, a_idle and b_idle state.
[1]	BUSREQ	OTG Bus Request If OTG A-device wants to do data transfers via USB bus, setting this bit will drive VBUS high to detect USB device connection. If user won't use the bus any more, clearing this bit will drop VBUS to save power. This bit will be cleared when A-device goes to A_wait_vfall state. This bit will be also cleared if VBUSDROP (OTG_CTL[0]) bit is set or IDSTS (OTG_STATUS[1]) changed. If user of an OTG-B Device wants to request VBUS, setting this bit will run SRP protocol.

Bits	Description
	<p>This bit will be cleared if SRP failure (OTG A-device does not provide VBUS after B-device issues ARP in specified interval, defined in OTG specification). This bit will be also cleared if VBUSDROP (OTG_CTL[0]) bit is set IDSTS (OTG_STATUS[1]) changed.</p> <p>0 = Do not launch VBUS in OTG A-device or not request SRP in OTG B-device. 1 = Launch VBUS in OTG A-device or request SRP in OTG B-device.</p>
[0]	<p>Drop VBUS Control</p> <p>If user application running on this OTG A-device wants to conserve power, set this bit to drop VBUS. BUSREQ (OTG_CTL[1]) will be also cleared no matter A-device or B-device.</p> <p>0 = Do not drop the VBUS. 1 = Drop the VBUS.</p>

HSOTG PHY Control Register (HSOTG_PHYCTL)

Bits	Description	
[31:6]	Reserved	Reserved.
[5]	VBSTSPOL	<p>Off-chip USB VBUS Power Switch Status Polarity The polarity of off-chip USB VBUS power switch valid signal depends on the selected component. A USB_VBUS_ST pin is used to monitor the valid signal of the off-chip USB VBUS power switch. Set this bit as following according to the polarity of off-chip USB VBUS power switch. 0 = The polarity of off-chip USB VBUS power switch valid status is high. 1 = The polarity of off-chip USB VBUS power switch valid status is low.</p>
[4]	VBNPOL	<p>Off-chip USB VBUS Power Switch Enable Polarity The OTG controller will enable off-chip USB VBUS power switch to provide VBUS power when need. A USB_VBUS_EN pin is used to control the off-chip USB VBUS power switch. The polarity of enabling off-chip USB VBUS power switch (high active or low active) depends on the selected component. Set this bit as following according to the polarity of off-chip USB VBUS power switch. 0 = The off-chip USB VBUS power switch enable is active high. 1 = The off-chip USB VBUS power switch enable is active low.</p>
[3:2]	Reserved	Reserved.
[1]	IDDETEN	<p>ID Detection Enable Bit 0 = Detect ID pin status Disabled. 1 = Detect ID pin status Enabled.</p>
[0]	OTGPHYEN	<p>OTG PHY Enable When USB frame is configured as OTG-device or ID-dependent, user needs to set this bit before using OTG function. If device is not configured as OTG-device nor ID-dependent, this bit is "don't care". 0 = OTG PHY Disabled. 1 = OTG PHY Enabled.</p>

[13]	SRPDETIEN	SRP Detected Interrupt Enable Bit 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[12]	Reserved	Reserved.
[11]	SECHGIEN	SESSEND Status Changed Interrupt Enable Bit If this bit is set to 1 and SESSEND (OTG_STATUS[2]) status is changed from high to low or from low to high, a interrupt will be asserted. 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[10]	VBCHGIEN	VBUSVLD Status Changed Interrupt Enable Bit If this bit is set to 1 and VBUSVLD (OTG_STATUS[5]) status is changed from high to low or from low to high, a interrupt will be asserted. 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[9]	AVLDCHGIEN	A-device Session Valid Status Changed Interrupt Enable Bit If this bit is set to 1 and AVLD (OTG_STATUS[4]) status is changed from high to low or from low to high, a interrupt will be asserted. 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[8]	BVLDCHGIEN	B-device Session Valid Status Changed Interrupt Enable Bit If this bit is set to 1 and BVLD (OTG_STATUS[3]) status is changed from high to low or from low to high, a interrupt will be asserted. 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[7]	HOSTIEN	Act As Host Interrupt Enable Bit If this bit is set to 1 and the device is changed as a host, a interrupt will be asserted.

Bits	Description
	0 = This device as a host interrupt Disabled. 1 = This device as a host interrupt Enabled.
[6]	PDEVIEEN Act As Peripheral Interrupt Enable Bit If this bit is set to 1 and the device is changed as a peripheral, a interrupt will be asserted. 0 = This device as a peripheral interrupt Disabled. 1 = This device as a peripheral interrupt Enabled.
[5]	IDCHGIEN IDSTS Changed Interrupt Enable Bit If this bit is set to 1 and IDSTS (OTG_STATUS[1]) status is changed from high to low or from low to high, a interrupt will be asserted. 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[4]	GOIDLEIEN OTG Device Goes to IDLE State Interrupt Enable Bit 0 = Interrupt Disabled. 1 = Interrupt Enabled. Note: Going to idle state means going to a_idle or b_idle state. Please refer to A-device state diagram and B-device state diagram in OTG spec.
[3]	HNPFIEN HNP Fail Interrupt Enable Bit 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[2]	SRPFIEN SRP Fail Interrupt Enable Bit 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[1]	VBEIEN VBUS Error Interrupt Enable Bit 0 = Interrupt Disabled. 1 = Interrupt Enabled. Note: VBUS error means going to a_vbus_err state. Please refer to A-device state diagram in OTG spec.
[0]	ROLECHGIEN Role (Host or Peripheral) Changed Interrupt Enable Bit 0 = Interrupt Disabled. 1 = Interrupt Enabled.

Bits	Description	
[31:14]	Reserved	Reserved.
[13]	SRPDETIF	SRP Detected Interrupt Status 0 = SRP not detected. 1 = SRP detected. Note: Write 1 to clear this status.
[12]	Reserved	Reserved.
[11]	SECHGIF	SESEND State Change Interrupt Status 0 = SESSEND (OTG_STATUS[2]) not toggled. 1 = SESSEND (OTG_STATUS[2]) from high to low or from low to high. Note: Write 1 to clear this flag.
[10]	VBCHGIF	VBUSVLD State Change Interrupt Status 0 = VBUSVLD (OTG_STATUS[5]) not toggled. 1 = VBUSVLD (OTG_STATUS[5]) from high to low or from low to high. Note: Write 1 to clear this status.
[9]	AVLDCHGIF	A-device Session Valid State Change Interrupt Status 0 = AVLD (OTG_STATUS[4]) not toggled. 1 = AVLD (OTG_STATUS[4]) from high to low or low to high. Note: Write 1 to clear this status.
[8]	BVLDCHGIF	B-device Session Valid State Change Interrupt Status 0 = BVLD (OTG_STATUS[3]) is not toggled. 1 = BVLD (OTG_STATUS[3]) from high to low or low to high. Note: Write 1 to clear this status.
[7]	HOSTIF	Act As Host Interrupt Status 0= This device does not act as a host. 1 = This device acts as a host.

Bits	Description
	Note: Write 1 to clear this flag.
[6]	<p>PDEVIF</p> <p>Act As Peripheral Interrupt Status 0= This device does not act as a peripheral. 1 = This device acts as a peripheral.</p> <p>Note: Write 1 to clear this flag.</p>
[5]	<p>IDCHGIF</p> <p>ID State Change Interrupt Status 0 = IDSTS (OTG_STATUS[1]) not toggled. 1 = IDSTS (OTG_STATUS[1]) from high to low or from low to high.</p> <p>Note: Write 1 to clear this flag.</p>
[4]	<p>GOIDLEIF</p> <p>OTG Device Goes to IDLE Interrupt Status Flag is set if the OTG device transfers from non-idle state to idle state. The OTG device will be neither a host nor a peripheral. 0 = OTG device does not go back to idle state (a_idle or b_idle). 1 = OTG device goes back to idle state(a_idle or b_idle).</p> <p>Note 1: Going to idle state means going to a_idle or b_idle state. Please refer to OTG specification.</p> <p>Note 2: Write 1 to clear this flag.</p>
[3]	<p>HNPFIF</p> <p>HNP Fail Interrupt Status When A-device has granted B-device to be host and USB bus is in SEO (both USB_D+ and USB_D- low) state, this bit will be set when A-device does not connect after specified interval expires. 0 = A-device connects to B-device before specified interval expires. 1 = A-device does not connect to B-device before specified interval expires.</p> <p>Note: Write 1 to clear this flag.</p>
[2]	<p>SRPFIF</p> <p>SRP Fail Interrupt Status After initiating SRP, an OTG B-device will wait for the OTG A-device to drive VBUS high at least TB_SRP_FAIL minimum, defined in OTG specification. This flag is set when the OTG B-device does not get VBUS high after this interval. 0 = OTG B-device gets VBUS high before this interval. 1 = OTG B-device does not get VBUS high before this interval.</p> <p>Note: Write 1 to clear this flag.</p>
[1]	<p>VBEIF</p> <p>VBUS Error Interrupt Status This bit will be set when voltage on VBUS cannot reach a minimum valid threshold 4.4V within a maximum time of 100ms after OTG A-device starting to drive VBUS high. 0 = OTG A-device drives VBUS over threshold voltage before this interval expires. 1 = OTG A-device cannot drive VBUS over threshold voltage before this interval expires.</p> <p>Note: Write 1 to clear this flag and recover from the VBUS error state.</p>
[0]	<p>ROLECHGIF</p> <p>OTG Role Change Interrupt Status This flag is set when the role of an OTG device changed from a host to a peripheral, or changed from a peripheral to a host while USB_ID pin status does not change. 0 = OTG device role not changed. 1 = OTG device role changed.</p> <p>Note: Write 1 to clear this flag.</p>

[0]	OVERCUR	Overcurrent Condition The voltage on VBUS cannot reach a minimum VBUS valid threshold, 4.4V minimum, within a maximum time of 100ms after OTG A-device drives VBUS high. 0 = OTG A-device drives VBUS successfully. 1 = OTG A-device cannot drives VBUS high in this interval.

6.35 CRC Controller (CRC)

6.35.1 Overview

The Cyclic Redundancy Check (CRC) generator can perform CRC calculation with four common polynomials CRC-CCITT, CRC-8, CRC-16, and CRC-32 settings.

6.35.2 Features

- Supports four common polynomials CRC-CCITT, CRC-8, CRC-16, and CRC-32
 - CRC-CCITT: $X^{16} + X^{12} + X^5 + 1$
 - CRC-8: $X^8 + X^2 + X + 1$
 - CRC-16: $X^{16} + X^{15} + X^2 + 1$
 - CRC-32: $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$
- Programmable seed value
- Supports programmable order reverse setting for input data and CRC checksum
- Supports programmable 1's complement setting for input data and CRC checksum
- Supports 8/16/32-bit of data width
 - 8-bit write mode: 1-AHB clock cycle operation
 - 16-bit write mode: 2-AHB clock cycle operation
 - 32-bit write mode: 4-AHB clock cycle operation
- Supports using PDMA to write data to perform CRC operation

6.35.3 Block Diagram

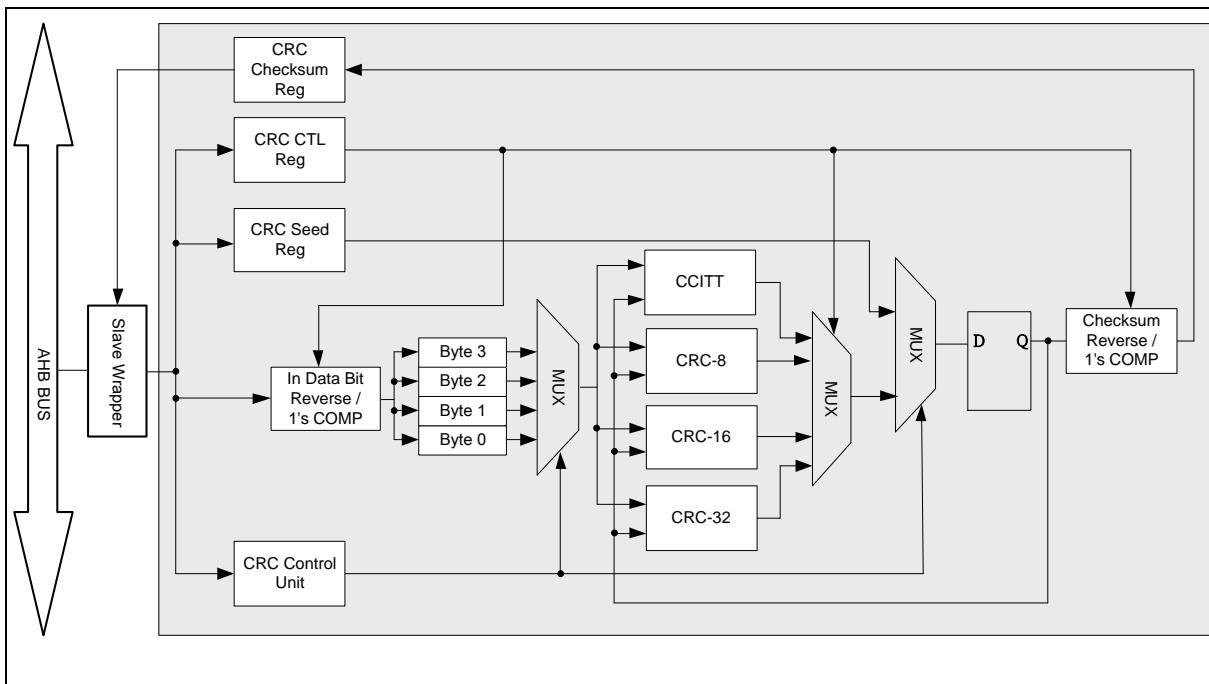

Figure 6.35-1 CRC Generator Block Diagram

6.35.4 Basic Configuration

- Clock Source Configuration
 - Enable CRC peripheral clock in CRCCKEN (CLK_AHBCLK[7]).
- Reset Configuration
 - Reset CRC controller in CRCRST (SYS_IPRST0[7]).

6.35.5 Functional Description

CRC generator can perform CRC calculation with four common polynomial settings. The operation polynomial includes CRC-CCITT, CRC-8, CRC-16 and CRC-32; User can choose the CRC operation polynomial mode by setting CRCMODE[1:0] (CRC_CTL[31:30] CRC Polynomial Mode).

The following is a program sequence example.

1. Enable CRC generator by setting CRCEN (CRC_CTL[0] CRC Channel Enable Bit).
 - 1) Initial setting for CRC calculation.
2. Configure 1's complement for CRC checksum by setting CHKSFMT (CRC_CTL[27] Checksum 1's Complement).
 - 1) Configure bit order reverse for CRC checksum by setting CHKSREV (CRC_CTL[25] Checksum Bit Order Reverse). The functional block is also shown in Figure 6.35-2 CHECKSUM Bit Order Reverse Functional Block
 - 2) Configure 1's complement for CRC write data by setting DATFMT (CRC_CTL[26] Write Data 1's Complement).
 - 3) Configure bit order reverse for CRC write data per byte by setting DATREV (CRC_CTL[24] Write Data Bit Order Reverse). The functional block is also shown in Figure 6.35-3.
3. Perform CHKSINIT (CRC_CTL[1] Checksum Initialization) to load the initial checksum value from CRC_SEED register value.
4. Write data to CRC_DAT register to calculate CRC checksum.
5. Get the CRC checksum result by reading CRC_CHECKSUM register.

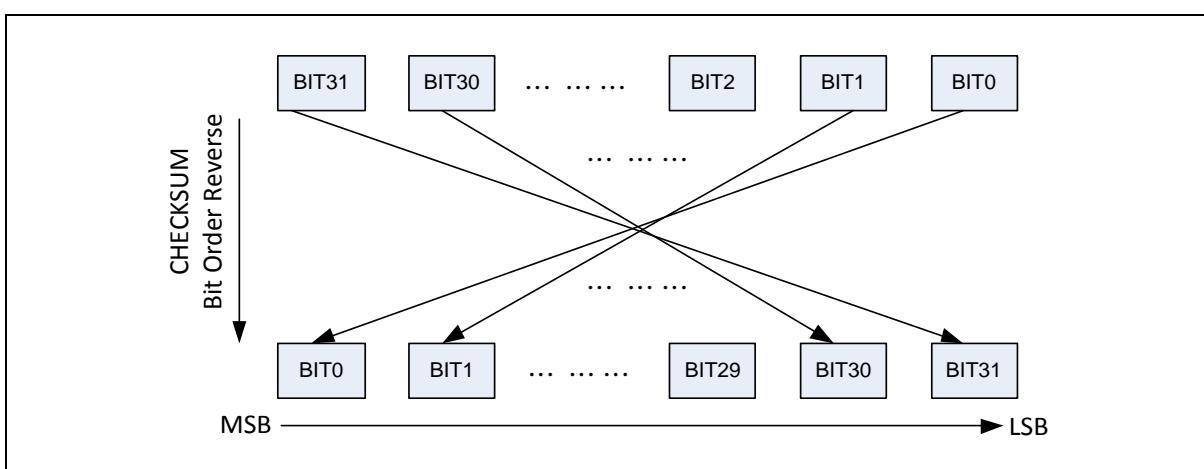

Figure 6.35-2 CHECKSUM Bit Order Reverse Functional Block

6.35.6 Register Map

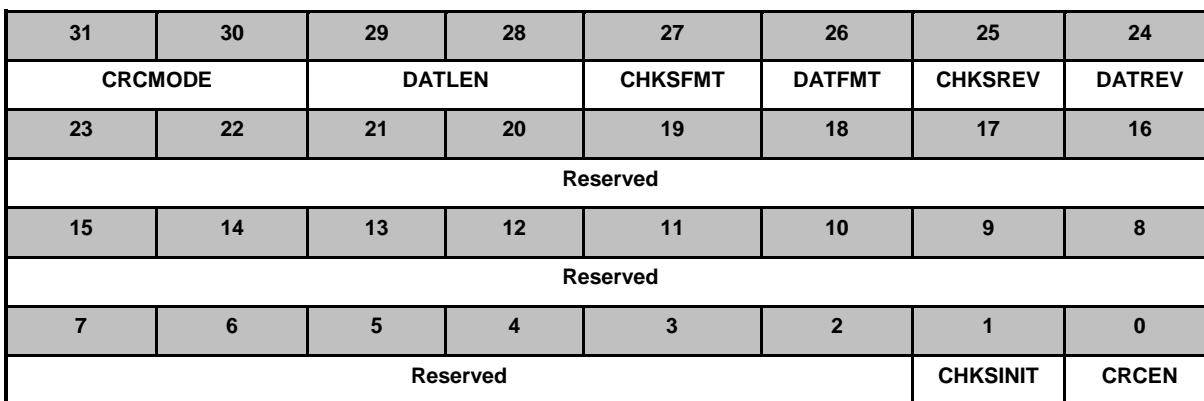

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
CRC Base Address:				
CRC_BA = 0x4003_1000				
CRC_CTL	CRC_BA+0x00	R/W	CRC Control Register	0x2000_0000
CRC_DAT	CRC_BA+0x04	R/W	CRC Write Data Register	0x0000_0000
CRC_SEED	CRC_BA+0x08	R/W	CRC Seed Register	0xFFFF_FFFF
CRC_CHECKSUM	CRC_BA+0x0C	R	CRC Checksum Register	0xFFFF_FFFF

6.35.7 Register Description

CRC Control Register (CRC_CTL)

Register	Offset	R/W	Description				Reset Value
CRC_CTL	CRC_BA+0x00	R/W	CRC Control Register				0x2000_0000

Bits	Description
[31:30]	CRCMODE CRC Polynomial Mode This field indicates the CRC operation polynomial mode. 00 = CRC-CCITT Polynomial mode. 01 = CRC-8 Polynomial mode. 10 = CRC-16 Polynomial mode. 11 = CRC-32 Polynomial mode.
[29:28]	DATLEN CPU Write Data Length This field indicates the write data length. 00 = Data length is 8-bit mode. 01 = Data length is 16-bit mode. 1x = Data length is 32-bit mode. Note: When the write data length is 8-bit mode, the valid data in CRC_DAT register is only DATA[7:0] bits; if the write data length is 16-bit mode, the valid data in CRC_DAT register is only DATA[15:0].
[27]	CHKSFMT Checksum 1's Complement This bit is used to enable the 1's complement function for checksum result in CRC_CHECKSUM register. 0 = 1's complement for CRC checksum Disabled. 1 = 1's complement for CRC checksum Enabled.
[26]	DATFMT Write Data 1's Complement This bit is used to enable the 1's complement function for write data value in CRC_DAT register. 0 = 1's complement for CRC writes data in Disabled. 1 = 1's complement for CRC writes data in Enabled.

[25]	CHKSREV	Checksum Bit Order Reverse This bit is used to enable the bit order reverse function for checksum result in CRC_CHECKSUM register. 0 = Bit order reverse for CRC checksum Disabled. 1 = Bit order reverse for CRC checksum Enabled. Note: If the checksum result is 0xDD7B0F2E, the bit order reverse for CRC checksum is 0x74F0DEBB.
[24]	DATREV	Write Data Bit Order Reverse This bit is used to enable the bit order reverse function per byte for write data value in CRC_DAT register. 0 = Bit order reversed for CRC write data in Disabled. 1 = Bit order reversed for CRC write data in Enabled (per byte). Note: If the write data is 0xAABBCCDD, the bit order reverse for CRC write data in is 0x55DD33BB.
[23:2]	Reserved	Reserved.
[1]	CHKSINIT	Checksum Initialization 0 = No effect. 1 = Initial checksum value by auto reload CRC_SEED register value to CRC_CHECKSUM register value. Note: This bit will be cleared automatically.
[0]	CRCEN	CRC Channel Enable Bit 0 = No effect. 1 = CRC operation Enabled.

[31:0]	CHECKSUM	CRC Checksum Results This field indicates the CRC checksum result.

6.36 Cryptographic Accelerator (CRYPTO)

6.36.1 Overview

The Crypto (Cryptographic Accelerator) includes a secure pseudo random number generator (PRNG) core and supports AES, DES/TDES, SHA and HMAC algorithms.

The PRNG core supports 64 bits, 128 bits, 192 bits, and 256 bits random number generation.

The AES accelerator is an implementation fully compliant with the AES (Advance Encryption Standard) encryption and decryption algorithm. The AES accelerator supports ECB, CBC, CFB, OFB, CTR, CBC-CS1, CBC-CS2, and CBC-CS3 mode.

The DES/TDES accelerator is an implementation fully compliant with the DES and Triple DES encryption/decryption algorithm. The DES/TDES accelerator supports ECB, CBC, CFB, OFB, and CTR mode.

The SHA accelerator is an implementation fully compliant with the SHA-160, SHA-224, SHA-256, SHA-384, and SHA-512 and corresponding HMAC algorithms.

The ECC accelerator is an implementation fully compliant with elliptic curve cryptography by using polynomial basis in binary field and prime filed.

6.36.2 Features

- PRNG
 - Supports 64 bits, 128 bits, 192 bits, and 256 bits random number generation
- AES
 - Supports FIPS NIST 197
 - Supports SP800-38A and addendum
 - Supports 128, 192, and 256 bits key
 - Supports both encryption and decryption
 - Supports ECB, CBC, CFB, OFB, CTR, CBC-CS1, CBC-CS2, and CBC-CS3 mode
 - Supports key expander
- DES
 - Supports FIPS 46-3
 - Supports both encryption and decryption
 - Supports ECB, CBC, CFB, OFB, and CTR mode
- TDES
 - Supports FIPS NIST 800-67
 - Implemented according to the X9.52 standard
 - Supports two keys or three keys mode
 - Supports both encryption and decryption
 - Supports ECB, CBC, CFB, OFB, and CTR mode
- SHA
 - Supports FIPS NIST 180, 180-2
 - Supports SHA-160, SHA-224, SHA-256, SHA-384, and SHA-512
- HMAC

- Supports FIPS NIST 180, 180-2
- Supports HMAC-SHA-160, HMAC-SHA-224, HMAC-SHA-256, HMAC-SHA-384, and HMAC-SHA-512
- ECC
 - Supports both prime field GF(p) and binary field GF(2^m)
 - Supports NIST P-192, P-224, P-256, P-384, and P-521
 - Supports NIST B-163, B-233, B-283, B-409, and B-571
 - Supports NIST K-163, K-233, K-283, K-409, and K-571
 - Supports point multiplication, addition and doubling operations in GF(p) and GF(2^m)
 - Supports modulus division, multiplication, addition and subtraction operations in GF(p)

6.36.3 Block Diagram

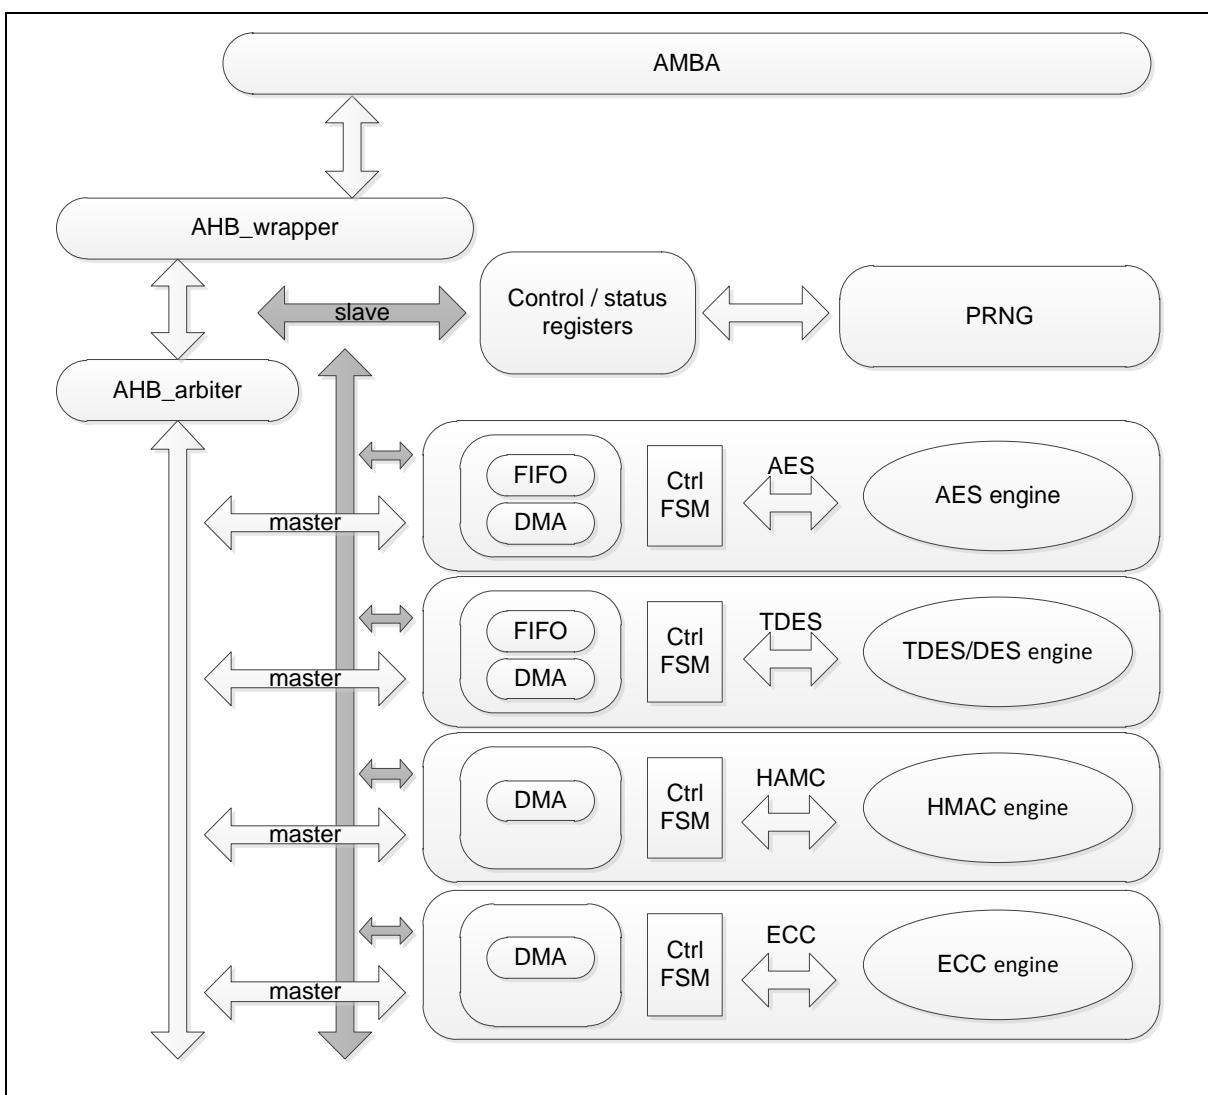

Figure 6.36-1 Cryptographic Accelerator Block Diagram

6.36.4 Basic Configuration

- Clock Source Configuration
 - Enable CRYPTO peripheral clock in CRYPTOCKEN (CLK_AHBCLK[12])
- Reset Configuration
 - Reset CRYPTO controller in CRYPTORST (SYS_IPRST0[12])

6.36.5 Functional Description

The cryptographic accelerator includes a secure pseudo random number generator (PRNG) core and supports AES, DES/TDES, SHA, HMAC and ECC algorithms. The accelerator can be used in different data security applications, such as secure communications that need cryptographic protection and integrity.

1. The PRNG core supports 64 bits, 128 bits, 192 bits, and 256 bits random number generation configured by KEYSZ.

The AES accelerator is a fully compliant implementation of the AES (Advance Encryption Standard) encryption and decryption algorithm. The AES accelerator supports ECB, CBC, CFB, OFB, CTR, CBC-CS1, CBC-CS2, and CBC-CS3 mode. The AES accelerator provides the DMA function to reduce the CPU intervention, and supports three burst lengths, sixteen-words, eight-words, and four-words.

2. The DES/TDES accelerator is a fully compliant implementation of the DES and Triple DES encryption/decryption algorithm. The DES/TDES accelerator supports ECB, CBC, CFB, OFB, and CTR mode. The DES/TDES accelerator also supports the DMA function to reduce the CPU intervention. Only two burst lengths, four words and eight words, are supported.
3. The SHA/HMAC accelerator is a fully compliant implementation of the SHA-160, SHA-224, SHA-256, SHA-384, SHA-512, and corresponding HMAC algorithm. The SHA/HMAC accelerator also supports the DMA function to reduce the CPU intervention. It supports three burst lengths, sixteen-words, eight-words, and four-words.
4. The ECC accelerator is a fully compliant implementation of the prime field GF(p) and binary field GF(2^m) algorithm. The prime field GF(p) supports NIST P-192, P-224, P-256, P-384 and P-521. The binary field GF(2^m) supports NIST B-163, B-233, B-283, B-409, B-571 and NIST K-163, K-233, K-283, K-409 and K-571.

Software can control the data flow by enabling the CRYPTO_INTEN, and monitor the accelerator status by checking the CRYPTO_INTSTS. When any engine happened operation error or buffer error, the corresponding error flag will set to 1 and inform to CPU if error interrupt enable bit is set to 1. If want to detail error condition, software can check status flag register of each engine. Table 6.36-1 lists each engine error enable bit, error flag bit and error conditions.

Engine	Error Interrupt Enable Bit	Error Interrupt Flag	Error Conditions
AES	AESEIEN (CRYPTO_INTEN[1])	AESEIF (CRYPTO_INTSTS[1])	INBUFERR/OUTBUFERR/BUSERR
TDES/DES	TDESEIEN (CRYPTO_INTEN[9])	TDEEIF (CRYPTO_INTSTS[9])	INBUFERR/OUTBUFERR/BUSERR
SHA/HMAC	HMACEIEN (CRYPTO_INTEN[25])	HMACEIF (CRYPTO_INTSTS[25])	DMAERR/BUSERR
ECC	ECCEIEN (CRYPTO_INTEN[23])	ECCEIF (CRYPTO_INTSTS[23])	BUSERR

Table 6.36-1 Each Engine Error Conditions and Error Flag

The cryptographic accelerator supports the following features to enhance the performance.

DMA Mode

Once DMA source address register, destination address register, and byte count register are configured by CPU, moving data from and to accelerator is done by DMA logic totally. This mode can off-load the loading from the CPU. The cryptographic accelerator embeds four hardware DMA channels for AES engine, four hardware DMA channels for DES/TDES engine, and one hardware DMA channel for SHA/HMAC engine.

Engine	DMA Enable Bit
AES	DMAEN (CRYPTO_AES_CTL[7])
TDES/DES	DMAEN (CRYPTO_TDES_CTL[7])
SHA/HMAC	DMAEN (CRYPTO_HMAC_CTL[7])
ECC	DMAEN (CRYPTO_ECC_CTL[7])

Table 6.36-2 DMA Enable Bit Table

DMA Cascade Mode

In the case that the data SRAM resource is tight, or another peripheral is scheduled to switch, the data source or sink needs an update, while the setting for the accelerator operation is planned to be kept. In this mode, software can update DMA source address register, destination address register, and byte count register during a cascade operation, without finishing the accelerator operation.

Engine	DMA Cascade Bit
AES	DMACSCAD (CRYPTO_AES_CTL[6])
TDES/DES	DMACSCAD (CRYPTO_TDES_CTL[6])

Table 6.36-3 DMA Cascade Bit Table

Non-DMA Mode

In the case that the input data is small in size, DMA mode is not preferred. This mode can reduce the processing time for the accelerator, since no DMA related register needs a configuration, and no latency in DMA logic is introduced. Input data was feeding to cryptographic engine via writing to data input register.

Channel Expansion Mode

In this mode, several virtual channels in one of four DMA channels are feasible in AES or DES/TDES mode. The total channel number can exceed the limit of four DMA channels. The intermediate data from feedback registers (CRYPTO_AES_FDBCKx, CRYPTO_TDES_FDBCKH, and CRYPTO_TDES_FDBCKL) should be stored temporarily in data SRAM. And switch to another configuration setting of accelerator operation that includes operational mode, encryption/decryption, key, key size, IV, and other parameters. Once switching back, the intermediate data from feedback registers should be written to initial vectors (CRYPTO_AESn_IVx, CRPY_TDESx_IVH, and CRYPTO_TDESx_IVL) for the accelerator to continue the operation with the original configuration setting. Note that, in ECB mode, there is no need to move the intermediate data from feedback registers to IV.

Engine	Channel Selection Bits
AES	CHANNEL (CRYPTO_AES_CTL[25,24])
TDES/DES	CHANNEL (CRYPTO_TDES_CTL[25,24])

Table 6.36-4 Channel Selection Bit Table

6.36.5.2 PRNG (Pseudo Random Number Generator)

The PRNG block diagram is depicted in Figure 6.36-2. The core supports 64 bits, 128 bits, 192 bits, and 256 bits random number generation configured by KEYSZ(CRYPTO_PRNG_CTL[3:2]).

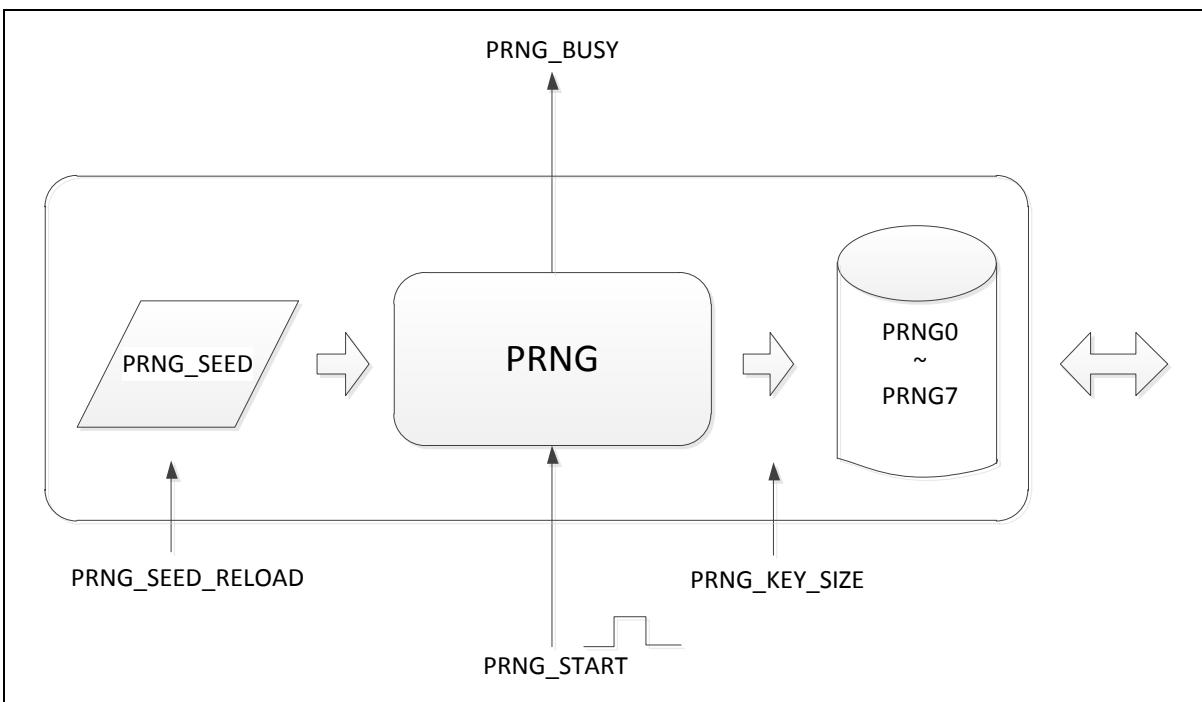

Figure 6.36-2 PRNG Function Diagram

Program steps to get the pseudo random number are depicted below.

1. Check the BUSY(CRYPTO_PRNG_CTL[8]) until it comes to 0.
2. Initialize PRNG parameters. Configure KEYSZ (CRYPTO_PRNG_CTL[3:2]), and write a random seed to CRYPTO_PRNG_SEED. Note that CRYPTO_PRNG_SEED should be initialized since it's not initialized as the chip powers up.
3. Configure PRNG control register CRYPTO_PRNG_CTL for key size(KEYSZ), seed reload(SEEDRLD), and PRNG start(START).
4. Software checks BUSY(CRYPTO_PRNG_CTL[8]) until it comes to 0, or waits for the PRNGIF (CRYPTO_INTSTS[16]) (must enable PRNGIEN (CRYPTO_INTEN[16])). Then software can read the output random numbers (KEY) from CRYPTO_PRNG_KEY0 ~ CRYPTO_PRNG_KEY7.

6.36.5.3 AES (Advanced Encryption Standard)

Electronic Codebook Mode

The Electronic Codebook (ECB) mode is a confidentiality mode that features the assignment of a fixed ciphertext block to each plaintext block, for a given key. It's analogous to the assignment of code words in a codebook.

In ECB encryption, each block of the plaintext is applied to the forward cipher function $CIPH_k$ directly and independently. The resulting sequence of output blocks is the ciphertext. In ECB decryption, each block of the ciphertext is applied to the inverse cipher function $CIPH^{-1}_k$ directly and independently. The resulting sequence of output blocks is the plaintext.

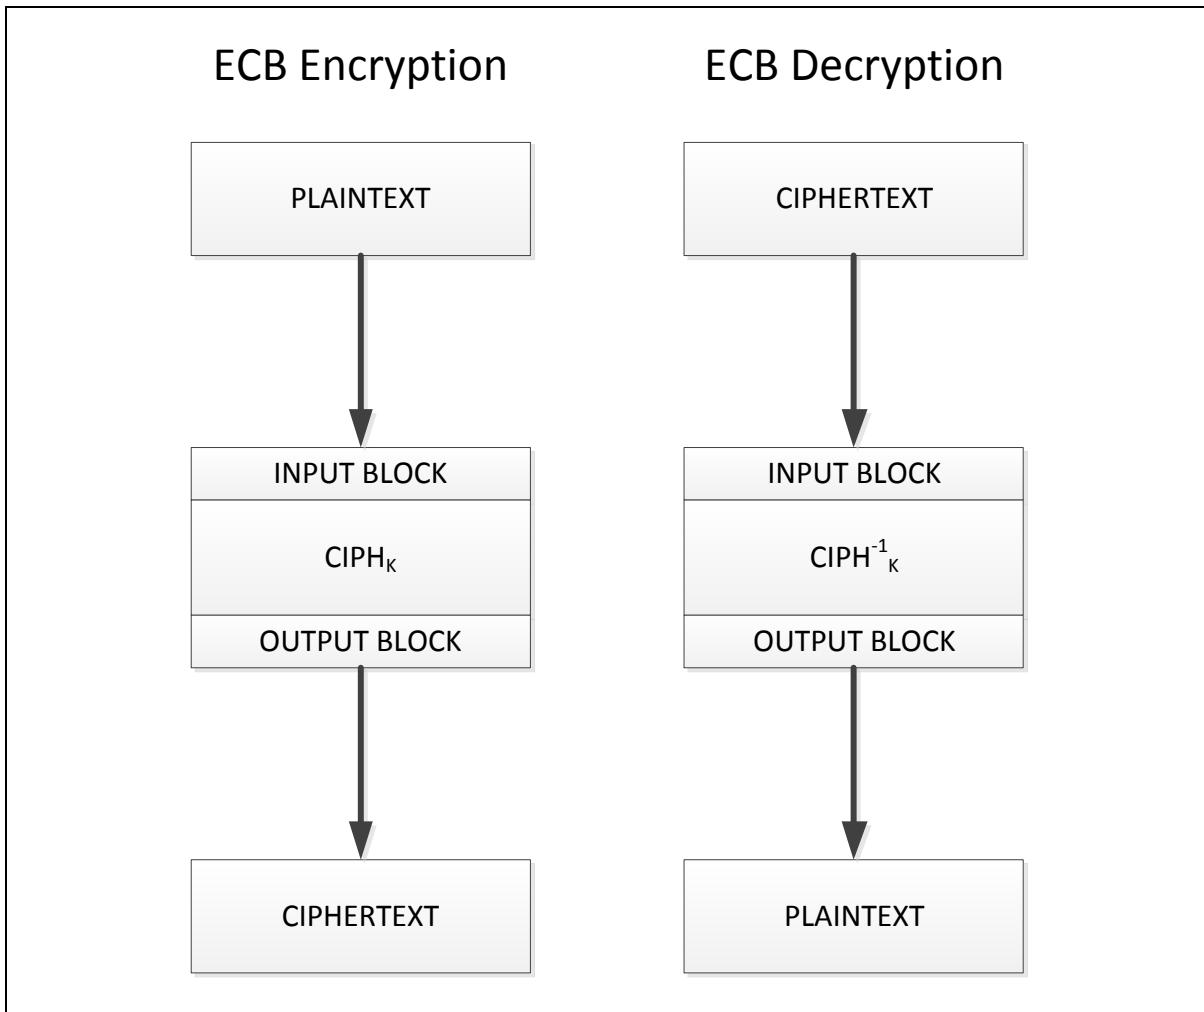

Figure 6.36-3 Electronic Codebook Mode

In ECB mode, any given plaintext block always gets encrypted to the same ciphertext block under a given key. If this property is undesirable in a particular application, the ECB mode should not be used.

Cipher Block Chaining Mode

The Cipher Block Chaining (CBC) mode is a confidentiality mode whose encryption process features the combining chaining of the plaintext blocks with the previous ciphertext blocks. The CBC mode requires an initialization vector (IV) to combine with the first plaintext block. The IV does not need to be secret, but it must be unpredictable.

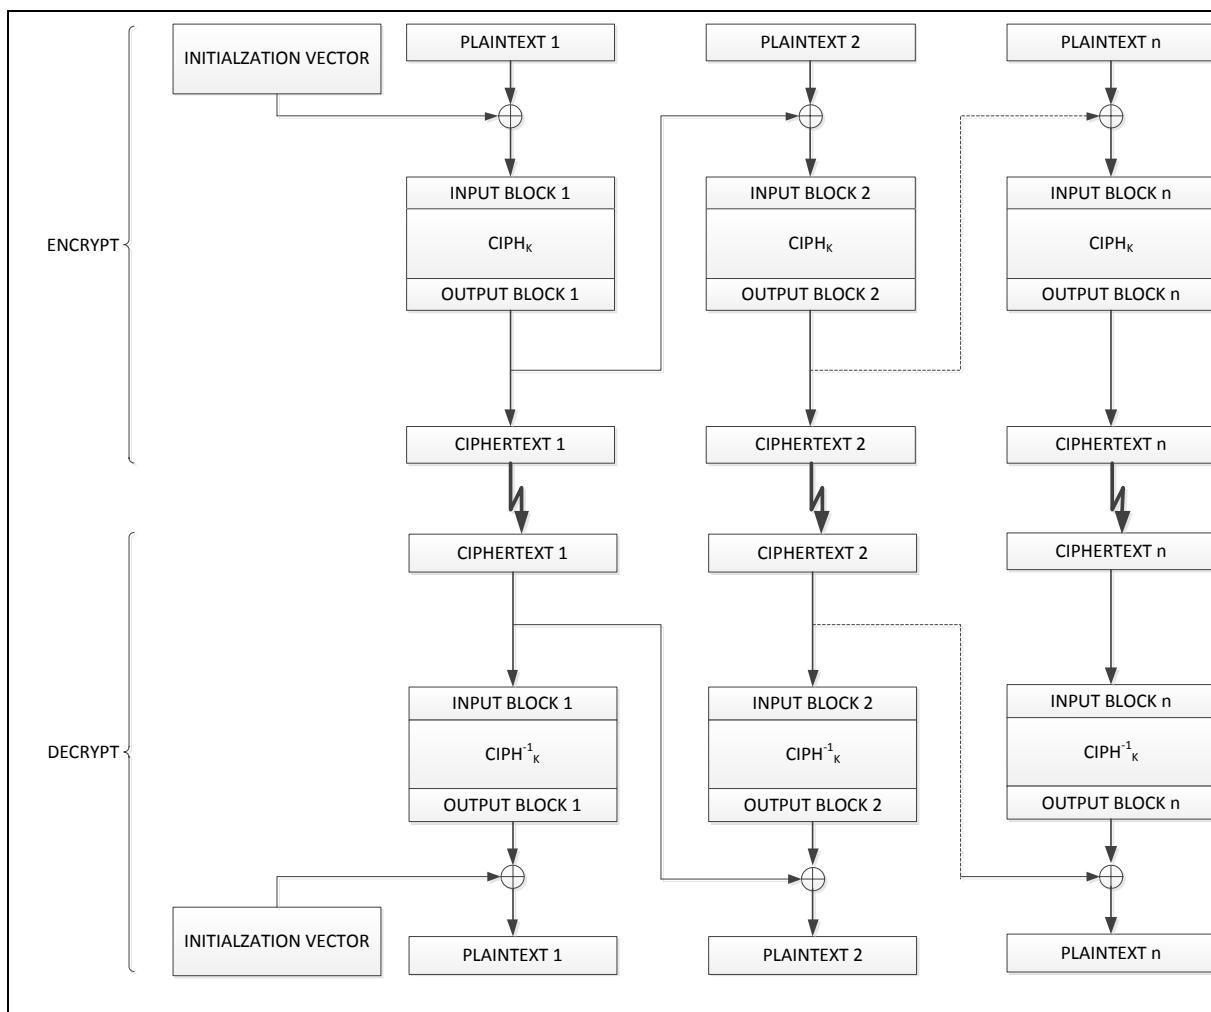

Figure 6.36-4 Cipher Block Chaining Mode

Cipher Feedback Mode (CFB)

The Cipher Feedback (CFB) mode is a confidentiality mode that features the feedback of successive ciphertext segments into the input blocks of the forward cipher to generate output blocks that are exclusive-ORed with the plaintext to produce the ciphertext, and vice versa. The CFB mode requires an IV as the initial input block. The IV need not be secret, but it must be unpredictable. The AES only supports 128-bit segment length CFB mode.

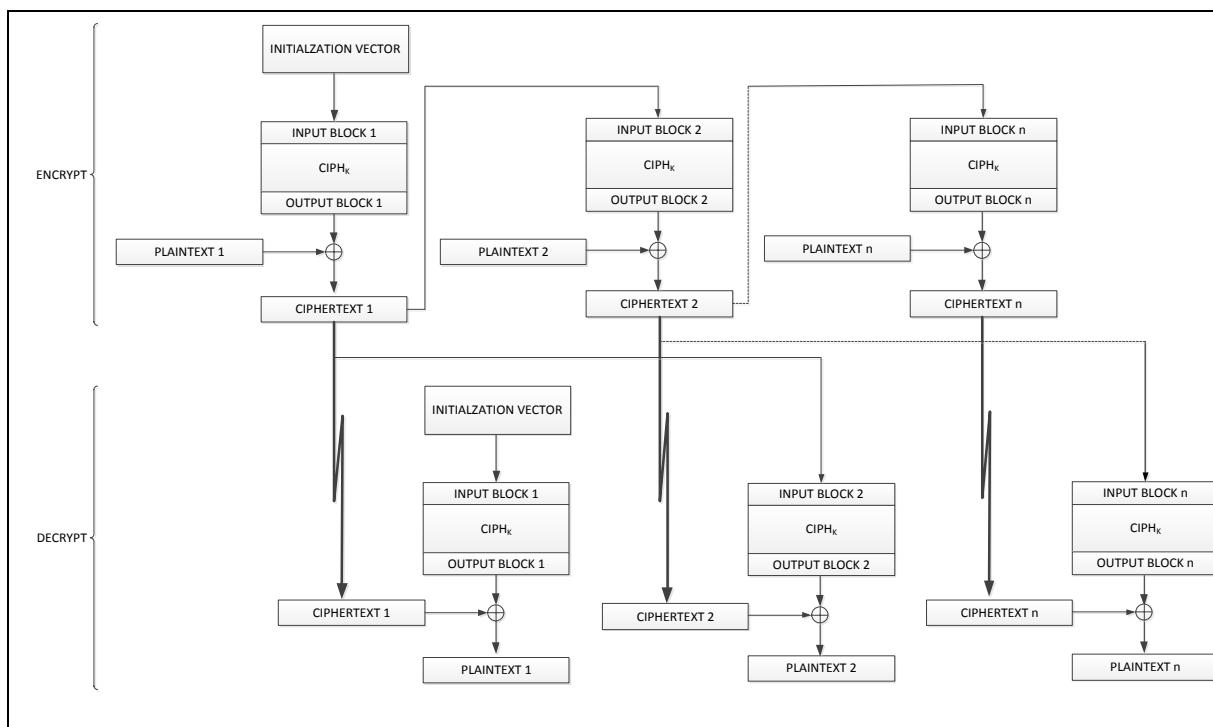

Figure 6.36-5 Cipher Feedback Mode

Output Feedback Mode

The Output Feedback (OFB) mode is a confidentiality mode that features the iteration of the forward cipher on an IV to generate a sequence of output blocks that are exclusive-ORed with the plaintext to produce the ciphertext, and vice versa. The OFB mode requires that the IV is a nonce, i.e., the IV must be unique for each execution of the mode under the given key.

The OFB mode requires a unique IV for every message that is ever encrypted under the given key. If, contrary to this requirement, the same IV is used for the encryption of more than one message, then the confidentiality of those messages may be compromised. Confidentiality may be similarly be compromised if any of the input blocks to the forward cipher function for the encryption of a message is designated as the IV for the encryption of another message under the given key.

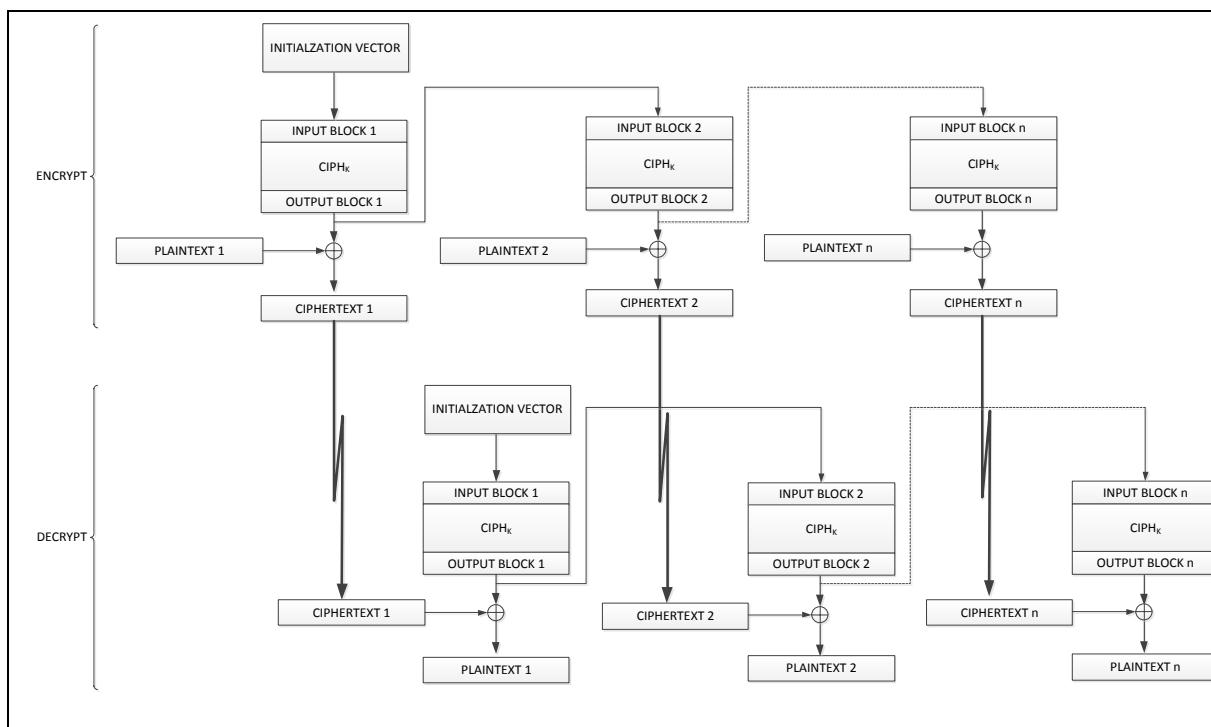

Figure 6.36-6 Output Feedback Mode

Counter Mode (CTR)

The Counter (CTR) mode is a confidentiality mode that features the application of the forward cipher to a set of input blocks, called counters, to produce a sequence of output blocks that are exclusive-ORed with the plaintext to produce the ciphertext, and vice versa. The sequence of counters must have the property that each block in the sequence is different from every other block. This condition is not restricted to a single message: across all of the messages that are encrypted under the given key, all of the counters must be distinct.

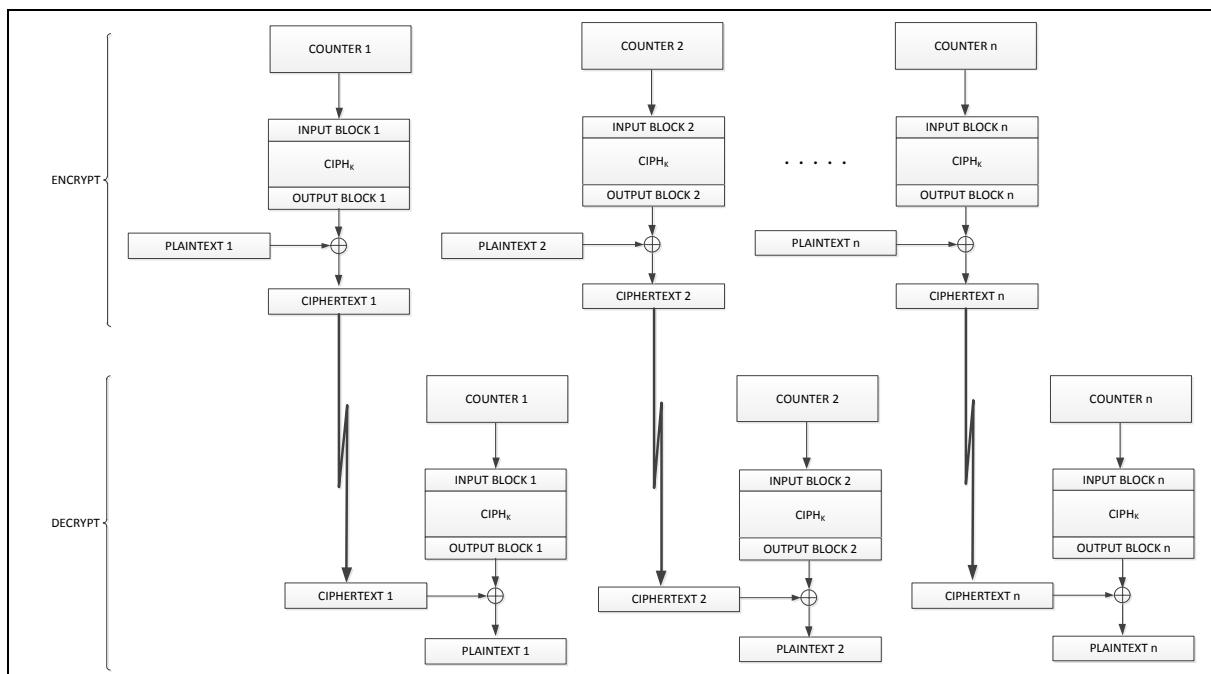

Figure 6.36-7 Counter Mode

CBC Ciphertext-Stealing 1 Mode (CBC-CS1)

Figure 6.36-8 illustrates the CBC-CS1-Encrypt algorithm for the case that P_n^* is a partial block. The cryptographic accelerator would append P_n^* with '0' to form a complete block P_n .

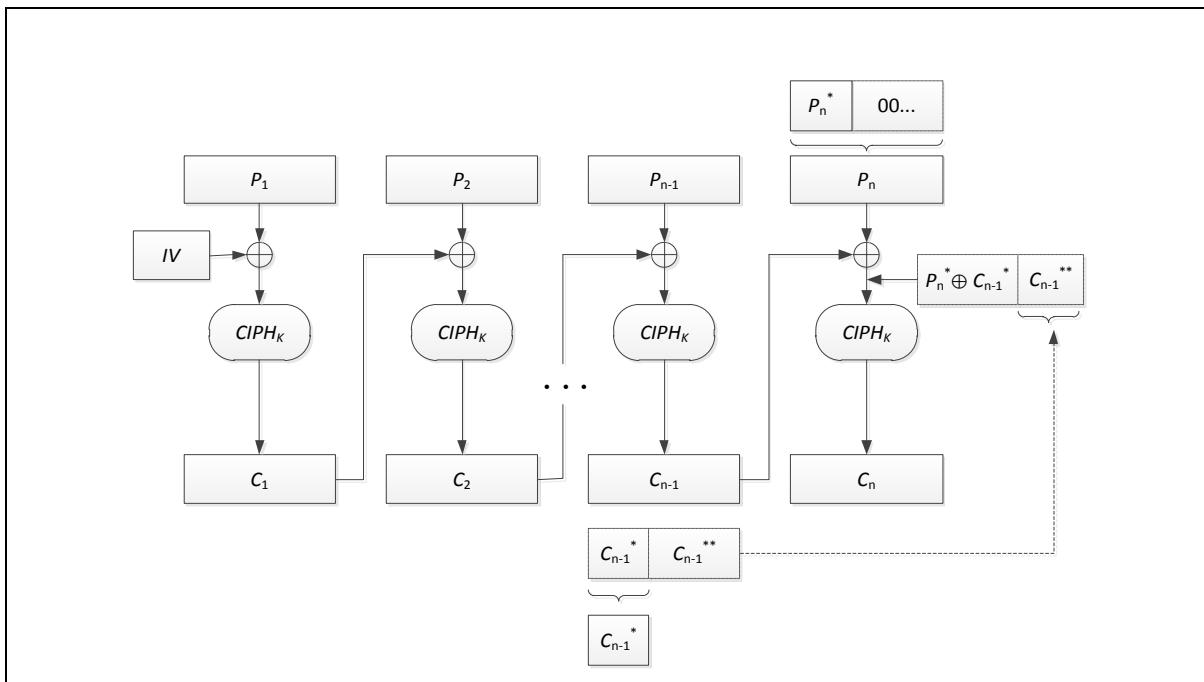

Figure 6.36-8 CBC-CS1 Encryption

Figure 6.36-9 illustrates the CBC-CS1-Decrypt algorithm for the case that C_{n-1}^* is a partial block.

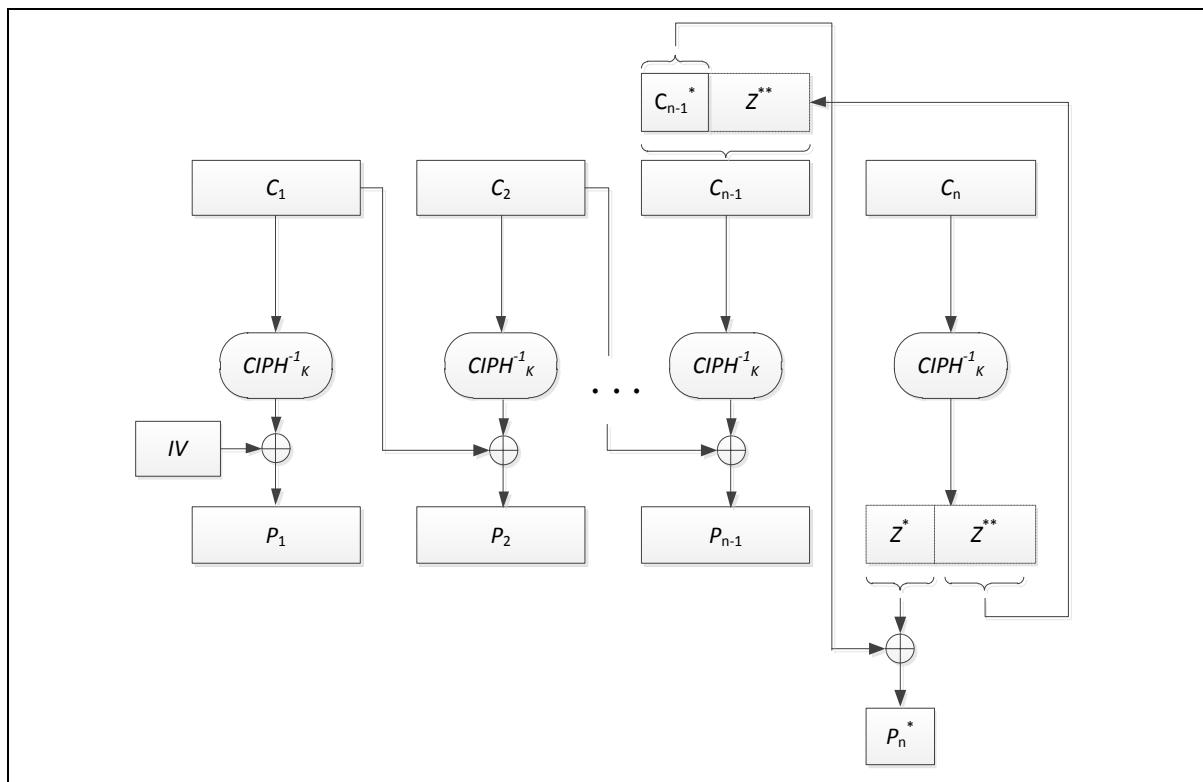

Figure 6.36-9 CBC-CS1 Decryption

CBC Ciphertext-Stealing 2 Mode (CBC-CS2)

When P_n^* is a partial block, then CBC-CS2-Encrypt and CBC-CS1-Encrypt differ only in the ordering of C_{n-1}^* and C_n .

CBC Ciphertext-Stealing 3 Mode (CBC-CS3)

C_{n-1}^* and C_n are unconditionally swapped, i.e., even when C_{n-1}^* is a complete block; therefore, CBC-CS3 is not strictly an extension of CBC mode. In the other case, i.e., when C_{n-1}^* is a nonempty partial block, CBC-CS3-Encrypt is equivalent to CBC-CS2-Encrypt.

Refer to the following programming steps for how to program the AES related registers.

AES DMA Mode Programming Flow

1. Write 1 to AESIEN (CRYPTO_INTEN[0]) to enable AES interrupt if needed.
2. Select one from four DMA channels.
3. Program AES key to registers CRYPTO_AESn_KEY0 ~ CRYPTO_AESn_KEY7. (where n is the selected channel number)
4. Program initial vectors to registers CRYPTO_AESn_IV0 ~ CRYPTO_AESn_IV3.
5. Program DMA source address to register CRYPTO_AESn_SADDR.
6. Program DMA destination address to register CRYPTO_AESn_DADDR.
7. Program DMA byte count to register CRYPTO_AESn_CNT.
8. Configure AES control register CRYPTO_AES_CTL for key protection(KEYPRT), channel selection(CHANNEL), encryption/decryption(ENCRYPTO), operational mode(OPMODE), DMA mode, key size(KEYSZ), and DMA input/output swap(INSWAP/OUTSWAP).
9. Write input data to DMA source address with selected DMA byte count.
10. Write 1 to START(CRYPTO_AES_CTL[0]) to start AES encryption/decryption.

11. Wait for the AES interrupt flag AESIF (CRYPTO_INTSTS[0]) be set.
12. Read output data from DMA destination address with selected DMA byte count.
13. Repeat step 9 to step 12 until all data processed if enabled DMACSCAD (CRYPTO_AES_CTL[6]).

AES Non-DMA Mode Programming Flow

1. Write 1 to AESIEN (CRYPTO_INTEN[0]) to enable AES interrupt if needed.
2. Program AES key to register CRYPTO_AESn_KEY0 ~ CRYPTO_AESn_KEY7. (where n is the selected channel number)
3. Program initial vectors to register CRYPTO_AESn_IV0 ~ CRYPTO_AESn_IV3.
4. Configure AES control register (CRYPTO_AES_CTL) for key protection(KEYPRT), channel select(CHANNEL), encryption/decryption(ENCRYPTO), operational mode(OPMODE), and key size(KEYSZ).
5. Write 1 to START(CRYPTO_AES_CTL[0]) to start AES encryption/decryption.
6. Polling INBUFFULL(CRYPTO_AES_STS[9]) and OUTBUFEMPTY(CRYPTO_AES_STS[16]). If INBUFFULL(CRYPTO_AES_STS[9]) is 0, write 32 bits input data to CRYPTO_AES_DATIN. If OUTBUFEMPTY(CRYPTO_AES_STS[16]) is 0, read 32 bits data from CRYPTO_AES_DATOUT.
7. Repeat step 6 until 128 bits data (16 bytes) are written to and read from AES engine.
8. Write 1 to DMALAST(CRYPTO_AES_CTL[5]) if current operation is last operation
9. Write data byte count of last operation to register CRYPTO_AES_CNT if current operation is last operation.
10. Repeat steps 6 to step 9 until all data processed.

6.36.5.4 DES/TDES (Data Encryption Standard / Triple DES)

FIPS 46-3 specifies two cryptographic algorithms, the Data Encryption Standard(DES) and the Triple Data Encryption Algorithm (TDEA). The cryptographic accelerator supports FIPS 46-3, both encryption and decryption, and ECB, CBC, CFB, OFB and CTR modes.

TDES DMA Mode Programming Flow

1. Write 1 to TDESIEN (CRYPTO_INTEN[8]) to enable TDES interrupt if needed.
2. Check the TDES engine is in idle state, i.e., BUSY(CRYPTO_TDES_STS [0]) is 0.
3. Program TDES key to registers CRYPTO_TDESn_KEY1H, CRYPTO_TDESn_KEY1L, CRYPTO_TDESn_KEY2H, CRYPTO_TDESn_KEY2L, CRYPTO_TDESn_KEY3H, and CRYPTO_TDESn_KEY3L. (where n is the selected channel number)
4. Program initial vector to registers CRYPTO_TDESn_IVH and CRYPTO_TDESn_IVL.
5. Program DMA source address to register CRYPTO_TDESn_SA.
6. Program DMA destination address to register CRYPTO_TDESn_DA.
7. Program DMA byte count to register CRYPTO_TDESn_CNT.
8. Configure TDES control register CRYPTO_TDES_CTL for channel selection(CHANNEL), encryption/decryption(ENCRYPTO), operational mode(OPMODE), DMA mode(DMAEN), TDES keys(3KEYS), TDES mode(TMODE), and DMA input/output swap(INSWAP/OUTSWAP).
9. Write input data to DMA source address with selected DMA byte count.
10. Write 1 to START(CRYPTO_TDES_CTL[0]) to start TDES encryption/decryption.
11. Wait for the TDES interrupt flag TDESIF (CRYPTO_INTSTS[8]) be set.
12. Read output data from DMA destination address with selected DMA byte count.

13. Repeat step 9 to step 12 until all data processed if enabled DMACSCAD (CRYPTO_TDES_CTL[6]).

TDES Non-DMA Mode Programming Flow

1. Write 1 to TDESIEN (CRYPTO_INTEN[8]) to enable TDES interrupt if needed.
2. Check the TDES engine is in idle state, i.e., BUSY(CRYPTO_TDES_STS[0]) is 0.
3. Program TDES key to registers CRYPTO_TDES_n_KEY1H, CRYPTO_TDES_n_KEY1L, CRYPTO_TDES_n_KEY2H, CRYPTO_TDES_n_KEY2L, CRYPTO_TDES_n_KEY3H, and CRYPTO_TDES_n_KEY3L. (where n is the selected channel number)
4. Program initial vector to registers CRYPTO_TDES_n_IVH and CRYPTO_TDES_n_IVL.
5. Configure TDES control register CRYPTO_TDES_CTL for channel selection(CHANNEL), encryption/decryption(ENCPRT), operational mode(OPMODE), TDES keys(3KEYS), and TDES mode(TMODE).
6. Write 1 to START(CRYPTO_TDES_CTL[0]) to start TDES encryption/decryption.
7. Polling INBUFFULL(CRYPTO_TDES_STS[9]) and OUTBUFEMPTY(CRYPTO_TDES_STS[16]). If INBUFFULL(CRYPTO_TDES_STS[9]) is 0, write 32 bits input data to CRYPTO_TDES_DATIN. If OUTBUFEMPTY(CRYPTO_TDES_STS[16]) is 0, read 32 bits data from CRYPTO_TDES_DATAOUT.
8. Repeat step 7 until 64 bits data (8 bytes) are written to and read from TDES engine.
9. Write 1 to DMALAST(CRYPTO_TDES_CTL[5]) if current operation is last operation
10. Write data byte count of last operation to register CRYPTO_TDES_CNT if current operation is last operation.
11. Repeat steps 7 to step 10 until all data processed.

6.36.5.5 SHA (Secure Hash Algorithm)

User can refer to the following steps to understand how to program the SHA related registers.

SHA DMA Mode Programming Flow

1. Write 1 to HMACIEN(CRYPTO_INTEN[24]) to enable SHA/HMAC interrupt if needed.
2. Configure SHA/HMAC control register CRYPTO_HMAC_CTL for SHA/HMAC engine input/output data swap(INSWAP/OUTSWAP), DMA mode(DMAEN), and SHA operation mode(OPMODE). Clear HMACEN(CRYPTO_HMAC_CTL[4]) to select SHA mode.
3. Program DMA source address to register CRYPTO_HMAC_SADDR.
4. Program DMA byte count to register CRYPTO_HMAC_DMACNT.
5. Write input data to DMA source address with selected DMA byte count.
6. Write 1 to START(CRYPTO_HMAC_CTL[0]) to start SHA encryption.
7. Wait for the SHA interrupt flag HMACIF(CRYPTO_INTSTS[24]) be set.
8. Read output digest (SHA160: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST4, SHA224: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST6, SHA256: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST7, SHA384: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST11, SHA512: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST15).

Note: The KEYCNT(CRYPTO_HMAC_KEYCNT[31:0]) keeps the byte count of key that SHA/HMAC engine operates.

SHA Non-DMA mode programming flow:

1. Configure SHA/HMAC control register CRYPTO_HMAC_CTL for SHA/HMAC engine input/output data swap(INSWAP/OUTSWAP) and SHA operation mode(OPMODE). Clear HMACEN(CRYPTO_HMAC_CTL[4]) to select SHA mode.

2. If it's the last input word, set DMALAST(CRYPTO_HMAC_CTL[5]).
3. Write 1 to START(CRYPTO_HMAC_CTL[0]) to start SHA encryption.
4. Wait for the SHA data input request DATINREQ(CRYPTO_HMAC_STS[16]) be set.
5. Write one word of input data to CRYPTO_HMAC_DATIN.
6. Repeat step 2 to 5 until all inut words are written into SHA engine.
7. Wait for the BUSY (CRYPTO_HMAC_STS[0]) be cleared.
8. Read output digest (SHA160: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST4, SHA224: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST6, SHA256: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST7, SHA384: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST11, SHA512: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST15).

Note: The KEYCNT(CRYPTO_HMAC_KEYCNT[31:0]) keeps the byte count of key that SHA/HMAC engine operates.

6.36.5.6 HMAC (*Keyed-Hash Message Authentication Code*)

The Keyed-Hash Message Authentication Code is a specific construction for calculating a message authentication code involving a cryptographic hash function in combination with a secret cryptographic key. Any cryptographic hash function, such as SHA-1, may be used in the calculation of an HMAC; the resulting MAC algorithm is termed HMAC-SHA1 accordingly.

User can refer to the following steps to understand how to program the HMAC related registers.

HMAC DMA Mode Programming Flow

1. Write 1 to HMACIEN(CRYPTO_INTEN[24]) to enable HMAC interrupt if needed.
2. Configure SHA/HMAC control register CRYPTO_HMAC_CTL for HMAC engine input/output data swap(INSWAP/OUTSWAP), DMA mode(DMAEN), and HMAC operation mode(OPMODE). Set HMACEN(CRYPTO_HMAC_CTL[4]) to select HMAC mode.
3. Program DMA source address to register CRYPTO_HMAC_SADDR.
4. Program DMA byte count to register CRYPTO_HMAC_DMACNT.
5. Write input data to DMA source address with selected DMA byte count.
6. Write 1 to START(CRYPTO_HMAC_CTL[0]) to start HMAC encryption.
7. Wait for the HMAC interrupt flag HMACIF(CRYPTO_INTSTS[24]) be set.
8. Read output digest (HMAC-SHA160: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST4, HMAC-SHA224: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST6, HMAC-SHA256: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST7, HMAC-SHA384: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST11, HMAC-SHA512: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST15).

Note: The KEYCNT(CRYPTO_HMAC_KEYCNT[31:0]) keeps the byte count of key that SHA/HMAC engine operates.

HMAC Non-DMA Mode Programming Flow

1. Configure SHA/HMAC control register CRYPTO_HMAC_CTL for SHA/HMAC engine input/output data swap(INSWAP/OUTSWAP) and HMAC operation mode(OPMODE). Set HMACEN(CRYPTO_HMAC_CTL[4]) to select HMAC mode.
2. If it's the last input word, set DMALAST(CRYPTO_HMAC_CTL[5]).
3. Write 1 to START(CRYPTO_HMAC_CTL[0]) to start HMAC encryption.
4. Wait for the HMAC data input request DATINREQ(CRYPTO_HMAC_STS[16]) be set.
5. Write one word of input data to CRYPTO_HMAC_DATIN.

6. Repeat step 2 to 5 until all input words are written into SHA engine.
7. Wait for the BUSY (CRYPTO_HMAC_STS[0]) be cleared.
8. Read output digest (HMAC-SHA160: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST4, HMAC-SHA224: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST6, HMAC-SHA256: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST7, HMAC-SHA384: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST11, HMAC-SHA512: CRYPTO_HMAC_DGST0 ~ CRYPTO_HMAC_DGST15).

Note: The KEYCNT(CRYPTO_HMAC_KEYCNT[31:0]) keeps the byte count of key that SHA/HMAC engine operates.

6.36.5.7 ECC (*Elliptic Curve Cryptography*)

Elliptic Curve Cryptography (ECC) is a famous approach of public-key cryptosystems. Recently, many protocols and applications utilize the algebraic cyclic group characters of elliptic curves over finite field to build cryptographic systems. All points of an elliptic curve will follow the formula of elliptic curve : $y^2 \equiv x^3 + Ax + B \pmod{N}$ in $GF(p)$ and $y^2 + x^3 \equiv x^3 + Ax^2 + B \pmod{N}$ in $GF(2^m)$. Figure 6.27-10 exhibits the main hierarchy chart of ECC applications. The often appeared parameters and corresponding registers are shown in Table 6.36-5.

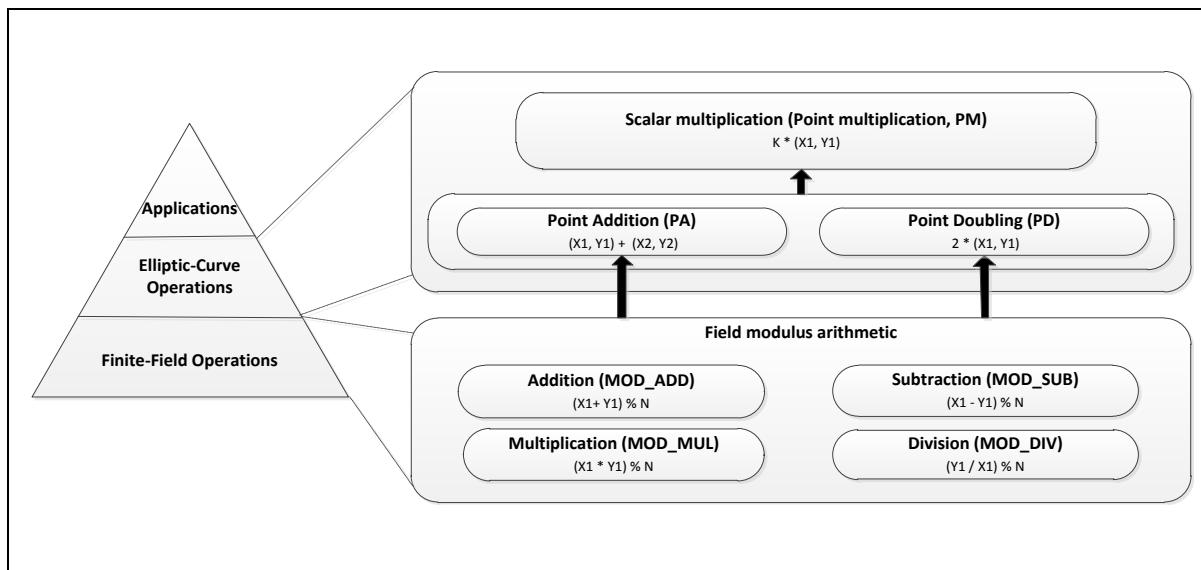

Figure 6.36-10 Main Hierarchy Chart of ECC

Parameter	Description	Corresponding Register
X1	The x-coordinate of point1	CRYPTO_ECC_X1_00~ CRYPTO_ECC_X1_17
Y1	The y-coordinate of point1	CRYPTO_ECC_Y1_00~ CRYPTO_ECC_Y1_17
X2	The x-coordinate of point2	CRYPTO_ECC_X2_00~ CRYPTO_ECC_X2_17
Y2	The y-coordinate of point2	CRYPTO_ECC_Y2_00~ CRYPTO_ECC_Y2_17
A	The curve parameter A	CRYPTO_ECC_A_00~ CRYPTO_ECC_A_17
B	The curve parameter B	CRYPTO_ECC_B_00~ CRYPTO_ECC_B_17
N	The curve parameter N	CRYPTO_ECC_N_00~ CRYPTO_ECC_N_17
M	The curve length	CRYPTO_ECC_CTL[31:22]
K	The scalar constant	CRYPTO_ECC_K_00~ CRYPTO_ECC_K_17

Table 6.36-5 ECC Parameters and Corresponding Registers Table

Scalar multiplication (point multiplication) is the core operation in ECC applications. The computation of scalar multiplication is composed of point addition and point doubling operations. Moreover, there are many finite field modulus arithmetic operations in the formula of point addition and doubling operation. To accelerate ECC applications, we propose an elliptic curve cryptographic accelerator that can process not only three point operations in both GF(p) and GF(2^m) but also four modulus operations in GF(p). Before starting ECC accelerator, user must provide the required input data of ECC operation include point coordinates (X1, Y1, X2, Y2), curve parameters (A, B, N, M) and scalar data (K) in Table 6.36-6 .The mark “√” means that the input data is necessary for this operation. The detail definition of input data and the corresponding registers in the ECC accelerator are exhibited in the next section Register Map.

After ECC accelerator finished, all point operations will generate a output point includes x-coordinate in the registers from CRYPTO_ECC_X1_00 to CRYPTO_ECC_X1_17 and y-coordinate in the registers from CRYPTO_ECC_Y1_00 to CRYPTO_ECC_Y1_17. In all modulus operations, ECC accelerator will only produce a output result in the registers from CRYPTO_ECC_X1_00 to CRYPTO_ECC_X1_17.

Operation	PM	PA	PD	MOD_DIV	MOD_MUL	MOD_ADD	MOD_SUB
ECCOP[1:0]	00	10	11	01	01	01	01
MODOP[1:0]	XX	XX	XX	00	01	10	11
X1	√	√	√	√	√	√	√
Y1	√	√	√	√	√	√	√
X2		√					
Y2		√					
A	√	√	√				
B	√		√				
N	√	√	√	√	√	√	√
M	√	√	√		√		
K	√						

Table 6.36-6 Required Input Data of Various Operations

User can refer to the following steps to understand how to program the ECC related registers.

ECC DMA Mode Programming Flow

1. Write 1 to ECCIEN(CRYPTO_INTEN[22]) to enable ECC interrupt if needed.
2. Program DMA source address to register CRYPTO_ECC_SADDR.
3. Program DMA destination address to register CRYPTO_ECC_DADDR.
4. Program DMA word count to register CRYPTO_ECC_WORDCNT.
5. Program the starting register address of all input data in Table 6.36-6 that will update to the register CRYPTO_ECC_STARTREG.
6. Write input data to DMA source address with selected DMA word count.
7. Configure ECC control register CRYPTO_ECC_CTL for ECC accelerator, such as the start signal of ECC accelerator(START), DMA mode enable signal(DMAEN), field selection(FSEL), point operation mode(ECCOP), modulus operation mode(MODOP), the control signals fo all input data registers(LDA, LDB, LDN, LDK, LDP1, LDP2), and the key length of elliptic curve(CURVEM).

8. Wait for the ECC interrupt flag ECCIF(CRYPTO_INTSTS[22]) be set.
9. Read output data and then clear ECC interrupt flag ECCIF.

ECC Non-DMA Mode Programming Flow

1. Write all necessary input data in the corresponding registers according to in Table 6.36-6, such as CURVEA, CURVEB, CURVEN, SCALAR.
2. Configure ECC control register CRYPTO_ECC_CTL for ECC accelerator, such as the start signal of ECC accelerator(START), field selection(FSEL), point operation mode(ECCOP), modulus operation mode(MODOP), the control signals fo all input data registers(LDA, LDB, LDN, LDK, LDP1, LDP2), and the key length of elliptic curve(CURVEM).
3. Wait for the BUSY (CRYPTO_ECC_STS[0]) be cleared.
4. Read output digest and then clear ECC interrupt flag ECCIF.

Some Notices of ECC Accelerator

1. The key length support of ECC accelerator is from 163 to 256 bits.
2. All input and output data must be positive. (If the input data is negative, it must be added N).
3. The irreducible polynomial of GF(2^m) must adopt the smallest one from HP, please refer to Table 6.36-7 (Reference from HP, Table of Low-Weight Binary Irreducible Polynomials, HPL-98-135, August, 1998)

	2,1	3,1	4,1	5,2

Table 6.36-7 Low-Weight Binary Irreducible Polynomials

4. Only when START and DMAEN (CRYPTO_ECC_CTL[0] and [7]) are assigned to 1 simultaneously, ECC DMA mode will be active.
5. When ECC engine is active (i.e., BUSY is 1 and DMABUSY (CRYPTO_ECC_STS[1]) is 0), user can't modify all input data registers (CRYPTO_ECC_X1_00 ~ CRYPTO_ECC_K_17).
6. If user wants to stop ECC accelerator, please configures the STOP (CRYPTO_ECC_CTL[1]) to 1. Note that: To avoid the transmission error of the next operation, BUSY signal will not be cleared immediately until the action of DMA is done.
7. The modulus operation not support for binary field.
8. The input data of modulus multiplication operation and division operation for PF must be less than N.
9. K is private key, so this register is write only.

The following describes the method of application about key pair generation, ECDSA and ECDH.

Key Pair Generation

Public key generation function: $Q = dG \pmod{N}$

1. Write the curve parameter A, B, N, and curve length M to corresponding registers according to Table 6.36-5.
2. Write the point G(x, y) to X1, Y1 registers according to Table 6.36-5.
3. Write the private key d to K register according to Table 6.36-5.
4. Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 00
5. Set FSEL(CRYPTO_ECC_CTL[8]) according to used curve of prime field or binary field
6. Set START(CRYPTO_ECC_CTL[0]) to 1
7. Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
8. Read public key Q from X1, Y1 registers

Elliptic Curve Digital Signature Algorithm (ECDSA)

ECDSA signature generation steps:

1. Calculate $e = \text{HASH}(m)$, where HASH is a cryptographic hashing algorithm, (i.e. SHA-1)
 - 1) Use SHA to calculate e
2. Select a random integer k form $[1, n-1]$
 - 1) Note that n is order, not prime modulus or irreducible polynomial function
3. Compute $r = x_1 \pmod{n}$, where $(x_1, y_1) = k * G$. If $r = 0$, go to step 2
 - 1) Write the curve parameter A, B, N and curve length M to corresponding registers according to Table 6.36-5
 - 2) Write the prime modulus or irreducible polynomial function to N registers according to Table 6.36-5
 - 3) Write the point G(x, y) to X1, Y1 registers according to Table 6.36-5
 - 4) Write the random integer k to K register according to Table 6.36-5
 - 5) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 00
 - 6) Set FSEL(CRYPTO_ECC_CTL[8]) according to used curve of prime field or binary field
 - 7) Set START(CRYPTO_ECC_CTL[0]) to 1
 - 8) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
 - 9) Write the curve order and curve length to N, M registers according to Table 6.36-5
 - 10) Write 0x0 to Y1 registers
 - 11) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 01
 - 12) Set MOPOP(CRYPTO_ECC_CTL[12:11]) to 10
 - 13) Set START(CRYPTO_ECC_CTL[0]) to 1
 - 14) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
 - 15) Read X1 registers to get r
4. Compute $s = k - 1 \times (e + d \times r) \pmod{n}$. If $s = 0$, go to step 2
 - 1) Write the curve order to N registers according to Table 6.36-5

- 2) Write the random integer k to X1 registers according to Table 6.36-5
 - 3) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 01
 - 4) Set MOPOP(CRYPTO_ECC_CTL[12:11]) to 00
 - 5) Set START(CRYPTO_ECC_CTL[0]) to 1
 - 6) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
 - 7) Read X1 registers to get k-1
 - 8) Write the curve order and curve length to N, M registers according to Table 6.36-5
 - 9) Write r, d to X1, Y1 registers
 - 10) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 01
 - 11) Set MOPOP(CRYPTO_ECC_CTL[12:11]) to 01
 - 12) Set START(CRYPTO_ECC_CTL[0]) to 1
 - 13) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
 - 14) Write the curve order to N registers according to Table 6.36-5
 - 15) Write e to Y1 registers
 - 16) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 01
 - 17) Set MOPOP(CRYPTO_ECC_CTL[12:11]) to 10
 - 18) Set START(CRYPTO_ECC_CTL[0]) to 1
 - 19) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
 - 20) Write the curve order and curve length to N, M registers according to Table 6.36-5
 - 21) Write k-1 to Y1 registers
 - 22) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 01
 - 23) Set MOPOP(CRYPTO_ECC_CTL[12:11]) to 01
 - 24) Set START(CRYPTO_ECC_CTL[0]) to 1
 - 25) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
 - 26) Read X1 registers to get s
5. The signature is the pair (r, s)

ECDSA signature verification steps:

1. Verify that r and s are integers in the interval [1, n-1]. If not, the signature is invalid
2. Compute e = HASH (m), where HASH is the hashing algorithm in signature generation
 - 1) Use SHA to calculate e
3. Compute w = s $\text{mod } n$
 - 1) Write the curve order to N registers according to Table 6.36-5
 - 2) Write s to X1 registers according to Table 6.36-5
 - 3) Write 0x1 to Y1 registers according to Table 6.36-5
 - 4) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 01
 - 5) Set MOPOP(CRYPTO_ECC_CTL[12:11]) to 00
 - 6) Set FSEL(CRYPTO_ECC_CTL[8]) according to used curve of prime field or binary field
 - 7) Set START(CRYPTO_ECC_CTL[0]) to 1

- 8) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
- 9) Read X1 registers to get w
4. Compute $u_1 = e \times w \pmod n$ and $u_2 = r \times w \pmod n$
 - 1) Write the curve order and curve length to N, M registers according to Table 6.36-5
 - 2) Write e, w to X1, Y1 registers
 - 3) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 01
 - 4) Set MOPOP(CRYPTO_ECC_CTL[12:11]) to 01
 - 5) Set START(CRYPTO_ECC_CTL[0]) to 1
 - 6) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
 - 7) Read X1 registers to get u_1
 - 8) Write the curve order and curve length to N, M registers according to Table 6.36-5
 - 9) Write r, w to X1, Y1 registers
 - 10) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 01
 - 11) Set MOPOP(CRYPTO_ECC_CTL[12:11]) to 01
 - 12) Set START(CRYPTO_ECC_CTL[0]) to 1
 - 13) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
 - 14) Read X1 registers to get u_2
5. Compute $X' (x_1', y_1') = u_1 * G + u_2 * Q$
 - 1) Write the curve parameter A, B, N, and curve length M to corresponding registers according to Table 6.36-5
 - 2) Write the point G(x, y) to X1, Y1 registers
 - 3) Write u_1 to K registers
 - 4) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 00
 - 5) Set START(CRYPTO_ECC_CTL[0]) to 1
 - 6) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
 - 7) Read X1, Y1 registers to get $u_1 * G$
 - 8) Write the curve parameter A, B, N, and curve length M to corresponding registers according to Table 6.36-5
 - 9) Write the public key Q(x,y) to X1, Y1 registers
 - 10) Write u_2 to K registers
 - 11) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 00
 - 12) Set START(CRYPTO_ECC_CTL[0]) to 1
 - 13) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
 - 14) Write the curve parameter A, B, N, and curve length M to corresponding registers according to Table 6.36-5
 - 15) Write the result data $u_1 * G$ to X2, Y2 registers
 - 16) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 10
 - 17) Set START(CRYPTO_ECC_CTL[0]) to 1

- 18) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
- 19) Read X1, Y1 registers to get X'(x1', y1')
- 20) Write the curve order and curve length to N, M registers according to Table 6.36-5
- 21) Write x1' to X1 registers
- 22) Write 0x0 to Y1 registers
- 23) Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 01
- 24) Set MOPOP(CRYPTO_ECC_CTL[12:11]) to 10
- 25) Set START(CRYPTO_ECC_CTL[0]) to 1
- 26) Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
- 27) Read X1 registers to get x1' (mod n)
6. The signature is valid if $x1' = r$, otherwise it is invalid.

Elliptic Curve Diffie-Hellman

Share secret generation function: Z is the x-coordinate of Q where $Q = dG \pmod{N}$

1. Write the curve parameter A, B, N, and curve length M to corresponding registers according to Table 6.36-5.
2. Write the public key of receiving party G(x, y) to X1, Y1 registers according to Table 6.36-5.
3. Write (cofactor h * my private key d) to K register according to Table 6.36-5.
 - 1) h=1 in P-192, P-224, P-256, P-384 and P-521
 - 2) h=2 in B-163, B-233, B-283, B-409, B-571 and K-163
 - 3) h=4 in K-233, K-283, K-409 and K-571
4. Set ECCOP(CRYPTO_ECC_CTL[10:9]) to 00
5. Set FSEL(CRYPTO_ECC_CTL[8]) according to used curve of prime field or binary field
6. Set START(CRYPTO_ECC_CTL[0]) to 1
7. Wait for BUSY(CRYPTO_ECC_STS[0]) be cleared
8. Read public key Q from X1, Y1 registers

Hash-based key derivation function: DerivedKeyingMaterial = KDF(Z, OtherInput)

Step1 For i = 1 to reps, where reps = ceil((the length of Z, OtherInput)/hash length)

1. Write the curve parameter A, B, N, and curve length M to corresponding registers according to Table 6.36-5.
2. Write the public key of receiving party G(x, y) to X1, Y1 registers according to Table 6.36-5.

Step 2 Return DerivedKeyingMaterial = Hash₁ || Hash₂ || ... || Hash_{reps}

Note:

1. the details of OtherInput please refer to the page 46 in NIST SP 800-56A, recommendation for Pair-Wise Key Establishment Schemes Using Discrete Logarithm Cryptography (http://csrc.nist.gov/groups/ST/toolkit/documents/SP800-56Arev1_3-8-07.pdf)
2. the details of cofactor please refer to “RECOMMENDED ELLIPTIC CURVES FOR FEDERAL GOVERNMENT USE” (<http://csrc.nist.gov/groups/ST/toolkit/documents/dss/NISTReCur.pdf>)

6.36.6 Register Map

R: read only, W: write only, R/W: both read and write

6.36.7 Register Description

6.36.7.1 Crypto Register

CRYPTO Interrupt Enable Control Register (CRYPTO_INTEN)

Register	Offset	R/W	Description				Reset Value
CRYPTO_INTEN	CRYPTO_BA+0x000	R/W	Crypto Interrupt Enable Control Register				0x0000_0000

31	30	29	28	27	26	25	24
Reserved						HMACEIEN	HMACIEN
23	22	21	20	19	18	17	16
ECCEIEN	ECCIEN	Reserved					
15	14	13	12	11	10	9	8
Reserved						TDESEIEN	TDESIEN
7	6	5	4	3	2	1	0
Reserved						AESEIEN	AESIEN

Bits	Description
[31:26]	Reserved Reserved.
[25]	HMACEIEN SHA/HMAC Error Interrupt Enable Bit 0 = SHA/HMAC error interrupt flag Disabled. 1 = SHA/HMAC error interrupt flag Enabled.
[24]	HMACIEN SHA/HMAC Interrupt Enable Bit 0 = SHA/HMAC interrupt Disabled. 1 = SHA/HMAC interrupt Enabled. Note: In DMA mode, an interrupt will be triggered when amount of data set in SHA_DMA_CNT is fed into the SHA/HMAC engine. In Non-DMA mode, an interrupt will be triggered when the SHA/HMAC engine finishes the operation.
[23]	ECCEIEN ECC Error Interrupt Enable Bit 0 = ECC error interrupt flag Disabled. 1 = ECC error interrupt flag Enabled.
[22]	ECCIEN ECC Interrupt Enable Bit 0 = ECC interrupt Disabled. 1 = ECC interrupt Enabled. Note: In DMA mode, an interrupt will be triggered when amount of data set in ECC_DMA_CNT is fed into the ECC engine. In Non-DMA mode, an interrupt will be triggered when the ECC engine finishes the operation.
[21:17]	Reserved Reserved.
[16]	PRNGIEN PRNG Interrupt Enable Bit 0 = PRNG interrupt Disabled. 1 = PRNG interrupt Enabled.
[15:10]	Reserved Reserved.

[9]	TDESEIEN	TDES/DES Error Flag Enable Bit 0 = TDES/DES error interrupt flag Disabled. 1 = TDES/DES error interrupt flag Enabled.
[8]	TDESIEN	TDES/DES Interrupt Enable Bit 0 = TDES/DES interrupt Disabled. 1 = TDES/DES interrupt Enabled. Note: In DMA mode, an interrupt will be triggered when amount of data set in TDES_DMA_CNT is fed into the TDES engine. In Non-DMA mode, an interrupt will be triggered when the TDES engine finishes the operation.
[7:2]	Reserved	Reserved.
[1]	AESEIEN	AES Error Flag Enable Bit 0 = AES error interrupt flag Disabled. 1 = AES error interrupt flag Enabled.
[0]	AESIEN	AES Interrupt Enable Bit 0 = AES interrupt Disabled. 1 = AES interrupt Enabled. Note: In DMA mode, an interrupt will be triggered when amount of data set in AES_DMA_CNT is fed into the AES engine. In Non-DMA mode, an interrupt will be triggered when the AES engine finishes the operation.

CRYPTO Interrupt Flag Register (CRYPTO_INTSTS)

Register	Offset	R/W	Description			Reset Value	
CRYPTO_INTSTS	CRYPTO_BA+0x004	R/W	Crypto Interrupt Flag			0x0000_0000	

31	30	29	28	27	26	25	24

Reserved						TDESEIF	TDESIF
7	6	5	4	3	2	1	0
Reserved						AESEIF	AESIF

Bits	Description
[31:26]	Reserved Reserved.
[25]	HMACEIF SHA/HMAC Error Flag This register includes operating and setting error. The detail flag is shown in CRYPTO_HMAC_STS register. This bit is cleared by writing 1, and it has no effect by writing 0. 0 = No SHA/HMAC error. 1 = SHA/HMAC error interrupt.
[24]	HMACIF SHA/HMAC Finish Interrupt Flag This bit is cleared by writing 1, and it has no effect by writing 0. 0 = No SHA/HMAC interrupt. 1 = SHA/HMAC operation done interrupt.
[23]	ECCEIF ECC Error Flag This register includes operating and setting error. The detail flag is shown in CRYPTO_ECC_STS register. This bit is cleared by writing 1, and it has no effect by writing 0. 0 = No ECC error. 1 = ECC error interrupt.
[22]	ECCIF ECC Finish Interrupt Flag This bit is cleared by writing 1, and it has no effect by writing 0. 0 = No ECC interrupt. 1 = ECC operation done interrupt.
[21:17]	Reserved Reserved.
[16]	PRNGIF PRNG Finish Interrupt Flag This bit is cleared by writing 1, and it has no effect by writing 0. 0 = No PRNG interrupt. 1 = PRNG key generation done interrupt.
[15:10]	Reserved Reserved.

[9]	TDESEIF	TDES/DES Error Flag This bit includes the operating and setting error. The detailed flag is shown in the CRYPTO_TDES_STS register. This includes operating and setting error. This bit is cleared by writing 1, and it has no effect by writing 0. 0 = No TDES/DES error. 1 = TDES/DES encryption/decryption error interrupt.
[8]	TDESIF	TDES/DES Finish Interrupt Flag This bit is cleared by writing 1, and it has no effect by writing 0. 0 = No TDES/DES interrupt. 1 = TDES/DES encryption/decryption done interrupt.
[7:2]	Reserved	Reserved.
[1]	AESEIF	AES Error Flag This bit is cleared by writing 1, and it has no effect by writing 0. 0 = No AES error. 1 = AES encryption/decryption error interrupt.
[0]	AESIF	AES Finish Interrupt Flag This bit is cleared by writing 1, and it has no effect by writing 0. 0 = No AES interrupt. 1 = AES encryption/decryption done interrupt.

6.36.7.2 PRNG Register

PRNG Control Register (CRYPTO_PRNG_CTL)

Register	Offset	R/W	Description	Reset Value
CRYPTO_PRNG_CTL	CRYPTO_BA+0x008	R/W	PRNG Control Register	0x0000_0000

Bits	Description	
[31:0]	KEY	Store PRNG Generated Key (Read Only) The bits store the key that is generated by PRNG.

6.36.7.3 AES Register

AES Control Register (CRYPTO_AES_CTL)

Register	Offset	R/W	Description				Reset Value
CRYPTO_AES_CTL	CRYPTO_BA+0x100	R/W	AES Control Register				0x0000_0000

31	30	29	28	27	26	25	24
KEYPRT	KEYUNPRT						CHANNEL
23	22	21	20	19	18	17	16
INSWAP	OUTSWAP	Reserved					
15	14	13	12	11	10	9	8
OPMODE							
7	6	5	4	3	2	1	0
DMAEN	DMACSCAD	DMALAST	Reserved	KEYSZ		STOP	START

Bits	Description
[31]	KEYPRT Protect Key Read as a flag to reflect KEYPRT. 0 = No effect. 1 = Protect the content of the AES key from reading. The return value for reading CRYPTO_AESn_KEYx is not the content of the registers CRYPTO_AESn_KEYx. Once it is set, it can be cleared by asserting KEYUNPRT. And the key content would be cleared as well.
[30:26]	KEYUNPRT Unprotect Key Writing 0 to CRYPTO_AES_CTL[31] and "10110" to CRYPTO_AES_CTL[30:26] is to unprotect the AES key. The KEYUNPRT can be read and written. When it is written as the AES engine is operating, BUSY flag is 1, there would be no effect on KEYUNPRT.
[25:24]	CHANNEL AES Engine Working Channel 00 = Current control register setting is for channel 0. 01 = Current control register setting is for channel 1. 10 = Current control register setting is for channel 2. 11 = Current control register setting is for channel 3.
[23]	INSWAP AES Engine Input Data Swap 0 = Keep the original order. 1 = The order that CPU feeds data to the accelerator will be changed from {byte3, byte2, byte1, byte0} to {byte0, byte1, byte2, byte3}.
[22]	OUTSWAP AES Engine Output Data Swap 0 = Keep the original order. 1 = The order that CPU outputs data from the accelerator will be changed from {byte3, byte2, byte1, byte0} to {byte0, byte1, byte2, byte3}.
[17]	Reserved Reserved.

[16]	ENCRYPTO	AES Encryption/Decryption 0 = AES engine executes decryption operation. 1 = AES engine executes encryption operation.
[15:8]	OPMODE	AES Engine Operation Modes 0x00 = ECB (Electronic Codebook Mode) 0x01 = CBC (Cipher Block Chaining Mode). 0x02 = CFB (Cipher Feedback Mode). 0x03 = OFB (Output Feedback Mode). 0x04 = CTR (Counter Mode). 0x10 = CBC-CS1 (CBC Ciphertext-Stealing 1 Mode). 0x11 = CBC-CS2 (CBC Ciphertext-Stealing 2 Mode). 0x12 = CBC-CS3 (CBC Ciphertext-Stealing 3 Mode).
[7]	DMAEN	AES Engine DMA Enable Bit 0 = AES DMA engine Disabled. The AES engine operates in Non-DMA mode. The data need to be written in CRYPTO_AES_DATIN. 1 = AES_DMA engine Enabled. The AES engine operates in DMA mode, and data movement from/to the engine is done by DMA logic.
[6]	DMACSCAD	AES Engine DMA with Cascade Mode 0 = DMA cascade function Disabled. 1 = In DMA cascade mode, software can update DMA source address register, destination address register, and byte count register during a cascade operation, without finishing the accelerator operation.
[5]	DMALAST	AES Last Block In DMA mode, this bit must be set as beginning the last DMA cascade round. In Non-DMA mode, this bit must be set when feeding in the last block of data in ECB, CBC, CTR, OFB, and CFB mode, and feeding in the (last-1) block of data at CBC-CS1, CBC-CS2, and CBC-CS3 mode. This bit is always 0 when it's read back. Must be written again once START is triggered.
[3:2]	KEYSZ	AES Key Size This bit defines three different key size for AES operation. 2'b00 = 128 bits key. 2'b01 = 192 bits key. 2'b10 = 256 bits key. 2'b11 = Reserved. If the AES accelerator is operating and the corresponding flag BUSY is 1, updating this register has no effect.
[1]	STOP	AES Engine Stop 0 = No effect. 1 = Stop AES engine. Note: This bit is always 0 when it's read back.
[0]	START	AES Engine Start 0 = No effect. 1 = Start AES engine. BUSY flag will be set. Note: This bit is always 0 when it's read back.

AES Status Flag Register (CRYPTO_AES_STS)

Register	Offset	R/W	Description			Reset Value
CRYPTO_AES_STS	CRYPTO_BA+0x104	R	AES Engine Flag			0x0001_0100

31	30	29	28	27	26	25	24

7	6	5	4	3	2	1	0
Reserved						BUSY	

Bits	Description	
[31:21]	Reserved	Reserved.
[20]	BUSERR	AES DMA Access Bus Error Flag 0 = No error. 1 = Bus error will stop DMA operation and AES engine.
[19]	Reserved	Reserved.
[18]	OUTBUFERR	AES Out Buffer Error Flag 0 = No error. 1 = Error happens during getting the result from AES engine.
[17]	OUTBUFFULL	AES Out Buffer Full Flag 0 = AES output buffer is not full. 1 = AES output buffer is full, and software needs to get data from CRYPTO_AES_DATOUT. Otherwise, the AES engine will be pending since the output buffer is full.
[16]	OUTBUFEMPTY	AES Out Buffer Empty 0 = AES output buffer is not empty. There are some valid data kept in output buffer. 1 = AES output buffer is empty. Software cannot get data from CRYPTO_AES_DATOUT. Otherwise, the flag OUTBUFERR will be set to 1 since the output buffer is empty.
[15:13]	Reserved	Reserved.
[12]	CNTERR	CRYPTO_AESn_CNT Setting Error 0 = No error in CRYPTO_AESn_CNT setting. 1 = CRYPTO_AESn_CNT is 0 or not a multiply of 16 in ECB, CBC, CFB, OFB, and CTR mode if DMAEN (CRYPTO_AES_CTL[7]) is enabled.
[11]	Reserved	Reserved.

[10]	INBUFERR	AES Input Buffer Error Flag 0 = No error. 1 = Error happens during feeding data to the AES engine.
[9]	INBUFFULL	AES Input Buffer Full Flag 0 = AES input buffer is not full. Software can feed the data into the AES engine. 1 = AES input buffer is full. Software cannot feed data to the AES engine. Otherwise, the flag INBUFERR will be set to 1.
[8]	INBUFEMPTY	AES Input Buffer Empty 0 = There are some data in input buffer waiting for the AES engine to process. 1 = AES input buffer is empty. Software needs to feed data to the AES engine. Otherwise, the AES engine will be pending to wait for input data.
[7:1]	Reserved	Reserved.
[0]	BUSY	AES Engine Busy 0 = The AES engine is idle or finished. 1 = The AES engine is under processing.

IV

Bits	Description
[31:0]	IV AES Initial Vectors n = 0, 1..3. x = 0, 1..3. Four initial vectors (CRYPTO_AESn_IV0, CRYPTO_AESn_IV1, CRYPTO_AESn_IV2, and CRYPTO_AESn_IV3) are for AES operating in CBC, CFB, and OFB mode. Four registers (CRYPTO_AESn_IV0, CRYPTO_AESn_IV1, CRYPTO_AESn_IV2, and CRYPTO_AESn_IV3) act as Nonce counter when the AES engine is operating in CTR mode.

**AES DMA Source Address Register (CRYPTO_AES0_SADDR, CRYPTO_AES1_SADDR,
CRYPTO AES2 SADDR, CRYPTO AES3 SADDR)**

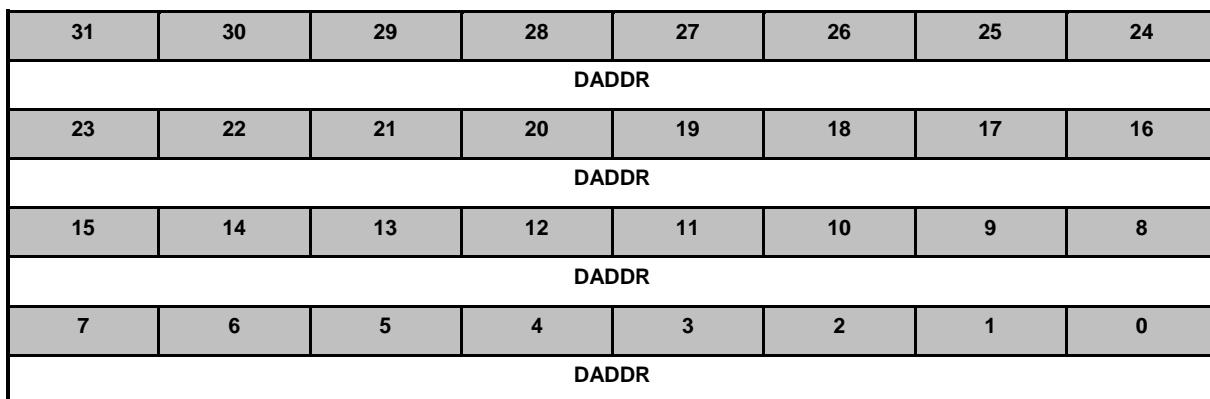

Register	Offset	R/W	Description	Reset Value
CRYPTO_AES0_SADD R	CRYPTO_BA+0x140	R/W	AES DMA Source Address Register for Channel 0	0x0000_0000
CRYPTO_AES1_SADD R	CRYPTO_BA+0x17C	R/W	AES DMA Source Address Register for Channel 1	0x0000_0000
CRYPTO_AES2_SADD R	CRYPTO_BA+0x1B8	R/W	AES DMA Source Address Register for Channel 2	0x0000_0000
CRYPTO_AES3_SADD R	CRYPTO_BA+0x1F4	R/W	AES DMA Source Address Register for Channel 3	0x0000_0000

Bits	Description	
[31:0]	SADDR	<p>AES DMA Source Address</p> <p>The AES accelerator supports DMA function to transfer the plain text between SRAM memory space and embedded FIFO. The SADDR keeps the source address of the data buffer where the source text is stored. Based on the source address, the AES accelerator can read the plain text (encryption) / cipher text (decryption) from SRAM memory space and do AES operation. The start of source address should be located at word boundary. In other words, bit 1 and 0 of SADDR are ignored.</p> <p>SADDR can be read and written. Writing to SADDR while the AES accelerator is operating doesn't affect the current AES operation. But the value of SADDR will be updated later on. Consequently, software can prepare the DMA source address for the next AES operation.</p> <p>In DMA mode, software can update the next CRYPTO_AESn_SADDR before triggering START.</p> <p>The value of CRYPTO_AESn_SADDR and CRYPTO_AESn_DADDR can be the same.</p>

AES DMA Destination Address Register (CRYPTO_AES0_DADDR, CRYPTO_AES1_DADDR, CRYPTO_AES2_DADDR, CRYPTO_AES3_DADDR)

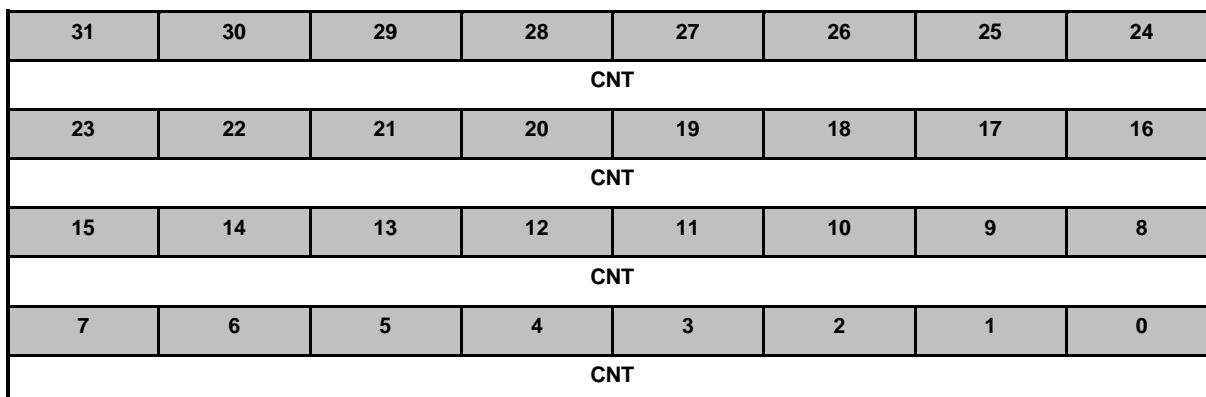

Register	Offset	R/W	Description	Reset Value
CRYPTO_AES0_DAD DR	CRYPTO_BA+0x144	R/W	AES DMA Destination Address Register for Channel 0	0x0000_0000
CRYPTO_AES1_DAD DR	CRYPTO_BA+0x180	R/W	AES DMA Destination Address Register for Channel 1	0x0000_0000
CRYPTO_AES2_DAD DR	CRYPTO_BA+0x1B C	R/W	AES DMA Destination Address Register for Channel 2	0x0000_0000
CRYPTO_AES3_DAD DR	CRYPTO_BA+0x1F 8	R/W	AES DMA Destination Address Register for Channel 3	0x0000_0000

Bits	Description	
[31:0]	DADDR	<p>AES DMA Destination Address</p> <p>The AES accelerator supports DMA function to transfer the cipher text between SRAM memory space and embedded FIFO. The DADDR keeps the destination address of the data buffer where the engine output's text will be stored. Based on the destination address, the AES accelerator can write the cipher text (encryption) / plain text (decryption) back to SRAM memory space after the AES operation is finished. The start of destination address should be located at word boundary. In other words, bit 1 and 0 of DADDR are ignored.</p> <p>DADDR can be read and written. Writing to DADDR while the AES accelerator is operating doesn't affect the current AES operation. But the value of DADDR will be updated later on. Consequently, software can prepare the destination address for the next AES operation.</p> <p>In DMA mode, software can update the next CRYPTO_AESn_SADDR and CRYPTO_AESn_DADDR before triggering START.</p> <p>The value of CRYPTO_AESn_SADDR and CRYPTO_AESn_DADDR can be the same.</p>

AES Byte Count Register (CRYPTO_AES0_CNT, CRYPTO_AES1_CNT, CRYPTO_AES2_CNT, CRYPTO_AES3_CNT)

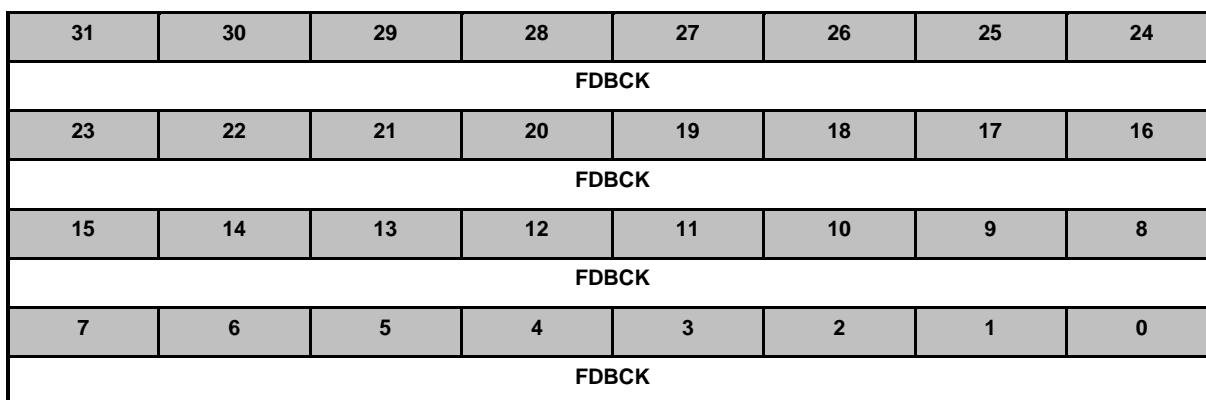

Register	Offset	R/W	Description	Reset Value
CRYPTO_AES0_CNT	CRYPTO_BA+0x148	R/W	AES Byte Count Register for Channel 0	0x0000_0000
CRYPTO_AES1_CNT	CRYPTO_BA+0x184	R/W	AES Byte Count Register for Channel 1	0x0000_0000
CRYPTO_AES2_CNT	CRYPTO_BA+0x1C0	R/W	AES Byte Count Register for Channel 2	0x0000_0000
CRYPTO_AES3_CNT	CRYPTO_BA+0x1FC	R/W	AES Byte Count Register for Channel 3	0x0000_0000

Bits	Description	
[31:0]	CNT	<p>AES Byte Count</p> <p>The CRYPTO_AESn_CNT keeps the byte count of source text that is for the AES engine operating in DMA mode. The CRYPTO_AESn_CNT is 32-bit and the maximum of byte count is 4G bytes.</p> <p>CRYPTO_AESn_CNT can be read and written. Writing to CRYPTO_AESn_CNT while the AES accelerator is operating doesn't affect the current AES operation. But the value of CRYPTO_AESn_CNT will be updated later on. Consequently, software can prepare the byte count of data for the next AES operation.</p> <p>According to CBC-CS1, CBC-CS2, and CBC-CS3 standard, the count of operation data must be more than 16 bytes. Operations that are qual or less than one block will output unexpected result.</p> <p>In Non-DMA ECB, CBC, CFB, OFB, and CTR mode, CRYPTO_AESn_CNT must be set as byte count for the last block of data before feeding in the last block of data. In Non-DMA CBC-CS1, CBC-CS2, and CBC-CS3 mode, CRYPTO_AESn_CNT must be set as byte count for the last two blocks of data before feeding in the last two blocks of data.</p>

AES Feedback x Register (CRYPTO_AES_FDBCKx)

Register	Offset	R/W	Description	Reset Value
CRYPTO_AES_FDBCK0	CRYPTO_BA+0x050	R	AES Engine Output Feedback Data after Cryptographic Operation	0x0000_0000
CRYPTO_AES_FDBCK1	CRYPTO_BA+0x054	R	AES Engine Output Feedback Data after Cryptographic Operation	0x0000_0000
CRYPTO_AES_FDBCK2	CRYPTO_BA+0x058	R	AES Engine Output Feedback Data after Cryptographic Operation	0x0000_0000
CRYPTO_AES_FDBCK3	CRYPTO_BA+0x05C	R	AES Engine Output Feedback Data after Cryptographic Operation	0x0000_0000

Bits	Description	
[31:0]	FDBCK	<p>AES Feedback Information</p> <p>The feedback value is 128 bits in size.</p> <p>The AES engine uses the data from CRYPTO_AES_FDBCKx as the data inputted to CRYPTO_AESn_IVx for the next block in DMA cascade mode.</p> <p>The AES engine outputs feedback information for IV in the next block's operation. Software can use this feedback information to implement more than four DMA channels. Software can store that feedback value temporarily. After switching back, fill the stored feedback value to CRYPTO_AESn_IVx in the same channel operation, and then continue the operation with the original setting.</p>

6.36.7.4 TDES/DES Register

TDES/DES Control Register (CRYPTO_TDES_CTL)

Register	Offset	R/W	Description				Reset Value
CRYPTO_TDES_CTL	CRYPTO_BA+0x200	R/W	TDES/DES Control Register				0x0000_0000

31	30	29	28	27	26	25	24

15	14	13	12	11	10	9	8
Reserved				OPMODE			
7	6	5	4	3	2	1	0
DMAEN	DMACSCAD	DMALAST	Reserved	3KEYS	TMODE	STOP	START

Bits	Description
[31]	KEYPRT Protect Key Read as a flag to reflect KEYPRT. 0 = No effect. 1 = This bit is to protect the content of TDES key from reading. The return value for reading CRYPTO_TDESn_KEYxH/L is not the content in the registers CRYPTO_TDESn_KEYxH/L. Once it is set, it can be cleared by asserting KEYUNPRT. The key content would be cleared as well.
[30:26]	KEYUNPRT Unprotect Key Writing 0 to CRYPTO_TDES_CTL [31] and "10110" to CRYPTO_TDES_CTL [30:26] is to unprotect TDES key. The KEYUNPRT can be read and written. When it is written as the TDES engine is operating, BUSY flag is 1, there would be no effect on KEYUNPRT.
[25:24]	CHANNEL TDES/DES Engine Working Channel 00 = Current control register setting is for channel 0. 01 = Current control register setting is for channel 1. 10 = Current control register setting is for channel 2. 11 = Current control register setting is for channel 3.
[23]	INSWAP TDES/DES Engine Input Data Swap 0 = Keep the original order. 1 = The order that CPU feeds data to the accelerator will be changed from {byte3, byte2, byte1, byte0} to {byte0, byte1, byte2, byte3}.
[22]	OUTSWAP TDES/DES Engine Output Data Swap 0 = Keep the original order. 1 = The order that CPU outputs data from the accelerator will be changed from {byte3, byte2, byte1, byte0} to {byte0, byte1, byte2, byte3}.

[21]	BLKSWAP	TDES/DES Engine Block Double Word Endian Swap 0 = Keep the original order, e.g. {WORD_H, WORD_L}. 1 = When this bit is set to 1, the TDES engine would exchange high and low word in the sequence {WORD_L, WORD_H}.
[20:17]	Reserved	Reserved.
[16]	ENCRYPTO	TDES/DES Encryption/Decryption 0 = TDES engine executes decryption operation. 1 = TDES engine executes encryption operation.
[15:11]	Reserved	Reserved.
[10:8]	OPMODE	TDES/DES Engine Operation Mode 0x00 = ECB (Electronic Codebook Mode). 0x01 = CBC (Cipher Block Chaining Mode). 0x02 = CFB (Cipher Feedback Mode). 0x03 = OFB (Output Feedback Mode). 0x04 = CTR (Counter Mode). Others = CTR (Counter Mode).
[7]	DMAEN	TDES/DES Engine DMA Enable Bit 0 = TDES_DMA engine Disabled. TDES engine operates in Non-DMA mode. The data need to be written in CRYPTO_TDES_DATIN. 1 = TDES_DMA engine Enabled. TDES engine operates in DMA mode, and data movement from/to the engine is done by DMA logic.
[6]	DMACSCAD	TDES/DES Engine DMA with Cascade Mode 0 = DMA cascade function Disabled. 1 = In DMA Cascade mode, software can update DMA source address register, destination address register, and byte count register during a cascade operation, without finishing the accelerator operation.
[5]	DMALAST	TDES/DES Engine Start for the Last Block In DMA mode, this bit must be set as beginning the last DMA cascade round. In Non-DMA mode, this bit must be set as feeding in last block of data.
[4]	Reserved	Reserved.
[3]	3KEYS	TDES/DES Key Number 0 = Select KEY1 and KEY2 in TDES/DES engine. 1 = Triple keys in TDES/DES engine Enabled.
[2]	TMODE	TDES/DES Engine Operating Mode 0 = Set DES mode for TDES/DES engine. 1 = Set Triple DES mode for TDES/DES engine.
[1]	STOP	TDES/DES Engine Stop 0 = No effect. 1 = Stop TDES/DES engine. Note: The bit is always 0 when it's read back.

[0]	START	TDES/DES Engine Start 0 = No effect. 1 = Start TDES/DES engine. The flag BUSY would be set. Note: The bit is always 0 when it's read back.

SADDR							
15	14	13	12	11	10	9	8
SADDR							
7	6	5	4	3	2	1	0
SADDR							

Bits	Description	
[31:0]	SADDR	<p>SHA/HMAC DMA Source Address</p> <p>The SHA/HMAC accelerator supports DMA function to transfer the plain text between SRAM memory space and embedded FIFO. The CRYPTO_HMAC_SADDR keeps the source address of the data buffer where the source text is stored. Based on the source address, the SHA/HMAC accelerator can read the plain text from SRAM memory space and do SHA/HMAC operation. The start of source address should be located at word boundary. In other words, bit 1 and 0 of CRYPTO_HMAC_SADDR are ignored.</p> <p>CRYPTO_HMAC_SADDR can be read and written. Writing to CRYPTO_HMAC_SADDR while the SHA/HMAC accelerator is operating doesn't affect the current SHA/HMAC operation. But the value of CRYPTO_HMAC_SADDR will be updated later on. Consequently, software can prepare the DMA source address for the next SHA/HMAC operation.</p> <p>In DMA mode, software can update the next CRYPTO_HMAC_SADDR before triggering START.</p> <p>Crypto_HMAC_SADDR and CRYPTO_HMAC_DADDR can be the same in the value.</p>

SHA/HMAC Byte Count Register (CRYPTO_HMAC_DMACNT)

DMACNT							
15	14	13	12	11	10	9	8
DMACNT							
7	6	5	4	3	2	1	0
DMACNT							

Bits	Description	
[31:0]	DMACNT	<p>SHA/HMAC Operation Byte Count</p> <p>The CRYPTO_HMAC_DMACNT keeps the byte count of source text that is for the SHA/HMAC engine operating in DMA mode. The CRYPTO_HMAC_DMACNT is 32-bit and the maximum of byte count is 4G bytes.</p> <p>CRYPTO_HMAC_DMACNT can be read and written. Writing to CRYPTO_HMAC_DMACNT while the SHA/HMAC accelerator is operating doesn't affect the current SHA/HMAC operation. But the value of CRYPTO_HMAC_DMACNT will be updated later on. Consequently, software can prepare the byte count of data for the next SHA/HMAC operation.</p> <p>In Non-DMA mode, CRYPTO_HMAC_DMACNT must be set as the byte count of the last block before feeding in the last block of data.</p>

Reserved			MODOP		ECCOP		FSEL
7	6	5	4	3	2	1	0
DMAEN	Reserved				STOP	START	

Bits	Description
[31:22]	CURVEM The key length of elliptic curve.
[21]	LDK The Control Signal of Register for SCALARK 0 = The register for SCALARK is not modified by DMA or user. 1 = The register for SCALARK is modified by DMA or user.
[20]	LDN The Control Signal of Register for the Parameter CURVEN of Elliptic Curve 0 = The register for CURVEN is not modified by DMA or user. 1 = The register for CURVEN is modified by DMA or user.
[19]	LDB The Control Signal of Register for the Parameter CURVEB of Elliptic Curve 0 = The register for CURVEB is not modified by DMA or user. 1 = The register for CURVEB is modified by DMA or user.
[18]	LDA The Control Signal of Register for the Parameter CURVEA of Elliptic Curve 0 = The register for CURVEA is not modified by DMA or user. 1 = The register for CURVEA is modified by DMA or user.
[17]	LDP2 The Control Signal of Register for the X and Y Coordinate of the Second Point (POINTX2, POINTY2) 0 = The register for POINTX2 and POINTY2 is not modified by DMA or user. 1 = The register for POINTX2 and POINTY2 is modified by DMA or user.
[16]	LDP1 The Control Signal of Register for the X and Y Coordinate of the First Point (POINTX1, POINTY1) 0 = The register for POINTX1 and POINTY1 is not modified by DMA or user. 1 = The register for POINTX1 and POINTY1 is modified by DMA or user.
[15:13]	Reserved Reserved.

[12:11]	MODOP	Modulus Operation for PF 00 = Division :. $\text{POINTX1} = (\text{POINTY1} / \text{POINTX1}) \% \text{CURVEN}$. 01 = Multiplication :. $\text{POINTX1} = (\text{POINTX1} * \text{POINTY1}) \% \text{CURVEN}$. 10 = Addition :. $\text{POINTX1} = (\text{POINTX1} + \text{POINTY1}) \% \text{CURVEN}$. 11 = Subtraction :. $\text{POINTX1} = (\text{POINTX1} - \text{POINTY1}) \% \text{CURVEN}$. MODOP is active only when ECCOP = 01.
[10:9]	ECCOP	Point Operation for BF and PF 00 = Point multiplication :. $(\text{POINTX1}, \text{POINTY1}) = \text{SCALARK} * (\text{POINTX1}, \text{POINTY1})$. 01 = Modulus operation : choose by MODOP (CRYPTO_ECC_CTL[12:11]). 10 = Point addition :. $(\text{POINTX1}, \text{POINTY1}) = (\text{POINTX1}, \text{POINTY1}) + (\text{POINTX2}, \text{POINTY2})$ 11 = Point doubling :. $(\text{POINTX1}, \text{POINTY1}) = 2 * (\text{POINTX1}, \text{POINTY1})$. Besides above three input data, point operations still need the parameters of elliptic curve (CURVEA, CURVEB, CURVEN and CURVEM) as shown in Figure 6.27-11.
[8]	FSEL	Field Selection 0 = Binary Field ($\text{GF}(2^m)$). 1 = Prime Field ($\text{GF}(p)$).
[7]	DMAEN	ECC Accelerator DMA Enable Bit 0 = ECC DMA engine Disabled. 1 = ECC DMA engine Enabled. Only when START and DMAEN are 1, ECC DMA engine will be active
[6:2]	Reserved	Reserved.
[1]	STOP	ECC Accelerator Stop 0 = No effect. 1 = Abort ECC accelerator and make it into idle state. This bit is always 0 when it's read back. Remember to clear ECC interrupt flag after stopping ECC accelerator.
[0]	START	ECC Accelerator Start 0 = No effect. 1 = Start ECC accelerator. BUSY flag will be set. This bit is always 0 when it's read back. ECC accelerator will ignore this START signal when BUSY flag is 1.

Bits	Description	
[31:0]	Reserved	ECC DMA Source Address The ECC accelerator supports DMA function to transfer the DATA and PARAMETER between SRAM memory space and ECC accelerator. The SADDR keeps the source address of the data buffer where the source text is stored. Based on the source address, the ECC accelerator can read the DATA and PARAMETER from SRAM memory space and do ECC operation. The start of source address should be located at word boundary. That is, bit 1 and 0 of SADDR are ignored. SADDR can be read and written. In DMA mode, software must update the CRYPTO_ECC_SADDR before triggering START.

ECC DMA Destination Address Register (CRYPTO_ECC_DADDR)

6.37 Enhanced 12-bit Analog-to-Digital Converter (EADC)

6.37.1 Overview

The chip contains one 12-bit successive approximation analog-to-digital converter (SAR ADC converter) with 16 external input channels and 3 internal channels. The ADC converter can be started by software trigger, PWM0/1 triggers, BPWM0/1 triggers, timer0~3 overflow pulse triggers, ADINT0, ADINT1 interrupt EOC (End of conversion) pulse trigger and external pin (EADC0_ST) input signal.

6.37.2 Features

- Analog input voltage range: 0~ V_{REF} (Max to 3.6V)
- Reference voltage from V_{REF} pin
- 12-bit resolution and 10-bit accuracy is guaranteed
- Up to 16 single-end analog external input channels or 8 pair differential analog input channels
- Up to 3 internal channels, they are band-gap voltage (V_{BG}), temperature sensor (V_{TEMP}), and V_{DD} power
- Four ADC interrupts (ADINT0~3) with individual interrupt vector addresses
- Maximum ADC clock frequency is 72 MHz
- Up to 5.14 MSPS conversion rate
- Configurable ADC internal sampling time.
- 12-bit, 10-bit, 8-bit, 6-bit configurable resolution.
- Supports calibration and load calibration words capability.
- Supports internal reference voltage V_{REF} : 1.6V, 2.0V, 2.5V, and 3.0V.
- Supports three power saving modes:
 - Deep Power-down mode
 - Power-down mode
 - Standby mode
- Up to 19 sample modules
 - Each of sample modules which is configurable for ADC converter channel EADC_CH0~15 and trigger source
 - Sample module 16~18 is fixed for ADC channel 16, 17, 18 input sources as band-gap voltage, temperature sensor, and V_{DD} power.
 - Double buffer for sample control logic module 0~3
 - Configurable sampling time for each sample module
 - Conversion results are held in 19 data registers with valid and overrun indicators
- An ADC conversion can be started by:
 - Write 1 to SWTRGn (EADC_SWTRG[n], n = 0~18)
 - External pin EADC0_ST
 - Timer0~3 overflow pulse triggers
 - ADINT0 and ADINT1 interrupt EOC (End of conversion) pulse triggers
 - EPWM/BPWM triggers

- Supports PDMA transfer
- Conversion Result Monitor by Compare Mode

6.37.3 Block Diagram

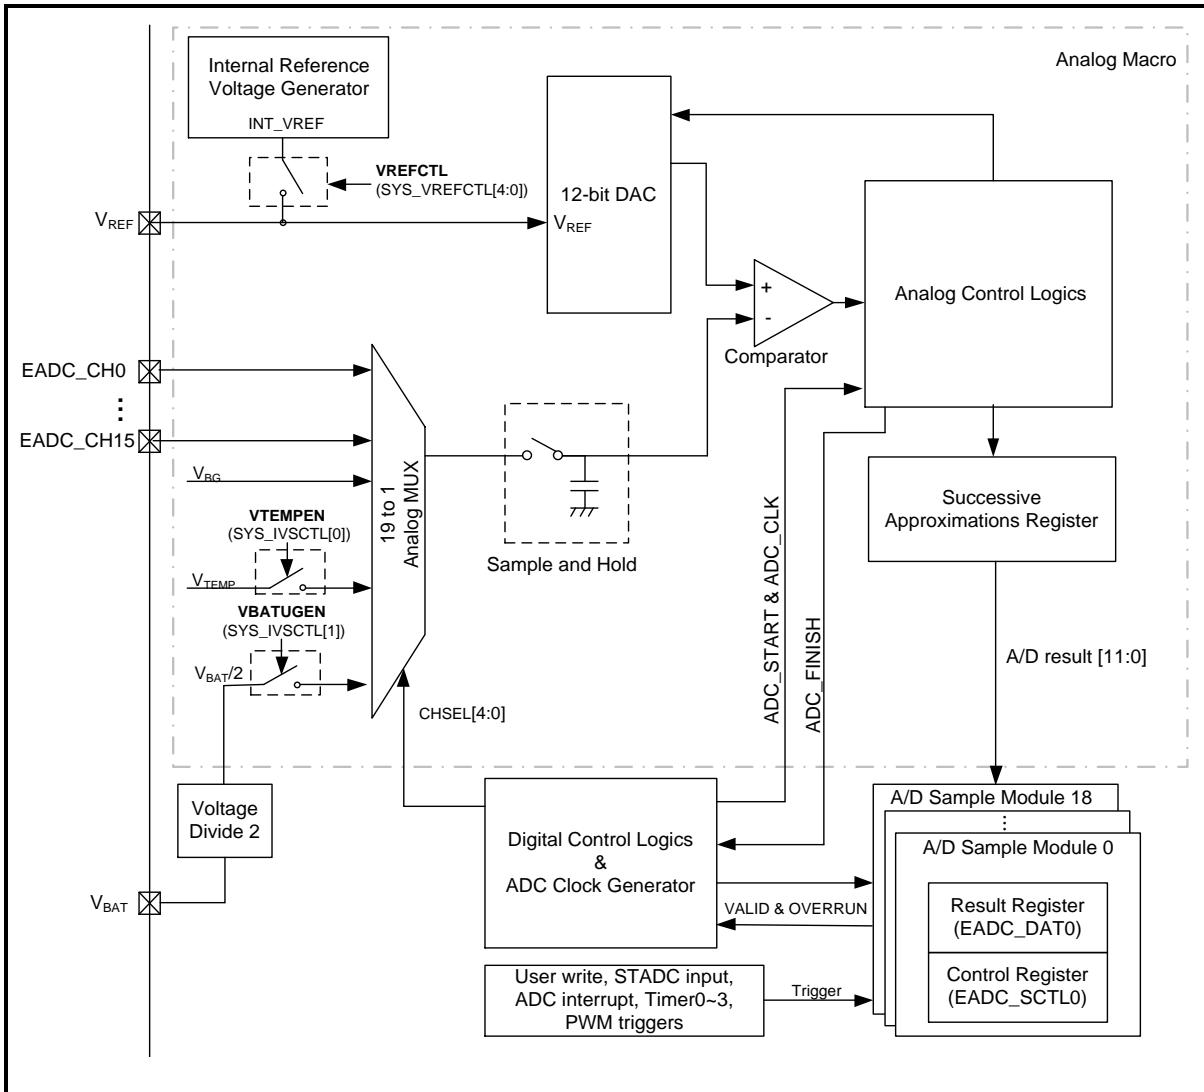

Figure 6.37-1 ADC Converter Block Diagram

6.37.4 Basic Configuration

- Clock source Configuration
 - Select the clock divider number on EADCDIV (CKL_CLKDIV0[23:16])
 - Enable EADC peripheral clock in EADCCKEN (CLK_APBCLK0[28]).
- Reset Configuration
 - Reset EADC controller in ADRST (EADC_CTL [1]).
- Pin configuration

6.37.5 Functional Description

The EADC controller consists of a 19 channel analog switch, 19 sample modules and a 12-bit successive approximation analog-to-digital converter. The EADC operation is based on sample module 0~18, and each of them has its configuration to decide which trigger source to start the conversion, which channel to convert. Sample module 0~15 can be configured to EADC_CH0~15 channel, and different trigger source. It provides user a flexible means to get the over-sampling results. The sample module 0~3 and sample module 4~15 are shows as follows.

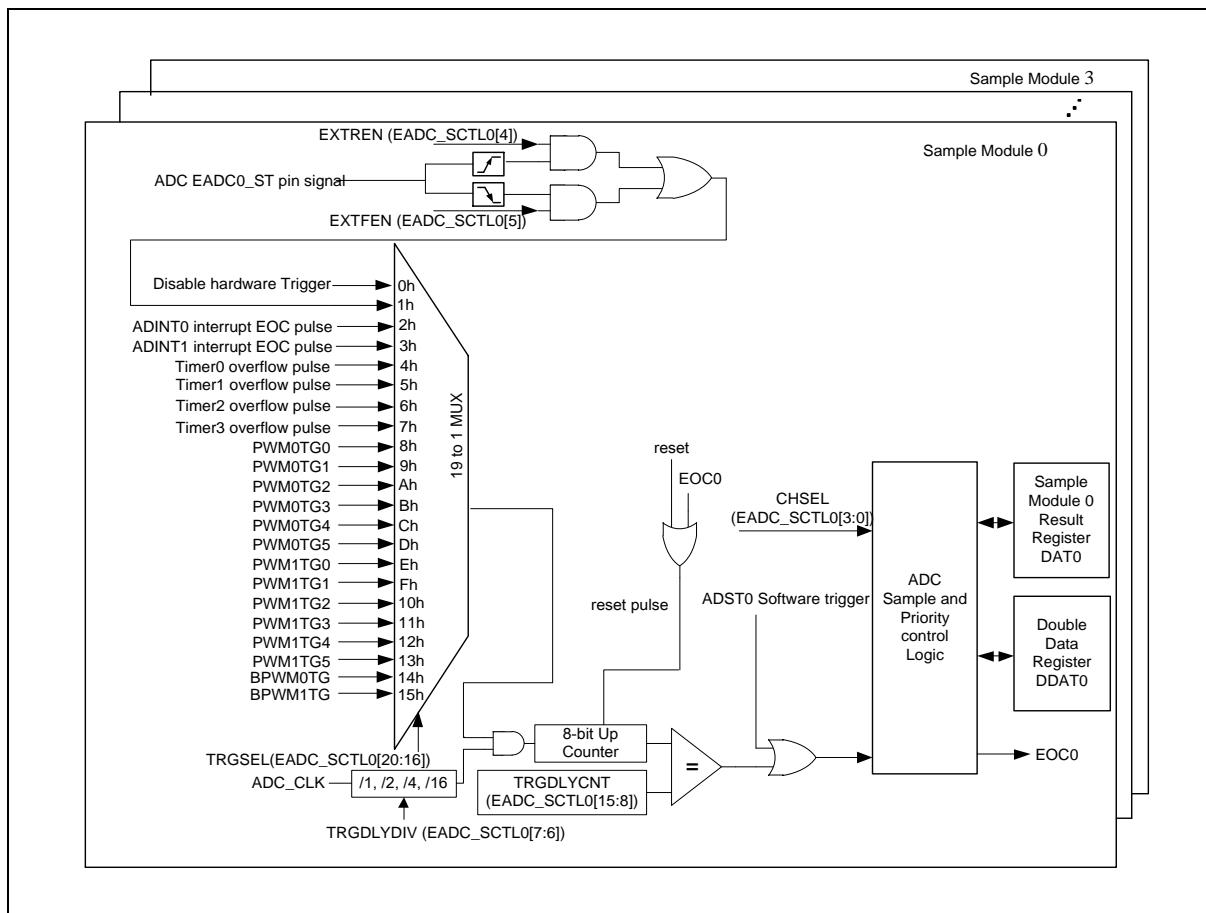

Figure 6.37-2 Sample Module 0~3 Block Diagram

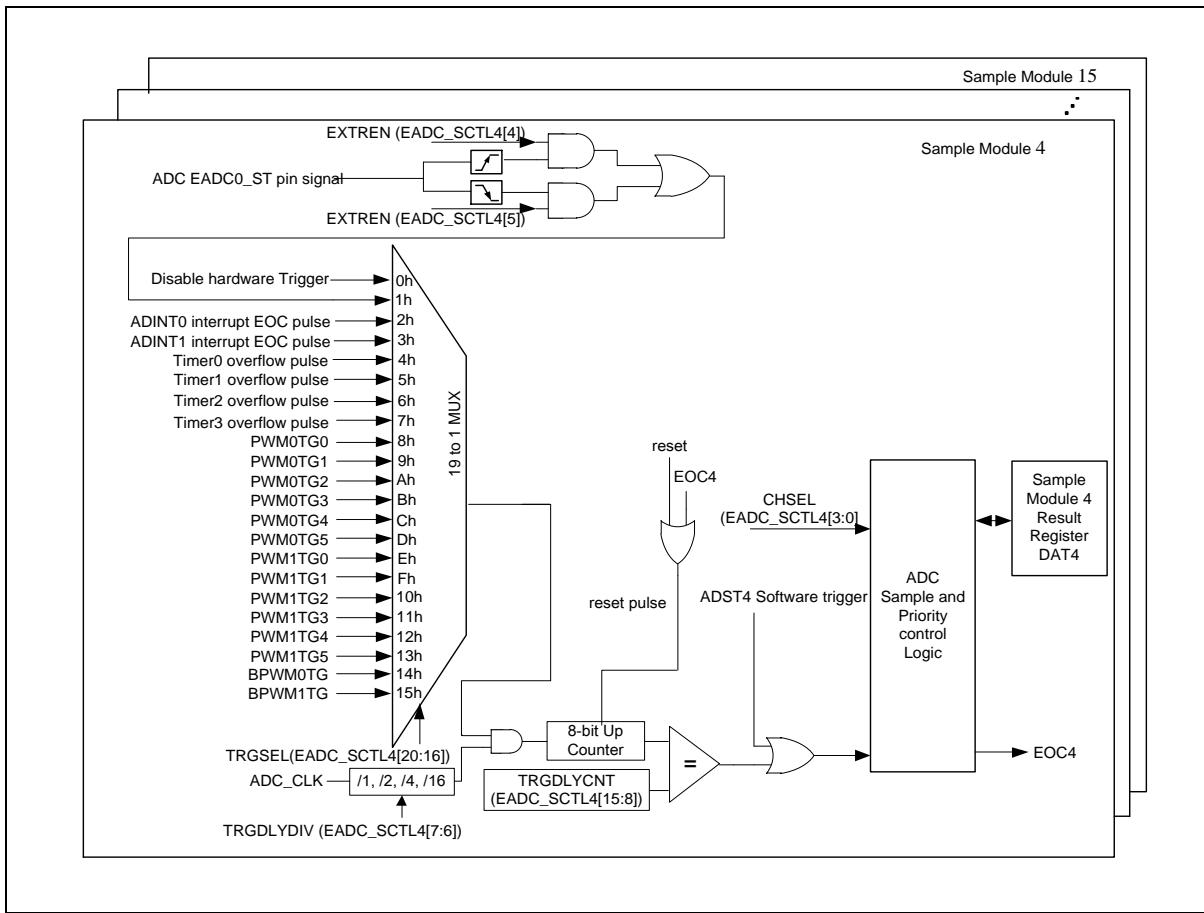

Figure 6.37-3 Sample Module 4~15 Block Diagram

Sample module 16~18 can convert internal channel (V_{BG} , V_{TEMP} , V_{DD}) and can be triggered by user write SWTRGn (EADC_SWTRG[n], n = 16~18). Figure 6.37-4 shows the sample module 16~18.

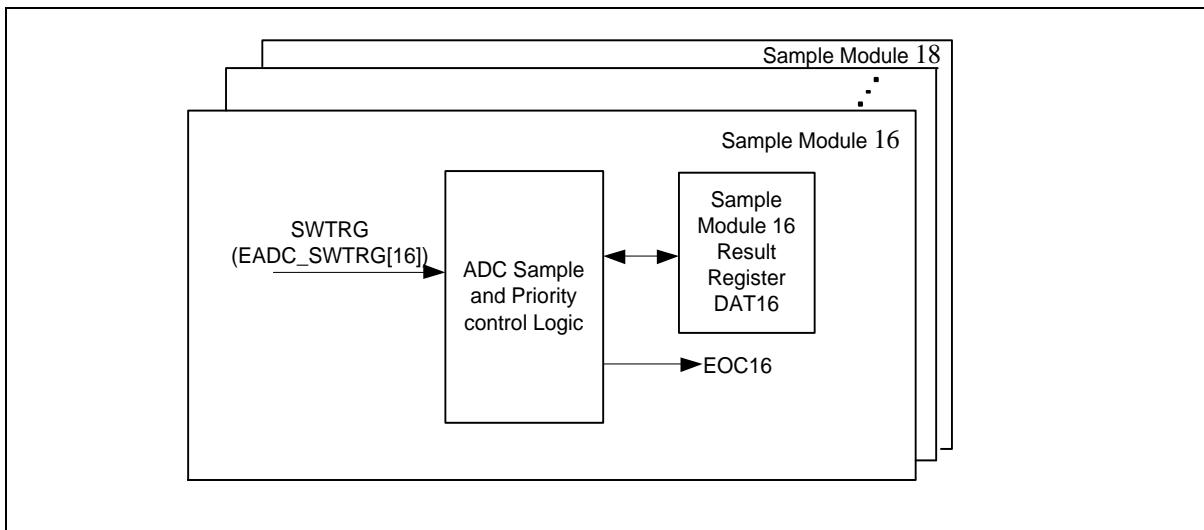

Figure 6.37-4 Sample Module 16~18 Block Diagram

The ADC conversion trigger sources in sample module 0~15 are listed below:

- Write 1 to SWTRGn (EADC_SWTRG[n], n = 0~15)

- External pin EADC0_ST
- Timer0~3 overflow pulse triggers
- ADINT0, ADINT1 ADC interrupt EOC (End of conversion) pulse triggers
- EPWM/BPWM triggers

The ADINT0 or ADINT1 interrupt pulses are generated whenever the specific sample module ADC EOC (End of conversion) pulse is generated. ADINT0 or ADINT1 interrupt pulse triggers can be fed back to trigger another ADC conversion, and is useful if a continuous scan conversion is needed.

6.37.5.1 ADC Clock Generator

The maximum EADC clock frequency is up to 72 MHz and the maximum sampling rate is up to 5.14 MSPS.

The clock control of EADC is shown as Figure 6.37-5. The EADC peripheral clock source is from HCLK clock, the ADC clock frequency is divided by an 8-bit pre-scalar with the following formula:

$$\text{EADC clock frequency} = (\text{PCLK1}) / (\text{EADCDIV} (\text{CLK_CLKDIV0}[23:16]) + 1)$$

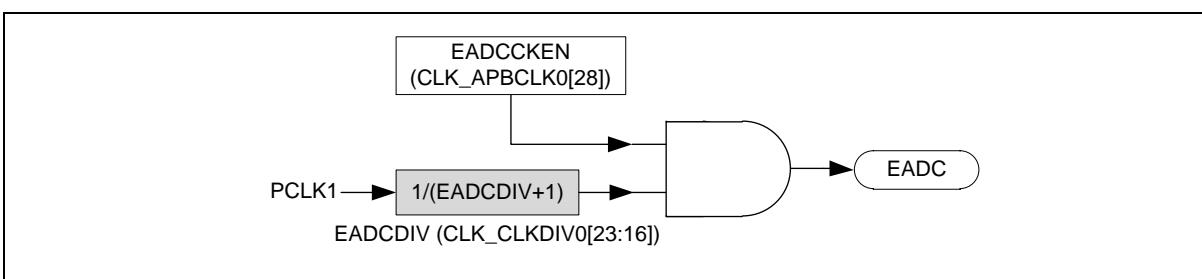

Figure 6.37-5 EADC Clock Control

6.37.5.2 ADC Software Trigger Mode

When a ADC conversion is performed on the sample module specified single channel, the operations are as follows:

1. ADC conversion is started when the SWTRGn (EADC_SWTRG[n], n=0~18) is set to 1 by user or other trigger inputs.
2. When ADC conversion is finished, the 12-bit result is stored in the ADC data register EADC_DATn (n=0~18) corresponding to the sample module.
3. On completion of conversion, the ADIFn (EADC_STATUS2[3:0], n=0~3) is set to 1 and ADC interrupt (ADINTn, n=0~3) is requested if the ADCIENn (EADC_CTL[5:2], n=0~3) bit is set to 1.
4. The SWTRGn (n=0~18) bit remains 1 during ADC conversion. When ADC conversion ends, the SWTRGn (n=0~18) bit is automatically cleared to 0 and the ADC converter will do another pending conversion.

The timing diagram of a conversion cycle is shown in Figure 6.37-6.

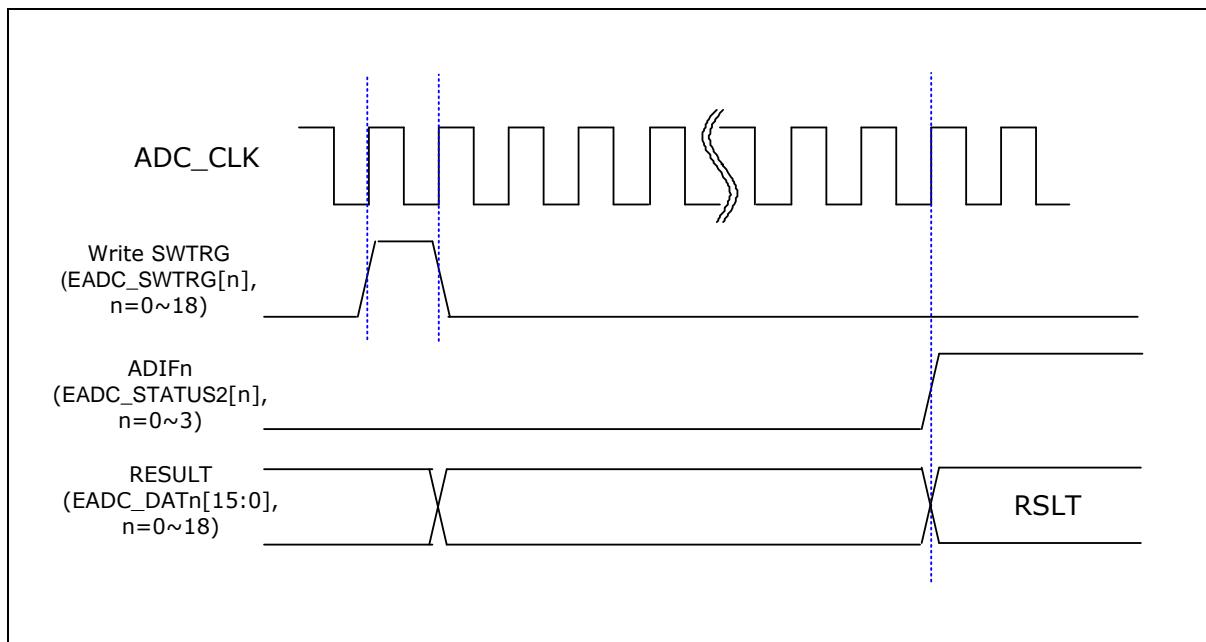

Figure 6.37-6 Example ADC Conversion Timing Diagram, n=0~18

If more than one sample module is enabled to convert analog signal, the sample module specified channel with highest priority is firstly converted and other enabled sample module will be pended. The lower number sample module has higher priority. The sample module 0 is highest priority and the sample module 18 is lowest priority.

Note: If the interval between next conversion is more than 100 us, ADC would enter idle state automatically. User needs to execute a dummy conversion before normal operation. In other words, the first conversion result is incorrect when ADC is in idle state.

6.37.5.3 ADC Conversion Priority

There is a priority group converter for determining the conversion order when multiple sample module trigger flags are set at the same time. Sample module with lower number has higher priority than the higher number sample module. The priority of sample module is shown as Figure 6.37-7. When more than one Sample Module are triggered at the same time, the Sample Module with lower number will start to convert first. The other Sample Module will be in the queue and the corresponding pending flag STPF(EADC_PENDSTS[n], n=0~18) are set to 1 by HW. After the Sample Module finish the conversion, STPF(EADC_PENDSTS[n], n=0~18) will be set to 0 automatically. If the Sample Module which is in the queue is triggered once more, the corresponding Overrun Flag SPOVF(EADC_OVSTS[n], n=0~18) will be set to 1 by HW.

For example, the Sample Module 0, 2, 3, 5 are triggered simultaneously. The input channel of Sample Module 0 will be converted first. Sample Module 2, 3, 5 will be suspended and STPF (EADC_PENDSTS[2], EADC_PENDSTS [3], EADC_PENDSTS [5]) will be set to 1. If Sample Module 5 is trigger once more in the same time, SPOVF(EADC_OVSTS[5]) will be set to 1.

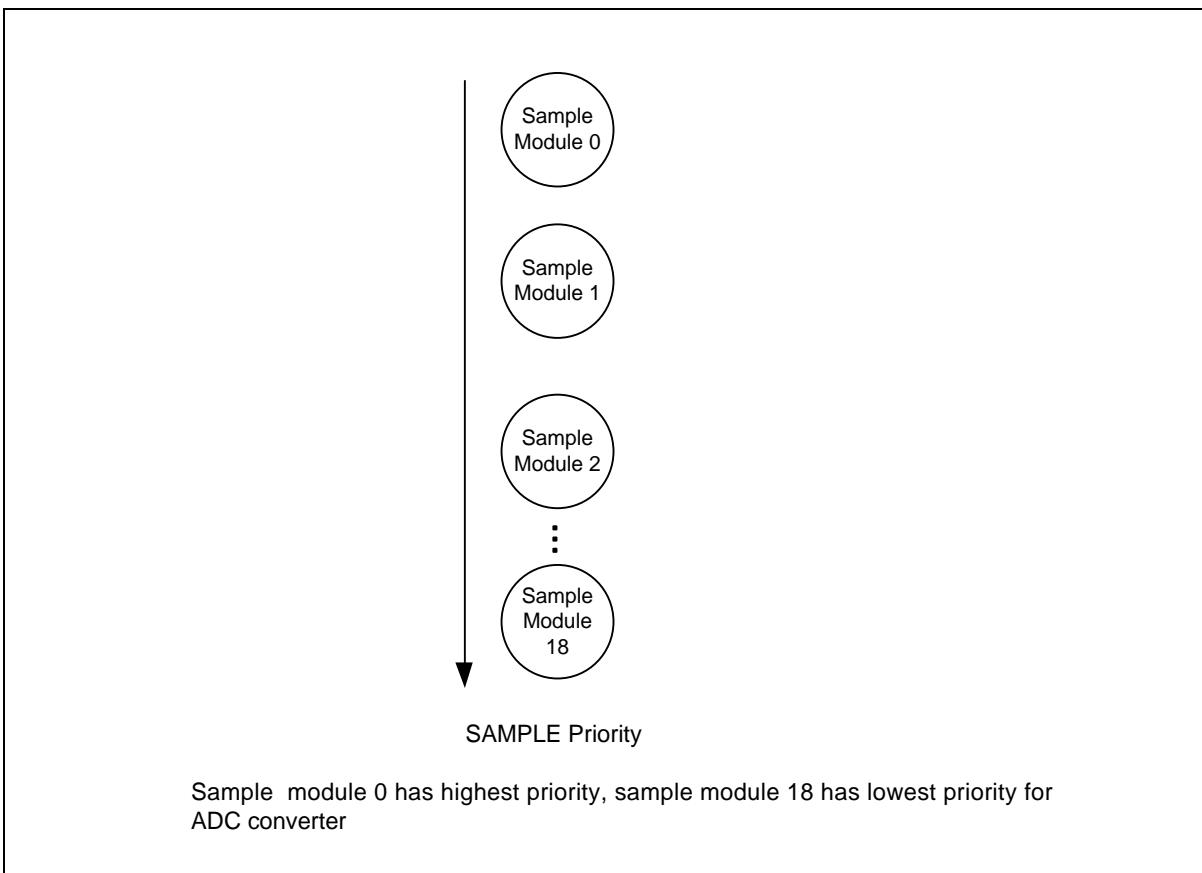

Figure 6.37-7 Sample Module Conversion Priority Arbitrator Diagram

6.37.5.4 Conversion Cycles and Sampling Rate Frequency

There are four kinds of resolutions which could be configured by RESSEL (EADC_CTL[7:6]). Each resolution corresponds to different conversion cycles. The relation is as Table 6.37-1.

Resolution	Minimum Conversion Cycles
6 bit	8 ADC_CLK
8 bit	10 ADC_CLK
10 bit	12 ADC_CLK
12 bit	14 ADC_CLK

Table 6.37-1 Relation between Resolution and Conversion Cycles

There are two kinds of analog input channels which are fast and slow channel. EADC_CH10~15 are fast channel and EADC_CH0~9 are slow channel. The maximum sampling rate of fast channel is 5.14 MSPS and slow channel is 2.14 MSPS. Exceed the limitation of sampling frequency will cause wrong conversion results. The sampling rate frequency can be computed with the following formula:

$$\text{Sampling rate frequency} = (\text{EADC clock frequency}) / (\text{conversion cycles})$$

6.37.5.5 Maximum Sampling Frequency Conversion by Software Trigger

If user needs to scan the fast channel at maximum sampling frequency, the conversion needs to be executed by the condition as: multiple sample modules, triggered by software, and triggered repeatedly during the last conversion. An example of continuous scan is as follows:

1. Using Module 0~15 to carry out successive conversion. Set CHSEL (EADC_SCTL0~15[3:0]) as one of fast channel (EADC_CH10~ EADC_CH15). Set EXTSMPT (EADC_SCTL0~15[31:24]) and TRGDLYCNT (EADC_SCTL0~15[15:8]) as 0x00 to minimize the sampling time.
2. Set SWTRG (EADC_SWTRG[18:0]) as 0xffff to trigger Module 0~15.
3. Wait CURSPL (EADC_STATUS3[4:0]) changes to 0xf which means Module 0~14 have been executed and Module 15 is in the process. Set SWTRG (EADC_SWTRG[18:0]) as 0x7fff to trigger Module 0~14 again for next round.
4. Wait CURSPL (EADC_STATUS3[4:0]) changes to 0x1, set SWTRG (EADC_SWTRG[18:0]) as 0x8000 to trigger Module 15.
5. Repeat Step 3~4 to continue the conversion.

6.37.5.6 ADC Sample Module End of Conversion Interrupt Operation

There are 4 ADC interrupts ADINT0~3, and each of these interrupts has its own interrupt vector address and can be configured to set multiple sample module EOC pulse (sample module 0~18 End of conversion pulses) as its interrupt trigger source. Figure 6.37-8 shows the control logic of interrupts. Take ADINT0 as an example, when ADCIEN0 (EADC_CTL[2]) = 1 and SPLIE_n (EADC_INTSRC0[n]) = 1 (n=0~18), the specific module EOC (End of conversion) pulses will set flag ADIF0 (EADC_STATUS[0]) as 1 and interrupt (ADINT0) will be asserted either.

The interrupt pulses (ADINT0/1) are generated whenever the specific sample module ADC EOC pulse is generated. It also can be the sample module conversion trigger sources, and user can use it to do the ADC continuous scan conversion.

The example of continuous scan triggered by interrupt is as follows:

1. If ADC sample module 2 EOC2 pulse is selected as ADINT0 interrupt trigger SPLIE2 (EADC_INTSRC0[2]) = 1 and ADINT0 is selected as sample module 0, 1, 2 hardware conversion trigger.
2. Set software trigger SWTRG2 (EADC_SWTRG[2]) to 1 to start a sample module 2 ADC conversion, after the conversion completes, it generates an EOC2 pulse signal and ADINT0 interrupt pulse at end of sample module 2 ADC conversion, ADINT0 interrupt pulse will trigger the sample module 0, 1, 2 to start the ADC conversions.
3. ADINT0 interrupt pulse repeats to trigger sample module 0, 1, 2 ADC conversions automatically.
4. Clear TRGSEL (EADC_SCTL2[20:16]) to 0 to disable sample module 2 ADINT0 interrupt pulse hardware trigger, if needs to stop the continuous scan.

Note: Because the system costs 3 ADC_CLK to trigger next module by interrupt pulse, the average conversion cycles of continuous scan triggered by interrupt is 17 ADC_CLK.

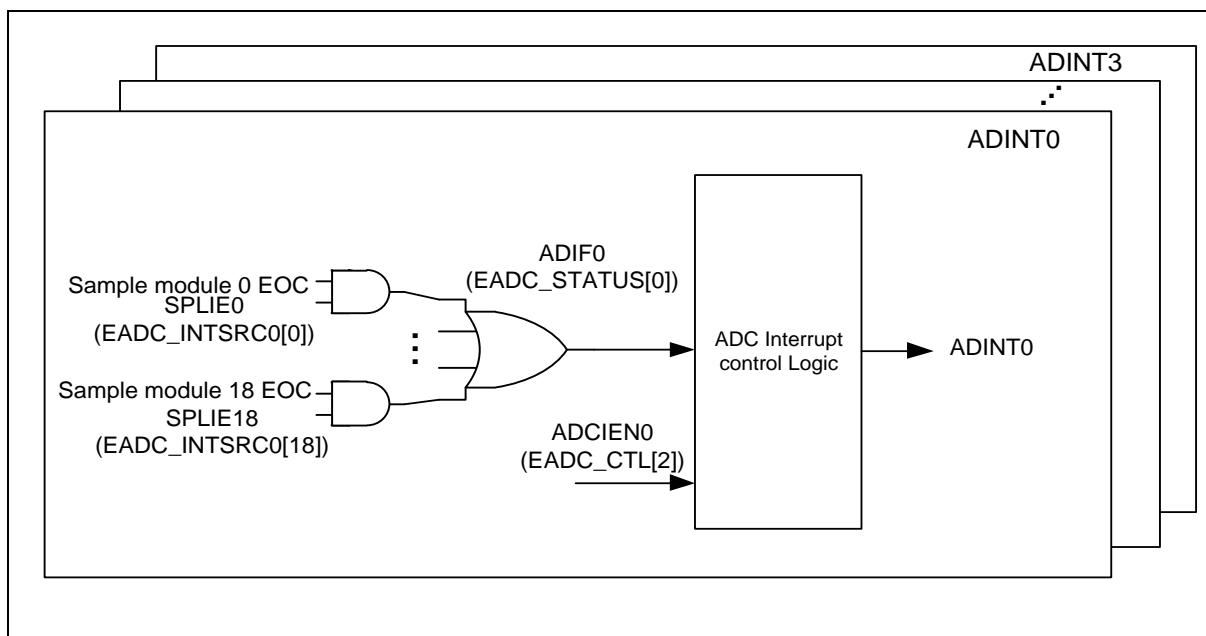

Figure 6.37-8 Specific Sample Module ADC EOC Signal for ADINT0~3 Interrupt

6.37.5.7 ADC Trigger by Timer Trigger and External Pin EADC0_ST

There are 4 Timer trigger source and an external pin EADC0_ST which can configure sample module 0~15 to trigger ADC start when Timer overflow occurs.

6.37.5.8 ADC Start Synchronous with PWM/BPWM Trigger

Besides user start, ADINT0/1 interrupt pulse, external pin EADC0_ST and Timer0~3 overflow pulse to start ADC conversion, this device has new feature to allow PWM/BPWM channels to trigger the ADC start. User may configure PWM/BPWM trigger types: rising, falling PWM/BPWM edge or center point of PWM/BPWM (center-aligned mode only) to trigger ADC start. The device also allows user to configure the amount of delay period to ADC start after hardware detected the external trigger. User can configure the trigger delay time by setting TRGDLYCNT (EADC_SCTLn[15:8], n=0~15) and TRGDLYDIV (EADC_SCTLn[7:6], n=8~15). Figure 6.37-9 shows the programmable delay time for PWM/BPWM-triggered ADC start conversion.

Figure 6.37-10 shows the programmable delay time for other trigger source.

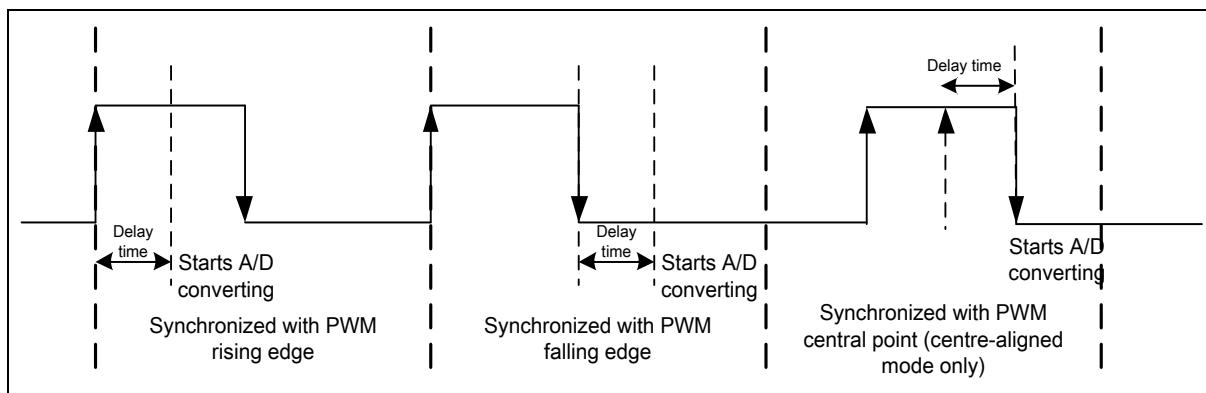

Figure 6.37-9 EPWM-triggered ADC Start Conversion

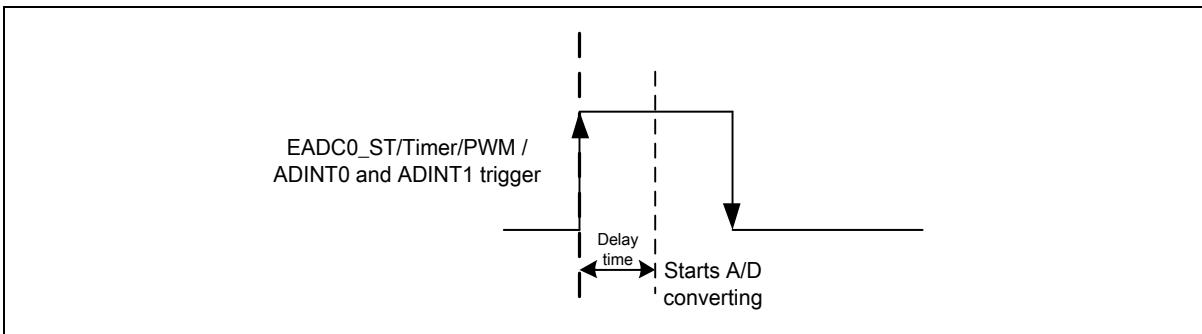

Figure 6.37-10 External triggered ADC Start Conversion

6.37.5.9 ADC Conversion Time and External Trigger

The ADC converter sample the analog input when ADC conversion start delay time (T_d) has passed after SWTRGn (EADC_SWTRG[n], n=0~18) is set to 1, then start conversion. Due to ADC clock is generated by PCLK divided by (ADC(CLKDIV[23:16])+1), the maximum delay time from user write SWTRGn to ADC start sampling analog input time is two ADC clock cycles. The start delay time is shown in Figure 6.37-11.

ADC conversion can be triggered by external pin EADC0_ST request. Setting the TRGSEL (EADC_SCTLn[20:16], n=0~15) to 0x01 is to select external trigger input from the EADC0_ST pin. User can set EXTFEN (EADC_SCTLn[5], n=0~15) and EXTREN (EADC_SCTLn[4], n=0~15) to enable pin EADC0_ST trigger condition is falling or rising edge. There is a de-bounce circuit to detect falling or rising edge. If rising edge trigger condition is selected, the low state must be kept at least 2 PCLK cycles and the following high state must be kept at least 3 PCLK cycles. If falling edge trigger condition is selected, the high state must be kept at least 2 PCLK cycles and the following low state must be kept at least 3 PCLK cycles. Pulse that is shorter than this specification will be ignored. The external trigger timing is shown in Figure 6.37-12.

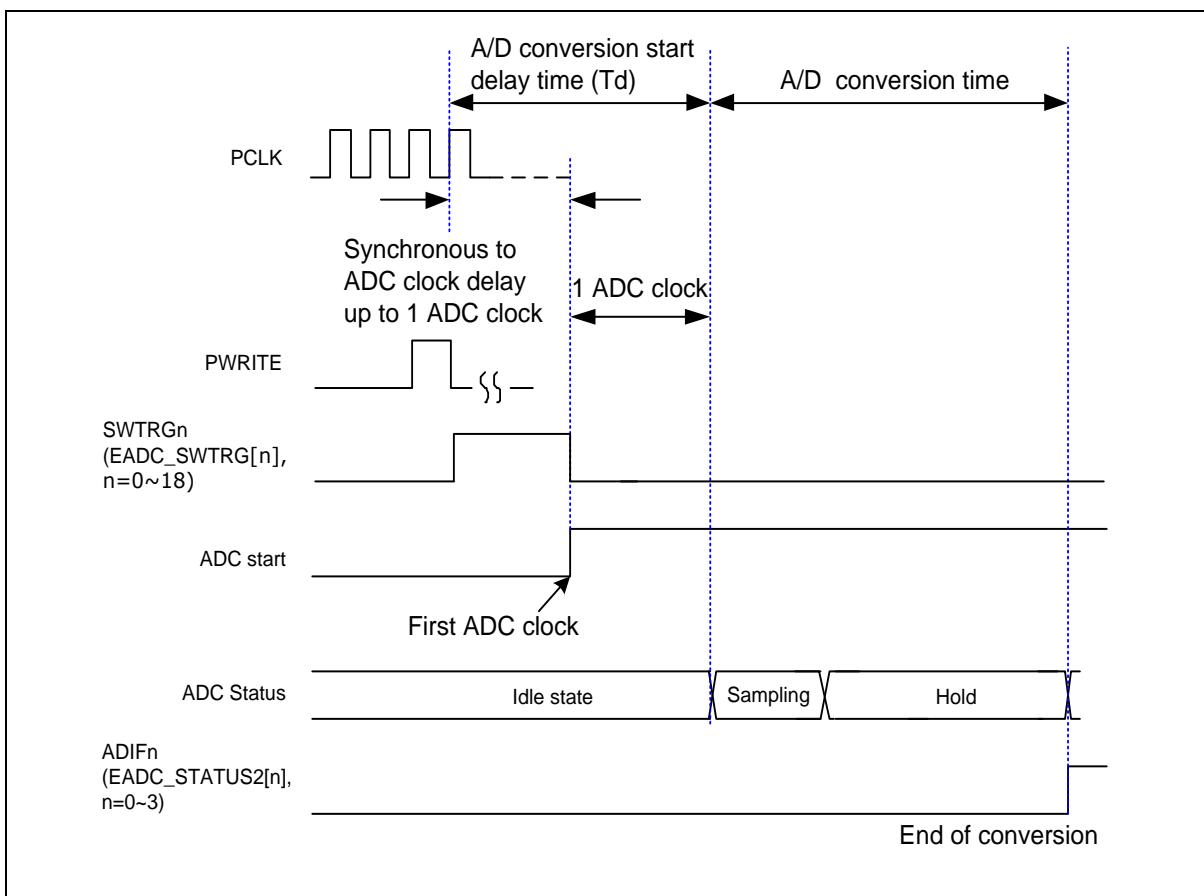

Figure 6.37-11 Conversion Start Delay Timing Diagram

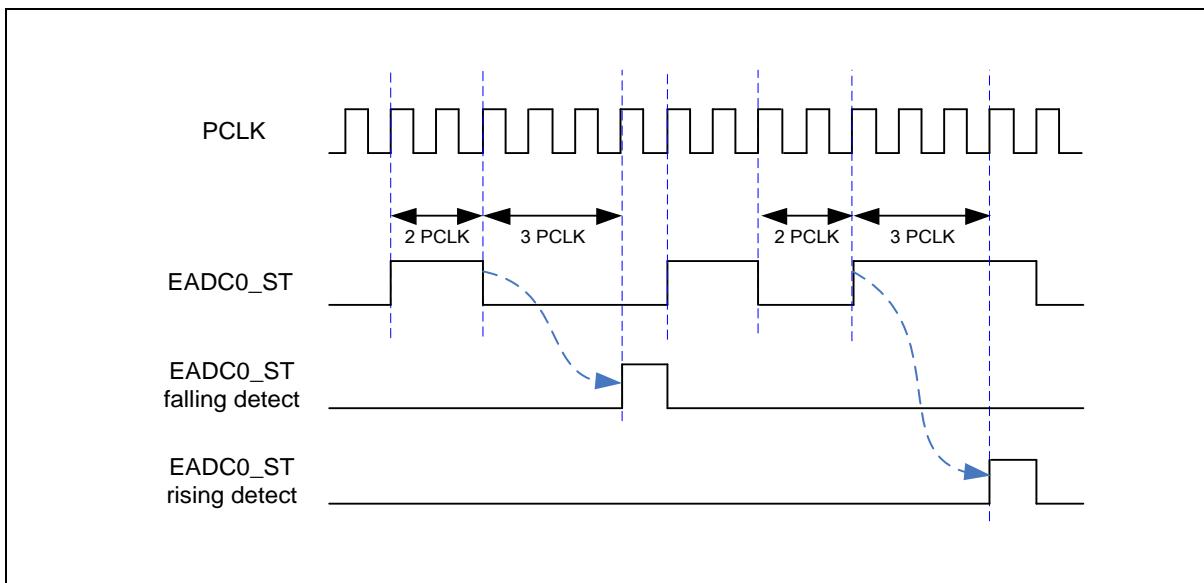

Figure 6.37-12 EADC0_ST De-bounce Timing Diagram

6.37.5.10 ADC Extend Sampling Time

When ADC operates at high ADC clock rate, the sampling time of analog input voltage may not be enough if the analog channel has heavy loading to cause fully charge time is longer. User can set

extend sampling time by writing EXTSMPT (EADC_SCTLn[31:24], n=0~15) for each sample module. The ADC extend sampling time is present between ADC controller judge which channel to be converting and ADC start to conversion. The range of extend sampling time is from 0 ~255 ADC clock. The extended sampling time is shown in Figure 6.37-13.

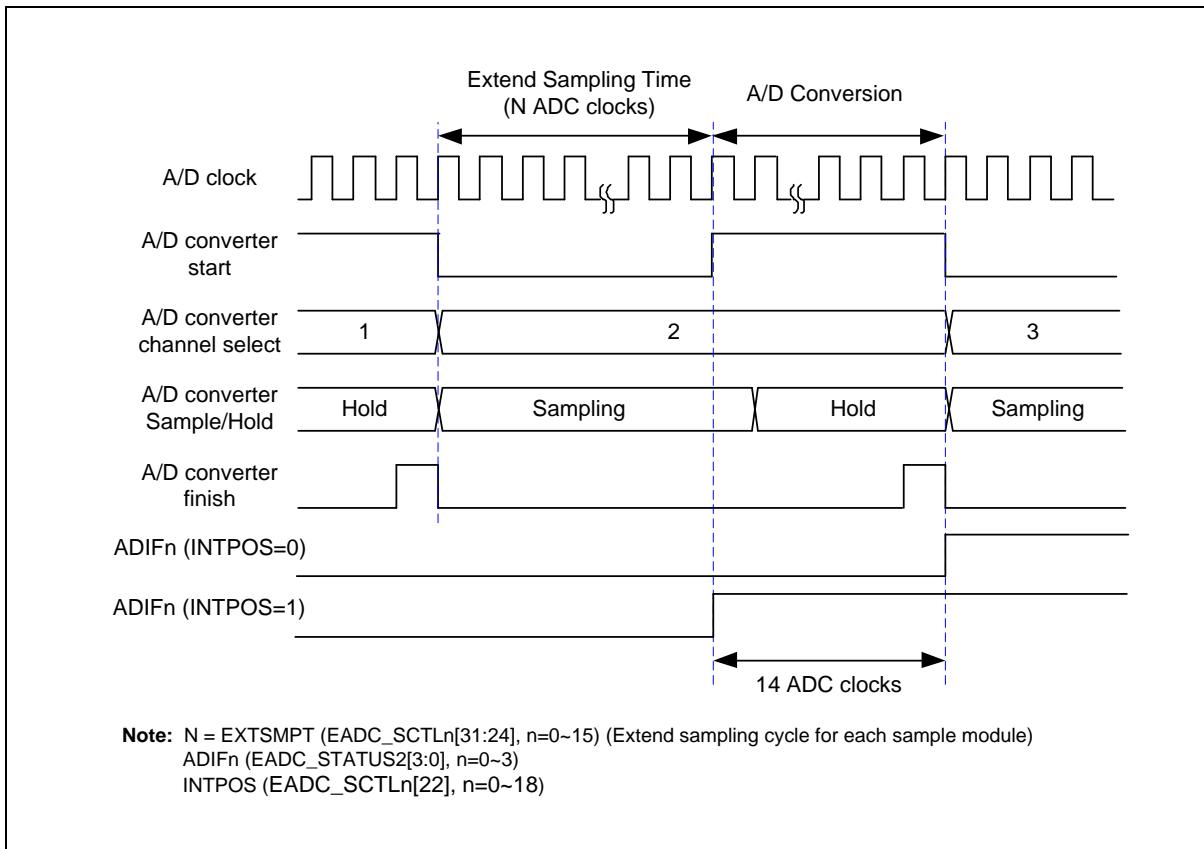

Figure 6.37-13 ADC Extend Sampling Timing Diagram

6.37.5.11 Conversion Result Monitor by Compare Mode

The ADC controller provides four sets of compare registers EADC_CMP0 ~ EADC_CMP3 to monitor a maximum of four specified sample module 0~18 conversion results from ADC conversion module, as shown in Figure 6.37-14. User can select which sample module result to be monitored by set CMPSPL (EADC_CMPn[7:3], n =0~3) and CMPCOND (EADC_CMPn[2], where n =0~3) is used to check conversion result is less than specify value or greater than (equal to) value specified in CMPDAT (EADC_CMPn[27:16], where n =0~3). When the conversion of the sample module specified by CMPSPL is completed, the comparing action will be triggered one time automatically. When the compare result meets the compare condition, the internal compare match counter will increase 1. If the compare result does not meet the condition, the compare match counter will reset to 0. When counter value reach the setting of (CMPMCNT (EADC_CMPn[11:8])+1, where n =0~3) then ADCMPFn (EADC_STATUS2[7:4], where n =0~3) bit will be set to 1, if ADCMPIE (EADC_CMPn[1], n =0~3) is set then an ADINT3 interrupt request is generated. User can use it to monitor the external analog input pin voltage transition. Detailed logics diagram is shown in Figure 6.37-14.

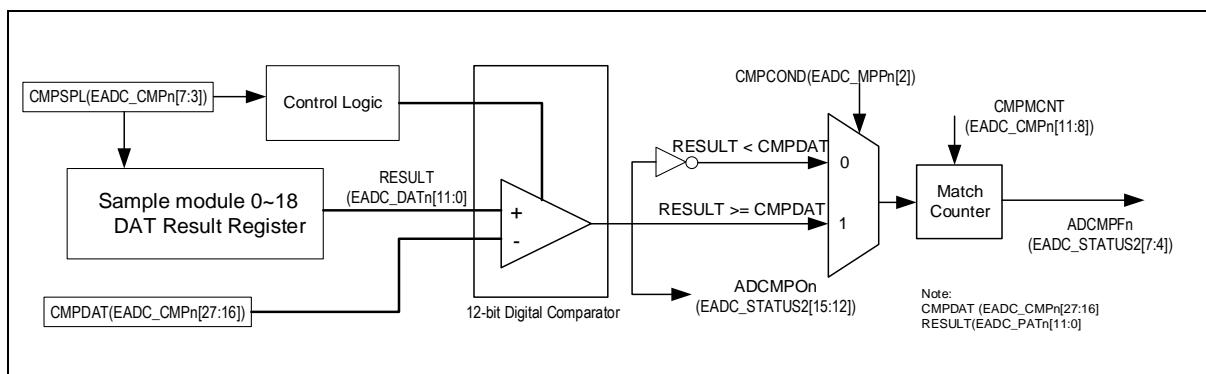

Figure 6.37-14 ADC Conversion Result Monitor Logics Diagram

The ADC controller supports a window compare mode. User can set CMPWEN (EADC_CMP0[15]/EADC_CMP2[15]) to enable this function. If user enables this function, ADCMPF0 (EADC_STATUS2[4]) will be set when both EADC_CMP0 and EADC_CMP1 compared condition matched. ADCMPF2 (EADC_STATUS2[6]) will be set when both EADC_CMP2 and EADC_CMP3 compared condition matched.

6.37.5.12 Differential Mode

The ADC controller supports analog differential mode. If user enables DIFFEN (EADC_CTL[8]), the differential mode will enable. The pair of analog input channel is as Table 6.37-2.

Differential analog input voltage (V_{diff}) = $V_{plus} - V_{minus}$, where V_{plus} is the analog input; V_{minus} is the inverted analog input.

Differential Analog Input Paired Channel	ADC Analog Input	
	V_{plus}	V_{minus}
0	EADC_CH0	EADC_CH1
1	EADC_CH2	EADC_CH3
2	EADC_CH4	EADC_CH5
3	EADC_CH6	EADC_CH7
4	EADC_CH8	EADC_CH9
5	EADC_CH10	EADC_CH11
6	EADC_CH12	EADC_CH13
7	EADC_CH14	EADC_CH15

Table 6.37-2 EADC Differential Model Channel Selection

In differential analog input mode, only the even number of the two corresponding channels needs to be enabled in CHSEL (EADC_SCTLn[3:0]). The conversion result will be placed to the corresponding data register of the enabled channel. The conversion result will store with 2'complement format when DMOF (EADC_CTL[9]) = 1.

6.37.5.13 Double Buffer Mode

The ADC controller supports a double buffer mode in sample module 0~3. If user enable DBMEN (EADC_SCTLn[23], n=0~3), the double buffer mode will enable. In double buffer mode, after first time ADC convert finish, the VALID (EADC_DATn[17], n=0~3) will set to high, but VALID (EADC_DDATn[17], n=0~3) will keep low. And the second time ADC converts finish, VALID (EADC_DDATn[17], n=0~3) will set to high either. Then, user can get the ADC results from

EADC_DATn and EADC_DDATn register.

6.37.5.14 PDMA Request

The ADC controller supports PDMA. User can enable PDMAEN (EADC_CTL[11]) and configure PDMA channel's source address as EADC_CURDAT (EADC_BA+0x4C). After enable PDMAEN and PDMA channel enable, if any VALID (EADC_DATn[17], n=0~18) is high, ADC controller will send request to PDMA and PDMA will read EADC_CURDAT to get result. The EADC_CURDAT register is a shadow register of highest priority EADC_DAT register. The lower number sample module is higher priority. After PDMA read EADC_CURDAT register, the VAILD of the shadow EADC_DAT register will be automatically cleared.

6.37.5.15 Interrupt Sources

The ADC converter generates ADIFn (EADC_STATUS2[3:0], n=0~3) at the start of conversion or the end of conversion decide by INTPOS (EADC_SCTLn[22], n=0~15). If ADCIEnn (EADC_CTL[5:2], n=0~3) is set then conversion end interrupt request ADINTn (n=0~3) is generated. The controller of interrupts is shown as Figure 6.37-15.

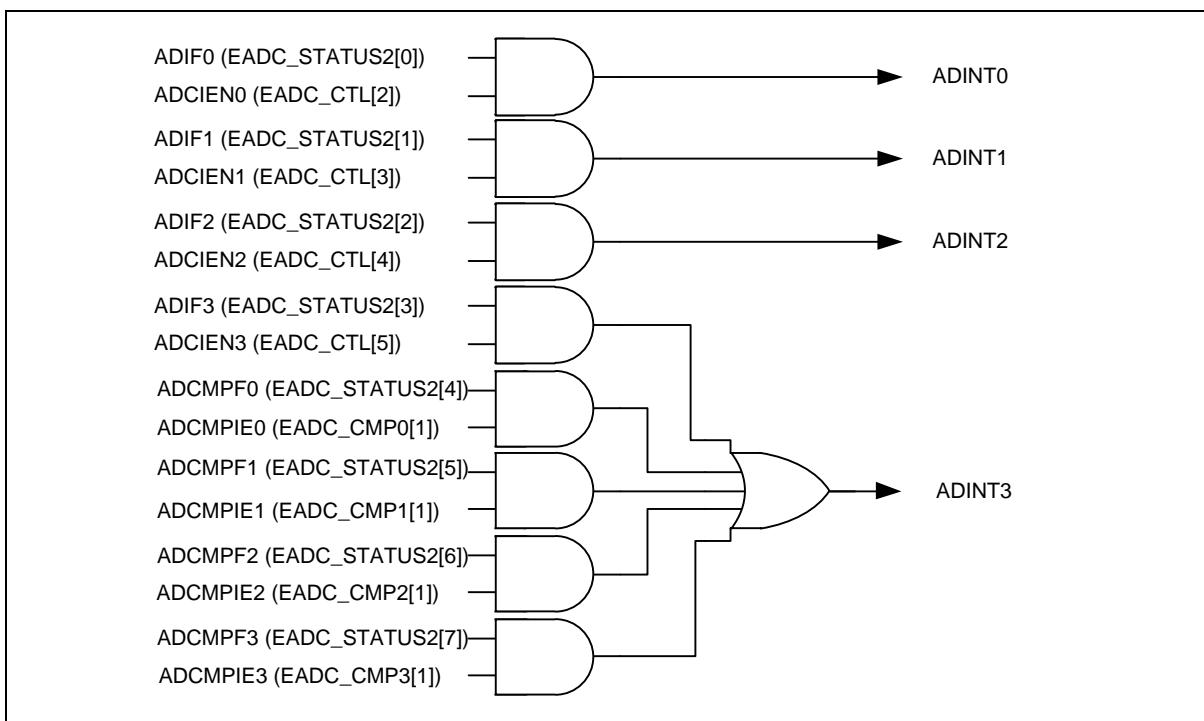

Figure 6.37-15 ADC Controller Interrupts

6.37.5.16 Power Management and Calibration

There are three kinds of power saving mode which are Deep Power-down, Power-down, and Standby. User may set PWDMOD (EADC_PWRM[3:2]) to select which power saving mode EADC would enter when ADCEN (EADC_CTL[0]) is set as 0. The difference of these Power-down mode is shown as Table 6.37-3. Because the internal LDO will be shut down in Deep Power-down and Power-down mode, EADC needs to take extra time to resume. The interval of time to resume is set by LDOSUT (EADC_PWRM[19:8]) which must be longer than 20 us. As for the Standby mode, LDO will keep enable and start-up time is unnecessary.

Power Supplies	Deep Power-Down	Power-Down	Standby
Internal LDO	Disable	Disable	Enable
Internal power switch	Disable	Enable	Enable

Table 6.37-3 EADC Power Saving Mode

When EADC is activated by setting ADCEN(EADC_CTL[0]) to 1, the start up sequence will execute automatically. After start up sequence finished, PWUPRDY (EADC_PWRM[0]) will be set to 1 by HW which means ready to convert. ADCEN (EADC_CTL[0]) must be kept at 1 until PWUPRDY (EADC_PWRM[0]) is set to 1 during the start up sequence. Changing ADCEN (EADC_CTL[0]) arbitrarily at start up sequence will cause EADC function failure.

The conversion results of ADC will be more accurate with calibration. User may set PWUCALEN (EADC_PWRM[1]) as 1 to carry out calibration at start up. This bit needs to cooperate with CALSEL (EADC_CALCTL [3]), the configuration of {PWUCALEN, CALSEL} is shown as Table 6.37-4. An example about start up with calibration is shown as Figure 6.37-16.

PWUCALEN	CALSEL	Configuration
0	0	Start up without calibration
0	1	Start up without calibration
1	0	Load calibration word at start up
1	1	Start up with calibration

Table 6.37-4 EADC Start up with Calibration

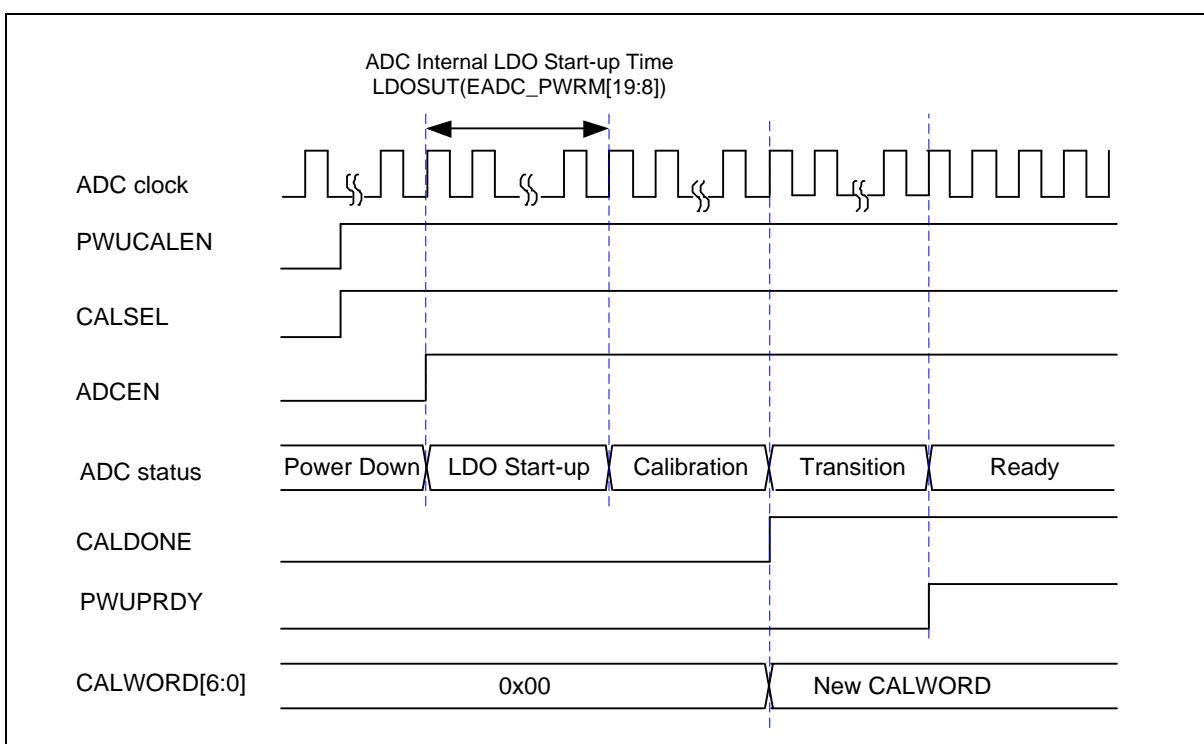

Figure 6.37-16 ADC Start up Sequence with Calibration

To get precise result, user may calibrate again after a few conversion. Set CALSTART (EADC_CALCTL[1]) as 1 could enable calibration again, but this bit needs to work with CALSEL (EADC_CALCTL[3]). Before set CALSTART (EADC_CALCTL[1]) as 1 to start calibration again, EADCDIV (CKL_CLKDIV0[23:16]) must be 0. Set CALSTART (EADC_CALCTL[1]) as 1 and CALSEL (EADC_CALCTL[3]) as 1 will execute calibration again then update CALWORD (EADC_CALDWRD[6:0]). Set CALSTART (EADC_CALCTL[1]) as 1 and CALSEL (EADC_CALCTL[3]) as 0 will load CALWORD (EADC_CALDWRD[6:0]) which was defined by user. The re-calibration

sequence should be as follows:

1. Set CALSEL (EADC_CALCTL[3]) as 1 or 0 to select calibration function
2. Set CALSTART (EADC_CALCTL[1]) as 1 to active calibration
3. CALDONE (EADC_CALCTL[2]) will be set as 0 by HW during calibration
4. Wait for CALDONE (EADC_CALCTL[2]) is set as 1 by HW. If CALSEL (EADC_CALCTL[3]) is set as 1, the new calibration word will be updated to CALWORD (EADC_CALDWRD[6:0]). If CALSEL (EADC_CALCTL[3]) is set as 0, the specific CALWORD (EADC_CALDWRD[6:0]) was loaded rather than executing calibration.

Note: Before set CALSTART (EADC_CALCTL[1]) as 1 to start calibration again, EADCDIV (CKL_CLKDIV0[23:16]) must be 0.

6.37.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
EADC Base Address:

RESULT							

Bits	Description	
[31:18]	Reserved	Reserved.
[17]	VALID	<p>Valid Flag This bit is set to 1 when corresponding sample module channel analog input conversion is completed and cleared by hardware after EADC_DAT register is read. 0 = Data in RESULT[11:0] bits is not valid. 1 = Data in RESULT[11:0] bits is valid.</p>
[16]	OV	<p>Overrun Flag If converted data in RESULT[11:0] has not been read before new conversion result is loaded to this register, OV is set to 1. 0 = Data in RESULT[11:0] is recent conversion result. 1 = Data in RESULT[11:0] is overwrite. Note: It is cleared by hardware after EADC_DAT register is read.</p>
[15:0]	RESULT	<p>ADC Conversion Result This field contains 12 bits conversion result. When DMOF (EADC_CTL[9]) is set to 0, 12-bit ADC conversion result with unsigned format will be filled in RESULT[11:0] and zero will be filled in RESULT[15:12]. When DMOF (EADC_CTL[9]) set to 1, 12-bit ADC conversion result with 2'complement format will be filled in RESULT[11:0] and signed bits to will be filled in RESULT[15:12].</p>

ADC PDMA Current Transfer Data Register (EADC_CURDAT)

Register	Offset	R/W	Description				Reset Value

7	6	5	4	3	2	1	0
RESSEL		ADCIEN3	ADCIEN2	ADCIEN1	ADCIEN0	ADCRST	ADCEN

Bits	Description	
[31:12]	Reserved	Reserved.
[11]	PDMAEN	<p>PDMA Transfer Enable Bit When ADC conversion is completed, the converted data is loaded into EADC_DATn (n: 0 ~ 18) register, user can enable this bit to generate a PDMA data transfer request. 0 = PDMA data transfer Disabled. 1 = PDMA data transfer Enabled. Note: When set this bit field to 1, user must set ADCIENn (EADC_CTL[5:2], n=0~3) = 0 to disable interrupt.</p>
[10]	Reserved	Reserved.
[9]	DMOF	<p>ADC Differential Input Mode Output Format 0 = ADC conversion result will be filled in RESULT (EADC_DATn[15:0], where n= 0 ~18) with unsigned format. 1 = ADC conversion result will be filled in RESULT (EADC_DATn[15:0], where n= 0 ~18) with 2'complement format.</p>
[8]	DIFFEN	<p>Differential Analog Input Mode Enable Bit 0 = Single-end analog input mode. 1 = Differential analog input mode.</p>
[7:6]	RESSEL	<p>Resolution Selection 00 = 6-bit ADC result will be put at RESULT (EADC_DATn[5:0]). 01 = 8-bit ADC result will be put at RESULT (EADC_DATn[7:0]). 10 = 10-bit ADC result will be put at RESULT (EADC_DATn[9:0]). 11 = 12-bit ADC result will be put at RESULT (EADC_DATn[11:0]).</p>
[5]	ADCIEN3	<p>Specific Sample Module ADC ADINT3 Interrupt Enable Bit The ADC converter generates a conversion end ADIF3 (EADC_STATUS2[3]) upon the end of specific sample module ADC conversion. If ADCIEN3 bit is set then conversion end interrupt request ADINT3 is generated. 0 = Specific sample module ADC ADINT3 interrupt function Disabled. 1 = Specific sample module ADC ADINT3 interrupt function Enabled.</p>

Bits	Description	
[4]	ADCIEN2	<p>Specific Sample Module ADC ADINT2 Interrupt Enable Bit</p> <p>The ADC converter generates a conversion end ADIF2 (EADC_STATUS2[2]) upon the end of specific sample module ADC conversion. If ADCIEN2 bit is set then conversion end interrupt request ADINT2 is generated.</p> <p>0 = Specific sample module ADC ADINT2 interrupt function Disabled. 1 = Specific sample module ADC ADINT2 interrupt function Enabled.</p>
[3]	ADCIEN1	<p>Specific Sample Module ADC ADINT1 Interrupt Enable Bit</p> <p>The ADC converter generates a conversion end ADIF1 (EADC_STATUS2[1]) upon the end of specific sample module ADC conversion. If ADCIEN1 bit is set then conversion end interrupt request ADINT1 is generated.</p> <p>0 = Specific sample module ADC ADINT1 interrupt function Disabled. 1 = Specific sample module ADC ADINT1 interrupt function Enabled.</p>
[2]	ADCIENO	<p>Specific Sample Module ADC ADINT0 Interrupt Enable Bit</p> <p>The ADC converter generates a conversion end ADIF0 (EADC_STATUS2[0]) upon the end of specific sample module ADC conversion. If ADCIENO bit is set then conversion end interrupt request ADINT0 is generated.</p> <p>0 = Specific sample module ADC ADINT0 interrupt function Disabled. 1 = Specific sample module ADC ADINT0 interrupt function Enabled.</p>
[1]	ADCRST	<p>ADC Converter Control Circuits Reset</p> <p>0 = No effect. 1 = Cause ADC control circuits reset to initial state, but not change the ADC registers value.</p> <p>Note: ADCRST bit remains 1 during ADC reset, when ADC reset end, the ADCRST bit is automatically cleared to 0.</p>
[0]	ADCEN	<p>ADC Converter Enable Bit</p> <p>0 = Disabled EADC. 1 = Enabled EADC.</p> <p>Note: Before starting ADC conversion function, this bit should be set to 1. Clear it to 0 to disable ADC converter analog circuit power consumption.</p>

ADC Sample Module Software Start Register (EADC_SWTRG)

Register	Offset	R/W	Description				Reset Value
EADC_SWTRG	EADC_BA+0x54	W	ADC Sample Module Software Start Register				0x0000_0000

TRGDLYDIV		EXTFEN	EXTREN	CHSEL			

Bits	Description	
[31:24]	EXTSMPT	ADC Sampling Time Extend When ADC converting at high conversion rate, the sampling time of analog input voltage may not enough if input channel loading is heavy, user can extend ADC sampling time after trigger source is coming to get enough sampling time. The range of start delay time is from 0~255 ADC clock.
[23]	DBMEN	Double Buffer Mode Enable Bit 0 = Sample has one sample result register (default). 1 = Sample has two sample result registers.
[22]	INTPOS	Interrupt Flag Position Select 0 = Set ADIFn (EADC_STATUS2[n], n=0~3) at ADC end of conversion. 1 = Set ADIFn (EADC_STATUS2[n], n=0~3) at ADC start of conversion.
[21]	Reserved	Reserved.

Bits	Description
[20:16]	TRGSEL ADC Sample Module Start of Conversion Trigger Source Selection 0H = Disable trigger. 1H = External trigger from EADC0_ST pin input. 2H = ADC ADINT0 interrupt EOC (End of conversion) pulse trigger. 3H = ADC ADINT1 interrupt EOC (End of conversion) pulse trigger. 4H = Timer0 overflow pulse trigger. 5H = Timer1 overflow pulse trigger. 6H = Timer2 overflow pulse trigger. 7H = Timer3 overflow pulse trigger. 8H = EPWM0TG0. 9H = EPWM0TG1. AH = EPWM0TG2. BH = EPWM0TG3. CH = EPWM0TG4. DH = EPWM0TG5. EH = EPWM1TG0. FH = EPWM1TG1. 10H = EPWM1TG2. 11H = EPWM1TG3. 12H = EPWM1TG4. 13H = EPWM1TG5. 14H = BPWM0TG. 15H = BPWM1TG. other = Reserved.
[15:8]	TRGDLYCNT ADC Sample Module Start of Conversion Trigger Delay Time Trigger delay time = TRGDLYCNT x ADC_CLK period x n (n=1,2,4,16 from TRGDLYDIV setting).
[7:6]	TRGDLYDIV ADC Sample Module Start of Conversion Trigger Delay Clock Divider Selection Trigger delay clock frequency: 00 = ADC_CLK/1. 01 = ADC_CLK/2. 10 = ADC_CLK/4. 11 = ADC_CLK/16.
[5]	EXTFEN ADC External Trigger Falling Edge Enable Bit 0 = Falling edge Disabled when ADC selects EADC0_ST as trigger source. 1 = Falling edge Enabled when ADC selects EADC0_ST as trigger source.
[4]	EXTREN ADC External Trigger Rising Edge Enable Bit 0 = Rising edge Disabled when ADC selects EADC0_ST as trigger source. 1 = Rising edge Enabled when ADC selects EADC0_ST as trigger source.

Bits	Description
[3:0]	CHSEL ADC Sample Module Channel Selection 00H = EADC_CH0 (slow channel). 01H = EADC_CH1 (slow channel). 02H = EADC_CH2 (slow channel). 03H = EADC_CH3 (slow channel). 04H = EADC_CH4 (slow channel). 05H = EADC_CH5 (slow channel). 06H = EADC_CH6 (slow channel). 07H = EADC_CH7 (slow channel). 08H = EADC_CH8 (slow channel). 09H = EADC_CH9 (slow channel). 0AH = EADC_CH10 (fast channel). 0BH = EADC_CH11 (fast channel). 0CH = EADC_CH12 (fast channel). 0DH = EADC_CH13 (fast channel). 0EH = EADC_CH14 (fast channel). 0FH = EADC_CH15 (fast channel).

ADC Sample Module 4~15 Control Registers (EADC_SCTL4~EADC_SCTL15)

Register	Offset	R/W	Description	Reset Value

CMPSPL				CMPCOND	ADCMPIE	ADCMPPEN	

Bits	Description	
[31:28]	Reserved	Reserved.
[27:16]	CMPDAT	Comparison Data The 12 bits data is used to compare with conversion result of specified sample module. User can use it to monitor the external analog input pin voltage transition without imposing a load on software.
[15]	CMPWEN	Compare Window Mode Enable Bit 0 = ADCMPF0 (EADC_STATUS2[4]) will be set when EADC_CMP0 compared condition matched. ADCMPF2 (EADC_STATUS2[6]) will be set when EADC_CMP2 compared condition matched 1 = ADCMPF0 (EADC_STATUS2[4]) will be set when both EADC_CMP0 and EADC_CMP1 compared condition matched. ADCMPF2 (EADC_STATUS2[6]) will be set when both EADC_CMP2 and EADC_CMP3 compared condition matched. Note: This bit is only present in EADC_CMP0 and EADC_CMP2 register.
[14:12]	Reserved	Reserved.
[11:8]	CMPPMCNT	Compare Match Count When the specified ADC sample module analog conversion result matches the compare condition defined by CMPCOND (EADC_CMPPn[2], n=0~3), the internal match counter will increase 1. If the compare result does not meet the compare condition, the internal compare match counter will reset to 0. When the internal counter reaches the value to (CMPPMCNT +1), the ADCMPFn (EADC_STATUS2[7:4], n=0~3) will be set.

Bits	Description
[7:3]	<p>Compare Sample Module Selection</p> <p>00000 = Sample Module 0 conversion result EADC_DAT0 is selected to be compared.</p> <p>00001 = Sample Module 1 conversion result EADC_DAT1 is selected to be compared.</p> <p>00010 = Sample Module 2 conversion result EADC_DAT2 is selected to be compared.</p> <p>00011 = Sample Module 3 conversion result EADC_DAT3 is selected to be compared.</p> <p>00100 = Sample Module 4 conversion result EADC_DAT4 is selected to be compared.</p> <p>00101 = Sample Module 5 conversion result EADC_DAT5 is selected to be compared.</p> <p>00110 = Sample Module 6 conversion result EADC_DAT6 is selected to be compared.</p> <p>00111 = Sample Module 7 conversion result EADC_DAT7 is selected to be compared.</p> <p>01000 = Sample Module 8 conversion result EADC_DAT8 is selected to be compared.</p> <p>01001 = Sample Module 9 conversion result EADC_DAT9 is selected to be compared.</p> <p>01010 = Sample Module 10 conversion result EADC_DAT10 is selected to be compared.</p> <p>01011 = Sample Module 11 conversion result EADC_DAT11 is selected to be compared.</p> <p>01100 = Sample Module 12 conversion result EADC_DAT12 is selected to be compared.</p> <p>01101 = Sample Module 13 conversion result EADC_DAT13 is selected to be compared.</p> <p>01110 = Sample Module 14 conversion result EADC_DAT14 is selected to be compared.</p> <p>01111 = Sample Module 15 conversion result EADC_DAT15 is selected to be compared.</p> <p>10000 = Sample Module 16 conversion result EADC_DAT16 is selected to be compared.</p> <p>10001 = Sample Module 17 conversion result EADC_DAT17 is selected to be compared.</p> <p>10010 = Sample Module 18 conversion result EADC_DAT18 is selected to be compared.</p>
[2]	<p>Compare Condition</p> <p>0= Set the compare condition as that when a 12-bit ADC conversion result is less than the 12-bit CMPDAT (EADC_CMPn [27:16]), the internal match counter will increase one.</p> <p>1= Set the compare condition as that when a 12-bit ADC conversion result is greater or equal to the 12-bit CMPDAT (EADC_CMPn [27:16]), the internal match counter will increase one.</p> <p>Note: When the internal counter reaches the value to (CMPMCNT (EADC_CMPn[11:8], n=0~3) +1), the CMPF bit will be set.</p>
[1]	<p>ADC Result Compare Interrupt Enable Bit</p> <p>0 = Compare function interrupt Disabled.</p> <p>1 = Compare function interrupt Enabled.</p> <p>If the compare function is enabled and the compare condition matches the setting of CMPCOND (EADC_CMPn[2], n=0~3) and CMPMCNT (EADC_CMPn[11:8], n=0~3), ADCMPFn (EADC_STATUS2[7:4], n=0~3) will be asserted, in the meanwhile, if ADCMPIE is set to 1, a compare interrupt request is generated.</p>
[0]	<p>ADC Result Compare Enable Bit</p> <p>0 = Compare Disabled.</p> <p>1 = Compare Enabled.</p> <p>Set this bit to 1 to enable compare CMPDAT (EADC_CMPn[27:16], n=0~3) with specified sample module conversion result when converted data is loaded into EADC_DAT register.</p>

EADC_DDAT3	EADC_BA+0x10C	R	ADC Double Data Register 3 for Sample Module 3			0x0000_0000

Bits	Description	
[31:17]	Reserved	Reserved.
[17]	VALID	<p>Valid Flag 0 = Double data in RESULT (EADC_DDATn[15:0]) is not valid. 1 = Double data in RESULT (EADC_DDATn[15:0]) is valid. This bit is set to 1 when corresponding sample module channel analog input conversion is completed and cleared by hardware after EADC_DDATn register is read. (n=0~3).</p>
[16]	OV	<p>Overrun Flag 0 = Data in RESULT (EADC_DATn[15:0], n=0~3) is recent conversion result. 1 = Data in RESULT (EADC_DATn[15:0], n=0~3) is overwrite. If converted data in RESULT[15:0] has not been read before new conversion result is loaded to this register, OV is set to 1. It is cleared by hardware after EADC_DDAT register is read.</p>
[15:0]	RESULT	<p>ADC Conversion Results This field contains 12 bits conversion results. When the DMOF (EADC_CTL[9]) is set to 0, 12-bit ADC conversion result with unsigned format will be filled in RESULT [11:0] and zero will be filled in RESULT [15:12]. When DMOF (EADC_CTL[9]) is set to 1, 12-bit ADC conversion result with 2's complement format will be filled in RESULT [11:0] and signed bits will be filled in RESULT [15:12].</p>

ADC Power Management Register (EADC_PWRM)

Bits	Description	
[31:20]	Reserved	Reserved.
[19:8]	LDOSUT	ADC Internal LDO Start-up Time Set this bit field to control LDO start-up time. The minimum required LDO start-up time is 20us. LDO start-up time = (1/ADC_CLK) x LDOSUT.
[7:4]	Reserved	Reserved.
[3:2]	PWDMOD	ADC Power-down Mode Set this bit field to select ADC Power-down mode when system power-down. 00 = ADC Deep Power-down mode. 01 = ADC Power down. 10 = ADC Standby mode. 11 = ADC Deep Power-down mode. Note: Different PWDMOD has different power down/up sequence, in order to avoid ADC powering up with wrong sequence; user must keep PWMOD consistent each time in power down and start up.
[1]	PWUCALEN	Power Up Calibration Function Enable Bit 0 = Calibration function Disabled at power up. 1 = Calibration function Enabled at power up. Note: This bit work together with CALSEL (EADC_CALCTL [3]), see the following {PWUCALEN, CALSEL } Description: PWUCALEN is 0 and CALSEL is 0: No need to calibrate. PWUCALEN is 0 and CALSEL is 1: No need to calibrate. PWUCALEN is 1 and CALSEL is 0: Load calibration word when power up. PWUCALEN is 1 and CALSEL is 1: Calibrate when power up.
[0]	PWUPRDY	ADC Power-up Sequence Completed and Ready for Conversion (Read Only) 0 = ADC is not ready for conversion may be in power down state or in the progress of start up. 1 = ADC is ready for conversion.

ADC Calibration Control Register (EADC_CALCTL)

Bits	Description	
[31:7]	Reserved	Reserved.
[6:0]	CALWORD	<p>Calibration Word Bits</p> <p>Write to this register with the previous calibration word before load calibration action. Read this register after calibration done.</p> <p>Note: The calibration block contains two parts “CALIBRATION” and “LOAD CALIBRATION”; if the calibration block configure as “CALIBRATION”; then this register represent the result of calibration when calibration is completed; if configure as “LOAD CALIBRATION” ; configure this register before loading calibration action, after loading calibration complete, the loaded calibration word will apply to the ADC; while in loading calibration function the loaded value will not be equal to the original CALWORD until calibration is done.</p>

6.38 Digital to Analog Converter (DAC)

6.38.1 Overview

The DAC module is a 12-bit, voltage output digital-to-analog converter. It can be configured to 12- or 8-bit output mode and can be used in conjunction with the PDMA controller. The DAC integrates a voltage output buffer that can be used to reduce output impedance and drive external loads directly without having to add an external operational amplifier.

6.38.2 Features

- Analog output voltage range: 0~AVDD.
- Supports 12- or 8-bit output mode.
- Rail to rail settle time 8us.
- Supports up to two 12-bit 1 MSPS voltage type DAC.
- Reference voltage from internal reference voltage (INT_VREF), V_{REF} pin.
- DAC maximum conversion updating rate 1 MSPS.
- Supports voltage output buffer mode and bypass voltage output buffer mode.
- Supports software and hardware trigger, including Timer0~3, EPWM0, EPWM1, and external trigger pin to start DAC conversion.
- Supports PDMA mode.
- Supports group mode of synchronized update capability for two DACs.

6.38.4.2 DAC1 Basic Configuration

- Clock source Configuration
 - Enable DAC1 peripheral clock in DACCKEN (CLK_APBCLK1[12]).
- Reset Configuration
 - Reset DAC1 controller in DCRST (SYS_IPRST2[12]).
- Pin configuration

Group	Pin Name	GPIO	MFP
DAC1	DAC1_OUT	PB.13	MFP1
	DAC1_ST	PA.11	MFP14
		PA.1	MFP15

6.38.5 Functional Description

6.38.5.1 DAC Output

The DAC is a 12-bit voltage output digital-to-analog converter and can be configured as 12- or 8-bit operation mode. The DAC integrates a voltage output buffer that can be used to reduce output impedance and drive external loads directly without having to add an external operational amplifier. The DAC channel output buffer can be enabled and disabled by BYPASS (DACn_CTL[8]), n=0, 1. The maximum DAC output voltage is limited to the selected reference voltage source.

6.38.5.2 DAC Reference Voltage

The DAC reference voltage is shared with EADC reference voltage and it is configured by VREFCTL (SYS_VREFCTL[4:0]) in system manager control registers. The reference voltage for the DAC can be configured from external reference voltage pin (V_{REF}) or internal reference voltage generator (INT_VREF).

6.38.5.3 DAC Data Format

The DAC supports conversion data left alignment or right alignment mode. Depending on the selected configuration mode, the data needs to be written into the specified register as follows:

- 12-bit left alignment: user has to load data into DACn_DAT[15:4] bits. DACn_DAT[31:16] and DACn_DAT[3:0] are ignored in DAC conversion.
- 12-bit right alignment: user has to load data into DACn_DAT[11:0] bits, DACn_DAT[31:12] are ignored in DAC conversion.

While DAC is working in 8-bit mode, alignment setting has no effect. To enable 8-bit mode, set BWSEL(DACn_CTL[15:14]) to 01. Otherwise, keep BWSEL as 00.

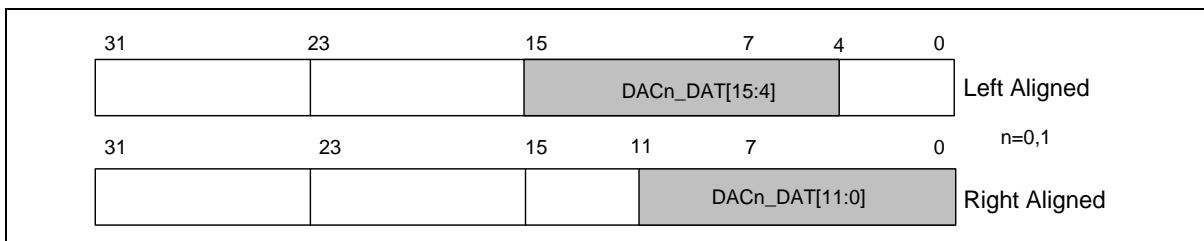

Figure 6.38-2 Data Holding Register Format

6.38.5.4 DAC Conversion

Any data transfer to the DAC channel is performed by loading the data into DACn_DAT register. Figure 6.38-3 shows the DAC conversion started by software write operation. When user writes the conversion data to data holding register DACn_DAT, the data is loaded into data output register DACn_DATOUT by hardware and DAC starts data conversion after one PCLK (APB clock) clock cycle. Figure 6.38-4 shows the DAC conversion started by hardware trigger (external pin DACn_ST, timer trigger event or EPWM timer trigger event). The data stored in the DACn_DAT register is automatically transferred to the data output buffer DACn_DATOUT after occurring one PCLK (APB clock) the event.

When DAC data output register DACn_DATOUT is loaded with the DACn_DAT contents, the analog output voltage becomes available after specified conversion settling time. The conversion settling time is 8us when 12-bit input code transition from lowest code (0x000) to highest code (0xFFFF). Two adjacent codes conversion settling time is 1us. The DAC controller provides a 10-bit time counter for user to count the conversion time period. In continuous conversion operation, user needs to write appropriate value to SETTLET (DACn_TCTL[9:0]) to define DAC conversion time period. The value must be longer than DAC conversion settling time which is specified in DAC electric characteristic table. For example, when DAC controller APB clock speed is 80MHz and DAC conversion settling time is 8us, the selected SETTLET value must be greater than 0x280. When the conversion is started, the conversion finish flag FINISH (DACn_STATUS[0]) is cleared to 0 by hardware and set to 1 after the time counter counts to SETTLET. Note that n=0,1.

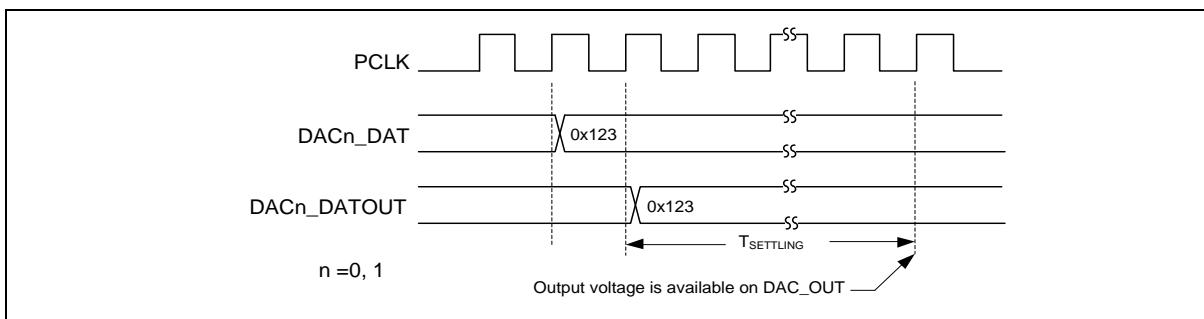

Figure 6.38-3 DAC Conversion Started by Software Write Trigger

6.38.5.5 DAC Output Voltage

Digital inputs are converted to output voltage on a linear conversion between 0 and reference voltage V_{REF} . The analog output voltage on DAC pin is determined by the following equation:

$$DACOUT = V_{REF} * \frac{DATnOUT[11:0]}{4096}, n=0,1$$

6.38.5.6 DAC Trigger Selection

The DAC conversion can be started by writing DACn_DAT, software trigger or hardware trigger. When TRGEN (DACn_CTL[4]) is 0, the data conversion is started by writing DACn_DAT register. When TRGEN (DACn_CTL[4]) is 1, the data conversion is started by external DACn_ST pin, timer event, or EPWM timer event. If the software trigger is selected, the conversion starts once the SWTRG

(DACn_SWTRG[0]) is set to 1. The SWTRG is cleared to 0 by hardware automatically when DACn_DATOUT has been loaded with DACDAT content. The TRGSEL (DACn_CTL[7:5]) determines which one of eight events is selected to start the conversion.

When DAC detects a rising edge on the selected trigger event input, the last data stored in DACDAT is transferred into the DACn_DATOUT[11:0] and DAC starts converting after one PCLK (APB clock) clock cycle. Note that n=0,1.

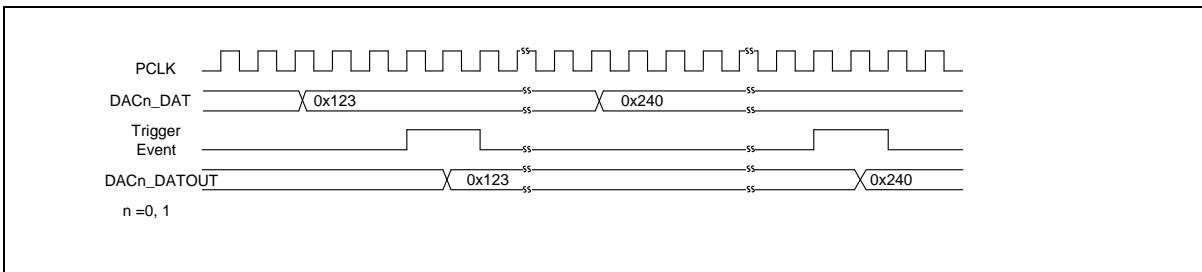

Figure 6.38-4 DAC Conversion Started by Hardware Trigger Event

6.38.5.7 DAC Group Mode

The DAC0 and DAC1 can be grouped together by setting GRPEN (DAC0_CTL[16]) to synchronize the update of each DAC output. Hardware ensures that these two DACs will be updated simultaneously in group mode. In group mode, DAC1_CTL and DAC1_TCTL has no effect. DAC1's behavior is controlled by DAC0_CTL and DAC0_TCTL. Figure 6.38-5 shows an example of group mode and compared with normal mode.

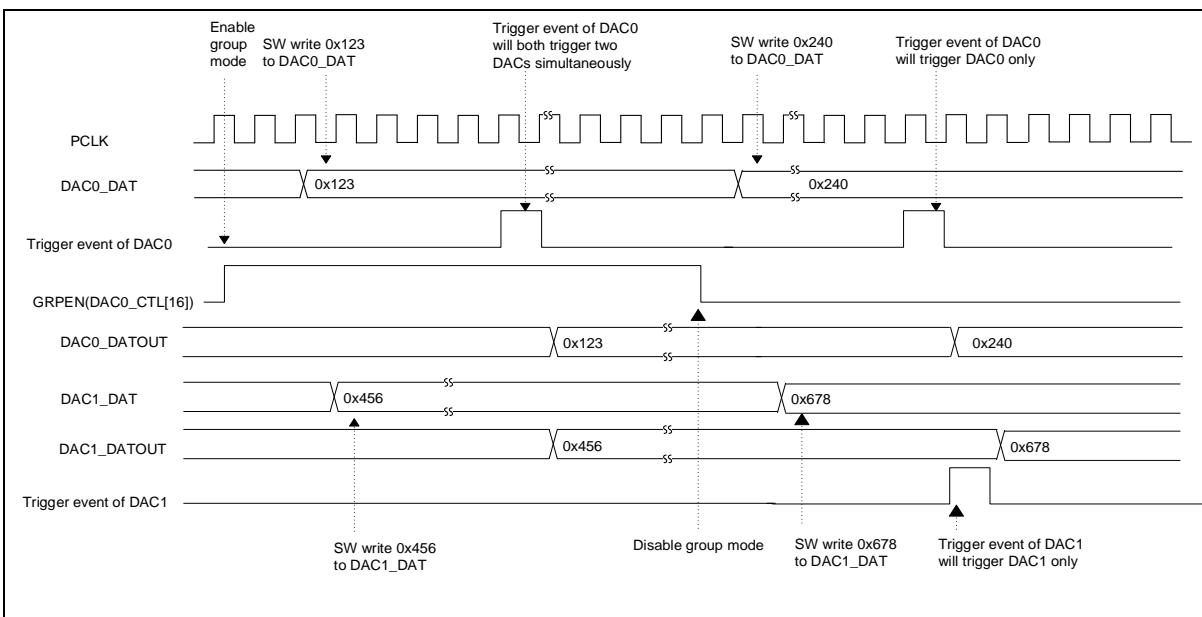

Figure 6.38-5 DAC0 and DAC1 Group and Ungroup Update Example

6.38.5.8 DMA Operation

A DAC DMA request is generated when a hardware trigger event occurs while DMAEN (DACn_CTL[2]) is set. The content of DACn_DAT is transferred to the DACn_DATOUT[11:0] and DAC starts data conversion after one PCLK (APB clock) clock cycle. The new transferred data by PDMA in DACn_DAT will be converted when next trigger event arrives. Figure 6.38-6 shows the DAC PDMA under-run condition, when the second DMA request trigger event arrives before the first conversion

finish, then no new PDMA request is issued and DMA under-run flag DMAUDR (DACn_STATUS[1]) is set 1 to report the error condition. DMA data transfers are then disabled and no further DMA request is treated and DAC continues to convert last data. An interrupt is also generated if the corresponding DMAURIEN (DACn_CTL[3]) is enabled. User has to change the trigger event frequency in timer or EPWM timer and then start DAC conversion again. Note that n=0,1.

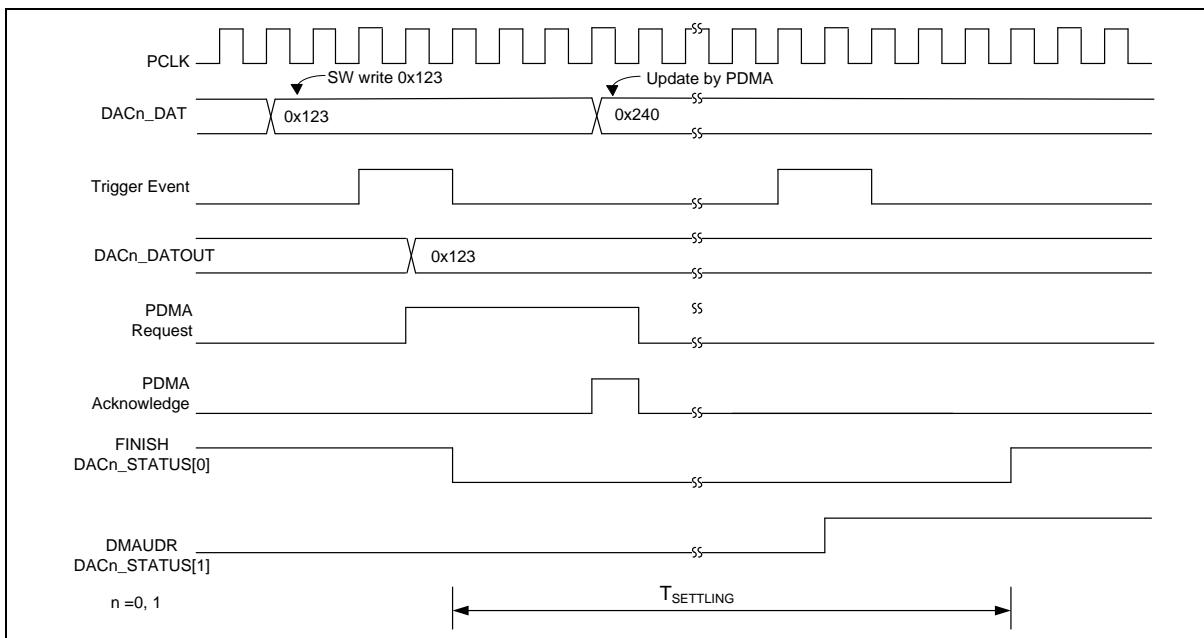

Figure 6.38-6 DAC PDMA Under-Run Condition Example

DMA request can also be generated by software enable, user sets DMAEN (DACn_CTL[2]) to 1 and TRGEN (DACn_CTL[4]) to 0, DMA request is generated periodically according to the conversion time defined by SETTLET (DACn_TCTL[9:0]) value. DAC output is updated periodically. When user clears DMAEN (DACn_CTL[2]) to 0, DAC controller will stop issuing next new PDMA transfer request. Figure 6.38-7 provide an example of DAC continuous conversion with software PDMA mode. Note that n=0,1.

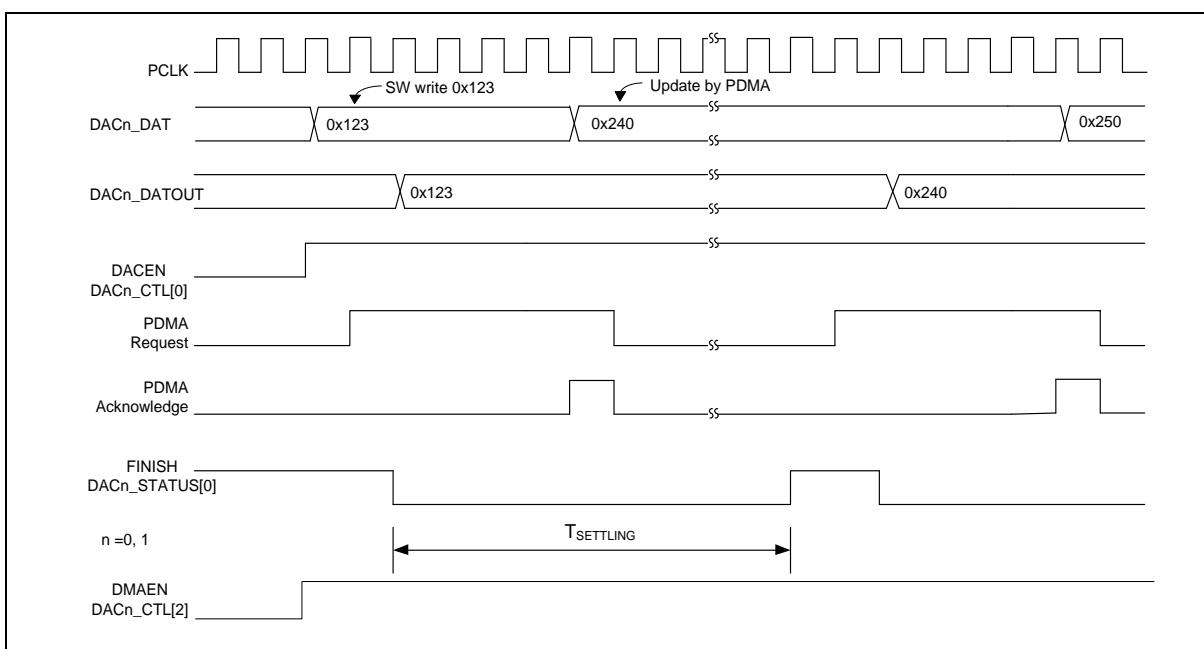

Figure 6.38-7 DAC Continuous Conversion with Software PDMA Mode

6.38.5.9 Interrupt Sources

There are two interrupt sources in DAC controller, one is DAC data conversion finish interrupt and the other is DMA under-run interrupt as shown in Figure 6.38-8. When DAC conversion finish, the FINISH (DACn_STATUS[0]) is set to 1 and an interrupt occurs while DACIEN (DACn_CTL[1]) is enabled. If new DMA trigger event occurs during DAC data conversion period, the DMA under-run flag DMAUDR (DACn_STATUS[1]) is generated and an interrupt occurs if DMAURIEN (DACn_CTL[3]) is enabled. Note that n=0,1.

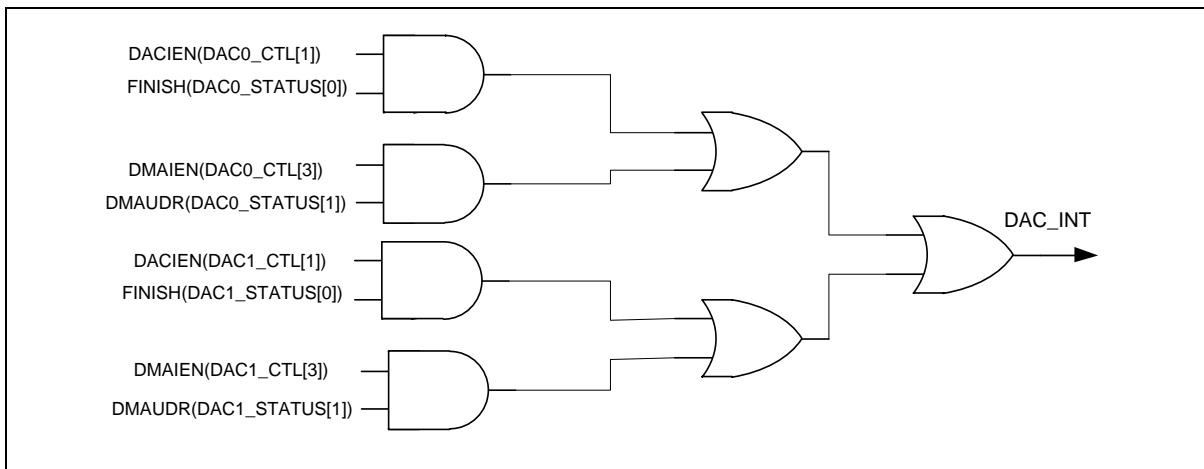

Figure 6.38-8 DAC Interrupt Source

6.39 Analog Comparator Controller (ACMP)

6.39.1 Overview

The chip provides two comparators. The comparator output is logic 1 when positive input is greater than negative input; otherwise, the output is 0. Each comparator can be configured to generate an interrupt when the comparator output value changes.

6.39.2 Features

- Analog input voltage range: 0 ~ AVDD (voltage of AVDD pin)
- Up to two rail-to-rail analog comparators
- Supports hysteresis function
 - Supports programmable hysteresis window: 0mV, 10mV, 20mV and 30mV
- Supports wake-up function
- Supports programmable propagation speed and low power consumption
- Selectable input sources of positive input and negative input
- ACMP0 supports:
 - 4 multiplexed I/O pins at positive sources:
 - ◆ ACMP0_P0, ACMP0_P1, ACMP0_P2, or ACMP0_P3
 - 4 negative sources:
 - ◆ ACMP0_N
 - ◆ Comparator Reference Voltage (CRV)
 - ◆ Internal band-gap voltage (VBG)
 - ◆ DAC0 output (DAC0_OUT)
- ACMP1 supports
 - 4 multiplexed I/O pins at positive sources:
 - ◆ ACMP1_P0, ACMP1_P1, ACMP1_P2, or ACMP1_P3
 - 4 negative sources:
 - ◆ ACMP1_N
 - ◆ Comparator Reference Voltage (CRV)
 - ◆ Internal band-gap voltage (VBG)
 - ◆ DAC0 output (DAC0_OUT)
- Shares one ACMP interrupt vector for all comparators
- Interrupts generated when compare results change (Interrupt event condition is programmable)
- Supports triggers for break events and cycle-by-cycle control for EPWM
- Supports window compare mode and window latch mode

6.39.5 Functional Description

6.39.5.1 Hysteresis Function

The analog comparator provides the hysteresis function to make the comparator to have a stable output transition and it can refer to Figure 6.39-2. If comparator output is 0, it will not be changed to 1 until the positive input voltage exceeds the negative input voltage by a high threshold voltage. Similarly, if comparator output is 1, it will not be changed to 0 until the positive input voltage drops below the negative input voltage by a low threshold voltage.

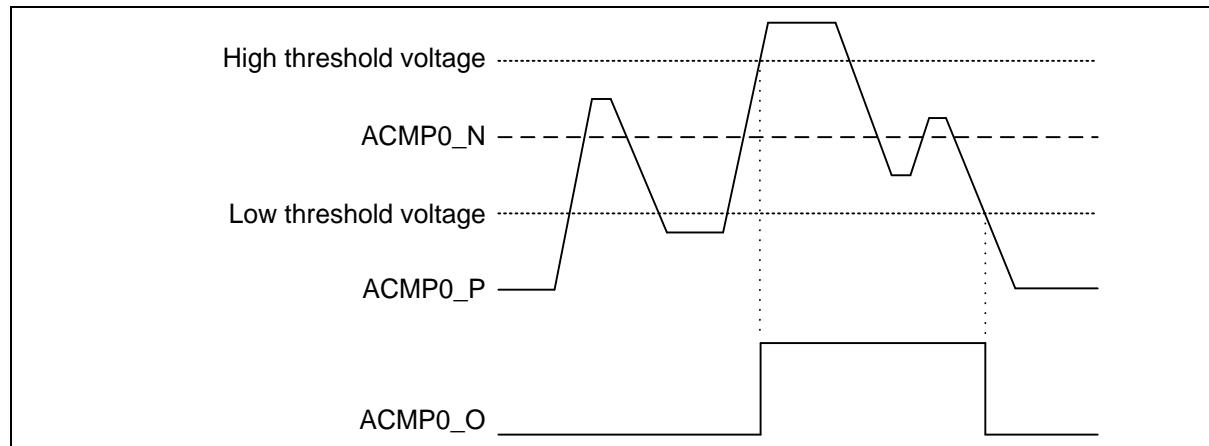

Figure 6.39-2 Comparator Hysteresis Function of ACMP0

6.39.5.2 Window Latch Mode

Figure 6.39-3 shows the comparator operation in window latch mode. Window latch mode can be enabled by setting WLATEN (ACMP_CTL0/1[17]) to 1. When window latch function enabled, ACMP0/1_WLAT pin is used to control the output WLATOUT0/1 .When ACMP0/1_WLAT pin is high, ACMP0/1 passes through to WLATOUT0/1. When ACMP0/1_WLAT pin is low, WLATOUT0/1 will keep last state of WLATOUT0/1.

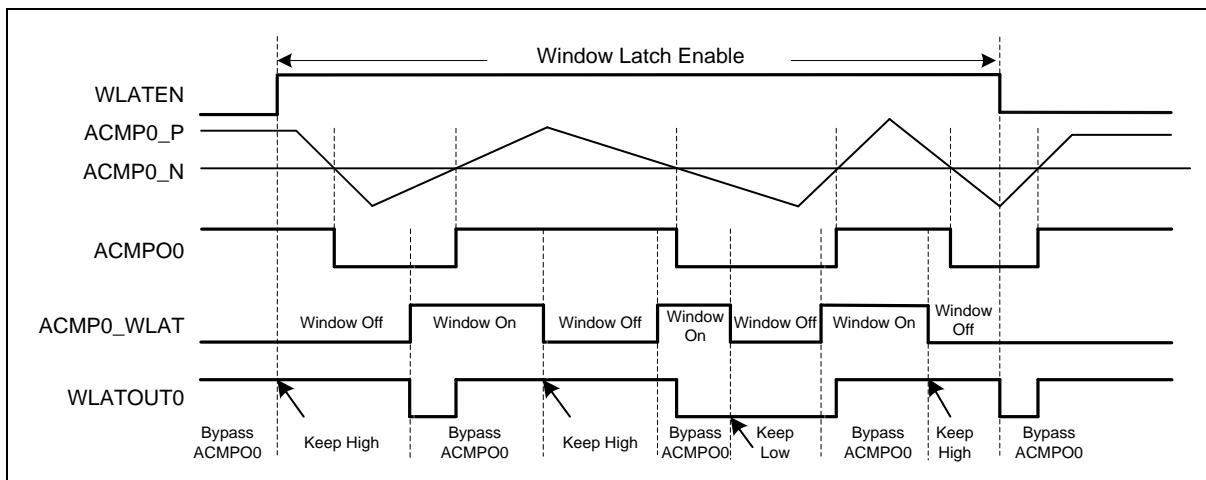

Figure 6.39-3 Window Latch Mode

6.39.5.3 Filter Function

The analog comparator provides filter function to avoid the un-stable state of comparator output.

By setting FILTSEL (ACMP_CTL0[15:13], ACMP_CTL1[15:13]), the comparator output would be sampled by consecutive PCLKs. With longer sample clocks, the comparator output would be more stable. But the sensitivity of comparator output would be reduced.

Figure 6.39-4 shows an example of filter function of ACMP0 with FILTSEL = 3 (4 PCLK). In this example, the comparing result is sampled by PCLK. All result must keep for 4 PCLK clocks before it can be output to ACMPO0. If the comparing result is shorter than 4 PCLK, it will be filtered.

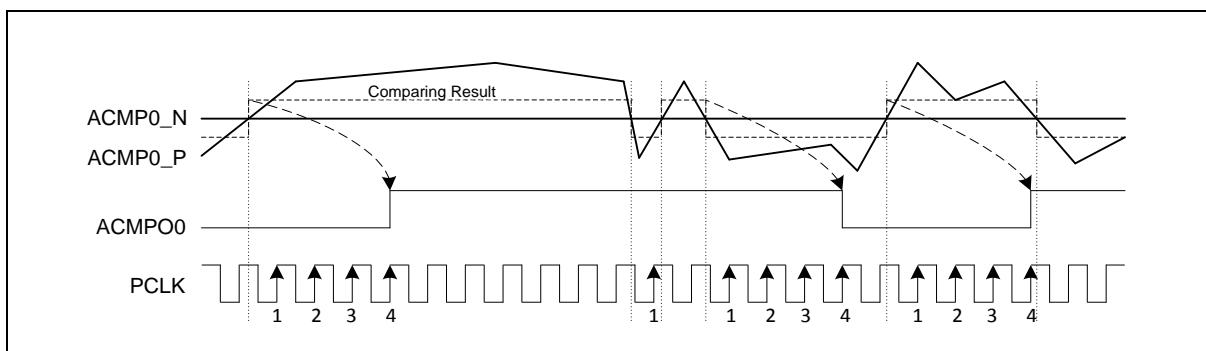

Figure 6.39-4 An example of filter function

6.39.5.4 Interrupt Sources

The outputs of ACMP0 and ACMP1 are reflected at ACMPO0 (ACMP_STATUS[4]) and ACMPO1 (ACMP_STATUS[5]) respectively. Then they are processed by window latch and filter functions. Finally, the output signal could be utilized to assert interrupts. Refer to Figure 6.39-5, if ACMPIE of ACMP_CTL0/1 register is set to 1, the interrupt will be enabled. If the output state ACMPO0/1 is changed as the setting of INTPOL (ACMP_CTL0/1[9:8]), the comparator interrupt will be asserted and the corresponding flag, ACMPIF0 (ACMP_STATUS[0]) and ACMPIF1 (ACMP_STATUS[1]), will be set to 1. The interrupt flag can be cleared to 0 by writing 1.

WKIF(ACMP_STATUS[8], ACMP_STATUS[9]) will be set according to the setting of INTPOL (ACMP_CTL0/1[9:8]) if ACMP wakeup function is enabled. These two flags also cause interrupt rising that makes system wakeup from power down by ACMP.

Figure 6.39-5 shows the interrupts sources of ACMP.

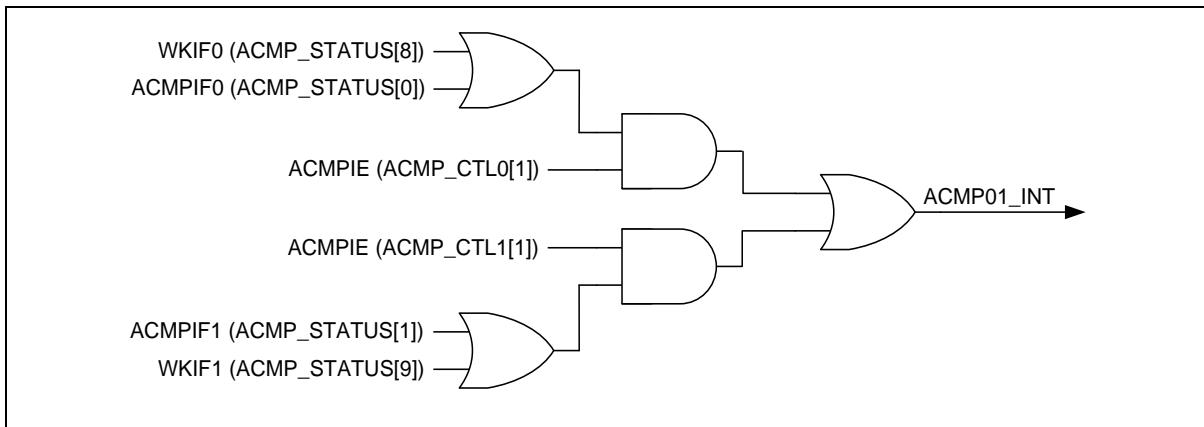

Figure 6.39-5 Comparator Controller Interrupt

6.39.5.5 Comparator Reference Voltage (CRV)

The comparator reference voltage (CRV) module is responsible for generating reference voltage for comparators. The CRV module consists of resistor ladder and analog switch. User can set the CRV output voltage by setting CRVCTL (ACMP_VREF[3:0]). The CRV output voltage can be selected as the negative input of comparator by setting NEGSEL (ACMP_CTL0[5:4], ACMP_CTL1[5:4]). Figure 6.39-6 shows the block diagram of Comparator Reference Voltage.

The resistor ladder will be disabled by hardware to reduce power consumption when NEGSEL (ACMP_CTL0[5:4], ACMP_CTL1[5:4]) is not selected to CRV module. The reference voltage of resistor ladder can be the voltage of AVDD pin or the INT_VREF voltage which is controlled by SYS_VREFCTL register.

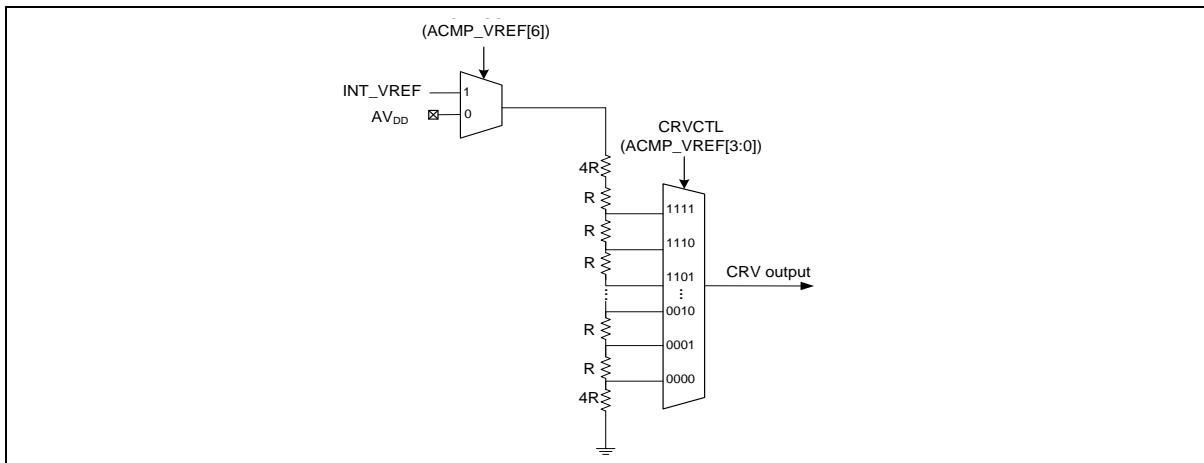

Figure 6.39-6 Comparator Reference Voltage Block Diagram

6.39.5.6 Window Compare Mode

The comparator provides window compare mode. When window compare mode is enabled by setting WCMPSL (ACMP_CTL0/1[18]) to 1, user can monitor a specific analog voltage source with a designated range. User can connect the specific analog voltage source to either the positive inputs of both comparators or the negative inputs of both comparators. The upper bound and lower bound of the designated range are determined by the voltages applied to the other inputs of both comparators. If the output of a comparator is low and the other comparator outputs high, which means two comparators implies the upper and lower bound. User can directly monitor a specific analog voltage source via ACMPWO (ACMP_STATUS[16]). If ACMPWO is high, it implies a specific analog voltage source is in the range of upper and lower bound, which are called as the analog voltage is in the

window.

Figure 6.39-7 illustrates an example of window compare mode. In this example, once window compare mode is selected, user can choose one of four positive input sources of each comparator and connect these two inputs together outside the chip.

If ACMPS0 outputs high and ACMPS1 outputs low, it means the voltage source is in the range of lower bound and upper bound, which are called as the voltage source is in the window. Otherwise, the voltage source is outside the window.

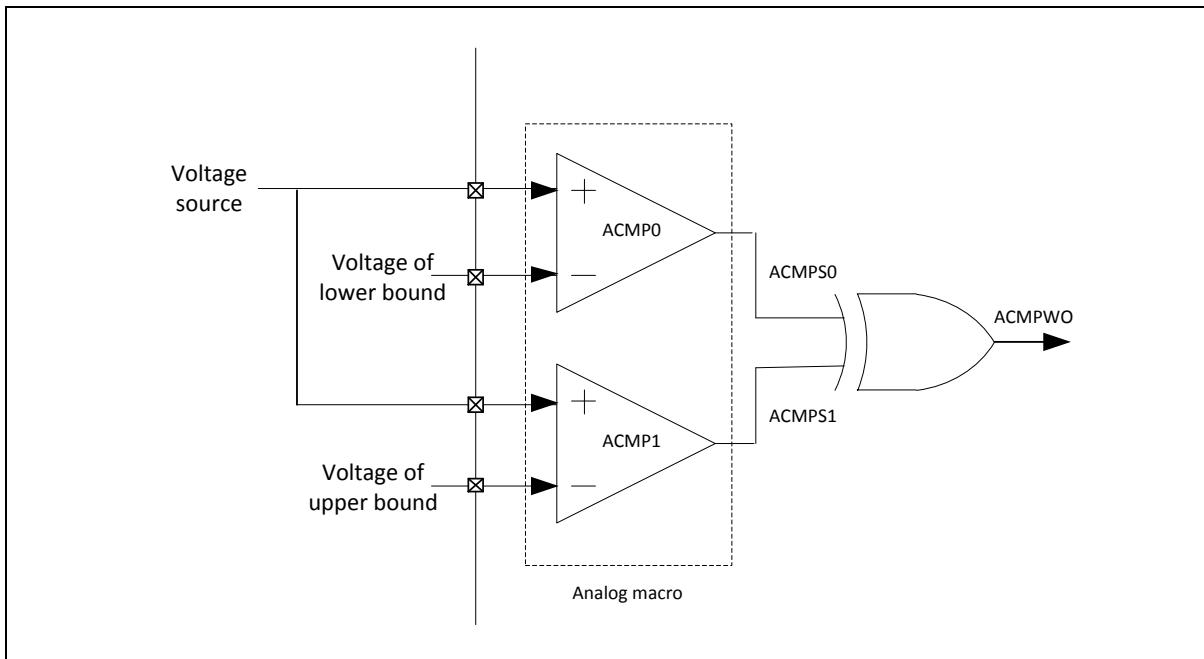

Figure 6.39-7 Example of Window Compare Mode

The comparator window output (ACMPWO) can be shown in ACMP_STATUS[16] and the truth table of window compare logic are shown in Table 6.39-1.

ACMPS0	ACMPS1	ACMPWO
0	0	0
0	1	1
1	1	0
1	0	1

Table 6.39-1 Truth Table of Window Compare Logic

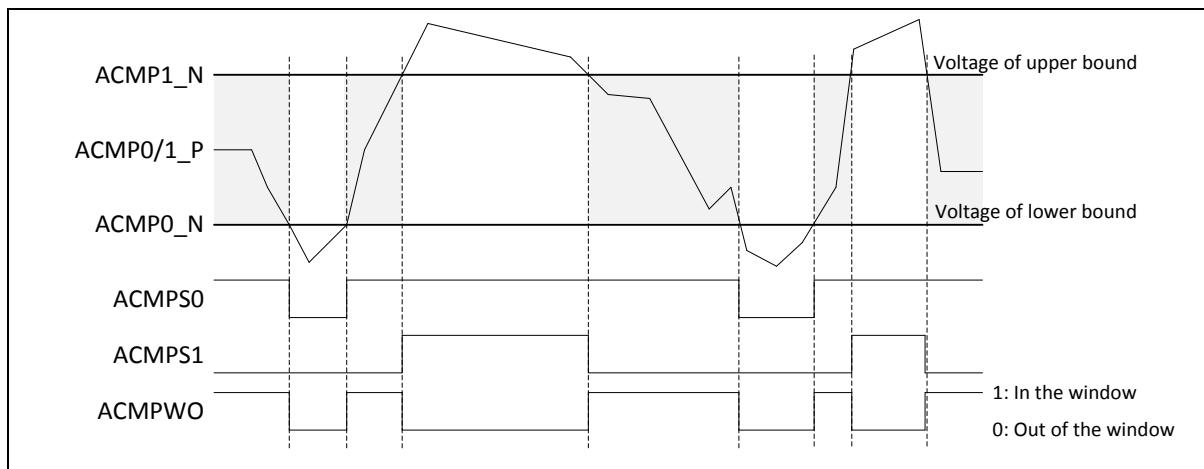

Figure 6.39-8 Example of Window Compare Mode

As shown in Figure 6.39-8, if ACMPWO equals 1, it means positive input voltage is inside the window. Otherwise, the positive input voltage is outside the window. Therefore, ACMPWO can be used to monitor voltage transition of external analog pin. Furthermore, ACMPWO still can be applied to window latch, filter functions and interrupt of ACMP.

Note that negative inputs must choose different source. Otherwise, the function will be meaningless.

6.39.6 Register Map

6.40 OP Amplifier (OPA)

6.40.1 Overview

This device is equipped with three operational amplifiers. Users can enable each of them individually, by their application purpose. PB.2 is connected to ADC0_CH2 and OPA0_O internally. User can read OPA output data from ADC.

6.40.2 Features

- Analog input voltage range: 0~VDD.
- Supports up to 3 operator amplifiers.
- Supports to use Schmitt trigger buffer output for simple comparator function.
- Supports to Schmitt trigger buffer output interrupts.

6.40.5 Functional Description

6.40.5.1 OP Amplifier Function

The OP amplifier can be enabled by setting OPENx (OPA_CTL[2:0]) bits where x=0, 1, 2 for OPA0, OPA1, OPA2 respectively. The OPA pin functions can refer to Figure 6.40-1 and OPA0 output is also internally connected to ADC channel for measurement requirement. Schmitt trigger enable can be set by setting OPDOENx (OPA_CTL[6:4]) bits. OP amplifiers digital output OPDOx (OPA_STATUS[2:0]) are set only when the output state of OP amplifiers changes and Schmitt trigger enable bits are set. OP amplifier digital output is always be 0 when the Schmitt trigger buffer is disabled.

6.40.5.2 Calibration Function

The OP amplifier circuit can be used in the application of Programmable Gain Amplifier (PGA), which can amplify signal by 2, 4, 8... The circuit has five trim bits which can be used to calibrate the offset voltage. Offset voltage comes from both mismatch of NMOS-type differential and PMOS-type differential input stages. Calibration can be started by setting CALTRGx (OPA_CALCTL[2:0]) and set CALCLKx (OPA_CALCTL[9:4] to 2'b00, x=0, 1, 2. After calibration, the input voltage offset can be reduced to be within $\pm 1.6\text{mV}(\text{typ})$. The rail-to-rail common mode input range is achieved by using an NMOS and a PMOS differential pairs connected in parallel. Reading the OPA_CALST register can monitor calibration status, which include calibration done status, NMOS, and PMOS calibration result status. Take a brief calibration flow for example: Once OPENx (OPA_CTL[2:0]) is enabled, hardware will automatically load default calibrated trim values to compensate offset voltage. Therefore, user can directly use OP amplifier without doing additional calibration action. If user wants to start calibration function again, the newer calibrated trim value will be updated after calibration done. Noted that every time OPEN is set, user must set CALTRGx (OPA_CALCTL[2:0]) to start calibration function getting newer offset trim values, or OP amplifier will operate with older offset trim values. It is noted that x=0, 1, 2.

6.40.5.3 Interrupt Sources

OPDOIF0 (OPA_STATUS[4]) and OPDOIF1 (OPA_STATUS[5]), OPDOIF2 (OPA_STATUS[6]) interrupt flag are set respectively by hardware whenever digital output interrupt enable OPDOIEN0 (OPA_CTL[8]), OPDOIEN1 (OPA_CTL[9]), OPDOIEN2 (OPA_CTL[10]) are set the OPA0, 1, 2 Schmitt trigger non-inverting buffer output change states. The flag bit is cleared by writing 1 to it. Schmitt trigger buffer outputs of OP amplifier0, 1, 2 can be as one of the comparator interrupt sources.

6.40.6 Register Map

R: read only, W: write only, R/W: both read and write, C: Only value 0 can be written

Register	Offset	R/W	Description	Reset Value
OPA Base Address:				
OPA_BA = 0x4004_6000				
OPA_CTL	OPA_BA+0x00	R/W	OP Amplifier Control Register	0x0000_0000
OPA_STATUS	OPA_BA+0x04	R/W	OP Amplifier Status Register	0x0000_0000
OPA_CALCTL	OPA_BA+0x08	R/W	OP Amplifier Calibration Control Register	0x0000_03F0
OPA_CALST	OPA_BA+0x0C	R	OP Amplifier Calibration Status Register	0x0000_0000

6.40.7 Register Description

OPA Control Register (OPA_CTL)

Register	Offset	R/W	Description				Reset Value
OPA_CTL	OPA_BA+0x00	R/W	OP Amplifier Control Register				0x0000_0000

[1]	CALNS0	OP Amplifier 0 Calibration Result Status for NMOS 0 = Pass. 1 = Fail.
[0]	DONE0	OP Amplifier 0 Calibration Done Status 0 = Calibrating. 1 = Calibration Done.

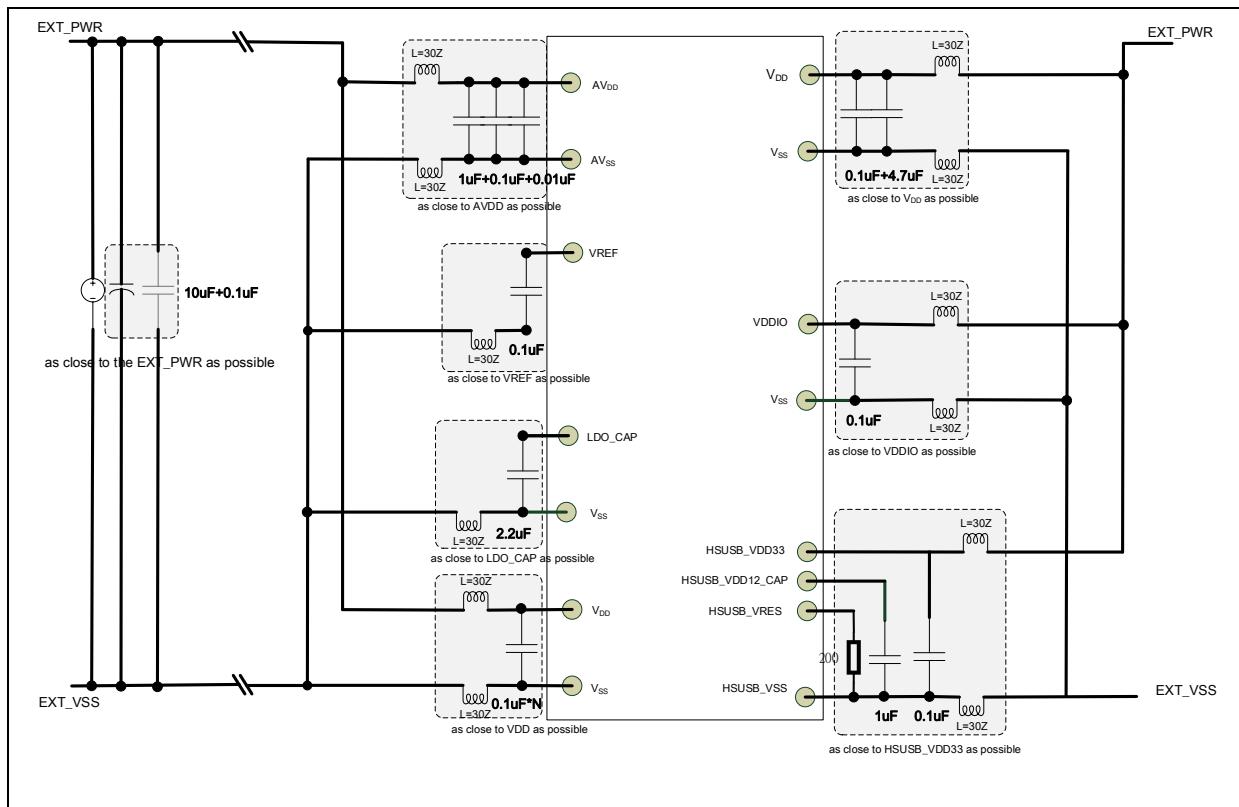

7 APPLICATION CIRCUIT

7.1 Power Supply Scheme with External V_{REF}

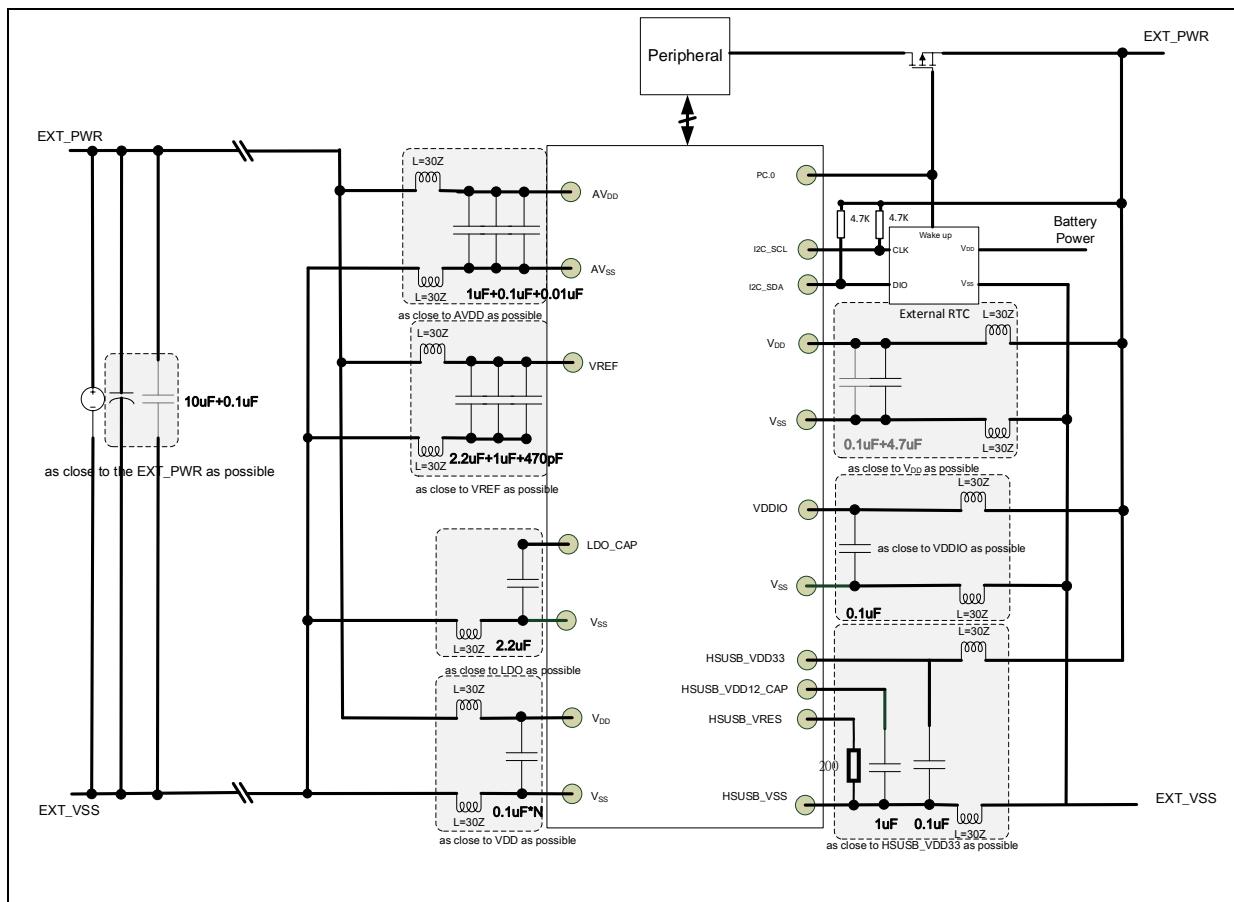

Note: Total capacitance of LDO_CAP pin is $2.2\mu F$.

7.2 Power Supply Scheme with Internal V_{REF}

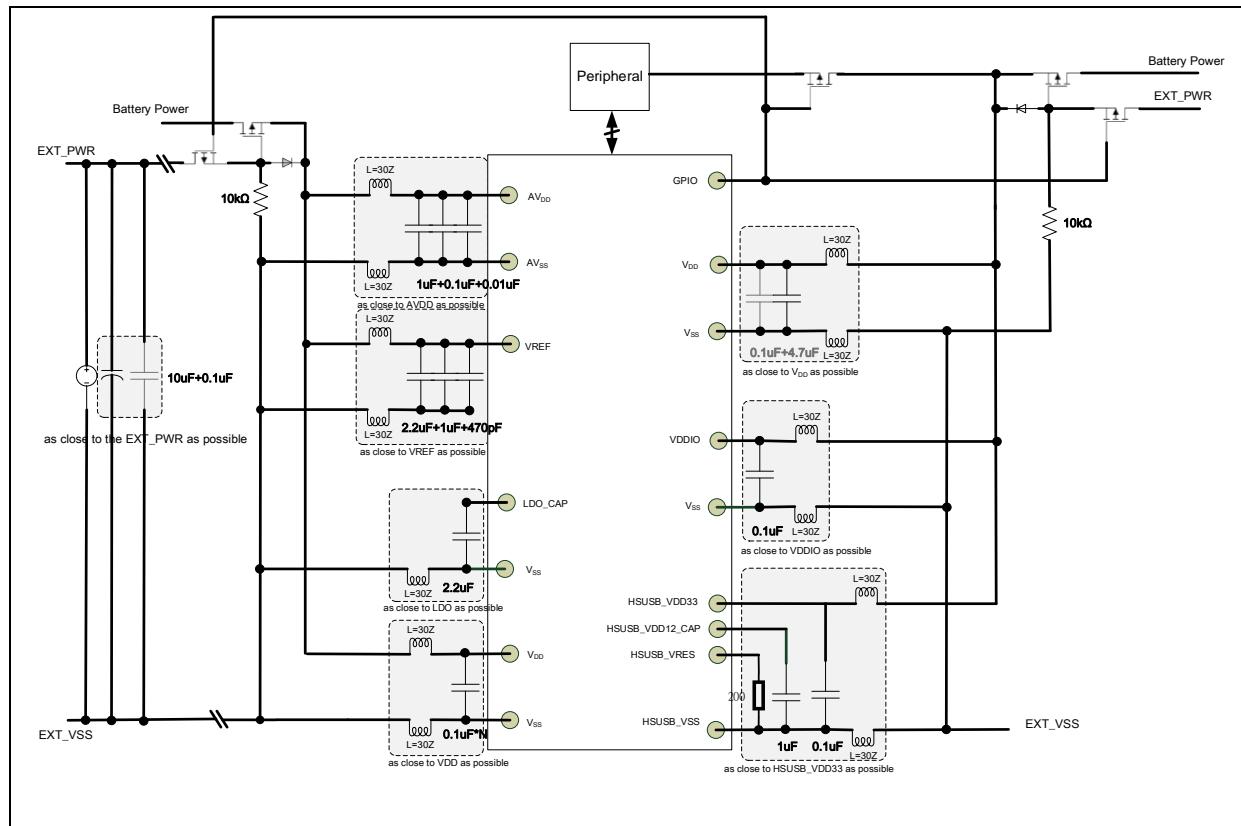

Note: Total capacitance of LDO_CAP pin is $2.2\mu F$.

7.3 Power Supply Scheme with External V_{REF} and External RTC with Battery Power

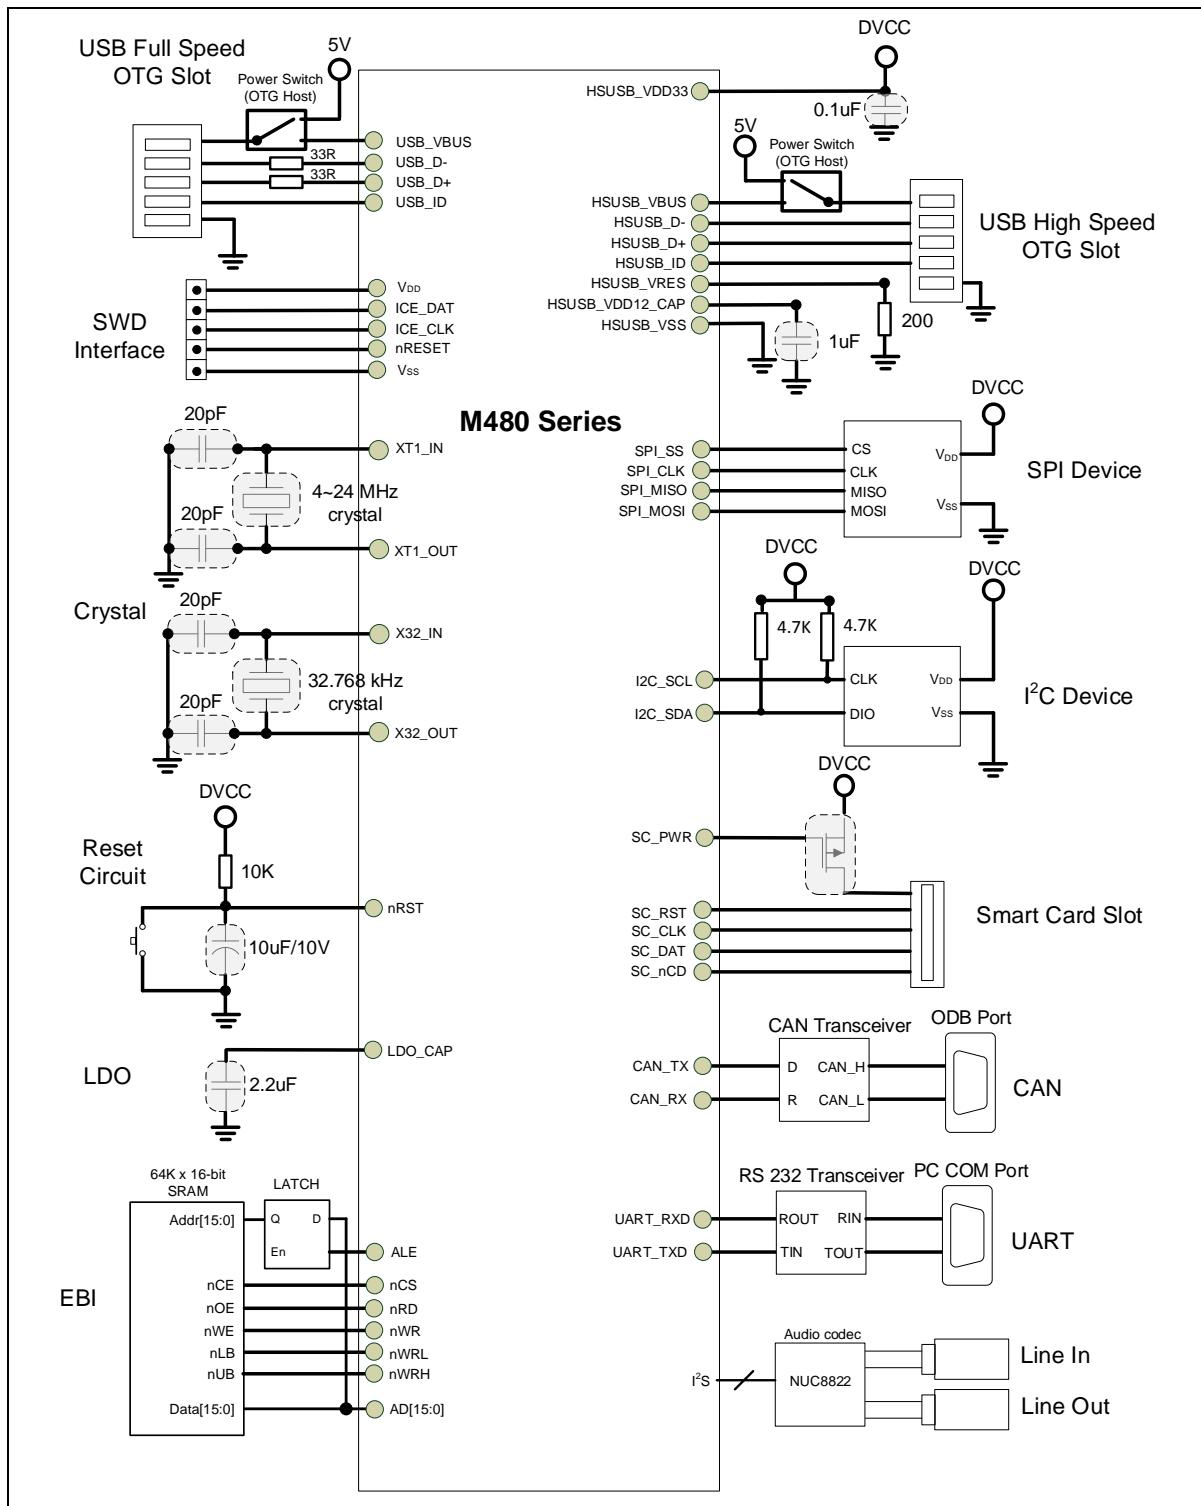

Note: Total capacitance of LDO_CAP pin is 2.2uF.

7.4 Power Supply Scheme with External V_{REF} and Internal RTC with Battery Power

Note: Total capacitance of LDO_CAP pin is 2.2uF.

7.5 Peripheral Application scheme

Note: USB_ID, HSUSB_ID could be floating using USB or USB HS without OTG.

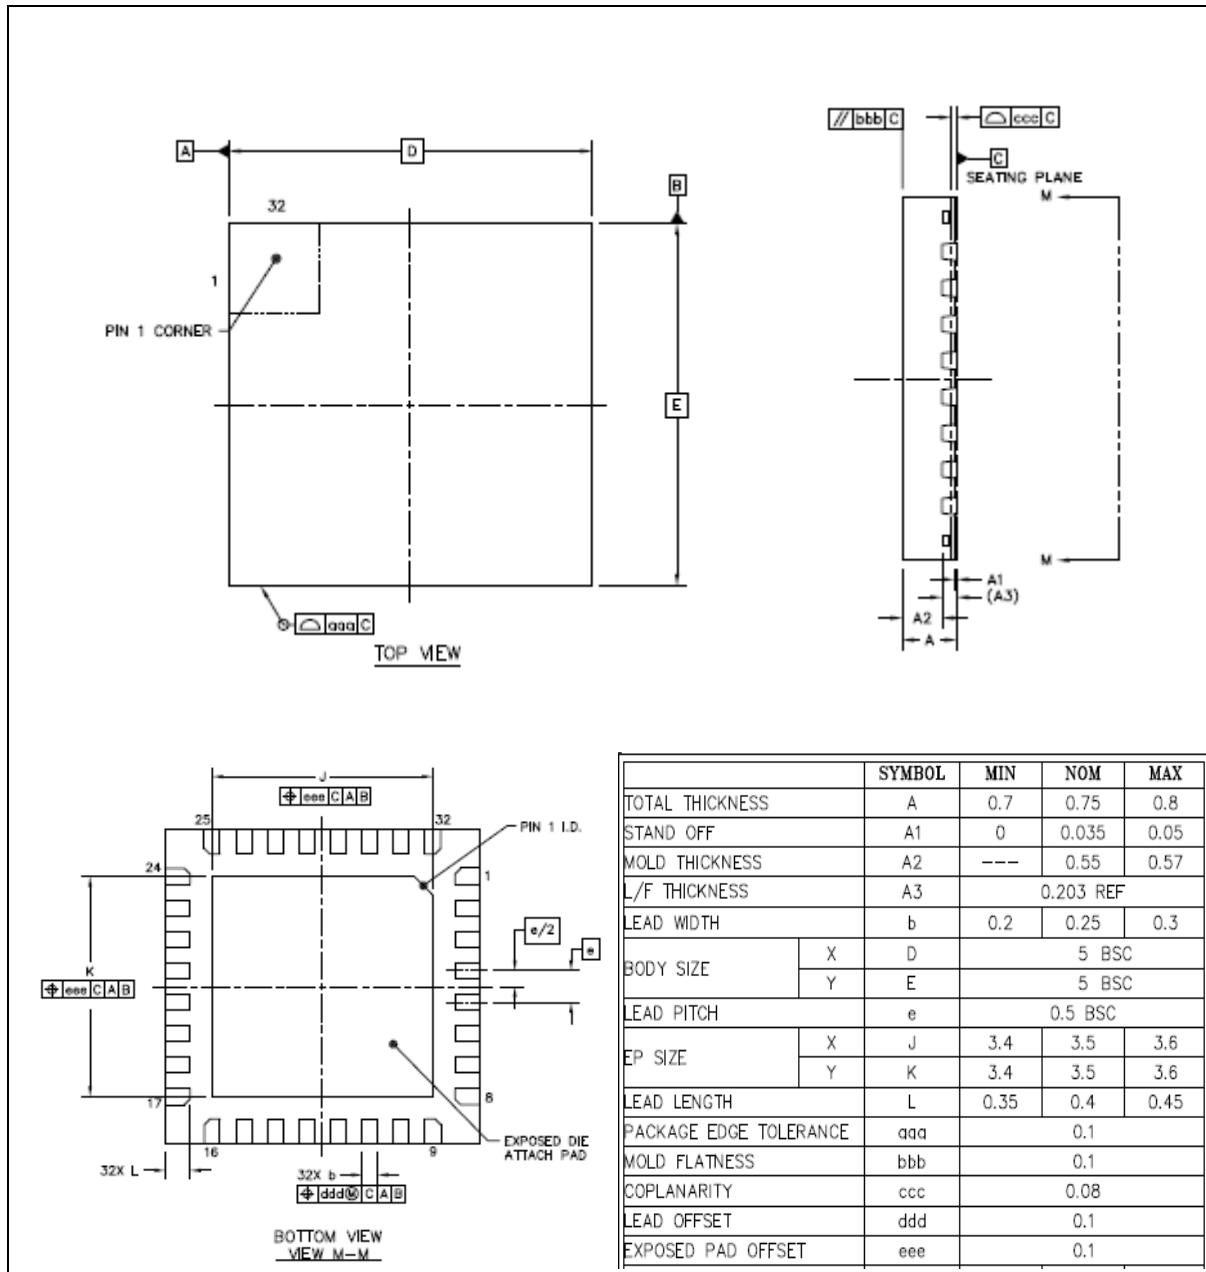

Note: Total capacitance of LDO_CAP pin is 2.2uF.

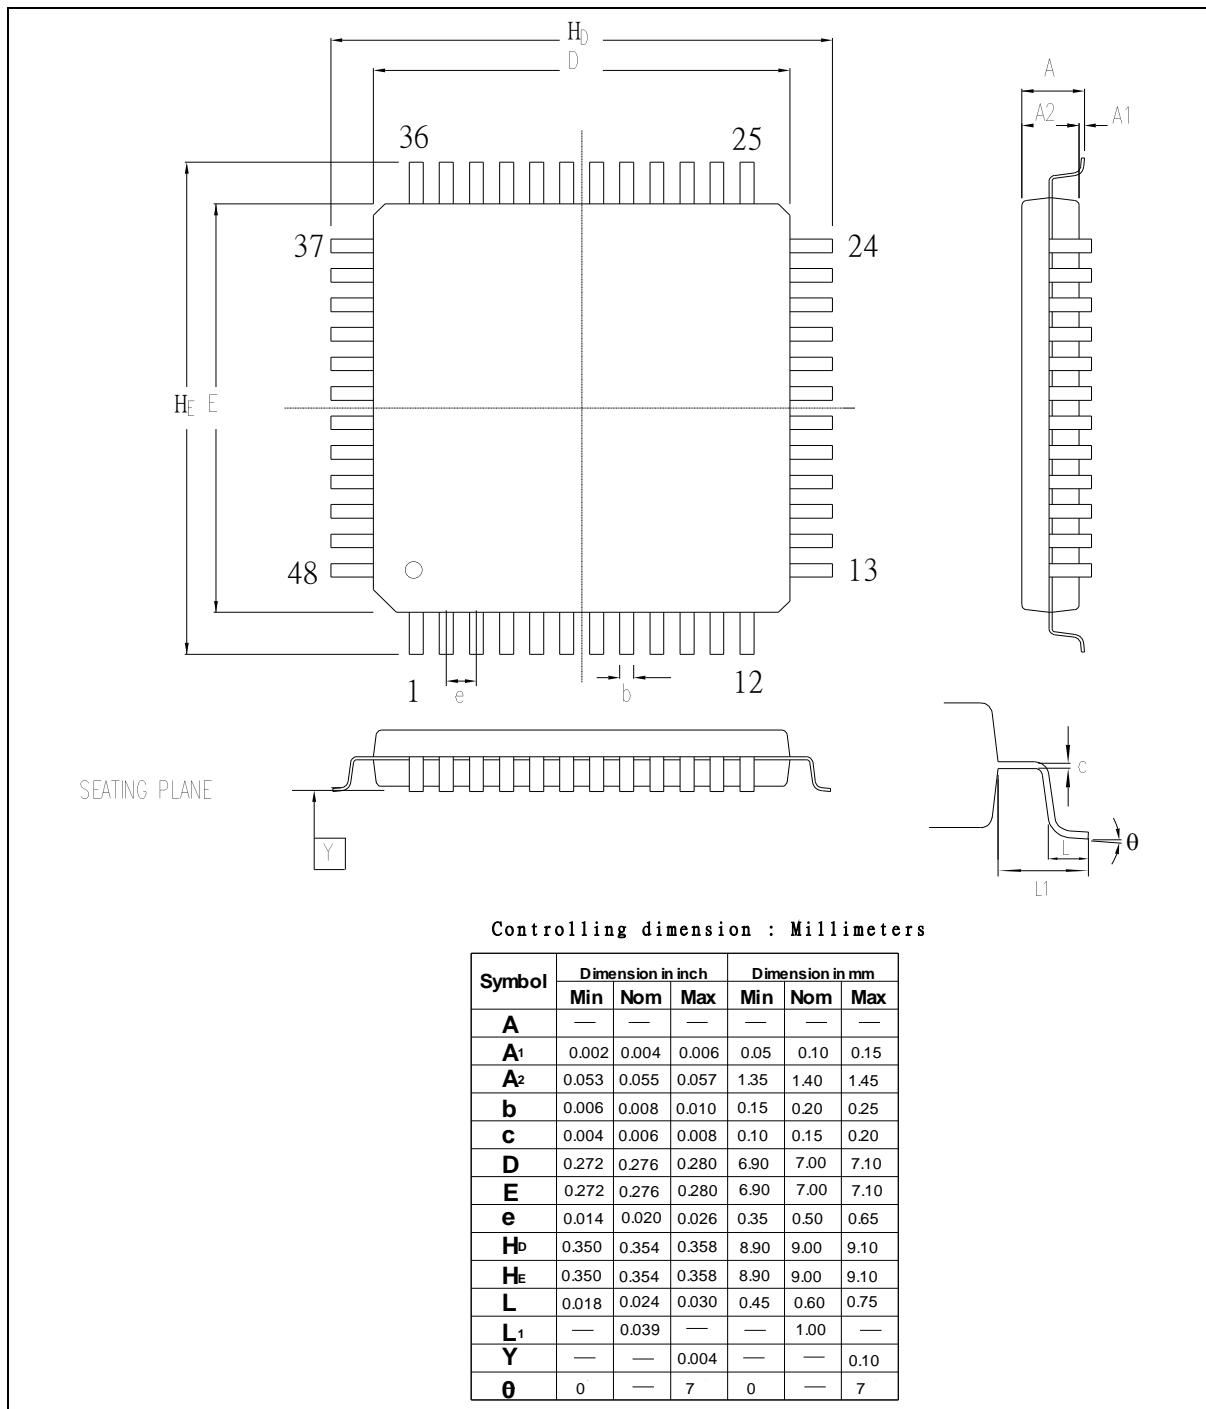

8 ELECTRICAL CHARACTERISTICS

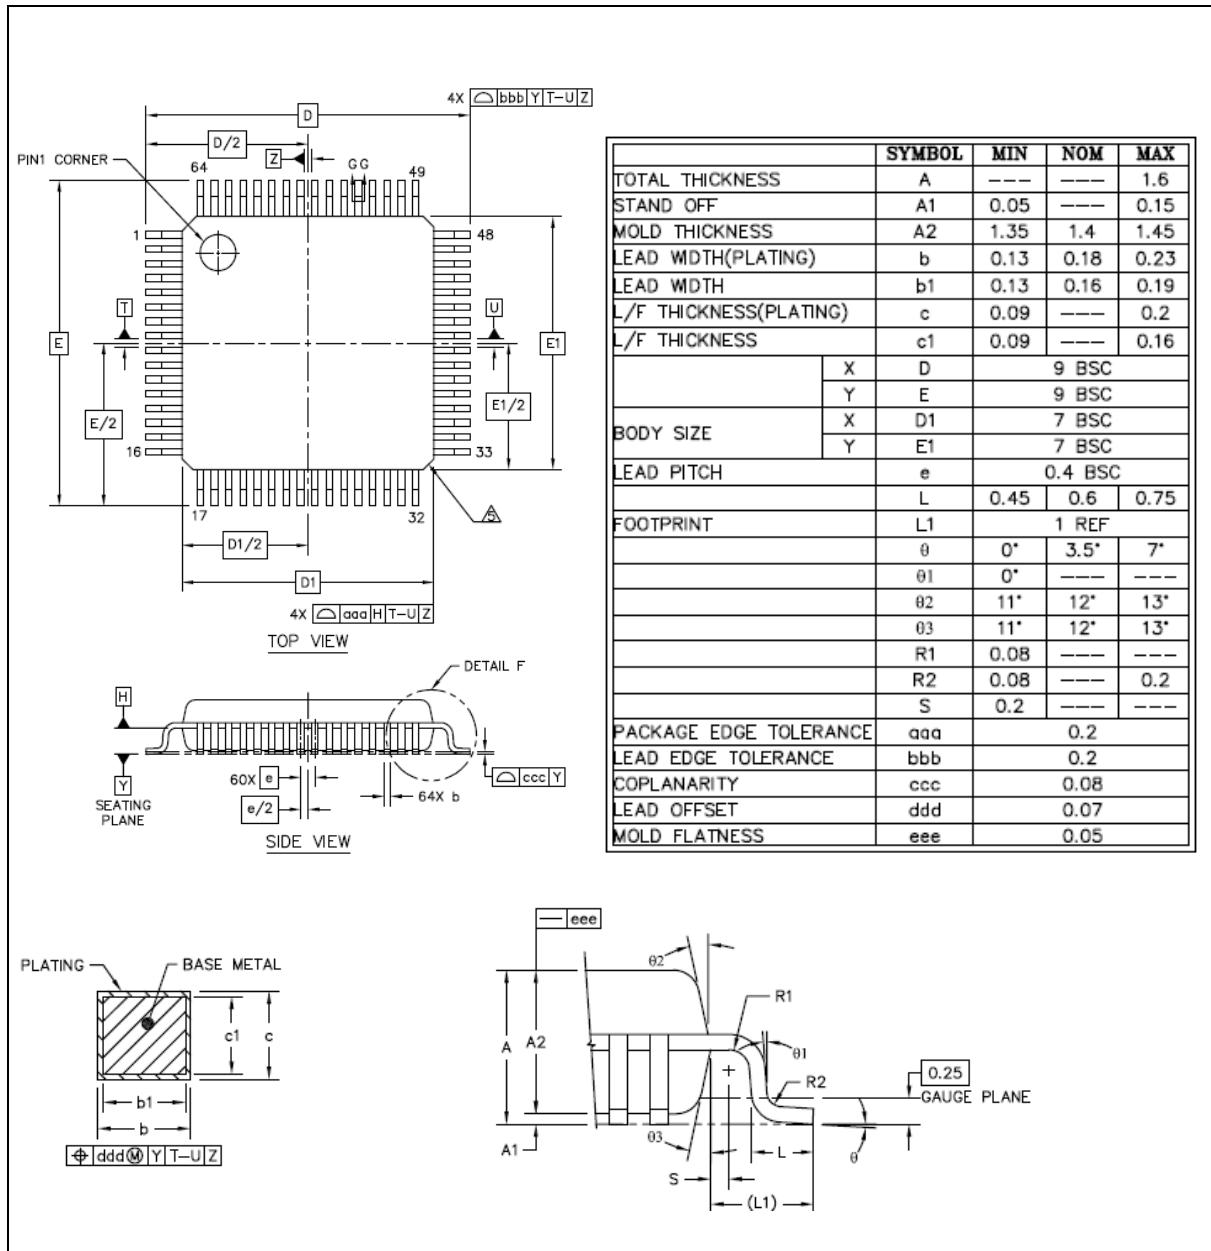

For information on the M480 electrical characteristics, please refer to NuMicro® M480 Series Datasheet.

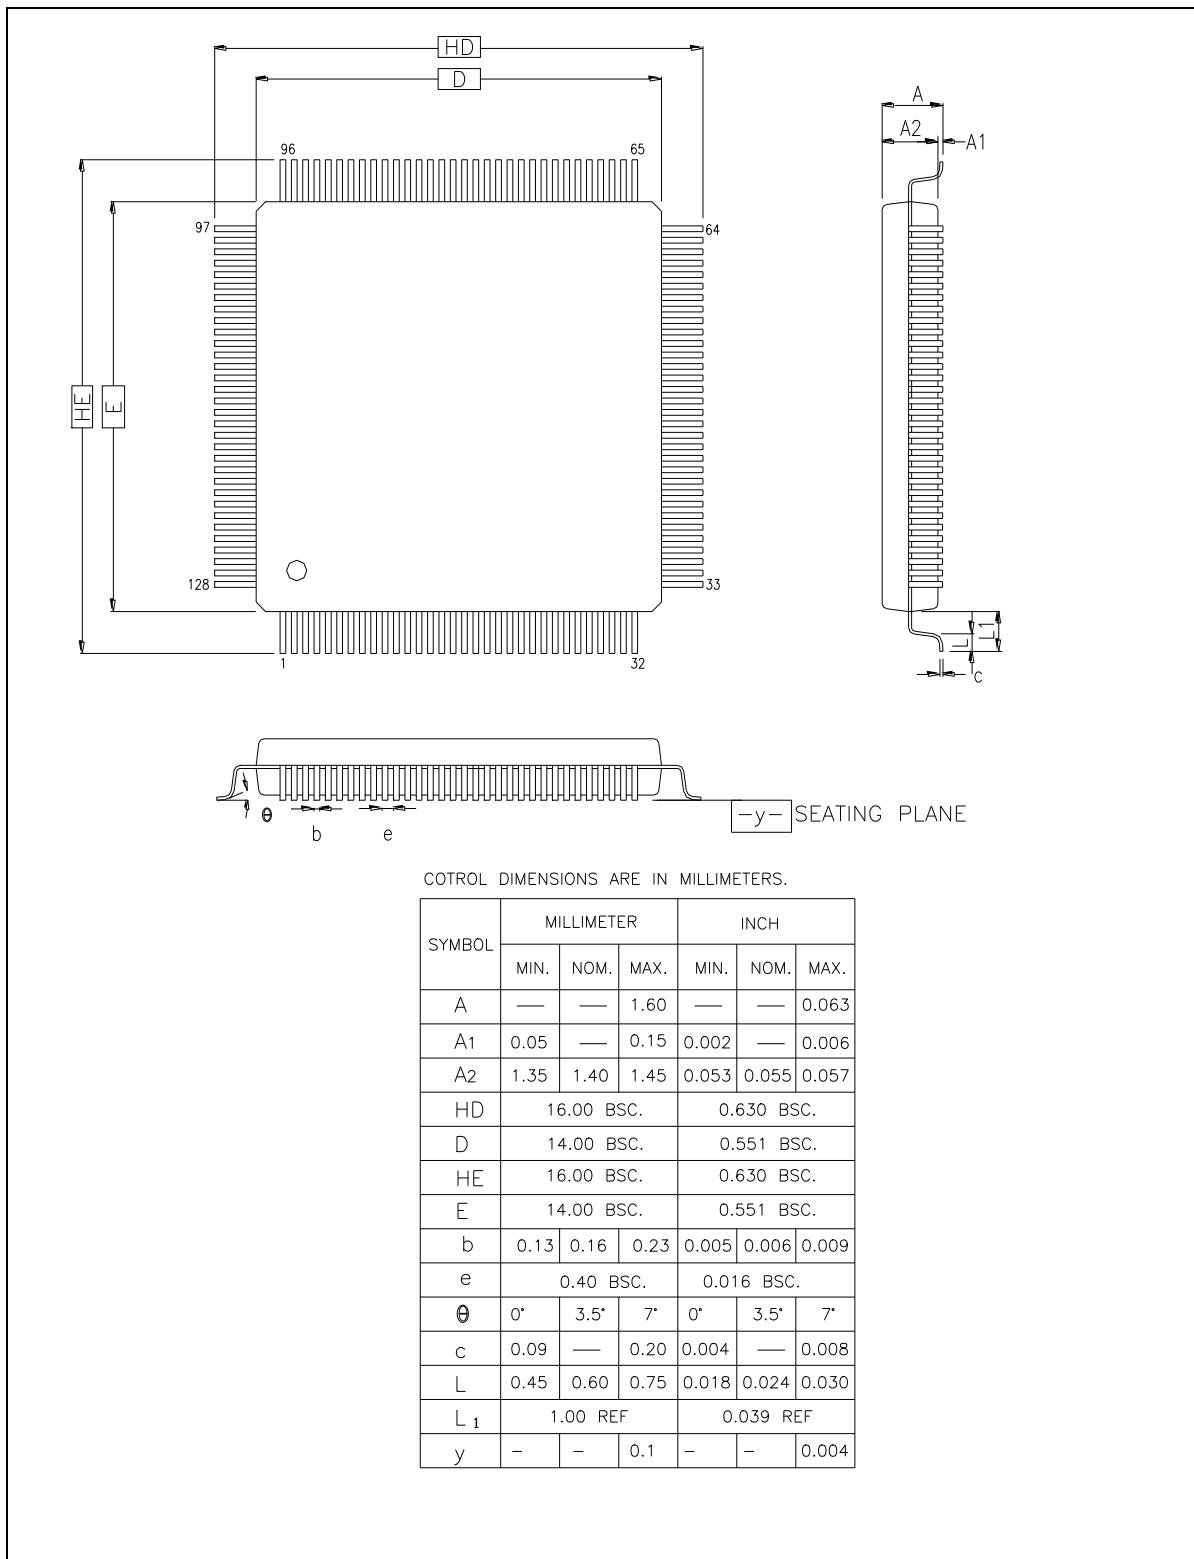

9 PACKAGE DIMENSIONS

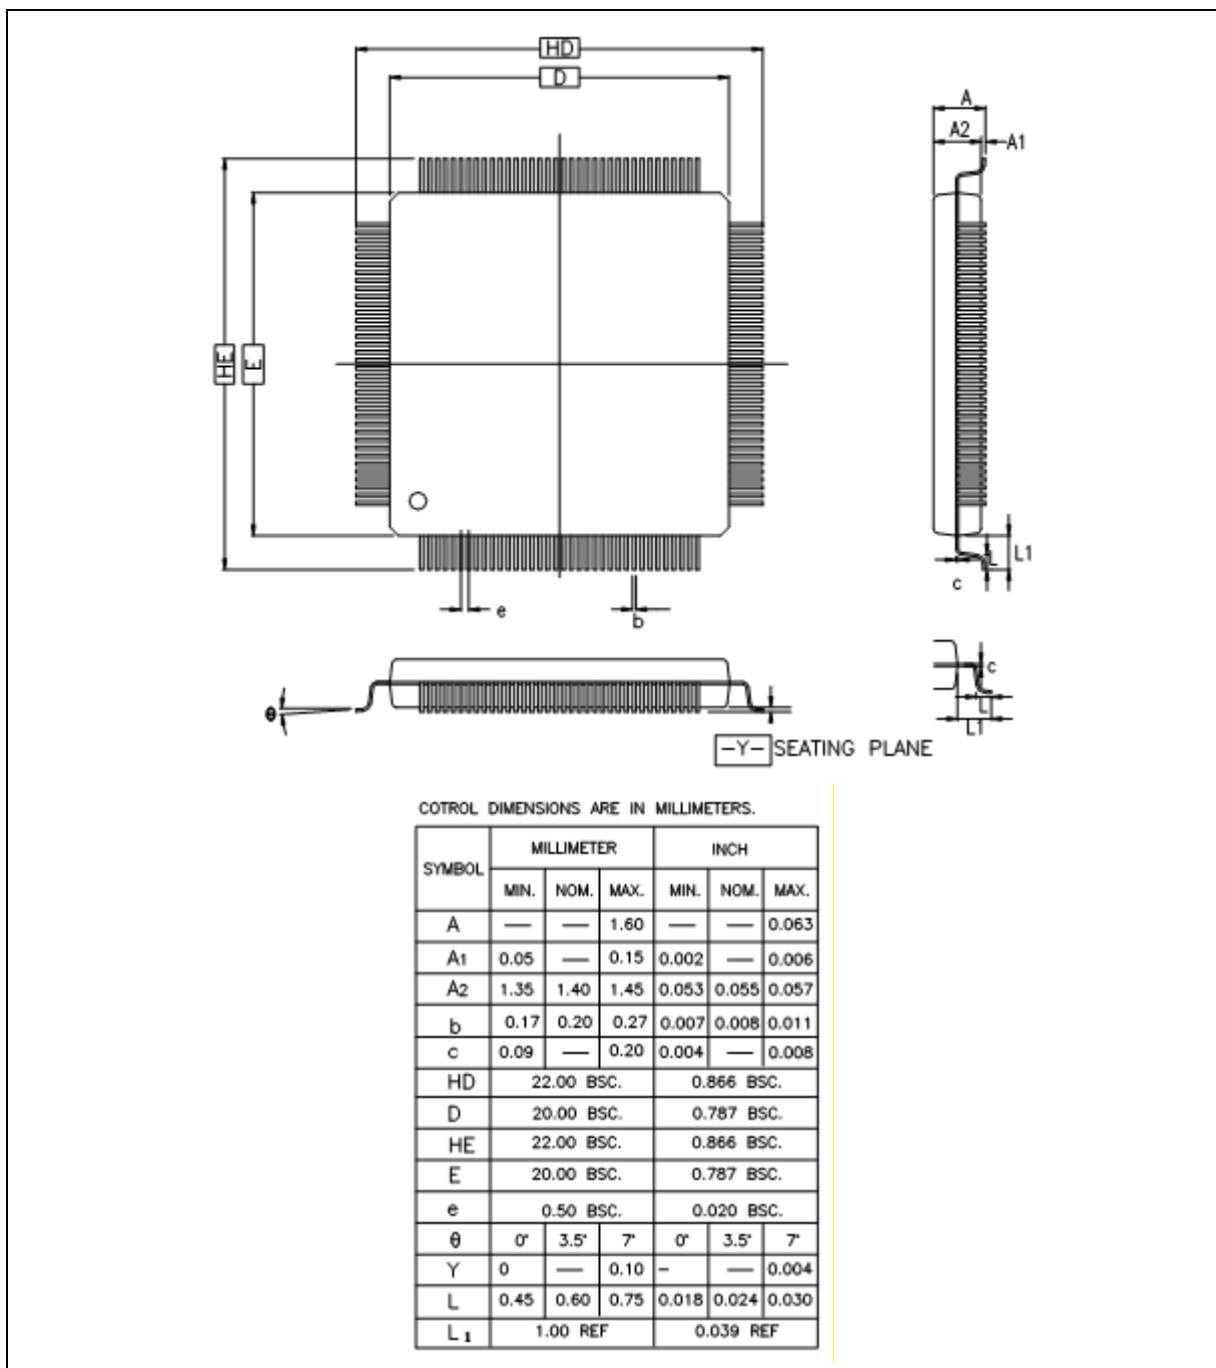

9.1 QFN 33L (5x5x0.8 mm³ Pitch 0.5 mm)

9.2 LQFP 48L (7x7x1.4 mm³ Footprint 2.0mm)

9.3 LQFP 64L (7x7x1.4 mm³ Footprint 2.0 mm)

9.4 LQFP 128L (14x14x1.4 mm³ Footprint 2.0 mm)

9.5 LQFP 144L (20x20x1.4 mm³ Footprint 2.0 mm)

10 ABBREVIATIONS

10.1 Abbreviations

Acronym	Description
ACMP	Analog Comparator Controller
ADC	Analog-to-Digital Converter
AES	Advanced Encryption Standard
APB	Advanced Peripheral Bus
AHB	Advanced High-Performance Bus
BOD	Brown-out Detection
CAN	Controller Area Network
DAP	Debug Access Port
DES	Data Encryption Standard
EADC	Enhanced Analog-to-Digital Converter
EBI	External Bus Interface
EMAC	Ethernet MAC Controller
EPWM	Enhanced Pulse Width Modulation
FIFO	First In, First Out
FMC	Flash Memory Controller
FPU	Floating-point Unit
GPIO	General-Purpose Input/Output
HCLK	The Clock of Advanced High-Performance Bus
HIRC	12 MHz Internal High Speed RC Oscillator
HXT	4~24 MHz External High Speed Crystal Oscillator
IAP	In Application Programming
ICP	In Circuit Programming
ISP	In System Programming
LDO	Low Dropout Regulator
LIN	Local Interconnect Network
LIRC	10 kHz internal low speed RC oscillator (LIRC)
MPU	Memory Protection Unit
NVIC	Nested Vectored Interrupt Controller
PCLK	The Clock of Advanced Peripheral Bus
PDMA	Peripheral Direct Memory Access
PLL	Phase-Locked Loop
PWM	Pulse Width Modulation

QEI	Quadrature Encoder Interface
SD	Secure Digital
SPI	Serial Peripheral Interface
SPS	Samples per Second
TDES	Triple Data Encryption Standard
TK	Touch Key
TMR	Timer Controller
UART	Universal Asynchronous Receiver/Transmitter
UCID	Unique Customer ID
USB	Universal Serial Bus
WDT	Watchdog Timer
WWDT	Window Watchdog Timer

11 REVISION HISTORY

Date	Revision	Description
2018.03.30	1.00	Initial version.
2018.07.16	1.01	<ol style="list-style-type: none">1. Added HSOTGRST, OTGRST in the SYS_IPRST1 register in section 6.2.12.2. Added the note “the SRAM bank2 has additional two wait cycles when reading data” in section 6.2.7.3. Added the note that HXT should be 12 MHz for USB High-speed application in Figure 6.3-1.4. Added the note “PCLK must be less than 96 MHz” in the CLK_PCLKDIV register in section 6.3.10.

Important Notice

Nuvoton Products are neither intended nor warranted for usage in systems or equipment, any malfunction or failure of which may cause loss of human life, bodily injury or severe property damage. Such applications are deemed, “Insecure Usage”.

Insecure usage includes, but is not limited to: equipment for surgical implementation, atomic energy control instruments, airplane or spaceship instruments, the control or operation of dynamic, brake or safety systems designed for vehicular use, traffic signal instruments, all types of safety devices, and other applications intended to support or sustain life.

All Insecure Usage shall be made at customer’s risk, and in the event that third parties lay claims to Nuvoton as a result of customer’s Insecure Usage, customer shall indemnify the damages and liabilities thus incurred by Nuvoton.

Please note that all data and specifications are subject to change without notice.
All the trademarks of products and companies mentioned in this datasheet belong to their respective owners.
